If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

If `VkPhysicalDeviceInlineUniformBlockFeatures::descriptorBindingInlineUniformBlockUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.
descriptor type \textit{VK\_DESCRIPOR\_TYPE\_INLINE\_UNIFORM\_BLOCK} \textbf{must} not use \textit{VK\_DESCRIPOR\_BINDING\_UPDATE\_AFTER\_BIND\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If \textit{VkPhysicalDeviceAccelerationStructureFeaturesKHR} ::\textit{descriptorBindingAccelerationStructureUpdateAfterBind} is not enabled, all bindings with descriptor type \textit{VK\_DESCRIPOR\_TYPE\_ACCELERATION\_STRUCTURE\_KHR} or \textit{VK\_DESCRIPOR\_TYPE\_ACCELERATION\_STRUCTURE\_NV} \textbf{must} not use \textit{VK\_DESCRIPOR\_BINDING\_UPDATE\_AFTER\_BIND\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
  All bindings with descriptor type \textit{VK\_DESCRIPOR\_TYPE\_INPUT\_ATTACHMENT}, \textit{VK\_DESCRIPOR\_TYPE\_UNIFORM\_BUFFER\_DYNAMIC}, or \textit{VK\_DESCRIPOR\_TYPE\_STORAGE\_BUFFER\_DYNAMIC} \textbf{must} not use \textit{VK\_DESCRIPOR\_BINDING\_UPDATE\_AFTER\_BIND\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If \textit{VkPhysicalDeviceDescriptorIndexingFeatures} ::\textit{descriptorBindingUpdateUnusedWhilePending} is not enabled, all elements of \textit{pBindingFlags} \textbf{must} not include \textit{VK\_DESCRIPOR\_BINDING\_UPDATE\_UNUSED\_WHILE\_PENDING\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
  If \textit{VkPhysicalDeviceDescriptorIndexingFeatures} ::\textit{descriptorBindingPartiallyBound} is not enabled, all elements of \textit{pBindingFlags} \textbf{must} not include \textit{VK\_DESCRIPOR\_BINDING\_PARTIALLY\_BOUND\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
  If \textit{VkPhysicalDeviceDescriptorIndexingFeatures} ::\textit{descriptor BindingVariableDescriptorCount} is not enabled, all elements of \textit{pBindingFlags} \textbf{must} not include \textit{VK\_DESCRIPOR\_BINDING\_VARIABLE\_DESCRIPTOR\_COUNT\_BIT}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
  If an element of \textit{pBindingFlags} includes \textit{VK\_DESCRIPOR\_BINDING\_VARIABLE\_DESCRIPTOR\_COUNT\_BIT}, that element's descriptorType \textbf{must} not be \textit{VK\_DESCRIPOR\_TYPE\_UNIFORM\_BUFFER\_DYNAMIC} or \textit{VK\_DESCRIPOR\_TYPE\_STORAGE\_BUFFER\_DYNAMIC}

---

**Valid Usage (Implicit)**

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
  
  \textit{sType} \textbf{must} be \textit{VK\_STRUCTURE\_TYPE\_DESCRIPTOR\_SET\_LAYOUT\_BINDING\_FLAGS\_CREATE\_INFO}

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter

  If \textit{bindingCount} is not 0, \textit{pBindingFlags} \textbf{must} be a valid pointer to an array of \textit{bindingCount} valid combinations of \textit{VkDescriptorBindingFlagBits} values

**Bits which can be set in each element of \textit{VkDescriptorSetLayoutBindingFlagsCreateInfo}**
**pBindingFlags**, specifying options for the corresponding descriptor set layout binding, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
} VkDescriptorBindingFlagBits;
```

- **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not dynamically used need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT**. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** indicates that this is a variable-sized descriptor binding whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet*` and `maxPerStageDescriptor*`, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**. In this case, `descriptorCount` specifies the upper bound on the byte size of the binding; thus it counts against the `maxInlineUniformTotalSize` limit instead.
Note

Note that while VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT and VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT both involve updates to descriptor sets after they are bound, VK_DESCRIPTOR_BINDING_UPDATE UNUSED WHILE_PENDING_BIT is a weaker requirement since it is only about descriptors that are not used, whereas VK_DESCRIPTOR_BINDING_UPDATE AFTER BIND_BIT requires the implementation to observe updates to descriptors that are used.

// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;

VkDescriptorBindingFlags is a bitmask type for setting a mask of zero or more VkDescriptorBindingFlagBits.

To query information about whether a descriptor set layout can be created, call:

// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);

or the equivalent command

// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);

- device is the logical device that would create the descriptor set layout.
- pCreateInfo is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- pSupport is a pointer to a VkDescriptorSetLayoutSupport structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like maxDescriptorSet*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, this command is guaranteed to return VK_TRUE in VkDescriptorSetLayoutSupport::supported. If the descriptor set layout exceeds the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether
the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as maxPerStageDescriptor*, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as maxPerStageDescriptor* in order to be used in a pipeline layout.

Note
This is a VkDevice query rather than VkPhysicalDevice because the answer may depend on enabled features.

Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDescriptorSetLayoutCreateInfo structure

- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
pSupport must be a valid pointer to a VkDescriptorSetLayoutSupport structure

Information about support for the descriptor set layout is returned in a VkDescriptorSetLayoutSupport structure:

```
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```

or the equivalent

```
// Provided by VK_KHR_maintenance3
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- supported specifies whether the descriptor set layout can be created.

supported is set to VK_TRUE if the descriptor set can be created, or else is set to VK_FALSE.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT
If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns additional information about whether the descriptor set layout is supported.

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `maxVariableDescriptorCount` indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the `VkDescriptorSetLayoutCreateInfo` structure specified in `vkGetDescriptorSetLayoutSupport::pCreateInfo` includes a variable-sized descriptor, then `supported` is determined assuming the requested size of the variable-sized descriptor, and `maxVariableDescriptorCount` is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the `VkDescriptorSetLayoutCreateInfo` structure does not include a variable-sized descriptor, or if the `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount` feature is not enabled, then `maxVariableDescriptorCount` is set to zero. For the purposes of this command, a variable-sized descriptor binding with a `descriptorCount` of zero is treated as having a `descriptorCount` of four if `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, or one otherwise, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to `maxVariableDescriptorCount` is undefined.

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT`

The following examples show a shader snippet using two descriptor sets, and application code that...
creates corresponding descriptor set layouts.

**GLSL example**

```glsl
// binding to a single sampled image descriptor in set 0
//
// layout (set=0, binding=0) uniform texture2D mySampledImage;

// binding to an array of sampled image descriptors in set 0
//
// layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

// binding to a single uniform buffer descriptor in set 1
//
// layout (set=1, binding=0) uniform myUniformBuffer
// {
//   vec4 myElement[32];
// }
```

**SPIR-V example**

```spir-v
... %1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant %7
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
```
API example

```c
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] = {
    // binding to a single image descriptor
    { .binding = 0,
      .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
      .descriptorCount = 1,
      .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
      .pImmutableSamplers = NULL
    },

    // binding to an array of image descriptors
    { .binding = 1,
      .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
      .descriptorCount = 12,
      .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
      .pImmutableSamplers = NULL
    },

    // binding to a single uniform buffer descriptor
    { .binding = 0,
      .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
      .descriptorCount = 1,
      .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
      .pImmutableSamplers = NULL
    }
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] = {
    // Information for first descriptor set with two descriptor bindings
    { .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
      .pNext = NULL,
      ... };
```
flags = 0,
    bindingCount = 2,
    pBindings = &myDescriptorSetLayoutBinding[0]
});

// Information for second descriptor set with one descriptor binding
{
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .bindingCount = 1,
    .pBindings = &myDescriptorSetLayoutBinding[2]
}

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
myResult = vkCreateDescriptorSetLayout(
        myDevice,
        &myDescriptorSetLayoutCreateInfo[0],
        NULL,
        &myDescriptorSetLayout[0]);

// Create second descriptor set layout
myResult = vkCreateDescriptorSetLayout(
        myDevice,
        &myDescriptorSetLayoutCreateInfo[1],
        NULL,
        &myDescriptorSetLayout[1]);

To destroy a descriptor set layout, call:

// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the descriptor set layout.
• descriptorSetLayout is the descriptor set layout to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
  If VkAllocationCallbacks were provided when descriptorSetLayout was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285
  If no VkAllocationCallbacks were provided when descriptorSetLayout was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyDescriptorSetLayout-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter
  If descriptorSetLayout is not VK_NULL_HANDLE, descriptorSetLayout must be a valid VkDescriptorSetLayout handle

• VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent
  If descriptorSetLayout is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to descriptorSetLayout must be externally synchronized

14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a pipeline layout. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that can be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by VkPipelineLayout handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:
VkResult vkCreatePipelineLayout(
    VkDevice device,
    const VkPipelineLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineLayout* pPipelineLayout);

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineLayout` is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

**Valid Usage (Implicit)***

- VUID-vkCreatePipelineLayout-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreatePipelineLayout-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
- VUID-vkCreatePipelineLayout-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreatePipelineLayout-pPipelineLayout-parameter
  `pPipelineLayout` must be a valid pointer to a `VkPipelineLayout` handle

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineLayoutCreateInfo` structure is defined as:
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of *VkPipelineLayoutCreateFlagBits* specifying options for pipeline layout creation.
- **setLayoutCount** is the number of descriptor sets included in the pipeline layout.
- **pSetLayouts** is a pointer to an array of *VkDescriptorSetLayout* objects.
- **pushConstantRangeCount** is the number of push constant ranges included in the pipeline layout.
- **pPushConstantRanges** is a pointer to an array of *VkPushConstantRange* structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

> **Note**
> Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

### Valid Usage

- **VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286**
  
  *setLayoutCount* must be less than or equal to *VkPhysicalDeviceLimits::maxBoundDescriptorSets*

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03016**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a *descriptorType* of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of *pSetLayouts* must be less than or equal to *VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers*

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03017**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a *descriptorType* of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of *pSetLayouts* must be less than
or equal to \( \text{VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03018**
  The total number of descriptors in descriptor set layouts created without the \( \text{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} \) bit set with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER} \) and \( \text{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} \) accessible to any given shader stage across all elements of \( \text{pSetLayouts} \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-06939**
  The total number of descriptors in descriptor set layouts created without the \( \text{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} \) bit set with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} \), \( \text{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE} \), and \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} \), accessible to any given shader stage across all elements of \( \text{pSetLayouts} \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03020**
  The total number of descriptors in descriptor set layouts created without the \( \text{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} \) bit set with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE} \), and \( \text{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} \) accessible to any given shader stage across all elements of \( \text{pSetLayouts} \) must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03021**
  The total number of descriptors in descriptor set layouts created without the \( \text{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} \) bit set and with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} \) accessible to any given shader stage across all elements of \( \text{pSetLayouts} \), must be less than or equal to \( \text{VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03022**
  The total number of descriptors with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_SAMPLER} \) and \( \text{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} \) accessible to any given shader stage across all elements of \( \text{pSetLayouts} \) must be less than or equal to \( \text{VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03023**
  The total number of descriptors with a descriptorType of \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER} \) and \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} \) accessible to any given shader stage across all elements of \( \text{pSetLayouts} \) must be less than or equal to \( \text{VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers} \)

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03024**
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC
accessible to any given shader stage across all elements of pSetLayouts must be less than or
equal to VkPhysicalDeviceDescriptorIndexingProperties

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03033
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03035
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetInlineUniformBlocks

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036
The total number of descriptors of the type VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`.

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`.

The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`.

The total number of descriptors with a `descriptorType` of `919`...
VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to 
VkPhysicalDeviceVulkan13Properties::maxInlineUniformTotalSize

• VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292
Any two elements of pPushConstantRanges must not include the same stage in stageFlags

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293
pSetLayouts must not contain more than one descriptor set layout that was created with 
VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR set

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03571
The total number of bindings in descriptor set layouts created without the 
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of 
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to 
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03572
The total number of bindings with a descriptorType of 
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to 
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03573
The total number of bindings in descriptor set layouts created without the 
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of 
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to 
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03574
The total number of bindings with a descriptorType of 
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to 
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures

• VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753
Elements of pSetLayouts must be valid VkDescriptorSetLayout objects

Valid Usage (Implicit)

• VUID-VkPipelineLayoutCreateInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO

• VUID-VkPipelineLayoutCreateInfo-flags-zerobitmask
flags must be 0
If `setLayoutCount` is not 0, `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` valid or `VK_NULL_HANDLE` `VkDescriptorSetLayout` handles.

If `pushConstantRangeCount` is not 0, `pPushConstantRanges` must be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures.

```c
typedef enum VkPipelineLayoutCreateFlagBits {
} VkPipelineLayoutCreateFlagBits;
```

All values for this enum are defined by extensions.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask of `VkPipelineLayoutCreateFlagBits`.

The `VkPushConstantRange` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {
    VkShaderStageFlags stageFlags;
    uint32_t offset;
    uint32_t size;
} VkPushConstantRange;
```

- `stageFlags` is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.
- `offset` and `size` are the start offset and size, respectively, consumed by the range. Both `offset` and `size` are in units of bytes and must be a multiple of 4. The layout of the push constant variables is specified in the shader.

**Valid Usage**

- VUID-VkPushConstantRange-offset-00294
  `offset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`
- VUID-VkPushConstantRange-offset-00295
  `offset` must be a multiple of 4
- VUID-VkPushConstantRange-size-00296
  `size` must be greater than 0
- VUID-VkPushConstantRange-size-00297
  `size` must be a multiple of 4
size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

Valid Usage (Implicit)

- VUID-VkPushConstantRange-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkPushConstantRange-stageFlags-requiredbitmap
  stageFlags must not be 0

Once created, pipeline layouts are used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline must be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in stageFlags. The pipeline layout can include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with stageFlags including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

### To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the pipeline layout.
- `pipelineLayout` is the pipeline layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If `VkAllocationCallbacks` were provided when `pipelineLayout` was created, a compatible
set of callbacks must be provided here

- VUID-vkDestroyPipelineLayout-pipelineLayout-00300
  If no VkAllocationCallbacks were provided when pipelineLayout was created, pAllocator must be NULL

- VUID-vkDestroyPipelineLayout-pipelineLayout-02004
  pipelineLayout must not have been passed to any vkCmd* command for any command buffers that are still in the recording state when vkDestroyPipelineLayout is called

Valid Usage (Implicit)

- VUID-vkDestroyPipelineLayout-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyPipelineLayout-pipelineLayout-parameter
  If pipelineLayout is not VK_NULL_HANDLE, pipelineLayout must be a valid VkPipelineLayout handle

- VUID-vkDestroyPipelineLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyPipelineLayout-pipelineLayout-parent
  If pipelineLayout is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to pipelineLayout must be externally synchronized

Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with identically defined descriptor set layouts for sets zero through N, and if they were created with identical push constant ranges.

When binding a descriptor set (see Descriptor Set Binding) to set number N, a previously bound descriptor set bound with lower index M than N is disturbed if the pipeline layouts for set M and N are not compatible for set M. Otherwise, the bound descriptor set in M is not disturbed.

If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout not compatible for set N, then all bindings in sets numbered greater than N are disturbed.

When binding a pipeline, the pipeline can correctly access any previously bound descriptor set N if it was bound with compatible pipeline layout for set N, and it was not disturbed.

Layout compatibility means that descriptor sets can be bound to a command buffer for use by any
pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets can remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

When a descriptor set is disturbed by binding descriptor sets, the disturbed set is considered to contain undefined descriptors bound with the same pipeline layout as the disturbing descriptor set.

**Implementor’s Note**

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N should only be a function of sets [0..N].

**Note**

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see maxBoundDescriptorSets in Limits).

**API example**

```cpp
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };

const VkPushConstantRange ranges[] =
{
    {  
        .stageFlags = VK_SHADER_STAGE_VERTEX_BIT,  
        .offset = 0,  
        .size = 4
    },
    {  
        .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,  
        .offset = 4,  
        .size = 4
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO,  
    .pNext = NULL,  
    .flags = 0,  
    .setLayoutCount = 2,  
    .pSetLayouts = layouts,
```
14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
   VkDevice device,
    const VkDescriptorPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorPool* pDescriptorPool);
```

- `device` is the logical device that creates the descriptor pool.
- `pCreateInfo` is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorPool` is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in `pDescriptorPool`.

**Valid Usage (Implicit)**

- VUID-vkCreateDescriptorPool-device-parameter `device` must be a valid VkDevice handle
- VUID-vkCreateDescriptorPool-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDescriptorPoolCreateInfo structure

- VUID-vkCreateDescriptorPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDescriptorPool-pDescriptorPool-parameter
  pDescriptorPool must be a valid pointer to a valid VkDescriptorPool handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Additional information about the pool is passed in a VkDescriptorPoolCreateInfo structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkDescriptorPoolCreateFlagBits specifying certain supported operations on the pool.
- `maxSets` is the maximum number of descriptor sets that can be allocated from the pool.
- `poolSizeCount` is the number of elements in `pPoolSizes`.
- `pPoolSizes` is a pointer to an array of VkDescriptorPoolSize structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple VkDescriptorPoolSize structures containing the same descriptor type appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and may lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all
outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation must not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation must not cause an allocation failure (note that this is always the case for a pool created without the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation must not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application can create an additional descriptor pool to perform further descriptor set allocations.

If flags has the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set, descriptor pool creation may fail with the error VK_ERROR_FRAGMENTATION if the total number of descriptors across all pools (including this one) created with this bit set exceeds maxUpdateAfterBindDescriptorsInAllPools, or if fragmentation of the underlying hardware resources occurs.

Valid Usage

- VUID-VkDescriptorPoolCreateInfo-descriptorPoolOverallocation-09227
  maxSets must be greater than 0

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-09424
  If pPoolSizes contains a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the pNext chain must include a VkDescriptorPoolInlineUniformBlockCreateInfo structure whose maxInlineUniformBlockBindings member is not zero

Valid Usage (Implicit)

- VUID-VkDescriptorPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO

- VUID-VkDescriptorPoolCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDescriptorPoolInlineUniformBlockCreateInfo

- VUID-VkDescriptorPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkDescriptorPoolCreateInfo-flags-parameter
  flags must be a valid combination of VkDescriptorPoolCreateFlagBits values

- VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter
  If poolSizeCount is not 0, pPoolSizes must be a valid pointer to an array of poolSizeCount valid VkDescriptorPoolSize structures

In order to be able to allocate descriptor sets having inline uniform block bindings the descriptor
pool **must** be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a `VkDescriptorPoolSize` structure with a `descriptorType` value of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. This can be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfo` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolInlineUniformBlockCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.

### Valid Usage (Implicit)
- `VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType` `sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO`

Bits which **can** be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
} VkDescriptorPoolCreateFlagBits;
```

- `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` specifies that descriptor sets **can** return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool **must** not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.
- `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` specifies that descriptor sets allocated from this pool **can** include bindings with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set. It is valid to allocate descriptor sets that have bindings that do not set the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit from a pool that has `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` set.
VkDescriptorPoolCreateFlags is a bitmask type for setting a mask of zero or more VkDescriptorPoolCreateFlagBits.

The VkDescriptorPoolSize structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType type;
    uint32_t descriptorCount;
} VkDescriptorPoolSize;
```

- **type** is the type of descriptor.
- **descriptorCount** is the number of descriptors of that type to allocate. If **type** is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then **descriptorCount** is the number of bytes to allocate for descriptors of this type.

**Note**

When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the **descriptorCount** value, as indicated by VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount.

For simplicity the application can use the VkPhysicalDeviceMaintenance6PropertiesKHR::maxCombinedImageSamplerDescriptorCount property, which is sized to accommodate any and all formats that require a sampler Y’C_bC_r conversion supported by the implementation.

**Valid Usage**

- **VUID-VkDescriptorPoolSize-descriptorCount-00302**
  
  **descriptorCount** must be greater than 0

- **VUID-VkDescriptorPoolSize-type-02218**
  
  If **type** is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then **descriptorCount** must be a multiple of 4

**Valid Usage (Implicit)**

- **VUID-VkDescriptorPoolSize-type-parameter**
  
  **type** must be a valid VkDescriptorType value
To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor pool.
- `descriptorPool` is the descriptor pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

Valid Usage

- VUID-vkDestroyDescriptorPool-descriptorPool-00303
  All submitted commands that refer to `descriptorPool` (via any allocated descriptor sets) must have completed execution

- VUID-vkDestroyDescriptorPool-descriptorPool-00304
  If `VkAllocationCallbacks` were provided when `descriptorPool` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDescriptorPool-descriptorPool-00305
  If no `VkAllocationCallbacks` were provided when `descriptorPool` was created, `pAllocator` must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyDescriptorPool-device-parameter
devicemust be a valid `VkDevice` handle

- VUID-vkDestroyDescriptorPool-descriptorPool-parameter
  If `descriptorPool` is not `VK_NULL_HANDLE`, `descriptorPool` must be a valid `VkDescriptorPool` handle

- VUID-vkDestroyDescriptorPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyDescriptorPool-parent
  If `descriptorPool` is a valid handle, it must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to descriptorPool must be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by VkDescriptorSet handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device,
    const VkDescriptorSetAllocateInfo* pAllocateInfo,
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a VkDescriptorSetAllocateInfo structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of VkDescriptorSet handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined, with the exception that samplers with a non-null `pImmutableSamplers` are initialized on allocation.Descriptors also become undefined if the underlying resource or view object is destroyed. Descriptor sets containing undefined descriptors can still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are dynamically used must have been populated before the descriptor set is consumed.
- For descriptor set bindings created without the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are statically used must have been populated before the descriptor set is consumed.
- Descriptor bindings with descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK can be undefined when the descriptor set is consumed; though values in that block will be undefined.
- Entries that are not used by a pipeline can have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo`.
If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then **VK_ERROR_OUT_OF_POOL_MEMORY** must be returned.

vkAllocateDescriptorSets can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the pDescriptorSets array to **VK_NULL_HANDLE** and return the error.

### Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
  - device must be a valid VkDevice handle

- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  - pAllocateInfo must be a valid pointer to a valid VkDescriptorSetAllocateInfo structure

- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  - pDescriptorSets must be a valid pointer to an array of pAllocateInfo->descriptorSetCount VkDescriptorSet handles

- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  - pAllocateInfo->descriptorSetCount must be greater than 0

### Host Synchronization

- Host access to pAllocateInfo->descriptorPool must be externally synchronized

### Return Codes

#### Success
- VK_SUCCESS

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FRAGMENTED_POOL
- VK_ERROR_OUT_OF_POOL_MEMORY
The `VkDescriptorSetAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPool descriptorPool;
    uint32_t descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

### Valid Usage

- **VUID-VkDescriptorSetAllocateInfo-apiVersion-07895**
  If the `VK_KHR_maintenance1` extension is not enabled and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `descriptorSetCount` must not be greater than the number of sets that are currently available for allocation in `descriptorPool`

- **VUID-VkDescriptorSetAllocateInfo-apiVersion-07896**
  If the `VK_KHR_maintenance1` extension is not enabled and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `descriptorPool` must have enough free descriptor capacity remaining to allocate the descriptor sets of the specified layouts

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308**
  Each element of `pSetLayouts` must not have been created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044**
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-09380**
  If `pSetLayouts[i]` was created with an element of `pBindingFlags` that includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, and `VkDescriptorSetVariableDescriptorCountAllocateInfo` is included in the `pNext` chain, and `VkDescriptorSetVariableDescriptorCountAllocateInfo::descriptorSetCount` is not zero, then `VkDescriptorSetVariableDescriptorCountAllocateInfo::pDescriptorCounts[i]` must be less than or equal to `VkDescriptorSetLayoutBinding::descriptorCount` for the corresponding binding used to create `pSetLayouts[i]`
Valid Usage (Implicit)

• VUID-VkDescriptorSetAllocateInfo-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO**

• VUID-VkDescriptorSetAllocateInfo-pNext-pNext
  **pNext** must be **NULL** or a pointer to a valid instance of **VkDescriptorSetVariableDescriptorCountAllocateInfo**

• VUID-VkDescriptorSetAllocateInfo-sType-unique
  The **sType** value of each struct in the **pNext** chain must be unique

• VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter
  **descriptorPool** must be a valid **VkDescriptorPool** handle

• VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter
  **pSetLayouts** must be a valid pointer to an array of **descriptorSetCount** valid **VkDescriptorSetLayout** handles

• VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength
  **descriptorSetCount** must be greater than **0**

• VUID-VkDescriptorSetAllocateInfo-commonparent
  Both of **descriptorPool**, and the elements of **pSetLayouts** must have been created, allocated, or retrieved from the same **VkDevice**

If the **pNext** chain of a **VkDescriptorSetAllocateInfo** structure includes a **VkDescriptorSetVariableDescriptorCountAllocateInfo** structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The **VkDescriptorSetVariableDescriptorCountAllocateInfo** structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void*pNext;
    uint32_t descriptorSetCount;
    const uint32_t*pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **descriptorSetCount** is zero or the number of elements in **pDescriptorCounts**.

• **pDescriptorCounts** is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If **descriptorSetCount** is zero or this structure is not included in the **pNext** chain, then the variable
lengths are considered to be zero. Otherwise, \( p_{\text{DescriptorCounts}}[i] \) is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of \( \text{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} \) then \( p_{\text{DescriptorCounts}}[i] \) specifies the binding's capacity in bytes. If \( \text{VkDescriptorSetAllocateInfo}::p\text{SetLayouts}[i] \) does not include a variable-sized descriptor binding, then \( p_{\text{DescriptorCounts}}[i] \) is ignored.

**Valid Usage**

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045
  
  If \( \text{descriptorSetCount} \) is not zero, \( \text{descriptorSetCount} \) must equal \( \text{VkDescriptorSetAllocateInfo}::\text{descriptorSetCount} \)

**Valid Usage (Implicit)**

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType
  
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO} \)

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
  
  If \( \text{descriptorSetCount} \) is not 0, \( \text{pDescriptorCounts} \) must be a valid pointer to an array of \( \text{descriptorSetCount} \) uint32_t values

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0

VkResult vkFreeDescriptorSets(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets);
```

- \( \text{device} \) is the logical device that owns the descriptor pool.
- \( \text{descriptorPool} \) is the descriptor pool from which the descriptor sets were allocated.
- \( \text{descriptorSetCount} \) is the number of elements in the \( \text{pDescriptorSets} \) array.
- \( \text{pDescriptorSets} \) is a pointer to an array of handles to \( \text{VkDescriptorSet} \) objects.

After calling \( \text{vkFreeDescriptorSets} \), all descriptor sets in \( \text{pDescriptorSets} \) are invalid.

**Valid Usage**

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  
  All submitted commands that refer to any element of \( \text{pDescriptorSets} \) must have completed execution
pDescriptorSets must be a valid pointer to an array of descriptorSetCount VkDescriptorSet handles, each element of which must either be a valid handle or VK_NULL_HANDLE

descriptorPool must have been created with the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT flag

device must be a valid VkDevice handle

descriptorPool must be a valid VkDescriptorPool handle

descriptorSetCount must be greater than 0

descriptorPool must have been created, allocated, or retrieved from device

Each element of pDescriptorSets that is a valid handle must have been created, allocated, or retrieved from descriptorPool

Host access to descriptorPool must be externally synchronized

Host access to each member of pDescriptorSets must be externally synchronized

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:
// Provided by VK_VERSION_1_0

VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);

• device is the logical device that owns the descriptor pool.
• descriptorPool is the descriptor pool to be reset.
• flags is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

Valid Usage

• VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of descriptorPool (via any allocated descriptor sets) must have completed execution

Valid Usage (Implicit)

• VUID-vkResetDescriptorPool-device-parameter
device must be a valid VkDevice handle
• VUID-vkResetDescriptorPool-descriptorPool-parameter
descriptorPool must be a valid VkDescriptorPool handle
• VUID-vkResetDescriptorPool-flags-zerobitmask
  flags must be 0
• VUID-vkResetDescriptorPool-descriptorPool-parent
  descriptorPool must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to descriptorPool must be externally synchronized
• Host access to any VkDescriptorSet objects allocated from descriptorPool must be externally synchronized

Return Codes

Success
• VK_SUCCESS
14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

```c
void vkUpdateDescriptorSets(
    VkDevice device,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);
```

- **device** is the logical device that updates the descriptor sets.
- **descriptorWriteCount** is the number of elements in the **pDescriptorWrites** array.
- **pDescriptorWrites** is a pointer to an array of **VkWriteDescriptorSet** structures describing the descriptor sets to write to.
- **descriptorCopyCount** is the number of elements in the **pDescriptorCopies** array.
- **pDescriptorCopies** is a pointer to an array of **VkCopyDescriptorSet** structures describing the descriptor sets to copy between.

The operations described by **pDescriptorWrites** are performed first, followed by the operations described by **pDescriptorCopies**. Within each array, the operations are performed in the order they appear in the array.

Each element in the **pDescriptorWrites** array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the **pDescriptorCopies** array is a **VkCopyDescriptorSet** structure describing an operation copying descriptors between sets.

If the **dstSet** member of any element of **pDescriptorWrites** or **pDescriptorCopies** is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** or **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** bits set, that command buffer becomes...
Valid Usage

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236
  For each element \(i\) where \(p\)DescriptorWrites\([i\].\)\(\text{descriptorType}\) is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{UNIFORM}\_\text{TEXTEL\_BUFFER}\) or \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{STORAGE\_TEXTEL\_BUFFER}\), elements of the \(p\)TexelBufferView member of \(p\)DescriptorWrites\([i\] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237
  For each element \(i\) where \(p\)DescriptorWrites\([i\].\)\(\text{descriptorType}\) is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{UNIFORM\_BUFFER}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{STORAGE\_BUFFER}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{UNIFORM\_BUFFER\_DYNAMIC}\), or \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{STORAGE\_BUFFER\_DYNAMIC}\), the buffer member of any element of the \(p\)BufferInfo member of \(p\)DescriptorWrites\([i\] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptor Writes-06238
  For each element \(i\) where \(p\)DescriptorWrites\([i\].\)\(\text{descriptorType}\) is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{SAMPLER}\) or \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{COMBINED\_IMAGE\_SAMPLER}\), and \(dst\)\(\text{Set}\) was not allocated with a layout that included immutable samplers for \(dst\)\(\text{Binding}\) with \(\text{descriptorType}\), the sampler member of any element of the \(p\)ImageInfo member of \(p\)DescriptorWrites\([i\] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239
  For each element \(i\) where \(p\)DescriptorWrites\([i\].\)\(\text{descriptorType}\) is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{SAMPLED\_IMAGE}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{STORAGE\_IMAGE}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{INPUT\_ATTACHMENT}\), or \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{COMBINED\_IMAGE\_SAMPLER}\), the imageView member of any element of \(p\)DescriptorWrites\([i\] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptor Writes-06240
  For each element \(i\) where \(p\)DescriptorWrites\([i\].\)\(\text{descriptorType}\) is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{ACCELERATION\_STRUCTURE\_KHR}\), elements of the \(p\)AccelerationStructures member of a \(Vk\)Write\(\text{DescriptorSet}\)AccelerationStructure\(\text{KHR}\) structure in the \(p\)\(\text{Next}\) chain of \(p\)DescriptorWrites\([i\] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorCopies-06493
  For each element \(i\) where \(p\)DescriptorCopies\([i\] descriptorType is \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{SAMPLER}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{COMBINED\_IMAGE\_SAMPLER}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{SAMPLED\_IMAGE}\), \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{STORAGE\_IMAGE}\), or \(VK\_\text{DESCRIP}T\_\text{TYPE}\_\text{INPUT\_ATTACHMENT}\), \(p\)DescriptorCopies\([i\].\)pImageInfo must be a valid pointer to an array of \(p\)DescriptorCopies\([i\].\)\(\text{descriptorCount}\) valid \(Vk\)DescriptorImageInfo structures.

• VUID-vkUpdateDescriptorSets-None-03047
  The \(dst\)\(\text{Set}\) member of each element of \(p\)DescriptorWrites or \(p\)DescriptorCopies for bindings which were created without the \(VK\_\text{DESCRIP}T\_\text{BINDING\_UPDATE\_AFTER\_BIND\_BIT}\) or \(VK\_\text{DESCRIP}T\_\text{BINDING\_UPDATE\_UNUSED\_WHILE\_PENDING\_BIT}\) bits set must not be used by any command that was recorded to a command buffer which is in the pending state.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
Host access to `pDescriptorWrites[i].dstSet` and `pDescriptorCopies[i].dstSet` must be externally synchronized unless explicitly denoted otherwise for specific flags.

**Valid Usage (Implicit)**

- **VUID-vkUpdateDescriptorSets-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter**
  
  If `descriptorWriteCount` is not 0, `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures.

- **VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter**
  
  If `descriptorCopyCount` is not 0, `pDescriptorCopies` must be a valid pointer to an array of `descriptorCopyCount` valid `VkCopyDescriptorSet` structures.

The `VkWriteDescriptorSet` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView* pTexelBufferView;
} VkWriteDescriptorSet;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `dstSet` is the destination descriptor set to update.
- `dstBinding` is the descriptor binding within that set.
- `dstArrayElement` is the starting element in that array. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset within the binding.
- `descriptorCount` is the number of descriptors to update. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, then `descriptorCount` specifies the number of bytes to update. Otherwise, `descriptorCount` is one of:
  - the number of elements in `pImageInfo`
  - the number of elements in `pBufferInfo`
- the number of elements in pTexelBufferView
- a value matching the dataSize member of a VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain
- a value matching the accelerationStructureCount of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain

-(descriptorType is a VkDescriptorType specifying the type of each descriptor in pImageInfo, pBufferInfo, or pTexelBufferView, as described below. It must be the same type as the descriptorType specified in VkDescriptorSetLayoutBinding for dstSet at dstBinding. The type of the descriptor also controls which array the descriptors are taken from.

- pImageInfo is a pointer to an array of VkDescriptorImageInfo structures or is ignored, as described below.

- pBufferInfo is a pointer to an array of VkDescriptorBufferInfo structures or is ignored, as described below.

- pTexelBufferView is a pointer to an array of VkBufferView handles as described in the Buffer Views section or is ignored, as described below.

Only one of pImageInfo, pBufferInfo, or pTexelBufferView members is used according to the descriptor type specified in the descriptorType member of the containing VkWriteDescriptorSet structure, or none of them in case descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, in which case the source data for the descriptor writes is taken from the VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet, or if descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, in which case the source data for the descriptor writes is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet, as specified below.

If the dstBinding has fewer than descriptorCount array elements remaining starting from dstArrayElement, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at array element zero. If a binding has a descriptorCount of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all descriptorCount descriptors. Consecutive bindings must have identical VkDescriptorType, VkShaderStageFlags, VkDescriptorBindingFlagBits, and immutable samplers references.

**Note**

The same behavior applies to bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK where descriptorCount specifies the number of bytes to update while dstArrayElement specifies the starting byte offset, thus in this case if the dstBinding has a smaller byte size than the sum of dstArrayElement and descriptorCount, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at offset zero. This falls out as a special case of the above rule.

**Valid Usage**

- VUID-VkWriteDescriptorSet-dstBinding-00315
`dstBinding` must be less than or equal to the maximum value of `binding` of all `VkDescriptorSetLayoutBinding` structures specified when `dstSet`'s descriptor set layout was created

- VUID-VkWriteDescriptorSet-dstBinding-00316
  `dstBinding` must be a binding with a non-zero `descriptorCount`

- VUID-VkWriteDescriptorSet-descriptorCount-00317
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, must have identical `descriptorType` and `stageFlags`

- VUID-VkWriteDescriptorSet-descriptorCount-00318
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, must all either use immutable samplers or must all not use immutable samplers

- VUID-VkWriteDescriptorSet-descriptorType-00319
  `descriptorType` must match the type of `dstBinding` within `dstSet`

- VUID-VkWriteDescriptorSet-dstSet-00320
  `dstSet` must be a valid `VkDescriptorSet` handle

- VUID-VkWriteDescriptorSet-dstArrayElement-00321
  The sum of `dstArrayElement` and `descriptorCount` must be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkWriteDescriptorSet-descriptorType-02219
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02220
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount` must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02994
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `pTexelBufferView` must be either a valid `VkBufferView` handle or `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-02995
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` and the `nullDescriptor` feature is not enabled, each element of `pTexelBufferView` must not be `VK_NULL_HANDLE`

- VUID-VkWriteDescriptorSet-descriptorType-00324
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, `pBufferInfo` must be a valid pointer to an array of `descriptorCount` valid `VkDescriptorBufferInfo` structures

- VUID-VkWriteDescriptorSet-descriptorType-00325
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was not allocated with a layout that included immutable samplers for `dstBinding` with `descriptorType`, the sampler
member of each element of pImageInfo must be a valid VkSampler object

- VUID-VkWriteDescriptorSet-descriptorType-02996
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the imageView member of each element of pImageInfo must be either a valid VkImageView handle or VK_NULL_HANDLE.

- VUID-VkWriteDescriptorSet-descriptorType-02997
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and the nullDescriptor feature is not enabled, the imageView member of each element of pImageInfo must not be VK_NULL_HANDLE.

- VUID-VkWriteDescriptorSet-descriptorType-07683
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must not be VK_NULL_HANDLE.

- VUID-VkWriteDescriptorSet-descriptorType-02221
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the pNext chain must include a VkWriteDescriptorSetInlineUniformBlock structure whose dataSize member equals descriptorCount.

- VUID-VkWriteDescriptorSet-descriptorType-02382
  If descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, the pNext chain must include a VkWriteDescriptorSetAccelerationStructureKHR structure whose accelerationStructureCount member equals descriptorCount.

- VUID-VkWriteDescriptorSet-descriptorType-01946
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, then the imageView member of each pImageInfo element must have been created without a VkSamplerYcbcrConversionInfo structure in its pNext chain.

- VUID-VkWriteDescriptorSet-descriptorType-01948
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was allocated with a layout that included immutable samplers for dstBinding, and the corresponding immutable sampler must have been created with an identically defined VkSamplerYcbcrConversionInfo object.

- VUID-VkWriteDescriptorSet-descriptorType-09506
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was allocated with a layout that included immutable samplers for dstBinding, then the imageView member of each element of pImageInfo which corresponds to an immutable sampler that enables sampler Y’CbCr conversion must have been created with a VkSamplerYcbcrConversionInfo structure in its pNext chain with an identically defined VkSamplerYcbcrConversionInfo to the corresponding immutable sampler.

- VUID-VkWriteDescriptorSet-descriptorType-09506
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, dstSet was allocated with a layout that included immutable samplers for dstBinding, and those samplers enable sampler Y’CbCr conversion, then imageView must not be VK_NULL_HANDLE.
If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` set.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `VkPhysicalDeviceLimits::maxUniformBufferRange`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `VkPhysicalDeviceLimits::maxStorageBufferRange`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, the `pTexelBufferView` buffer view usage must include `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, the `pTexelBufferView` buffer view usage must include `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with the identity swizzle
If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` set.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Sampled Image.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Combined Image Sampler.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Input Attachment.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Storage Image.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` must not have been allocated with a layout that included immutable samplers for `dstBinding`.

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSet-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`

- VUID-VkWriteDescriptorSet-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkWriteDescriptorSetAccelerationStructureKHR` or `VkWriteDescriptorSetInlineUniformBlock`

- VUID-VkWriteDescriptorSet-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkWriteDescriptorSet-descriptorType-parameter
  `descriptorType` must be a valid `VkDescriptorType` value

- VUID-VkWriteDescriptorSet-descriptorCount-arraylength
  `descriptorCount` must be greater than 0
Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which **must** be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
} VkDescriptorType;
```

- **VK_DESCRIPTOR_TYPE_SAMPLER** specifies a **sampler descriptor**.
- **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** specifies a **combined image sampler descriptor**.
- **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE** specifies a **sampled image descriptor**.
- **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE** specifies a **storage image descriptor**.
- **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** specifies a **uniform texel buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** specifies a **storage texel buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** specifies a **uniform buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** specifies a **storage buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC** specifies a **dynamic uniform buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** specifies a **dynamic storage buffer descriptor**.
- **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT** specifies an **input attachment descriptor**.
- **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** specifies an **inline uniform block**.

When a descriptor set is updated via elements of `VkWriteDescriptorSet`, members of `pImageInfo`, `pBufferInfo` and `pTexelBufferView` are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:
For **VK_DESCRIPTOR_TYPE_SAMPLER**, only the `sampler` member of each element of `VkWriteDescriptorSet::pImageInfo` is accessed.

For **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE**, **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE**, or **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**, only the `imageView` and `imageLayout` members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.

For **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, all members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.

For **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER**, **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER**, **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**, or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**, all members of each element of `VkWriteDescriptorSet::pBufferInfo` are accessed.

For **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**, each element of `VkWriteDescriptorSet::pTexelBufferView` is accessed.

When updating descriptors with a `descriptorType` of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the `VkWriteDescriptorSetInlineUniformBlock` structure in the `pNext` chain of `VkWriteDescriptorSet`. When updating descriptors with a `descriptorType` of **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkDescriptorBufferInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- `buffer` is the buffer resource.
- `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- `range` is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

**Note**

When setting `range` to `VK_WHOLE_SIZE`, the effective range must not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC** and **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**
descriptor types, offset is the base offset from which the dynamic offset is applied and range is the static size used for all dynamic offsets.

When range is VK_WHOLE_SIZE the effective range is calculated at vkUpdateDescriptorSets is by taking the size of buffer minus the offset.

Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340
  offset must be less than the size of buffer

- VUID-VkDescriptorBufferInfo-range-00341
  If range is not equal to VK_WHOLE_SIZE, range must be greater than 0

- VUID-VkDescriptorBufferInfo-range-00342
  If range is not equal to VK_WHOLE_SIZE, range must be less than or equal to the size of buffer minus offset

- VUID-VkDescriptorBufferInfo-buffer-02998
  If the nullDescriptor feature is not enabled, buffer must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
  VkSampler sampler;
  VkImageView imageView;
  VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

- sampler is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.

- imageView is an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

- imageLayout is the layout that the image subresources accessible from imageView will be in at the time this descriptor is accessed. imageLayout is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.
Valid Usage

- **VUID-VkDescriptorImageInfo-imageView-06712**
  imageView **must** not be a 2D array image view created from a 3D image

- **VUID-VkDescriptorImageInfo-descriptorType-06713**
  imageView **must** not be a 2D view created from a 3D image

- **VUID-VkDescriptorImageInfo-descriptorType-06714**
  imageView **must** not be a 2D view created from a 3D image

- **VUID-VkDescriptorImageInfo-imageView-01976**
  If imageView is created from a depth/stencil image, the aspectMask used to create the imageView **must** include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

- **VUID-VkDescriptorImageInfo-imageLayout-09425**
  If imageLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, then the aspectMask used to create imageView **must** not include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- **VUID-VkDescriptorImageInfo-imageLayout-09426**
  If imageLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, then the aspectMask used to create imageView **must** not include VK_IMAGE_ASPECT_COLOR_BIT

- **VUID-VkDescriptorImageInfo-imageLayout-00344**
  imageLayout **must** match the actual VkImageLayout of each subresource accessible from imageView at the time this descriptor is accessed as defined by the image layout matching rules

- **VUID-VkDescriptorImageInfo-sampler-01564**
  If sampler is used and the VkFormat of the image is a multi-planar format, the image **must** have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the aspectMask of the imageView **must** be a valid multi-planar aspect mask bit

- **VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers is VK_FALSE, then sampler **must** have been created with VkSamplerCreateInfo::compareEnable set to VK_FALSE

Valid Usage (Implicit)

- **VUID-VkDescriptorImageInfo-commonparent**
  Both of imageView, and sampler that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice
If the descriptorType member of VkWriteDescriptorSet is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then the data to write to the descriptor set is specified through a VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet.

The VkWriteDescriptorSetInlineUniformBlock structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType sType;
    const void* pNext;
    uint32_t dataSize;
    const void* pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• dataSize is the number of bytes of inline uniform block data pointed to by pData.
• pData is a pointer to dataSize number of bytes of data to write to the inline uniform block.

Valid Usage

• VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
dataSize must be an integer multiple of 4

Valid Usage (Implicit)

• VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK

• VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

• VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  dataSize must be greater than 0

The VkWriteDescriptorSetAccelerationStructureKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```
- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` is a pointer to an array of `VkAccelerationStructureKHR` structures specifying the acceleration structures to update.

**Valid Usage**

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
  
  `accelerationStructureCount` must be equal to `descriptorCount` in the extended structure.

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  
  Each acceleration structure in `pAccelerationStructures` must have been created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  
  If the `nullDescriptor` feature is not enabled, each element of `pAccelerationStructures` must not be `VK_NULL_HANDLE`.

**Valid Usage (Implicit)**

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR`.

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  
  `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid or `VK_NULL_HANDLE` `VkAccelerationStructureKHR` handles.

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  
  `accelerationStructureCount` must be greater than 0.

The `VkCopyDescriptorSet` structure is defined as:
typedef struct VkCopyDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet srcSet;
    uint32_t srcBinding;
    uint32_t srcArrayElement;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
} VkCopyDescriptorSet;

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **srcSet**, **srcBinding**, and **srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then **srcArrayElement** specifies the starting byte offset within the binding to copy from.

• **dstSet**, **dstBinding**, and **dstArrayElement** are the destination set, binding, and array element, respectively. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then **dstArrayElement** specifies the starting byte offset within the binding to copy to.

• **descriptorCount** is the number of descriptors to copy from the source to destination. If **descriptorCount** is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then **descriptorCount** specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

**Valid Usage**

• VUID-VkCopyDescriptorSet-srcBinding-00345
  **srcBinding** must be a valid binding within **srcSet**

• VUID-VkCopyDescriptorSet-srcArrayElement-00346
  The sum of **srcArrayElement** and **descriptorCount** must be less than or equal to the number of array elements in the descriptor set binding specified by **srcBinding**, and all applicable consecutive bindings, as described by consecutive binding updates

• VUID-VkCopyDescriptorSet-dstBinding-00347
  **dstBinding** must be a valid binding within **dstSet**

• VUID-VkCopyDescriptorSet-dstArrayElement-00348
  The sum of **dstArrayElement** and **descriptorCount** must be less than or equal to the number of array elements in the descriptor set binding specified by **dstBinding**, and all applicable
consecutive bindings, as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-dstBinding-02632
  The type of dstBinding within dstSet must be equal to the type of srcBinding within srcSet

- VUID-VkCopyDescriptorSet-srcSet-00349
  If srcSet is equal to dstSet, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-srcBinding-02223
  If the descriptor type of the descriptor set binding specified by srcBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, srcArrayElement must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-dstBinding-02224
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-srcBinding-02225
  If the descriptor type of the descriptor set binding specified by either srcBinding or dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-srcSet-01918
  If srcSet's layout was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then dstSet's layout must also have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04885
  If srcSet's layout was created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then dstSet's layout must have been created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-01920
  If the descriptor pool from which srcSet was allocated was created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set, then the descriptor pool from which dstSet was allocated must also have been created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04887
  If the descriptor pool from which srcSet was allocated was created without the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set, then the descriptor pool from which dstSet was allocated must have been created without the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-dstBinding-02753
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding
14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

14.2.6. Descriptor Set Updates With Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, can be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an
application provided pointer to host memory are specified, which are combined with a pointer passed to vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- `device` is the logical device that creates the descriptor update template.
- `pCreateInfo` is a pointer to a VkDescriptorUpdateTemplateCreateInfo structure specifying the set of descriptors to update with a single call to vkCmdPushDescriptorSetWithTemplateKHR or vkUpdateDescriptorSetWithTemplate.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorUpdateTemplate` is a pointer to a VkDescriptorUpdateTemplate handle in which the resulting descriptor update template object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter `device` must be a valid VkDevice handle
- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid VkDescriptorUpdateTemplateCreateInfo structure
- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter `pDescriptorUpdateTemplate` must be a valid pointer to a VkDescriptorUpdateTemplate handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDescriptorUpdateTemplateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **descriptorUpdateEntryCount** is the number of elements in the pDescriptorUpdateEntries array.
- **pDescriptorUpdateEntries** is a pointer to an array of VkDescriptorUpdateTemplateEntry structures describing the descriptors to be updated by the descriptor update template.
- **templateType** Specifies the type of the descriptor update template. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET it can only be used to update descriptor sets with a fixed descriptorSetLayout. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR it can only be used to push descriptor sets using the provided pipelineBindPoint, pipelineLayout, and set number.
- **descriptorSetLayout** is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update
template must be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET.

- pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- pipelineLayout is a VkPipelineLayout object used to program the bindings. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- set is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

Valid Usage

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout must be a valid VkDescriptorSetLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineLayout must be a valid VkPipelineLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO

- VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter
  pDescriptorUpdateEntries must be a valid pointer to an array of descriptorUpdateEntryCount valid VkDescriptorUpdateTemplateEntry structures

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter
  templateType must be a valid VkDescriptorUpdateTemplateType value

- VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength
  descriptorUpdateEntryCount must be >= 0

958
**descriptorUpdateEntryCount** must be greater than 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent
  Both of **descriptorSetLayout**, and **pipelineLayout** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;
```

**VkDescriptorUpdateTemplateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the **VkDescriptorUpdateTemplateCreateInfo::templateType** property, which takes the following values:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    // VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
    // Provided by VK_KHR_descriptor_update_template
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR =
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
} VkDescriptorUpdateTemplateType;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;
```

- **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET** specifies that the descriptor update template will be used for descriptor set updates only.
- **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR** specifies that the descriptor update template will be used for push descriptor updates only.

The **VkDescriptorUpdateTemplateEntry** structure is defined as:
// Provided by VK_VERSION_1_1

typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;

or the equivalent

// Provided by VK_KHR_descriptor_update_template

typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;

• `dstBinding` is the descriptor binding to update when using this descriptor update template.

• `dstArrayElement` is the starting element in the array belonging to `dstBinding`. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset to update.

• `descriptorCount` is the number of descriptors to update. If `descriptorCount` is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to `VkWriteDescriptorSet` above. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.

• `descriptorType` is a `VkDescriptorType` specifying the type of the descriptor.

• `offset` is the offset in bytes of the first binding in the raw data structure.

• `stride` is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer `ptr` for each array element `j` of update entry `i` is computed using the following formula:

\[
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
\]

The stride is useful in case the bindings are stored in structs along with other data. If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the value of `stride` is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

**Valid Usage**

• VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354
**dstBinding must** be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors

- **VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355**
  `dstArrayElement` and `descriptorCount must` be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226**
  If `descriptor` type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement must` be an integer multiple of 4

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227**
  If `descriptor` type is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount must` be an integer multiple of 4

---

**Valid Usage (Implicit)**

- **VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter**
  `descriptorType must` be a valid `VkDescriptorType` value

To destroy a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
    VkDevice            device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice            device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

---

**Valid Usage**

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356**
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a
compatible set of callbacks must be provided here

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no VkAllocationCallbacks were provided when descriptorUpdateTemplate was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
  If descriptorUpdateTemplate is not VK_NULL_HANDLE, descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
  If descriptorUpdateTemplate is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to descriptorUpdateTemplate must be externally synchronized

Once a VkDescriptorUpdateTemplate has been created, descriptor sets can be updated by calling:

```c
// Provided by VK_VERSION_1_1
def void vkUpdateDescriptorSetWithTemplate(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
def void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

- device is the logical device that updates the descriptor set.
• descriptorSet is the descriptor set to update
• descriptorUpdateTemplate is a VkDescriptorUpdateTemplate object specifying the update mapping between pData and the descriptor set to update.
• pData is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR handles used to write the descriptors.

**Valid Usage**

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995
  Host access to descriptorSet must be externally synchronized unless explicitly denoted otherwise for specific flags

**Valid Usage (Implicit)**

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter
device must be a valid VkDevice handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter
descriptorSet must be a valid VkDescriptorSet handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter
descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parent
descriptorSet must have been created, allocated, or retrieved from device
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
descriptorUpdateTemplate must have been created, allocated, or retrieved from device

**API example**

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t applicationRelatedInformation;
};

struct AppDataStructure {
    VkDescriptorImageInfo imageInfo; // a single image info
    VkDescriptorBufferInfo bufferInfoArray[3]; // 3 buffer infos in an array
    AppBufferView bufferView[2]; // An application-defined structure containing a bufferView
    // ... some more application-related data
```
const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    {
        .binding = 0,
        .dstArrayElement = 0,
        .descriptorCount = 1,
        .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
        .offset = offsetof(AppDataStructure, imageInfo),
        .stride = 0 // stride not required if descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    {
        .binding = 1,
        .dstArrayElement = 0,
        .descriptorCount = 3,
        .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        .offset = offsetof(AppDataStructure, bufferInfoArray),
        .stride = sizeof(VkDescriptorBufferInfo) // descriptor buffer infos are compact
    },

    // binding to an array of buffer views
    {
        .binding = 2,
        .dstArrayElement = 0,
        .descriptorCount = 2,
        .descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
        .offset = offsetof(AppDataStructure, bufferView) +
                  offsetof(AppBufferView, bufferView),
        .stride = sizeof(AppBufferView) // bufferViews do not have to be compact
    },
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 3,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
    .descriptorSetLayout = myLayout,
    .pipelineBindPoint = 0, // ignored by given templateType
    .pipelineLayout = 0, // ignored by given templateType
    .set = 0, // ignored by given templateType
};
VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet, myDescriptorUpdateTemplate, &appData);

### 14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer that the descriptor sets will be bound to.
    VkPipelineBindPoint pipelineBindPoint,  // pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
    VkPipelineLayout layout,  // layout is a VkPipelineLayout object used to program the bindings.
    uint32_t firstSet,  // firstSet is the set number of the first descriptor set to be bound.
    uint32_t descriptorSetCount,  // descriptorSetCount is the number of elements in the pDescriptorSets array.
    const VkDescriptorSet* pDescriptorSets,  // pDescriptorSets is a pointer to an array of handles to VkDescriptorSet objects describing the descriptor sets to bind to.
    uint32_t dynamicOffsetCount,  // dynamicOffsetCount is the number of dynamic offsets in the pDynamicOffsets array.
    const uint32_t* pDynamicOffsets,  // pDynamicOffsets is a pointer to an array of uint32_t values specifying dynamic offsets.
);
```

vkCmdBindDescriptorSets binds descriptor sets pDescriptorSets[0..descriptorSetCount-1] to set numbers [firstSet..firstSet+descriptorSetCount-1] for subsequent bound pipeline commands set by pipelineBindPoint. Any bindings that were previously applied via these sets are no longer valid.
Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in Pipeline Layout Compatibility.

A compatible descriptor set must be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

When consuming a descriptor, a descriptor is considered valid if the descriptor is not undefined as described by descriptor set allocation. A descriptor that was disturbed by Pipeline Layout Compatibility, or was never bound by vkCmdBindDescriptorSets is not considered valid. If a pipeline accesses a descriptor either statically or dynamically depending on the VkDescriptorBindingFlagBits, the consuming descriptor type in the pipeline must match the VkDescriptorType in VkDescriptorSetLayoutCreateInfo for the descriptor to be considered valid.

Note Further validation may be carried out beyond validation for descriptor types, e.g. Texel Input Validation.

If any of the sets being bound include dynamic uniform or storage buffers, then pDynamicOffsets includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from pDynamicOffsets in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. dynamicOffsetCount must equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from pDynamicOffsets, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the pDescriptorSets must be compatible with the pipeline layout specified by layout. The layout used to program the bindings must also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility section.

The descriptor set contents bound by a call to vkCmdBindDescriptorSets may be consumed at the following times:

- For descriptor bindings created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, the contents may be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding must not be altered (overwritten by an update command, or freed) between the first point in time that it may be consumed, and when the
command completes executing on the queue.

The contents of \texttt{pDynamicOffsets} are consumed immediately during execution of \texttt{vkCmdBindDescriptorSets}. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

\begin{table}[!h]
\centering
\begin{tabular}{|l|}
\hline
Valid Usage  \\
\hline
\begin{itemize}
\item VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358  
Each element of \texttt{pDescriptorSets} must have been allocated with a \texttt{VkDescriptorSetLayout} that matches (is the same as, or identically defined as) the \texttt{VkDescriptorSetLayout} at set \texttt{n} in layout, where \texttt{n} is the sum of \texttt{firstSet} and the index into \texttt{pDescriptorSets}  
\item VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359  
dynamicOffsetCount must be equal to the total number of dynamic descriptors in \texttt{pDescriptorSets}  
\item VUID-vkCmdBindDescriptorSets-firstSet-00360  
The sum of \texttt{firstSet} and \texttt{descriptorSetCount} must be less than or equal to \texttt{VkPipelineLayoutCreateInfo::setLayoutCount} provided when layout was created  
\item VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971  
Each element of \texttt{pDynamicOffsets} which corresponds to a descriptor binding with type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} must be a multiple of \texttt{VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment}  
\item VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972  
Each element of \texttt{pDynamicOffsets} which corresponds to a descriptor binding with type \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} must be a multiple of \texttt{VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment}  
\item VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979  
For each dynamic uniform or storage buffer binding in \texttt{pDescriptorSets}, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer  
\item VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715  
For each dynamic uniform or storage buffer binding in \texttt{pDescriptorSets}, if the range was set with \texttt{VK_WHOLE_SIZE} then \texttt{pDynamicOffsets} which corresponds to the descriptor binding must be 0  
\item VUID-vkCmdBindDescriptorSets-pDescriptorSets-06563  
Each element of \texttt{pDescriptorSets} must be a valid \texttt{VkDescriptorSet}  
\item VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361  
pipelineBindPoint must be supported by the \texttt{commandBuffer}'s parent \texttt{VkCommandPool}'s queue family  
\end{itemize}  
\hline
\end{tabular}
\caption{Valid Usage}
\end{table}

\begin{table}[!h]
\centering
\begin{tabular}{|l|}
\hline
Valid Usage (Implicit)  \\
\hline
\begin{itemize}
\item VUID-vkCmdBindDescriptorSets-commandBuffer-parameter  
\end{itemize}  
\hline
\end{tabular}
\caption{Valid Usage (Implicit)}
\end{table}
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdBindDescriptorSets-layout-parameter layout must be a valid VkPipelineLayout handle

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter pDescriptorSets must be a valid pointer to an array of descriptorSetCount valid or VK_NULL_HANDLE VkDescriptorSet handles

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter If dynamicOffsetCount is not 0, pDynamicOffsets must be a valid pointer to an array of dynamicOffsetCount uint32_t values

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording commandBuffer must be in the recording state

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets-videocoding This command must only be called outside of a video coding scope

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength descriptorSetCount must be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent Each of commandBuffer, layout, and the elements of pDescriptorSets that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind one or more descriptor sets to a command buffer, call:
// Provided by VK_KHR_maintenance6

void vkCmdBindDescriptorSets2KHR(
    VkCommandBuffer commandBuffer,       // commandBuffer is the command buffer that the descriptor sets will be bound to.
    const VkBindDescriptorSetsInfoKHR* pBindDescriptorSetsInfo);       // pBindDescriptorSetsInfo is a pointer to a VkBindDescriptorSetsInfoKHR structure.

Valid Usage

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-09467
  Each bit in pBindDescriptorSetsInfo->stageFlags must be a stage supported by the commandBuffer's parent VkCommandPool's queue family.

Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-parameter
  pBindDescriptorSetsInfo must be a valid pointer to a valid VkBindDescriptorSetsInfoKHR structure.

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindDescriptorSets2KHR-videocoding
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The **VkBindDescriptorSetsInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindDescriptorSetsInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout layout;
    uint32_t firstSet;
    uint32_t descriptorSetCount;
    const VkDescriptorSet* pDescriptorSets;
    uint32_t dynamicOffsetCount;
    const uint32_t* pDynamicOffsets;
} VkBindDescriptorSetsInfoKHR;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stageFlags** is a bitmask of *VkShaderStageFlagBits* specifying the shader stages the descriptor sets will be bound to.
- **layout** is a *VkPipelineLayout* object used to program the bindings.
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the **pDescriptorSets** array.
- **pDescriptorSets** is a pointer to an array of handles to *VkDescriptorSet* objects describing the descriptor sets to bind to.
- **dynamicOffsetCount** is the number of dynamic offsets in the **pDynamicOffsets** array.
- **pDynamicOffsets** is a pointer to an array of *uint32_t* values specifying dynamic offsets.

If **stageFlags** specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a **stageFlags** value of **VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT** is equivalent to calling the original version of this command once with **VK_PIPELINE_BIND_POINT_GRAPHICS** and once with **VK_PIPELINE_BIND_POINT_COMPUTE**.
Valid Usage

- VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-00358
  Each element of `pDescriptorSets` must have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the ` VkDescriptorSetLayout` at set `n` in `layout`, where `n` is the sum of `firstSet` and the index into `pDescriptorSets`.

- VUID-VkBindDescriptorSetsInfoKHR-dynamicOffsetCount-00359
  `dynamicOffsetCount` must be equal to the total number of dynamic descriptors in `pDescriptorSets`.

- VUID-VkBindDescriptorSetsInfoKHR-firstSet-00360
  The sum of `firstSet` and `descriptorSetCount` must be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created.

- VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01971
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

- VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01972
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-01979
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer.

- VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-06715
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, if the range was set with `VK_WHOLE_SIZE` then `pDynamicOffsets` which corresponds to the descriptor binding must be 0.

- VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-06563
  Each element of `pDescriptorSets` must be a valid `VkDescriptorSet`.

- VUID-VkBindDescriptorSetsInfoKHR-None-09495
  `layout` must be a valid `VkPipelineLayout` handle.

Valid Usage (Implicit)

- VUID-VkBindDescriptorSetsInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_SETS_INFO_KHR`.

- VUID-VkBindDescriptorSetsInfoKHR-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`.

- VUID-VkBindDescriptorSetsInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.
14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer that the descriptors will be recorded in.
    VkPipelineBindPoint pipelineBindPoint,  // pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
    VkPipelineLayout layout,  // layout is a VkPipelineLayout object used to program the bindings.
    uint32_t set,  // set is the set number of the descriptor set in the pipeline layout that will be updated.
    uint32_t descriptorWriteCount,  // descriptorWriteCount is the number of elements in the pDescriptorWrites array.
    const VkWriteDescriptorSet* pDescriptorWrites);  // pDescriptorWrites is a pointer to an array of VkWriteDescriptorSet structures describing the descriptors to be updated.
```
**Push descriptors** are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is overwritten, or else until the set is disturbed as described in *Pipeline Layout Compatibility*. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the offset member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.

Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.

To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler’s binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

### Valid Usage

- VUID-vkCmdPushDescriptorSetKHR-set-00364
  - set must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when layout was created
- VUID-vkCmdPushDescriptorSetKHR-set-00365
  - set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494
  - For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pDescriptorWrites[i].pImageInfo` must be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures

973
pipelineBindPoint must be supported by the commandBuffer’s parent VkCommandPool’s queue family

Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdPushDescriptorSetKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter
  pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength
  descriptorWriteCount must be greater than 0

- VUID-vkCmdPushDescriptorSetKHR-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>
Alternatively, to push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSet2KHR(  
    VkCommandBuffer commandBuffer,  
    const VkPushDescriptorSetInfoKHR* pPushDescriptorSetInfo);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pPushDescriptorSetInfo` is a pointer to a `VkPushDescriptorSetInfoKHR` structure.

### Valid Usage

- **VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-09468**
  
  Each bit in `pPushDescriptorSetInfo->stageFlags` **must** be a stage supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

### Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-parameter**
  
  `pPushDescriptorSetInfo` **must** be a valid pointer to a valid `VkPushDescriptorSetInfoKHR` structure

- **VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-recording**
  
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

- **VUID-vkCmdPushDescriptorSet2KHR-videocoding**
  
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
The `VkPushDescriptorSetInfoKHR` structure is defined as:

```c
//Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
typedef struct VkPushDescriptorSetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout layout;
    uint32_t set;
    uint32_t descriptorWriteCount;
    const VkWriteDescriptorSet* pDescriptorWrites;
} VkPushDescriptorSetInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the descriptors.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

If `stageFlags` specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a `stageFlags` value of `VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT` is equivalent to calling the original version of this command once with `VK_PIPELINE_BIND_POINT_GRAPHICS` and once with `VK_PIPELINE_BIND_POINT_COMPUTE`.

### Valid Usage

- `VUID-VkPushDescriptorSetInfoKHR-set-00364
  set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created
• VUID-VkPushDescriptorSetInfoKHR-set-00365
  set **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`

• VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-06494
  For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pDescriptorWrites[i].pImageInfo` **must** be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures

• VUID-VkPushDescriptorSetInfoKHR-None-09495
  `layout` **must** be a valid `VkPipelineLayout` handle

---

**Valid Usage (Implicit)**

• VUID-VkPushDescriptorSetInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_INFO_KHR`

• VUID-VkPushDescriptorSetInfoKHR-pNext-pNext
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`

• VUID-VkPushDescriptorSetInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

• VUID-VkPushDescriptorSetInfoKHR-stageFlags-parameter
  `stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values

• VUID-VkPushDescriptorSetInfoKHR-stageFlags-requiredbitmask
  `stageFlags` **must** not be `0`

• VUID-VkPushDescriptorSetInfoKHR-layout-parameter
  If `layout` is not `VK_NULL_HANDLE`, `layout` **must** be a valid `VkPipelineLayout` handle

• VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-parameter
  `pDescriptorWrites` **must** be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures

• VUID-VkPushDescriptorSetInfoKHR-descriptorWriteCount-arraylength
  `descriptorWriteCount` **must** be greater than `0`

---

14.2.9. Push Descriptor Updates With Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:
// Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
// VK_KHR_descriptor_update_template with VK_KHR_push_descriptor

```c
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    VkPipelineLayout layout,
    uint32_t set,
    const void* pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It **must** be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This **must** be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.

### Valid Usage

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366
  The `pipelineBindPoint` specified during the creation of the descriptor update template **must** be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686
  `pData` **must** be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-07993
  `layout` **must** be compatible with the layout used to create `descriptorUpdateTemplate`

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-07994
  `descriptorUpdateTemplate` **must** have been created with a `templateType` of `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07995
  `set` **must** be the same value used to create `descriptorUpdateTemplate`

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07304
  `set` **must** be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07305
  `set` **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>

<td>State</td>
</tr>
</tbody>
</table>

API example

```c
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo; // a single image info
    // ... some more application-related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
```
// binding to a single image descriptor
{
    .binding = 0,
    .dstArrayElement = 0,
    .descriptorCount = 1,
    .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
    .offset = offsetof(AppDataStructure, imageInfo),
    .stride = 0     // not required if descriptorCount is 1
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 1,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR,
    .descriptorSetLayout = 0,  // ignored by given templateType
    .pipelineBindPoint = VK_PIPELINE_BIND_POINT_GRAPHICS,
    .pipelineLayout = myPipelineLayout,
    .set = 0,
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate, myPipelineLayout, 0, &appData);

Alternatively, to use a descriptor update template to specify the push descriptors to update, call:

// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplate2KHR(
    VkCommandBuffer commandBuffer, const VkPushDescriptorSetWithTemplateInfoKHR* pPushDescriptorSetWithTemplateInfo);

- **commandBuffer** is the command buffer that the descriptors will be recorded in.
- **pPushDescriptorSetWithTemplateInfo** is a pointer to a `VkPushDescriptorSetWithTemplateInfoKHR` structure.
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-parameter
  
  The `commandBuffer must` be a valid `VkCommandBuffer` handle

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-pPushDescriptorSetWithTemplateInfo-parameter
  
  `pPushDescriptorSetWithTemplateInfo must` be a valid pointer to a valid `VkPushDescriptorSetWithTemplateInfoKHR` structure

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-recording
  
  `commandBuffer must` be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-cmdpool
  
  The `VkCommandPool that `commandBuffer was allocated from must` support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-videocoding
  
  This command `must` only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer must` be externally synchronized

- Host access to the `VkCommandPool that `commandBuffer was allocated from must` be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkPushDescriptorSetWithTemplateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
typedef struct VkPushDescriptorSetWithTemplateInfoKHR {
    VkStructureType             sType;
    const void*                 pNext;
    VkDescriptorUpdateTemplate  descriptorUpdateTemplate;
    VkPipelineLayout            layout;
    uint32_t                     set;
    const void*                  pData;
} VkPushDescriptorSetWithTemplateInfoKHR;
```
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **descriptorUpdateTemplate** is a descriptor update template defining how to interpret the descriptor information in **pData**.

• **layout** is a **VkPipelineLayout** object used to program the bindings. It **must** be compatible with the layout used to create the **descriptorUpdateTemplate** handle.

• **set** is the set number of the descriptor set in the pipeline layout that will be updated. This **must** be the same number used to create the **descriptorUpdateTemplate** handle.

• **pData** is a pointer to memory containing descriptors for the templated update.

### Valid Usage

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-commandBuffer-00366**
  The **pipelineBindPoint** specified during the creation of the descriptor update template **must** be supported by the **commandBuffer**'s parent **VkCommandPool**'s queue family

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-pData-01686**
  **pData** **must** be a valid pointer to a memory containing one or more valid instances of **VkDescriptorImageInfo**, **VkDescriptorBufferInfo**, or **VkBufferView** in a layout defined by **descriptorUpdateTemplate** when it was created with **vkCreateDescriptorUpdateTemplate**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-layout-07993**
  **layout** **must** be compatible with the layout used to create **descriptorUpdateTemplate**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-descriptorUpdateTemplate-07994**
  **descriptorUpdateTemplate** **must** have been created with a **templateType** of **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTOR_KHR**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07995**
  **set** **must** be the same value used to create **descriptorUpdateTemplate**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07304**
  **set** **must** be less than **VkPipelineLayoutCreateInfo::setLayoutCount** provided when **layout** was created

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07305**
  **set** **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with **VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-None-09495**
  **layout** **must** be a valid **VkPipelineLayout** handle

### Valid Usage (Implicit)

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-sType-sType**
  **sType** **must** be **VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_WITH_TEMPLATE_INFO_KHR**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-pNext-pNext**
  **pNext** **must** be **NULL** or a pointer to a valid instance of **VkPipelineLayoutCreateInfo**
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

*Note*

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer in which the push constant update will be recorded.
    VkPipelineLayout layout,        // layout is the pipeline layout used to program the push constant updates.
    VkShaderStageFlags stageFlags, // stageFlags is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the push constants in the updated range.
    uint32_t offset,                // offset is the start offset of the push constant range to update, in units of bytes.
    uint32_t size,                  // size is the size of the push constant range to update, in units of bytes.
    const void* pValues);          // pValues is a pointer to an array of size bytes containing the new push constant values.
```

When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.
Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline’s layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout’s push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.

**Valid Usage**

- **VUID-vkCmdPushConstants-offset-01795**
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there must be a push constant range in `layout` that includes that byte and that stage.

- **VUID-vkCmdPushConstants-offset-01796**
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` must include all stages in that push constant range’s `VkPushConstantRange::stageFlags`.

- **VUID-vkCmdPushConstants-offset-00368**
  `offset` must be a multiple of 4.

- **VUID-vkCmdPushConstants-size-00369**
  `size` must be a multiple of 4.

- **VUID-vkCmdPushConstants-offset-00370**
  `offset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`.

- **VUID-vkCmdPushConstants-size-00371**
  `size` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`.

**Valid Usage (Implicit)**

- **VUID-vkCmdPushConstants-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPushConstants-layout-parameter**
  `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-vkCmdPushConstants-stageFlags-parameter**
  `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-vkCmdPushConstants-stageFlags-requiredbitmask**
  `stageFlags` must not be 0.
• VUID-vkCmdPushConstants-pValues-parameter
  \texttt{pValues must} be a valid pointer to an array of size bytes

• VUID-vkCmdPushConstants-commandBuffer-recording
  \texttt{commandBuffer must} be in the recording state

• VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support graphics, or compute operations

• VUID-vkCmdPushConstants-videocoding
  This command \texttt{must} only be called outside of a video coding scope

• VUID-vkCmdPushConstants-size-arraylength
  size \texttt{must} be greater than 0

• VUID-vkCmdPushConstants-commonparent
  Both of \texttt{commandBuffer}, and layout \texttt{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}

---

**Host Synchronization**

• Host access to \texttt{commandBuffer must} be externally synchronized

• Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

</tr>
</tbody>
</table>

Alternatively, to update push constants, call:

```c
// Provided by VK_KHR_maintenance6
void vkCmdPushConstants2KHR(
    VkCommandBuffer commandBuffer,
    const VkPushConstantsInfoKHR* pPushConstantsInfo);
```

• \texttt{commandBuffer} is the command buffer in which the push constant update will be recorded.

• \texttt{pPushConstantsInfo} is a pointer to a \texttt{VkPushConstantsInfoKHR} structure.

---

**Valid Usage (Implicit)**
• VUID-vkCmdPushConstants2KHR-commandBuffer-parameter  
  `commandBuffer must be a valid VkCommandBuffer handle`

• VUID-vkCmdPushConstants2KHR-pPushConstantsInfo-parameter  
  `pPushConstantsInfo must be a valid pointer to a valid VkPushConstantsInfoKHR structure`

• VUID-vkCmdPushConstants2KHR-commandBuffer-recording  
  `commandBuffer must be in the recording state`

• VUID-vkCmdPushConstants2KHR-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

• VUID-vkCmdPushConstants2KHR-videocoding  
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkPushConstantsInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkPushConstantsInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayout layout;
    VkShaderStageFlags stageFlags;
    uint32_t offset;
    uint32_t size;
    const void* pValues;
} VkPushConstantsInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `layout` is the pipeline layout used to program the push constant updates.
• **stageFlags** is a bitmask of [VkShaderStageFlagBits](#) specifying the shader stages that will use the push constants in the updated range.

• **offset** is the start offset of the push constant range to update, in units of bytes.

• **size** is the size of the push constant range to update, in units of bytes.

• **pValues** is a pointer to an array of **size** bytes containing the new push constant values.

### Valid Usage

- **VUID-VkPushConstantsInfoKHR-offset-01795**
  For each byte in the range specified by **offset** and **size** and for each shader stage in **stageFlags**, there **must** be a push constant range in **layout** that includes that byte and that stage.

- **VUID-VkPushConstantsInfoKHR-offset-01796**
  For each byte in the range specified by **offset** and **size** and for each push constant range that overlaps that byte, **stageFlags** **must** include all stages in that push constant range’s [VkPushConstantRange](#)::**stageFlags**

- **VUID-VkPushConstantsInfoKHR-offset-00368**
  **offset** **must** be a multiple of 4

- **VUID-VkPushConstantsInfoKHR-size-00369**
  **size** **must** be a multiple of 4

- **VUID-VkPushConstantsInfoKHR-offset-00370**
  **offset** **must** be less than [VkPhysicalDeviceLimits](#)::maxPushConstantsSize

- **VUID-VkPushConstantsInfoKHR-size-00371**
  **size** **must** be less than or equal to [VkPhysicalDeviceLimits](#)::maxPushConstantsSize minus **offset**

- **VUID-VkPushConstantsInfoKHR-None-09495**
  **layout** **must** be a valid [VkPipelineLayout](#) handle

### Valid Usage (Implicit)

- **VUID-VkPushConstantsInfoKHR-sType-sType**
  **sType** **must** be VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR

- **VUID-VkPushConstantsInfoKHR-pNext-pNext**
  **pNext** **must** be NULL or a pointer to a valid instance of [VkPipelineLayoutCreateInfo](#)

- **VUID-VkPushConstantsInfoKHR-sType-unique**
  The **sType** value of each struct in the **pNext** chain **must** be unique

- **VUID-VkPushConstantsInfoKHR-layout-parameter**
  If **layout** is not VK_NULL_HANDLE, **layout** **must** be a valid [VkPipelineLayout](#) handle

- **VUID-VkPushConstantsInfoKHR-stageFlags-parameter**
  **stageFlags** **must** be a valid combination of [VkShaderStageFlagBits](#) values
14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- **device** is the logical device that the buffer was created on.
- **pInfo** is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`, the return value will be the same address that was returned at capture time.

The returned address must satisfy the alignment requirement specified by `VkMemoryRequirements::alignment` for the buffer in `VkBufferDeviceAddressInfo::buffer`.

If multiple `VkBuffer` objects are bound to overlapping ranges of `VkDeviceMemory`, implementations may return address ranges which overlap. In this case, it is ambiguous which
VkBuffer is associated with any given device address. For purposes of valid usage, if multiple VkBuffer objects can be attributed to a device address, a VkBuffer is selected such that valid usage passes, if it exists.

**Valid Usage**

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferDeviceAddress-device-03325
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetBufferDeviceAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The `VkBufferDeviceAddressInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `buffer` specifies the buffer whose address is being queried.

**Valid Usage**

- VUID-VkBufferDeviceAddressInfo-buffer-02600
  If buffer is non-sparse and was not created with the
  VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag, then it must be bound
completely and contiguously to a single VkDeviceMemory object.

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  buffer must have been created with VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT

### Valid Usage (Implicit)

- VUID-VkBufferDeviceAddressInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  pNext must be NULL

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- device is the logical device that the buffer was created on.
- pInfo is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of pInfo->buffer.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress the return value must be the same address.

### Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled
Valid Usage (Implicit)

- **VUID-vkGetBufferOpaqueCaptureAddress-device-parameter**
  
  *device must be a valid* `VkDevice` *handle*

- **VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter**
  
  *pInfo must be a valid pointer to a valid* `VkBufferDeviceAddressInfo` *structure*

The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       stride;
    VkDeviceSize       size;
} VkStridedDeviceAddressRegionKHR;
```

- **deviceAddress** is the device address (as returned by the `vkGetBufferDeviceAddress` command) at which the region starts, or zero if the region is unused.

- **stride** is the byte stride between consecutive elements.

- **size** is the size in bytes of the region starting at `deviceAddress`.

Valid Usage

- **VUID-VkStridedDeviceAddressRegionKHR-size-04631**
  
  If `size` is not zero, all addresses between `deviceAddress` and `deviceAddress + size - 1` must be in the buffer device address range of the same buffer.

- **VUID-VkStridedDeviceAddressRegionKHR-size-04632**
  
  If `size` is not zero, **stride must be less than or equal to the size of the buffer from which `deviceAddress` was queried**.
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `VkPipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Tile Image Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

**Note**
In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block.
They must

- be explicitly declared (there are no implicit built-ins),
- be identified with a BuiltIn decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface.

Built-ins must not have any Location or Component decorations.

15.1.2. User-defined Variable Interface

The non-built-in variables listed by OpEntryPoint with the Input or Output storage class form the user-defined variable interface. These must have numeric type or, recursively, composite types of such types. If an implementation supports storageInputOutput16, components can have a width of 16 bits. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - XfbBuffer, XfbStride, Offset, and Stream
  - one is not decorated with Component and the other is declared with a Component of 0
  - Interpolation decorations
  - RelaxedPrecision if one is an input variable and the other an output variable
- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither is a structure member; or
  - if the maintenance4 feature is enabled, they are declared as OpTypeVector variables, and the output has a Component Count value higher than that of the input but the same Component Type; or
  - if the input is decorated with PerVertexKHR, and is declared in a fragment shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither the input nor the output is a structure member; or
  - if in any other case they are declared with an equivalent OpType* declaration.
- If both are structures and every member has an interface match.
The word “structure” above refers to both variables that have an \texttt{OpTypeStruct} type and interface blocks (which are also declared as \texttt{OpTypeStruct}).

All input variables and blocks \textbf{must} have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders \textbf{can} declare and write to output variables that are not declared or read by the subsequent stage.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

\textbf{15.1.4. Location Assignment}

This section describes \texttt{Location} assignments for user-defined variables and how many \texttt{Location} slots are consumed by a given user-variable type. \textit{As mentioned above,} some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many \texttt{Location} slots the type consumes.

The \texttt{Location} value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The \texttt{Component} specifies word components within these vector \texttt{Location} slots. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface \texttt{Location}:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive \texttt{Location} slots.

If a declared input or output is an array of size $n$ and each element takes $m$ \texttt{Location} slots, it will be assigned $m \times n$ consecutive \texttt{Location} slots starting with the specified \texttt{Location}.

If the declared input or output is an $n \times m$ 16-, 32- or 64-bit matrix, it will be assigned multiple \texttt{Location} slots starting with the specified \texttt{Location}. The number of \texttt{Location} slots assigned for each matrix will be the same as for an $n$-element array of $m$-component vectors.

An \texttt{OpVariable} with a structure type that is not a block \textbf{must} be decorated with a \texttt{Location}.

When an \texttt{OpVariable} with a structure type (either block or non-block) is decorated with a \texttt{Location}, the members in the structure type \textbf{must} not be decorated with a \texttt{Location}. The \texttt{OpVariable}'s members are assigned consecutive \texttt{Location} slots in declaration order, starting from the first member, which is assigned the \texttt{Location} decoration from the \texttt{OpVariable}.

When a block-type \texttt{OpVariable} is declared without a \texttt{Location} decoration, each member in its structure type \textbf{must} be decorated with a \texttt{Location}. Types nested deeper than the top-level members \textbf{must} not have \texttt{Location} decorations.

The \texttt{Location} slots consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.
Any two inputs listed as operands on the same `OpEntryPoint` must not be assigned the same `Location` slot and `Component` word, either explicitly or implicitly. Any two outputs listed as operands on the same `OpEntryPoint` must not be assigned the same `Location` slot and `Component` word, either explicitly or implicitly.

The number of input and output `Location` slots available for a shader input or output interface is limited, and dependent on the shader stage as described in `Shader Input and Output Locations`. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective `Location` must have a value less than the number of `Location` slots available for the given interface, as specified in the “Locations Available” column in `Shader Input and Output Locations`.

### 15.1.5. Component Assignment

The `Component` decoration allows the `Location` to be more finely specified for scalars and vectors, down to the individual `Component` word within a `Location` slot that are consumed. The `Component` word within a `Location` are 0, 1, 2, and 3. A variable or block member starting at `Component` N will consume `Component` words N, N+1, N+2, … up through its size. For 16-, and 32-bit types, it is invalid if this sequence of `Component` words gets larger than 3. A scalar 64-bit type will consume two of these `Component` words in sequence, and a two-component 64-bit vector type will consume all four `Component` words available within a `Location`. A three- or four-component 64-bit vector type must not specify a non-zero `Component` decoration. A three-component 64-bit vector type will consume all four `Component` words of the first `Location` and `Component` 0 and 1 of the second `Location`. This leaves `Component` 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a `Component` decoration of 1 or 3. A `Component` decoration must not be specified for any type that is not a scalar or vector.

A four-component 64-bit data type will consume all four `Component` words of the first `Location` and
all four Component words of the second Location.

15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input Location slots is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of i is associated with the color attachment indicated by VkRenderingInfo::pColorAttachments[i]. When using render pass objects, it is associated with the color attachment indicated by VkSubpassDescription::pColorAttachments[i]. Values are written to those attachments after passing through the blending unit as described in Blending, if enabled. Locations are consumed as described in Location Assignment. The number of available fragment output Location slots is given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

If the dynamicRenderingLocalRead feature is supported, fragment output locations can be remapped when using dynamic rendering.

To set the fragment output location mappings during rendering, call:
void vkCmdSetRenderingAttachmentLocationsKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingAttachmentLocationInfoKHR* pLocationInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pLocationInfo` is a `VkRenderingAttachmentLocationInfoKHR` structure indicating the new mappings.

This command sets the attachment location mappings for subsequent drawing commands, and **must** match the mappings provided to the currently bound pipeline, if one is bound, which **can** be set by chaining `VkRenderingAttachmentLocationInfoKHR` to `VkGraphicsPipelineCreateInfo`. Until this command is called, mappings in the command buffer state are treated as each color attachment specified in `vkCmdBeginRendering` having a location equal to its index in `VkRenderingInfo::pColorAttachments`. This state is reset whenever `vkCmdBeginRendering` is called.

### Valid Usage

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-dynamicRenderingLocalRead-09509
  `dynamicRenderingLocalRead` **must** be enabled

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-pLocationInfo-09510
  `pLocationInfo->colorAttachmentCount` **must** be equal to the value of `VkRenderingInfo::colorAttachmentCount` used to begin the current render pass instance

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-09511
  The current render pass instance **must** have been started or resumed by `vkCmdBeginRendering` in this `commandBuffer`

### Valid Usage (Implicit)

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-pLocationInfo-parameter
  `pLocationInfo` **must** be a valid pointer to a valid `VkRenderingAttachmentLocationInfoKHR` structure

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdSetRenderingAttachmentLocationsKHR-videocoding
  997
This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

The `VkRenderingAttachmentLocationInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
typedef struct VkRenderingAttachmentLocationInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorAttachmentCount;
    const uint32_t* pColorAttachmentLocations;
} VkRenderingAttachmentLocationInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `colorAttachmentCount` is the number of elements in `pColorAttachmentLocations`.
- `pColorAttachmentLocations` is a pointer to an array of `colorAttachmentCount uint32_t` values defining remapped locations for color attachments.

This structure allows applications to remap the locations of color attachments to different fragment shader output locations.

Each element of `pColorAttachmentLocations` set to `VK_ATTACHMENT_UNUSED` will be inaccessible to this pipeline as a color attachment; no location will map to it. Each element of `pColorAttachmentLocations` set to any other value will map the specified location value to the color attachment specified in the render pass at the corresponding index in the `pColorAttachmentLocations` array. Any writes to a fragment output location that is not mapped to an attachment **must** be discarded.

If `pColorAttachmentLocations` is `NULL`, it is equivalent to setting each element to its index within the array.
This structure can be included in the pNext chain of a VkGraphicsPipelineCreateInfo structure to set this state for a pipeline. If this structure is not included in the pNext chain of VkGraphicsPipelineCreateInfo, it is equivalent to specifying this structure with the following properties:

- colorAttachmentCount set to VkPipelineRenderingCreateInfo::colorAttachmentCount.
- pColorAttachmentLocations set to NULL.

This structure can be included in the pNext chain of a VkCommandBufferInheritanceInfo structure to specify inherited state from the primary command buffer. If VkCommandBufferInheritanceInfo::renderPass is not VK_NULL_HANDLE, or VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT is not specified in VkCommandBufferBeginInfo::flags, members of this structure are ignored. If this structure is not included in the pNext chain of VkCommandBufferInheritanceInfo, it is equivalent to specifying this structure with the following properties:

- colorAttachmentCount set to VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount.
- pColorAttachmentLocations set to NULL.

Valid Usage

- VUID-VkRenderingAttachmentLocationInfoKHR-dynamicRenderingLocalRead-09512
  If the dynamicRenderingLocalRead feature is not enabled, and pColorAttachmentLocations is not NULL, each element must be set to the value of its index within the array

- VUID-VkRenderingAttachmentLocationInfoKHR-pColorAttachmentLocations-09513
  Elements of pColorAttachmentLocations that are not VK_ATTACHMENT_UNUSED must each be unique

- VUID-VkRenderingAttachmentLocationInfoKHR-colorAttachmentCount-09514
  colorAttachmentCount must be less than or equal to maxColorAttachments

- VUID-VkRenderingAttachmentLocationInfoKHR-pColorAttachmentLocations-09515
  Each element of pColorAttachmentLocations must be less than maxColorAttachments

Valid Usage (Implicit)

- VUID-VkRenderingAttachmentLocationInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_LOCATION_INFO_KHR

When an active fragment shader invocation finishes, the values of all fragment shader outputs are copied out and used as blend inputs or color attachments writes. If the invocation does not set a value for them, the input values to those blending or color attachment writes are undefined.

Components of the output variables are assigned as described in Component Assignment. Output Component words identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same Location, they must have the same underlying type (floating-point or...
Component words which do not correspond to any fragment shader output will also result in undefined values for blending or color attachment writes.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

There must be no output variable which has the same Location, Component, and Index as any other, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either OpTypeFloat or OpTypeInt, and a Width of 32. If storageInputOutput16 is supported, output values written by a fragment shader can be also declared with either OpTypeFloat or OpTypeInt and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion From Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

### 15.4. Fragment Tile Image Interface

When a fragment stage is present in a pipeline, the fragment shader tile image variables decorated with Location form an interface with the color attachments defined by the render pass instance. The fragment shader tile image variables are matched by Location decorations to the color attachments specified in the pColorAttachments array of the VkRenderingInfoKHR structure describing the render pass instance the fragment shader is executed in.

The fragment shader variables listed by OpEntryPoint with the TileImageEXT storage class and a decoration of Location form the fragment tile image interface. These variables must be declared with a type of OpTypeImage, and a Dim operand of TileImageDataEXT. The Component decoration is not supported for these variables.

Reading from a tile image variable with a Location decoration of i reads from the color attachment identified by the element of VkRenderingInfoKHR::pColorAttachments with a location equal to i. If the tile image variable is declared as an array of size N, it consumes N consecutive tile image locations, starting with the index specified. There must not be more than one tile image variable with the same Location whether explicitly declared or implied by an array declaration. The number of available tile image locations is the same as the number of available fragment output locations as given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

The basic data type (floating-point, integer, unsigned integer) of the tile image variable must match the basic format of the corresponding color attachment, or the values read from the tile image variables are undefined.
15.5. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the fragment input attachment interface. These variables must be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, an `Arrayed` operand of 0, and a `Sampled` operand of 2. The `MS` operand of the `OpTypeImage` must be 0 if the `samples` field of the corresponding `VkAttachmentDescription` is `VK_SAMPLE_COUNT_1_BIT` and 1 otherwise.

A subpass input variable identified with an `InputAttachmentIndex` decoration of `i` reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass input variable is declared as an array of size `N`, it consumes `N` consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration per image aspect. A multi-aspect image (e.g. a depth/stencil format) can use the same input variable. The number of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

When using dynamic rendering with the `dynamicRenderingLocalRead` feature enabled, a subpass input variable with a `InputAttachmentIndex` decoration of `i` can be mapped to a color, depth, or stencil attachment.

To set the input attachment index mappings during dynamic rendering, call:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
void vkCmdSetRenderingInputAttachmentIndicesKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInputAttachmentIndexInfoKHR* pInputAttachmentIndexInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInputAttachmentIndexInfo` is a `VkRenderingInputAttachmentIndexInfoKHR` structure indicating the new mappings.

This command sets the input attachment index mappings for subsequent drawing commands, and must match the mappings provided to the currently bound pipeline, if one is bound, which can be set by chaining `VkRenderingInputAttachmentIndexInfoKHR` to `VkGraphicsPipelineCreateInfo`.

Until this command is called, mappings in the command buffer state are treated as each color attachment specified in `vkCmdBeginRendering` mapping to subpass inputs with a `InputAttachmentIndex` equal to its index in `VkRenderingInfo::pColorAttachments`, and depth/stencil attachments mapping to input attachments without these decorations. This state is reset whenever `vkCmdBeginRendering` is called.
Valid Usage

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-dynamicRenderingLocalRead-09516
  `dynamicRenderingLocalRead` must be enabled

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-pInputAttachmentIndexInfo-09517
  `pInputAttachmentIndexInfo->colorAttachmentCount` must be equal to the value of `VkRenderingInfo::colorAttachmentCount` used to begin the current render pass instance

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-09518
  The current render pass instance must have been started or resumed by `vkCmdBeginRendering` in this `commandBuffer`

Valid Usage (Implicit)

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-pInputAttachmentIndexInfo-parameter
  `pInputAttachmentIndexInfo` must be a valid pointer to a valid `VkRenderingInputAttachmentIndexInfoKHR` structure

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdSetRenderingInputAttachmentIndicesKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkRenderingInputAttachmentIndexInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
typedef struct VkRenderingInputAttachmentIndexInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorAttachmentCount;
    const uint32_t* pColorAttachmentInputIndices;
    const uint32_t* pDepthInputAttachmentIndex;
    const uint32_t* pStencilInputAttachmentIndex;
} VkRenderingInputAttachmentIndexInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `colorAttachmentCount` is the number of elements in `pColorAttachmentInputIndices`.
- `pColorAttachmentInputIndices` is a pointer to an array of `colorAttachmentCount` `uint32_t` values defining indices for color attachments to be used as input attachments.
- `pDepthInputAttachmentIndex` is either NULL, or a pointer to a `uint32_t` value defining the index for the depth attachment to be used as an input attachment.
- `pStencilInputAttachmentIndex` is either NULL, or a pointer to a `uint32_t` value defining the index for the stencil attachment to be used as an input attachment.

This structure allows applications to remap attachments to different input attachment indices.

Each element of `pColorAttachmentInputIndices` set to a value of `VK_ATTACHMENT_UNUSED` indicates that the corresponding attachment will not be used as an input attachment in this pipeline. Any other value in each of those elements will map the corresponding attachment to a `InputAttachmentIndex` value defined in shader code.

If `pColorAttachmentInputIndices` is NULL, it is equivalent to setting each element to its index within the array.

If `pDepthInputAttachmentIndex` or `pStencilInputAttachmentIndex` are set to NULL, they map to input attachments without a `InputAttachmentIndex` decoration. If they point to a value of `VK_ATTACHMENT_UNUSED`, it indicates that the corresponding attachment will not be used as an input attachment in this pipeline. If they point to any other value it maps the corresponding attachment to a `InputAttachmentIndex` value defined in shader code.
This structure can be included in the `pNext` chain of a `VkGraphicsPipelineCreateInfo` structure to set this state for a pipeline. If this structure is not included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it is equivalent to specifying this structure with the following properties:

- `colorAttachmentCount` set to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.
- `pColorAttachmentInputIndices` set to `NULL`.
- `pDepthInputAttachmentIndex` set to `NULL`.
- `pStencilInputAttachmentIndex` set to `NULL`.

This structure can be included in the `pNext` chain of a `VkCommandBufferInheritanceInfo` structure to specify inherited state from the primary command buffer. If this structure is not included in the `pNext` chain of `VkCommandBufferInheritanceInfo`, it is equivalent to specifying this structure with the following properties:

- `colorAttachmentCount` set to `VkCommandBufferInheritanceRenderingInfo::colorAttachmentCount`.
- `pColorAttachmentInputIndices` set to `NULL`.
- `pDepthInputAttachmentIndex` set to `NULL`.
- `pStencilInputAttachmentIndex` set to `NULL`.

### Valid Usage

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09519**
  - If the `dynamicRenderingLocalRead` feature is not enabled, and `pColorAttachmentInputIndices` is not `NULL`, each element must be set to `VK_ATTACHMENT_UNUSED`.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09520**
  - If the `dynamicRenderingLocalRead` feature is not enabled, `pDepthInputAttachmentIndex` must be a valid pointer to a value of `VK_ATTACHMENT_UNUSED`.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-dynamicRenderingLocalRead-09521**
  - If the `dynamicRenderingLocalRead` feature is not enabled, `pStencilInputAttachmentIndex` must be a valid pointer to a value of `VK_ATTACHMENT_UNUSED`.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09522**
  - Elements of `pColorAttachmentInputIndices` that are not `VK_ATTACHMENT_UNUSED` must each be unique.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09523**
  - Elements of `pColorAttachmentInputIndices` that are not `VK_ATTACHMENT_UNUSED` must not take the same value as the content of `pDepthInputAttachmentIndex`.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-09524**
  - Elements of `pColorAttachmentInputIndices` that are not `VK_ATTACHMENT_UNUSED` must not take the same value as the content of `pStencilInputAttachmentIndex`.

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-colorAttachmentCount-09525**
  - `colorAttachmentCount` must be less than or equal to `maxColorAttachments`.
Valid Usage (Implicit)

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-sType-sType**  
  `sType` **must** be `VK_STRUCTURE_TYPE_RENDERING_INPUT_ATTACHMENT_INDEX_INFO_KHR`

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pColorAttachmentInputIndices-parameter**  
  If `colorAttachmentCount` is not 0, and `pColorAttachmentInputIndices` is not NULL, `pColorAttachmentInputIndices` **must** be a valid pointer to an array of `colorAttachmentCount` `uint32_t` values

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pDepthInputAttachmentIndex-parameter**  
  If `pDepthInputAttachmentIndex` is not NULL, `pDepthInputAttachmentIndex` **must** be a valid pointer to a valid `uint32_t` value

- **VUID-VkRenderingInputAttachmentIndexInfoKHR-pStencilInputAttachmentIndex-parameter**  
  If `pStencilInputAttachmentIndex` is not NULL, `pStencilInputAttachmentIndex` **must** be a valid pointer to a valid `uint32_t` value

Variables identified with the **InputAttachmentIndex** **must** only be used by a fragment stage. The numeric format of the subpass input **must** match the format of the corresponding input attachment, or the values of subpass loads from these variables are undefined. If the framebuffer attachment contains both depth and stencil aspects, the numeric format of the subpass input determines if depth or stencil aspect is accessed by the shader.

See **Input Attachment** for more details.

### 15.5.1. Fragment Input Attachment Compatibility

An input attachment that is statically accessed by a fragment shader **must** be backed by a descriptor that is equivalent to the `VkImageView` in the `VkFramebuffer`, except for `subresourceRange.aspectMask`. The `aspectMask` **must** be equal to the aspect accessed by the shader.

### 15.6. Ray Tracing Pipeline Interface

Ray tracing pipelines **may** have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or
data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

### 15.7. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage's OpEntryPoint with a storage class of Uniform, UniformConstant, StorageBuffer, or PushConstant. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

#### 15.7.1. Push Constant Interface

The shader variables defined with a storage class of PushConstant that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:
• typed as `OpTypeStruct`,
• identified with a `Block` decoration, and
• laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in `Offset and Stride Assignment`.

There **must** be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block **must** be placed at an `Offset` such that the entire member is entirely contained within the `VkPushConstantRange` for each `OpEntryPoint` that uses it, and the `stageFlags` for that range **must** specify the appropriate `VkShaderStageFlagBits` for that stage. The `Offset` decoration for any member of a push constant block **must** not cause the space required for that member to extend outside the range \([0, \text{maxPushConstantsSize})\).

Any member of a push constant block that is declared as an array **must** only be accessed with *dynamically uniform* indices.

### 15.7.2. Descriptor Set Interface

The **descriptor set interface** is comprised of the shader variables with the storage class of `StorageBuffer`, `Uniform` or `UniformConstant` (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables **must** have `DescriptorSet` and `Binding` decorations specified, which are assigned and matched with the `VkDescriptorSetLayout` objects in the pipeline layout as described in **DescriptorSet and Binding Assignment**.

The **Image Format** of an `OpTypeImage` declaration **must** not be `Unknown`, for variables which are used for `OpImageRead`, `OpImageSparseRead`, or `OpImageWrite` operations, except under the following conditions:

- For `OpImageWrite`, if the image format is listed in the storage without format list and if the `shaderStorageImageWriteWithoutFormat` feature is enabled and the shader module declares the `StorageImageWriteWithoutFormat` capability.
- For `OpImageWrite`, if the image format supports `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` and the shader module declares the `StorageImageWriteWithoutFormat` capability.
- For `OpImageRead` or `OpImageSparseRead`, if the image format is listed in the storage without format list and if the `shaderStorageImageReadWithoutFormat` feature is enabled and the shader module declares the `StorageImageReadWithoutFormat` capability.
- For `OpImageRead` or `OpImageSparseRead`, if the image format supports `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` and the shader module declares the `StorageImageReadWithoutFormat` capability.
- For `OpImageRead`, if `Dim` is `SubpassData` (indicating a read from an input attachment).

The **Image Format** of an `OpTypeImage` declaration **must** not be `Unknown`, for variables which are used for `OpAtomic*` operations.
Variables identified with the *Uniform* storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as *OpTypeStruct*, or an array of this type,
- identified with a *Block* or *BufferBlock* decoration, and
- laid out explicitly using the *Offset*, *ArrayStride*, and *MatrixStride* decorations as specified in *Offset and Stride Assignment*.

Variables identified with the *StorageBuffer* storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as *OpTypeStruct*, or an array of this type,
- identified with a *Block* decoration, and
- laid out explicitly using the *Offset*, *ArrayStride*, and *MatrixStride* decorations as specified in *Offset and Stride Assignment*.

The *Offset* decoration for any member of a *Block*-decorated variable in the *Uniform* storage class must not cause the space required for that variable to extend outside the range \([0, \text{maxUniformBufferRange})\). The *Offset* decoration for any member of a *Block*-decorated variable in the *StorageBuffer* storage class must not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Variables identified with the *Uniform* storage class can also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a *descriptorType* of *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK*. In this case the variable must be typed as *OpTypeStruct* and cannot be aggregated into arrays of that type. Further, the *Offset* decoration for any member of such a variable must not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize})\).

Variables identified with a storage class of *UniformConstant* and a decoration of *InputAttachmentIndex* must be declared as described in *Fragment Input Attachment Interface*.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor can have a type of *OpTypeImage*, *OpTypeSampler* (*Sampled*=1), or *OpTypeSampledImage*.

Arrays of any of these types can be indexed with *constant integral expressions*. The following features must be enabled and capabilities must be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- Storage images (except storage texel buffers and input attachments):
  - Dynamically uniform: *shaderStorageImageArrayDynamicIndexing* and *StorageImageArrayDynamicIndexing*
  - Non-uniform: *shaderStorageImageArrayNonUniformIndexing* and *StorageImageArrayNonUniformIndexing*
- Storage texel buffers:
  - Dynamically uniform: *shaderStorageTexelBufferArrayDynamicIndexing* and *StorageTexelBufferArrayDynamicIndexing*
- Non-uniform: \texttt{shaderStorageTexelBufferArrayNonUniformIndexing} and \texttt{StorageTexelBufferArrayNonUniformIndexing}

- Input attachments:
  - Dynamically uniform: \texttt{shaderInputAttachmentArrayDynamicIndexing} and \texttt{InputAttachmentArrayDynamicIndexing}
  - Non-uniform: \texttt{shaderInputAttachmentArrayNonUniformIndexing} and \texttt{InputAttachmentArrayNonUniformIndexing}

- Sampled images (except uniform texel buffers), samplers and combined image samplers:
  - Dynamically uniform: \texttt{shaderSampledImageArrayDynamicIndexing} and \texttt{SampledImageArrayDynamicIndexing}
  - Non-uniform: \texttt{shaderSampledImageArrayNonUniformIndexing} and \texttt{SampledImageArrayNonUniformIndexing}

- Uniform texel buffers:
  - Dynamically uniform: \texttt{shaderUniformTexelBufferArrayDynamicIndexing} and \texttt{UniformTexelBufferArrayDynamicIndexing}
  - Non-uniform: \texttt{shaderUniformTexelBufferArrayNonUniformIndexing} and \texttt{UniformTexelBufferArrayNonUniformIndexing}

- Uniform buffers:
  - Dynamically uniform: \texttt{shaderUniformBufferArrayDynamicIndexing} and \texttt{UniformBufferArrayDynamicIndexing}
  - Non-uniform: \texttt{shaderUniformBufferArrayNonUniformIndexing} and \texttt{UniformBufferArrayNonUniformIndexing}

- Storage buffers:
  - Dynamically uniform: \texttt{shaderStorageBufferArrayDynamicIndexing} and \texttt{StorageBufferArrayDynamicIndexing}
  - Non-uniform: \texttt{shaderStorageBufferArrayNonUniformIndexing} and \texttt{StorageBufferArrayNonUniformIndexing}

- Acceleration structures:
  - Dynamically uniform: Always supported.
  - Non-uniform: Always supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature \textbf{must} be enabled and the capability \textbf{must} be declared.

If the combined image sampler enables sampler Y’C_bC_r conversion, it \textbf{must} be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the
the shaderSampledImageArrayDynamicIndexing feature.

1. Where `OpTypeImage` is referenced, the `Dim` values `Buffer` and `Subpassdata` are only accepted where they are specifically referenced. They do not correspond to resource types where a generic `OpTypeImage` is specified.

2. In addition to `DescriptorSet` and `Binding`.

### 15.7.3. DescriptorSet and Binding Assignment

A variable decorated with a `DescriptorSet` decoration of `s` and a `Binding` decoration of `b` indicates that this variable is associated with the `VkDescriptorSetLayoutBinding` that has a `binding` equal to `b` in `pSetLayouts[s]` that was specified in `VkPipelineLayoutCreateInfo`.

`DescriptorSet` decoration values must be between zero and `maxBoundDescriptorSets` minus one, inclusive. `Binding` decoration values can be any 32-bit unsigned integer value, as described in `Descriptor Set Layout`. Each descriptor set has its own binding name space.

If the `Binding` decoration is used with an array, the entire array is assigned that binding value. The array must be a single-dimensional array and size of the array must be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set must not be used. If the array is runtime-sized, the `runtimeDescriptorArray` feature must be enabled and the `RuntimeDescriptorArray` capability must be declared. The index of each element of the array is referred to as the `arrayElement`. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an `arrayElement` of zero.

There is a limit on the number of resources of each type that can be accessed by a pipeline stage as shown in `Shader Resource Limits`. The “Resources Per Stage” column gives the limit on the number each type of resource that can be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits.

The pipeline layout may include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s `stageFlags`.

However, if a variable assigned to a given `DescriptorSet` and `Binding` is statically used by the entry point for a shader stage, the pipeline layout must contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s `stageFlags` must include the appropriate `VkShaderStageFlagBits` for that stage. The variable must be of a valid resource type determined by its SPIR-V type and storage class, as defined in `Shader Resource and Storage Class Correspondence`. The descriptor set layout binding must be of a corresponding descriptor type, as
There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are statically used has an impact. If any shader variable identifying a resource is statically used in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and Aliased decorations should be used to avoid data hazards (see section 2.18.2 Aliasing in the SPIR-V specification).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER that has multiple corresponding shader variables in the UniformConstant storage class, where some could be OpTypeImage (Sampled=1), some could be OpTypeSampler, and some could be OpTypeSampledImage.

</table>

1

Input attachments can only be used in the fragment shader stage

15.7.4. Offset and Stride Assignment

Certain objects must be explicitly laid out using the Offset, ArrayStride, and MatrixStride, as described in SPIR-V explicit layout validation rules. All such layouts also must conform to the following requirements.

Note

The numeric order of Offset decorations does not need to follow member declaration order.

Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with C columns and R rows is equivalent to a C element array of vectors with R components.
- A row-major matrix with C columns and R rows is equivalent to an R element array of vectors with C components.

The scalar alignment of the type of an OpTypeStruct member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits scalar alignment from the equivalent array declaration.

The base alignment of the type of an OpTypeStruct member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
• A three- or four-component vector has a base alignment equal to four times its scalar alignment.

• An array has a base alignment equal to the base alignment of its element type.

• A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the StorageBuffer storage class, StorageBuffer8BitAccess or UniformAndStorageBuffer8BitAccess must be declared in the SPIR-V module.)

• A matrix type inherits base alignment from the equivalent array declaration.

The extended alignment of the type of an OpTypeStruct member is similarly defined as follows:

• A scalar or vector type has an extended alignment equal to its base alignment.

• An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.

• A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to improperly straddle if either of the following are true:

• It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at $F$ and its last byte at $L$, where $\text{floor}(F / 16) \neq \text{floor}(L / 16)$.

• It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

**Standard Buffer Layout**

Every member of an OpTypeStruct that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the scalarBlockLayout feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.

2. If the workgroupMemoryExplicitLayoutScalarBlockLayout feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.

3. All vectors must be aligned according to their scalar alignment.

4. If the uniformBufferStandardLayout feature is not enabled on the device, then any member of an OpTypeStruct with a storage class of Uniform and a decoration of Block must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

**Note**

Even if scalar alignment is supported, it is generally more performant to use the base alignment.

The memory layout must obey the following rules:
• The Offset decoration of any member **must** be a multiple of its alignment.

• Any ArrayStride or MatrixStride decoration **must** be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

• The storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant, and the scalarBlockLayout feature is not enabled on the device.

• The storage class is Workgroup, and either the struct member is not part of a Block or the workgroupMemoryExplicitLayoutScalarBlockLayout feature is not enabled on the device.

• The storage class is any other storage class.

the memory layout **must** also obey the following rules:

• Vectors **must** not improperly straddle, as defined above.

• The Offset decoration of a member **must** not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

---

**Note**

The **std430 layout** in GLSL satisfies these rules for types using the base alignment. The **std140 layout** satisfies the rules for types using the extended alignment.

### 15.8. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a BuiltIn SPIR-V decoration. The meaning of each BuiltIn decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values **can** be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

Any two Input storage class OpVariable declarations listed as operands on the same OpEntryPoint **must** not have the same BuiltIn decoration. Any two Output storage class OpVariable declarations listed as operands on the same OpEntryPoint **must** not have the same BuiltIn decoration.

**BaryCoordKHR**

The BaryCoordKHR decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.
Valid Usage

- VUID-BaryCoordKHR-BaryCoordKHR-04154
  The `BaryCoordKHR` decoration **must** be used only within the Fragment Execution Model

- VUID-BaryCoordKHR-BaryCoordKHR-04155
  The variable decorated with `BaryCoordKHR` **must** be declared using the Input Storage Class

- VUID-BaryCoordKHR-BaryCoordKHR-04156
  The variable decorated with `BaryCoordKHR` **must** be declared as a three-component vector of 32-bit floating-point values

### BaryCoordNoPerspKHR

The `BaryCoordNoPerspKHR` decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

#### Valid Usage

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160
  The `BaryCoordNoPerspKHR` decoration **must** be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161
  The variable decorated with `BaryCoordNoPerspKHR` **must** be declared using the Input Storage Class

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04162
  The variable decorated with `BaryCoordNoPerspKHR` **must** be declared as a three-component vector of 32-bit floating-point values

### BaseInstance

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the `firstInstance` parameter to a `direct drawing command` or the `firstInstance` member of a structure consumed by an `indirect drawing command`.

#### Valid Usage

- VUID-BaseInstance-BaseInstance-04181
  The `BaseInstance` decoration **must** be used only within the Vertex Execution Model

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with `BaseInstance` **must** be declared using the Input Storage Class

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with `BaseInstance` **must** be declared as a scalar 32-bit integer value
BaseVertex

Decorating a variable with the BaseVertex built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For non-indexed drawing commands, this variable is the firstVertex parameter to a direct drawing command or the firstVertex member of the structure consumed by an indirect drawing command. For indexed drawing commands, this variable is the vertexOffset parameter to a direct drawing command or the vertexOffset member of the structure consumed by an indirect drawing command.

Valid Usage

- VUID-BaseVertex-BaseVertex-04184
  The BaseVertex decoration must be used only within the Vertex Execution Model
- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with BaseVertex must be declared using the Input Storage Class
- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with BaseVertex must be declared as a scalar 32-bit integer value

ClipDistance

Decorating a variable with the ClipDistance built-in decoration will make that variable contain the mechanism for controlling user clipping. ClipDistance is an array such that the i\textsuperscript{th} element of the array specifies the clip distance for plane i. A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

Note
The array variable decorated with ClipDistance is explicitly sized by the shader.

Note
In the last pre-rasterization shader stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If ClipDistance is then used by a fragment shader, ClipDistance contains these linearly interpolated values.

Valid Usage

- VUID-ClipDistance-ClipDistance-04187
  The ClipDistance decoration must be used only within the MeshEXT, MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model
- VUID-ClipDistance-ClipDistance-04188
  The variable decorated with ClipDistance within the MeshEXT, MeshNV, or Vertex Execution Model must be declared using the Output Storage Class
- VUID-ClipDistance-ClipDistance-04189
  The variable decorated with ClipDistance within the Fragment Execution Model must be
declared using the \textit{Input Storage Class}

- **VUID-ClipDistance-ClipDistance-04190**
  The variable decorated with \textit{ClipDistance} within the \textit{TessellationControl}, \textit{TessellationEvaluation}, or \textit{Geometry Execution Model} \textbf{must} not be declared in a \textit{Storage Class} other than \textit{Input} or \textit{Output}

- **VUID-ClipDistance-ClipDistance-04191**
  The variable decorated with \textit{ClipDistance} \textbf{must} be declared as an array of 32-bit floating-point values

\textbf{CullDistance}

Decorating a variable with the \textit{CullDistance} built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

\textbf{Note}

In fragment shaders, the values of the \textit{CullDistance} array are linearly interpolated across each primitive.

\textbf{Note}

If \textit{CullDistance} decorates an input variable, that variable will contain the corresponding value from the \textit{CullDistance} decorated output variable from the previous shader stage.

\textbf{Valid Usage}

- **VUID-CullDistance-CullDistance-04196**
  The \textit{CullDistance} decoration \textbf{must} be used only within the \textit{MeshEXT}, \textit{MeshNV}, \textit{Vertex}, \textit{Fragment}, \textit{TessellationControl}, \textit{TessellationEvaluation}, or \textit{Geometry Execution Model}

- **VUID-CullDistance-CullDistance-04197**
  The variable decorated with \textit{CullDistance} within the \textit{MeshEXT}, \textit{MeshNV} or \textit{Vertex Execution Model} \textbf{must} be declared using the \textit{Output Storage Class}

- **VUID-CullDistance-CullDistance-04198**
  The variable decorated with \textit{CullDistance} within the \textit{Fragment Execution Model} \textbf{must} be declared using the \textit{Input Storage Class}

- **VUID-CullDistance-CullDistance-04199**
  The variable decorated with \textit{CullDistance} within the \textit{TessellationControl}, \textit{TessellationEvaluation}, or \textit{Geometry Execution Model} \textbf{must} not be declared using a \textit{Storage Class} other than \textit{Input} or \textit{Output}

- **VUID-CullDistance-CullDistance-04200**
  The variable decorated with \textit{CullDistance} \textbf{must} be declared as an array of 32-bit floating-point values
CullMaskKHR

A variable decorated with the CullMaskKHR decoration will specify the cull mask of the ray being processed. The value is given by the Cull Mask parameter passed into one of the OpTrace* instructions.

Valid Usage

- VUID-CullMaskKHR-CullMaskKHR-06735
  The CullMaskKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-CullMaskKHR-CullMaskKHR-06736
  The variable decorated with CullMaskKHR must be declared using the Input Storage Class

- VUID-CullMaskKHR-CullMaskKHR-06737
  The variable decorated with CullMaskKHR must be declared as a scalar 32-bit integer value

DeviceIndex

The DeviceIndex decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \([0, \max(1, \text{physicalDeviceCount}))\), where physicalDeviceCount is the physicalDeviceCount member of VkDeviceGroupDeviceCreateInfo.

Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with DeviceIndex must be declared using the Input Storage Class

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with DeviceIndex must be declared as a scalar 32-bit integer value

DrawIndex

Decorating a variable with the DrawIndex built-in will make that variable contain the integer value corresponding to the zero-based index of the draw that invoked the current vertex shader invocation. For indirect drawing commands, DrawIndex begins at zero and increments by one for each draw executed. The number of draws is given by the drawCount parameter. For direct drawing commands, DrawIndex is always zero. DrawIndex is dynamically uniform.

Valid Usage

- VUID-DrawIndex-DrawIndex-04207
  The DrawIndex decoration must be used only within the Vertex, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with DrawIndex must be declared using the Input Storage Class

- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with DrawIndex must be declared using the Input Storage Class
The variable decorated with DrawIndex must be declared as a scalar 32-bit integer value.

**FragCoord**

Decorating a variable with the FragCoord built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When Sample Shading is enabled, the \(x\) and \(y\) components of FragCoord reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of FragCoord reflect the location of the center of the fragment.

The \(z\) component of FragCoord is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w}\).

The Centroid interpolation decoration is ignored, but allowed, on FragCoord.

**Valid Usage**

- VUID-FragCoord-FragCoord-04210
  The FragCoord decoration must be used only within the Fragment Execution Model
- VUID-FragCoord-FragCoord-04211
  The variable decorated with FragCoord must be declared using the Input Storage Class
- VUID-FragCoord-FragCoord-04212
  The variable decorated with FragCoord must be declared as a four-component vector of 32-bit floating-point values

**FragDepth**

To have a shader supply a fragment-depth value, the shader must declare the DepthReplacing execution mode. Such a shader’s fragment-depth value will come from the variable decorated with the FragDepth built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See fragment shader depth replacement for details.

**Valid Usage**

- VUID-FragDepth-FragDepth-04213
  The FragDepth decoration must be used only within the Fragment Execution Model
- VUID-FragDepth-FragDepth-04214
  The variable decorated with FragDepth must be declared using the Output Storage Class
- VUID-FragDepth-FragDepth-04215
  The variable decorated with FragDepth must be declared as a scalar 32-bit floating-point...
value

- **VUID-FragDepth-FragDepth-04216**

  If the shader dynamically writes to the variable decorated with `FragDepth`, the **DepthReplacing Execution Mode** must be declared.

---

**FragStencilRefEXT**

Decorating a variable with the `FragStencilRefEXT` built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to `FragStencilRefEXT`, a shader must declare the `StencilRefReplacingEXT` execution mode. If a shader declares the `StencilRefReplacingEXT` execution mode and there is an execution path through the shader that does not set `FragStencilRefEXT`, then the fragment’s stencil reference value is undefined for executions of the shader that take that path.

Only the least significant \( s \) bits of the integer value of the variable decorated with `FragStencilRefEXT` are considered for stencil testing, where \( s \) is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

See [fragment shader stencil reference replacement](#) for more details.

---

**Valid Usage**

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04223**
  The `FragStencilRefEXT` decoration must be used only within the **Fragment Execution Model**

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04224**
  The variable decorated with `FragStencilRefEXT` must be declared using the **Output Storage Class**

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04225**
  The variable decorated with `FragStencilRefEXT` must be declared as a scalar integer value

---

**FrontFacing**

Decorating a variable with the `FrontFacing` built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

---

**Valid Usage**

- **VUID-FrontFacing-FrontFacing-04229**
  The `FrontFacing` decoration must be used only within the **Fragment Execution Model**

- **VUID-FrontFacing-FrontFacing-04230**
  The variable decorated with `FrontFacing` must be declared using the **Input Storage Class**

- **VUID-FrontFacing-FrontFacing-04231**
GlobalInvocationId

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus `LocalInvocationId`.

Valid Usage

- VUID-GlobalInvocationId-GlobalInvocationId-04236
  The `GlobalInvocationId` decoration must be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model

- VUID-GlobalInvocationId-GlobalInvocationId-04237
  The variable decorated with `GlobalInvocationId` must be declared using the Input Storage Class

- VUID-GlobalInvocationId-GlobalInvocationId-04238
  The variable decorated with `GlobalInvocationId` must be declared as a three-component vector of 32-bit integer values

HelperInvocation

Decorating a variable with the `HelperInvocation` built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

Note

It is very likely that a helper invocation will have a value of `SampleMask` fragment shader input value that is zero.

Valid Usage

- VUID-HelperInvocation-HelperInvocation-04239
  The `HelperInvocation` decoration must be used only within the Fragment Execution Model

- VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with `HelperInvocation` must be declared using the Input Storage Class

- VUID-HelperInvocation-HelperInvocation-04241
  The variable decorated with `HelperInvocation` must be declared as a boolean value

HitKindKHR

A variable decorated with the `HitKindKHR` decoration will describe the intersection that triggered
the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of OpReportIntersectionKHR. For triangle intersection candidates, this will be one of HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR.

**Valid Usage**

- VUID-HitKindKHR-HitKindKHR-04242
  The HitKindKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitKindKHR-HitKindKHR-04243
  The variable decorated with HitKindKHR must be declared using the Input Storage Class

- VUID-HitKindKHR-HitKindKHR-04244
  The variable decorated with HitKindKHR must be declared as a scalar 32-bit integer value

**HitTriangleVertexPositionsKHR**

A variable decorated with the HitTriangleVertexPositionsKHR decoration will specify the object space vertices of the triangle at the current intersection in application-provided order. The positions returned are transformed by the geometry transform, which is performed at standard floating-point precision, but without a specifically defined order of floating-point operations to perform the matrix multiplication.

**Valid Usage**

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08747
  The HitTriangleVertexPositionsKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08748
  The variable decorated with HitTriangleVertexPositionsKHR must be declared using the Input Storage Class

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08749
  The variable decorated with HitTriangleVertexPositionsKHR must be declared as an array of three vectors of three 32-bit float values

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08750
  The variable decorated with HitTriangleVertexPositionsKHR must be used only if the value of HitKindKHR is HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR

- VUID-HitTriangleVertexPositionsKHR-None-08751
  The acceleration structure corresponding to the current intersection must have been built with VK_BUILD ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR

**IncomingRayFlagsKHR**

A variable with the IncomingRayFlagsKHR decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the ray tracing pipeline
must not cause any corresponding flags to be set in variables with this decoration.

Valid Usage

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  The IncomingRayFlagsKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  The variable decorated with IncomingRayFlagsKHR must be declared using the Input Storage Class

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  The variable decorated with IncomingRayFlagsKHR must be declared as a scalar 32-bit integer value

**InstanceCustomIndexKHR**

A variable decorated with the InstanceCustomIndexKHR decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in VkAccelerationStructureInstanceKHR::instanceCustomIndex for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

Valid Usage

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The InstanceCustomIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with InstanceCustomIndexKHR must be declared using the Input Storage Class

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with InstanceCustomIndexKHR must be declared as a scalar 32-bit integer value

**InstanceId**

Decorating a variable in an intersection, any-hit, or closest hit shader with the InstanceId decoration will make that variable contain the index of the instance that intersects the current ray.

Valid Usage

- VUID-InstanceId-InstanceId-04254
  The InstanceId decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-InstanceId-InstanceId-04255
The variable decorated with `InstanceId` must be declared using the `Input Storage Class`

- VUID-InstanceId-InstanceId-04256
  The variable decorated with `InstanceId` must be declared as a scalar 32-bit integer value

**InvocationId**

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of instances declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

**Valid Usage**

- VUID-InvocationId-InvocationId-04257
  The `InvocationId` decoration must be used only within the TessellationControl or Geometry Execution Model

- VUID-InvocationId-InvocationId-04258
  The variable decorated with `InvocationId` must be declared using the `Input Storage Class`

- VUID-InvocationId-InvocationId-04259
  The variable decorated with `InvocationId` must be declared as a scalar 32-bit integer value

**InstanceIndex**

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the `firstInstance` member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

**Valid Usage**

- VUID-InstanceIndex-InstanceIndex-04263
  The `InstanceIndex` decoration must be used only within the Vertex Execution Model

- VUID-InstanceIndex-InstanceIndex-04264
  The variable decorated with `InstanceIndex` must be declared using the `Input Storage Class`

- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with `InstanceIndex` must be declared as a scalar 32-bit integer value

**LaunchIdKHR**

A variable decorated with the `LaunchIdKHR` decoration will specify the index of the work item
being processed. One work item is generated for each of the width × height × depth items dispatched by a \texttt{vkCmdTraceRaysKHR} command. All shader invocations inherit the same value for variables decorated with \texttt{LaunchIdKHR}.

**Valid Usage**

- **VUID-LaunchIdKHR-LaunchIdKHR-04266**
  The \texttt{LaunchIdKHR} decoration must be used only within the \texttt{RayGenerationKHR}, \texttt{IntersectionKHR}, \texttt{AnyHitKHR}, \texttt{ClosestHitKHR}, \texttt{MissKHR}, or \texttt{CallableKHR} Execution Model.

- **VUID-LaunchIdKHR-LaunchIdKHR-04267**
  The variable decorated with \texttt{LaunchIdKHR} must be declared using the \texttt{Input Storage Class}.

- **VUID-LaunchIdKHR-LaunchIdKHR-04268**
  The variable decorated with \texttt{LaunchIdKHR} must be declared as a three-component vector of 32-bit integer values.

**LaunchSizeKHR**

A variable decorated with the \texttt{LaunchSizeKHR} decoration will contain the width, height, and depth dimensions passed to the \texttt{vkCmdTraceRaysKHR} command that initiated this shader execution. The width is in the first component, the height is in the second component, and the depth is in the third component.

**Valid Usage**

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04269**
  The \texttt{LaunchSizeKHR} decoration must be used only within the \texttt{RayGenerationKHR}, \texttt{IntersectionKHR}, \texttt{AnyHitKHR}, \texttt{ClosestHitKHR}, \texttt{MissKHR}, or \texttt{CallableKHR} Execution Model.

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04270**
  The variable decorated with \texttt{LaunchSizeKHR} must be declared using the \texttt{Input Storage Class}.

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04271**
  The variable decorated with \texttt{LaunchSizeKHR} must be declared as a three-component vector of 32-bit integer values.

**Layer**

Decorating a variable with the \texttt{Layer} built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a vertex, tessellation evaluation, or geometry shader, any variable decorated with \texttt{Layer} can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active \texttt{pre-rasterization shader stage} (in pipeline order) controls the \texttt{Layer} that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the \texttt{Layer}.

If the last active \texttt{pre-rasterization shader stage} shader entry point's interface does not include a variable decorated with \texttt{Layer}, then the first layer is used. If a \texttt{pre-rasterization shader stage}
shader entry point’s interface includes a variable decorated with `Layer`, it must write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized, fragment shaders may be executed, and the framebuffer values for all layers are undefined.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

### Valid Usage

- **VUID-Layer-Layer-04272**
  The `Layer` decoration must be used only within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

- **VUID-Layer-Layer-04273**
  If the shaderOutputLayer feature is not enabled then the `Layer` decoration must be used only within the Geometry or Fragment Execution Model

- **VUID-Layer-Layer-04274**
  The variable decorated with `Layer` within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model must be declared using the Output Storage Class

- **VUID-Layer-Layer-04275**
  The variable decorated with `Layer` within the Fragment Execution Model must be declared using the Input Storage Class

- **VUID-Layer-Layer-04276**
  The variable decorated with `Layer` must be declared as a scalar 32-bit integer value

- **VUID-Layer-Layer-07039**
  The variable decorated with `Layer` within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration

### LocalInvocationId

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

**Note**

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.
Valid Usage

- VUID-LocalInvocationId-LocalInvocationId-04281
  The `LocalInvocationId` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV` Execution Model

- VUID-LocalInvocationId-LocalInvocationId-04282
  The variable decorated with `LocalInvocationId` **must** be declared using the Input Storage Class

- VUID-LocalInvocationId-LocalInvocationId-04283
  The variable decorated with `LocalInvocationId` **must** be declared as a three-component vector of 32-bit integer values

LocalInvocationIndex

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```plaintext
LocalInvocationIndex =
  LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +
  LocalInvocationId.y * WorkgroupSize.x +
  LocalInvocationId.x;
```

Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
  The `LocalInvocationIndex` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV` Execution Model

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with `LocalInvocationIndex` **must** be declared using the Input Storage Class

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with `LocalInvocationIndex` **must** be declared as a scalar 32-bit integer value

NumSubgroups

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

Valid Usage

- VUID-NumSubgroups-NumSubgroups-04293
  The `NumSubgroups` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV` Execution Model
The variable decorated with `NumSubgroups` must be declared using the `Input Storage Class`

The variable decorated with `NumSubgroups` must be declared as a scalar 32-bit integer value

### NumWorkgroups

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

### Valid Usage

- **VUID-NumWorkgroups-NumWorkgroups-04296**
  The `NumWorkgroups` decoration must be used only within the `GLCompute`, `MeshEXT`, or `TaskEXT` Execution Model

- **VUID-NumWorkgroups-NumWorkgroups-04297**
  The variable decorated with `NumWorkgroups` must be declared using the `Input Storage Class`

- **VUID-NumWorkgroups-NumWorkgroups-04298**
  The variable decorated with `NumWorkgroups` must be declared as a three-component vector of 32-bit integer values

### ObjectRayDirectionKHR

A variable decorated with the `ObjectRayDirectionKHR` decoration will specify the direction of the ray being processed, in object space.

### Valid Usage

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299**
  The `ObjectRayDirectionKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300**
  The variable decorated with `ObjectRayDirectionKHR` must be declared using the `Input Storage Class`

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301**
  The variable decorated with `ObjectRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values

### ObjectRayOriginKHR

A variable decorated with the `ObjectRayOriginKHR` decoration will specify the origin of the ray being processed, in object space.
Valid Usage

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The ObjectRayOriginKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303
  The variable decorated with ObjectRayOriginKHR must be declared using the Input Storage Class

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304
  The variable decorated with ObjectRayOriginKHR must be declared as a three-component vector of 32-bit floating-point values

ObjectToWorldKHR

A variable decorated with the ObjectToWorldKHR decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

Valid Usage

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305
  The ObjectToWorldKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with ObjectToWorldKHR must be declared using the Input Storage Class

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with ObjectToWorldKHR must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values

PatchVertices

Decorating a variable with the PatchVertices built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the name:patchControlPoints member of VkPipelineTessellationStateCreateInfo. In a Tessellation Evaluation Shader, PatchVertices is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the PatchVertices variable will also differ.

Valid Usage

- VUID-PatchVertices-PatchVertices-04308
  The PatchVertices decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

- VUID-PatchVertices-PatchVertices-04309
The variable decorated with `PatchVertices` **must** be declared using the **Input Storage Class**

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` **must** be declared as a scalar 32-bit integer value

**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

*Note*
Depending on how the point is rasterized, `PointCoord` **may** never reach (0,0) or (1,1).

**Valid Usage**

- VUID-PointCoord-PointCoord-04311
  The `PointCoord` decoration **must** be used only within the **Fragment Execution Model**

- VUID-PointCoord-PointCoord-04312
  The variable decorated with `PointCoord` **must** be declared using the **Input Storage Class**

- VUID-PointCoord-PointCoord-04313
  The variable decorated with `PointCoord` **must** be declared as a two-component vector of 32-bit floating-point values

**PointSize**

Decorating a variable with the `PointSize` built-in decoration will make that variable contain the size of point primitives or the final rasterization of polygons if `polygon mode` is `VK_POLYGON_MODE_POINT` when `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_TRUE`. The value written to the variable decorated with `PointSize` by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points produced by rasterization. If `maintenance5` is enabled and a value is not written to a variable decorated with `PointSize`, a value of 1.0 is used as the size of points.

*Note*
When `PointSize` decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with `PointSize` from the previous shader stage.

**Valid Usage**

- VUID-PointSize-PointSize-04314
The **PointSize** decoration **must** be used only within the **MeshEXT, MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model**

- **VUID-PointSize-PointSize-04315**
  The variable decorated with **PointSize** within the **MeshEXT, MeshNV, or Vertex Execution Model** **must** be declared using the **Output Storage Class**

- **VUID-PointSize-PointSize-04316**
  The variable decorated with **PointSize** within the **TessellationControl, TessellationEvaluation, or Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input** or **Output**

- **VUID-PointSize-PointSize-04317**
  The variable decorated with **PointSize** **must** be declared as a scalar 32-bit floating-point value

**Position**

Decorating a variable with the **Position** built-in decoration will make that variable contain the position of the current vertex. In the last **pre-rasterization shader stage**, the value of the variable decorated with **Position** is used in subsequent primitive assembly, clipping, and rasterization operations.

**Note**

When **Position** decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with **Position** from the previous shader stage.

**Valid Usage**

- **VUID-Position-Position-04318**
  The **Position** decoration **must** be used only within the **MeshEXT, MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model**

- **VUID-Position-Position-04319**
  The variable decorated with **Position** within the **MeshEXT, MeshNV, or Vertex Execution Model** **must** be declared using the **Output Storage Class**

- **VUID-Position-Position-04320**
  The variable decorated with **Position** within the **TessellationControl, TessellationEvaluation, or Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input** or **Output**

- **VUID-Position-Position-04321**
  The variable decorated with **Position** **must** be declared as a four-component vector of 32-bit floating-point values

**PrimitiveId**

Decorating a variable with the **PrimitiveId** built-in decoration will make that variable contain the index of the current primitive.
The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see Polygon Mode), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with PrimitiveId are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with PrimitiveId.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

**Note**

When the PrimitiveId decoration is applied to an output variable in the geometry shader, the resulting value is seen through the PrimitiveId decorated input variable in the fragment shader.

The fragment shader using PrimitiveId will need to declare either the Geometry or Tessellation capability to satisfy the requirement SPIR-V has to use PrimitiveId.

---

**Valid Usage**

- **VUID-PrimitiveId-PrimitiveId-04330**
  The PrimitiveId decoration must be used only within the MeshEXT, MeshNV, IntersectionKHR, AnyHitKHR, ClosestHitKHR, TessellationControl, TessellationEvaluation, Geometry, or TessellationExecution Model.

- **VUID-PrimitiveId-Fragment-04331**
  If pipeline contains both the Fragment and Geometry Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the Geometry shader must write to the output variables decorated with PrimitiveId in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  If pipeline contains both the Fragment and MeshEXT or MeshNV Execution Model and a variable decorated with PrimitiveId is read from Fragment shader, then the MeshEXT or MeshNV shader must write to the output variables decorated with PrimitiveId in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
If Fragment Execution Model contains a variable decorated with PrimitiveId, then either the MeshShadingEXT, MeshShadingNV, Geometry or Tessellation capability must also be declared.

- VUID-PrimitiveId-PrimitiveId-04334
  The variable decorated with PrimitiveId within the TessellationControl, TessellationEvaluation, Fragment, IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model must be declared using the Input Storage Class.

- VUID-PrimitiveId-PrimitiveId-04335
  The variable decorated with PrimitiveId within the Geometry Execution Model must be declared using the Input or Output Storage Class.

- VUID-PrimitiveId-PrimitiveId-04336
  The variable decorated with PrimitiveId within the MeshEXT or MeshNV Execution Model must be declared using the Output Storage Class.

- VUID-PrimitiveId-PrimitiveId-04337
  The variable decorated with PrimitiveId must be declared as a scalar 32-bit integer value.

- VUID-PrimitiveId-PrimitiveId-07040
  The variable decorated with PrimitiveId within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration.

**PrimitiveShadingRateKHR**

Decorating a variable with the PrimitiveShadingRateKHR built-in decoration will make that variable contain the primitive fragment shading rate.

The value written to the variable decorated with PrimitiveShadingRateKHR by the last pre-rasterization shader stage in the pipeline is used as the primitive fragment shading rate. Outputs in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with PrimitiveShadingRateKHR, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has PrimitiveShadingRateKHR in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

**Valid Usage**

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484
  The PrimitiveShadingRateKHR decoration must be used only within the MeshEXT, MeshNV, Vertex, or Geometry Execution Model.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485
  The variable decorated with PrimitiveShadingRateKHR must be declared using the Output Storage Class.

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486
  The variable decorated with PrimitiveShadingRateKHR must be declared as a scalar 32-bit integer value.
The value written to PrimitiveShadingRateKHR must include no more than one of Vertical2Pixels and Vertical4Pixels.

The value written to PrimitiveShadingRateKHR must include no more than one of Horizontal2Pixels and Horizontal4Pixels.

The value written to PrimitiveShadingRateKHR must not have any bits set other than those defined by Fragment Shading Rate Flags enumerants in the SPIR-V specification.

The variable decorated with PrimitiveShadingRateKHR within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration.

RayGeometryIndexKHR

A variable decorated with the RayGeometryIndexKHR decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

Valid Usage

The RayGeometryIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model.

The variable decorated with RayGeometryIndexKHR must be declared using the Input Storage Class.

The variable decorated with RayGeometryIndexKHR must be declared as a scalar 32-bit integer value.

RayTmaxKHR

A variable decorated with the RayTmaxKHR decoration will contain the parametric $t_{\text{max}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into the pipeline trace ray instruction.

The $t_{\text{max}}$ value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling OpReportIntersectionKHR if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into the pipeline trace ray instruction.
Valid Usage

• VUID-RayTmaxKHR-RayTmaxKHR-04348
  The RayTmaxKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

• VUID-RayTmaxKHR-RayTmaxKHR-04349
  The variable decorated with RayTmaxKHR must be declared using the Input Storage Class.

• VUID-RayTmaxKHR-RayTmaxKHR-04350
  The variable decorated with RayTmaxKHR must be declared as a scalar 32-bit floating-point value.

RayTminKHR

A variable decorated with the RayTminKHR decoration will contain the parametric \( t_{min} \) value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into the pipeline trace ray instruction.

The \( t_{min} \) value remains constant for the duration of the ray query.

Valid Usage

• VUID-RayTminKHR-RayTminKHR-04351
  The RayTminKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

• VUID-RayTminKHR-RayTminKHR-04352
  The variable decorated with RayTminKHR must be declared using the Input Storage Class.

• VUID-RayTminKHR-RayTminKHR-04353
  The variable decorated with RayTminKHR must be declared as a scalar 32-bit floating-point value.

SampleId

Decorating a variable with the SampleId built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. SampleId ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with SampleId, Sample Shading is considered enabled with a minSampleShading value of 1.0.

Valid Usage

• VUID-SampleId-SampleId-04354
  The SampleId decoration must be used only within the Fragment Execution Model.

• VUID-SampleId-SampleId-04355
  The variable decorated with SampleId must be declared using the Input Storage Class.

• VUID-SampleId-SampleId-04356
The variable decorated with `SampleId` **must** be declared as a scalar 32-bit integer value.

**SampleMask**

Decorating a variable with the `SampleMask` built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the `Input` storage class decorated with `SampleMask` will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. `SampleMask[]` is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (`SampleMask[M]`) corresponds to sample $32 \times M + B$.

A variable in the `Output` storage class decorated with `SampleMask` is an array of integers forming a bit array in a manner similar to an input variable decorated with `SampleMask`, but where each bit represents coverage as computed by the shader. This computed `SampleMask` is combined with the generated coverage mask in the multisample coverage operation.

Variables decorated with `SampleMask` **must** be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with `SampleMask`, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with `SampleMask`, the sample mask has no effect on the processing of a fragment.

**Valid Usage**

- VUID-SampleMask-SampleMask-04357
  The `SampleMask` decoration **must** be used only within the Fragment Execution Model

- VUID-SampleMask-SampleMask-04358
  The variable decorated with `SampleMask` **must** be declared using the `Input` or `Output Storage Class`

- VUID-SampleMask-SampleMask-04359
  The variable decorated with `SampleMask` **must** be declared as an array of 32-bit integer values

**SamplePosition**

Decorating a variable with the `SamplePosition` built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If a fragment shader entry point's interface includes an input variable decorated with `SamplePosition`, **Sample Shading** is considered enabled with a `minSampleShading` value of 1.0.
Valid Usage

- VUID-SamplePosition-SamplePosition-04360
  The SamplePosition decoration must be used only within the Fragment Execution Model

- VUID-SamplePosition-SamplePosition-04361
  The variable decorated with SamplePosition must be declared using the Input Storage Class

- VUID-SamplePosition-SamplePosition-04362
  The variable decorated with SamplePosition must be declared as a two-component vector of 32-bit floating-point values

ShadingRateKHR

Decorating a variable with the ShadingRateKHR built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.

Valid Usage

- VUID-ShadingRateKHR-ShadingRateKHR-04490
  The ShadingRateKHR decoration must be used only within the Fragment Execution Model

- VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with ShadingRateKHR must be declared using the Input Storage Class

- VUID-ShadingRateKHR-ShadingRateKHR-04492
  The variable decorated with ShadingRateKHR must be declared as a scalar 32-bit integer value

SubgroupId

Decorating a variable with the SubgroupId built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, NumSubgroups-1].

Valid Usage

- VUID-SubgroupId-SubgroupId-04367
  The SubgroupId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-SubgroupId-SubgroupId-04368
  The variable decorated with SubgroupId must be declared using the Input Storage Class

- VUID-SubgroupId-SubgroupId-04369
  The variable decorated with SubgroupId must be declared as a scalar 32-bit integer value

SubgroupEqMask

Decorating a variable with the SubgroupEqMask builtin decoration will make that variable contain
the subgroup mask of the current subgroup invocation. The bit corresponding to the SubgroupLocalInvocationId is set in the variable decorated with SubgroupEqMask. All other bits are set to zero.

SubgroupEqMaskKHR is an alias of SubgroupEqMask.

Valid Usage

• VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with SubgroupEqMask must be declared using the Input Storage Class

• VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with SubgroupEqMask must be declared as a four-component vector of 32-bit integer values

SubgroupGeMask

Decorating a variable with the SubgroupGeMask builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to SubgroupLocalInvocationId through SubgroupSize-1 are set in the variable decorated with SubgroupGeMask. All other bits are set to zero.

SubgroupGeMaskKHR is an alias of SubgroupGeMask.

Valid Usage

• VUID-SubgroupGeMask-SubgroupGeMask-04372
  The variable decorated with SubgroupGeMask must be declared using the Input Storage Class

• VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with SubgroupGeMask must be declared as a four-component vector of 32-bit integer values

SubgroupGtMask

Decorating a variable with the SubgroupGtMask builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than SubgroupLocalInvocationId through SubgroupSize-1 are set in the variable decorated with SubgroupGtMask. All other bits are set to zero.

SubgroupGtMaskKHR is an alias of SubgroupGtMask.

Valid Usage

• VUID-SubgroupGtMask-SubgroupGtMask-04374
  The variable decorated with SubgroupGtMask must be declared using the Input Storage Class
The variable decorated with `SubgroupGtMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupLeMask**
Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

**Valid Usage**
- VUID-SubgroupLeMask-SubgroupLeMask-04376
  The variable decorated with `SubgroupLeMask` must be declared using the *Input Storage Class*
- VUID-SubgroupLeMask-SubgroupLeMask-04377
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLtMask**
Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

**Valid Usage**
- VUID-SubgroupLtMask-SubgroupLtMask-04378
  The variable decorated with `SubgroupLtMask` must be declared using the *Input Storage Class*
- VUID-SubgroupLtMask-SubgroupLtMask-04379
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLocalInvocationId**
Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0,SubgroupSize-1]`.

If `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is specified, or if `module` declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the *stage* is a
multiple of SubgroupSize, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups **must** be launched with all invocations active, i.e., there is an active invocation with SubgroupLocalInvocationId for each value in range [0,SubgroupSize-1].

**Note**

There is no direct relationship between SubgroupLocalInvocationId and LocalInvocationId or LocalInvocationIndex. If the pipeline or shader object was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

index = SubgroupLocalInvocationId + SubgroupId × SubgroupSize

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

**Note**

VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT and VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT are effectively deprecated when compiling SPIR-V 1.6 shaders, as this behavior is the default for Vulkan with SPIR-V 1.6. This is more aligned with developer expectations, and avoids applications unexpectedly breaking in the future.

**Valid Usage**

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380**
  The variable decorated with SubgroupLocalInvocationId **must** be declared using the Input Storage Class

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  The variable decorated with SubgroupLocalInvocationId **must** be declared as a scalar 32-bit integer value

**SubgroupSize**

Decorating a variable with the SubgroupSize builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value **must** be a power-of-two integer.

If the pipeline was created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set, or the shader object was created with the VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT flag set, or the SPIR-V module is at least version 1.6, the SubgroupSize decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value **must** be between minSubgroupSize and maxSubgroupSize and **must** be uniform with subgroup scope. The value **may** vary across a single draw call, and for fragment shaders **may** vary across a single primitive. In compute dispatches, SubgroupSize **must** be uniform with command scope.
If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure, or the shader object was created with a chained `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If SPIR-V `module` is less than version 1.6 and the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure was chained, and the shader was not created with the `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**

The old behavior for `SubgroupSize` is considered deprecated as certain compute algorithms cannot be easily implemented without the guarantees of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`.

**Valid Usage**

- VUID-SubgroupSize-SubgroupSize-04382
  The variable decorated with `SubgroupSize` must be declared using the Input Storage Class

- VUID-SubgroupSize-SubgroupSize-04383
  The variable decorated with `SubgroupSize` must be declared as a scalar 32-bit integer value

**TessCoord**

Decorating a variable with the `TessCoord` built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the tessellation modes of `Quads` or `IsoLines`, the third component is always zero.

**Valid Usage**

- VUID-TessCoord-TessCoord-04387
  The `TessCoord` decoration must be used only within the TessellationEvaluation Execution Model

- VUID-TessCoord-TessCoord-04388
  The variable decorated with `TessCoord` must be declared using the Input Storage Class

- VUID-TessCoord-TessCoord-04389
  The variable decorated with `TessCoord` must be declared as a three-component vector of 32-bit floating-point values
**TessLevelOuter**

Decorating a variable with the `TessLevelOuter` built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelOuter` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` can read the values written by the tessellation control shader.

---

**Valid Usage**

- VUID-TessLevelOuter-TessLevelOuter-04390
  The `TessLevelOuter` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model.

- VUID-TessLevelOuter-TessLevelOuter-04391
  The variable decorated with `TessLevelOuter` within the `TessellationControl` Execution Model **must** be declared using the Output Storage Class.

- VUID-TessLevelOuter-TessLevelOuter-04392
  The variable decorated with `TessLevelOuter` within the `TessellationEvaluation` Execution Model **must** be declared using the Input Storage Class.

- VUID-TessLevelOuter-TessLevelOuter-04393
  The variable decorated with `TessLevelOuter` must be declared as an array of size four, containing 32-bit floating-point values.

---

**TessLevelInner**

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.

---

**Valid Usage**

- VUID-TessLevelInner-TessLevelInner-04394
  The `TessLevelInner` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model.

- VUID-TessLevelInner-TessLevelInner-04395
  The variable decorated with `TessLevelInner` within the `TessellationControl` Execution Model **must** be declared using the Output Storage Class.
The variable decorated with `TessLevelInner` within the `TessellationEvaluation Execution Model` must be declared using the `Input Storage Class`.

The variable decorated with `TessLevelInner` must be declared as an array of size two, containing 32-bit floating-point values.

### VertexIndex

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

**Note**

`VertexIndex` starts at the same starting value for each instance.

### Valid Usage

- **VUID-VertexIndex-VertexIndex-04398**
  The `VertexIndex` decoration **must** be used only within the `Vertex Execution Model`.

- **VUID-VertexIndex-VertexIndex-04399**
  The variable decorated with `VertexIndex` **must** be declared using the `Input Storage Class`.

- **VUID-VertexIndex-VertexIndex-04400**
  The variable decorated with `VertexIndex` **must** be declared as a scalar 32-bit integer value.

### ViewIndex

The `ViewIndex` decoration **can** be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

### Valid Usage

- **VUID-ViewIndex-ViewIndex-04401**
  The `ViewIndex` decoration **must** be used only within the `MeshEXT, Vertex, Geometry, TessellationControl, TessellationEvaluation or Fragment Execution Model`.

- **VUID-ViewIndex-ViewIndex-04402**
  The variable decorated with `ViewIndex` **must** be declared using the `Input Storage Class`.
The variable decorated with ViewIndex must be declared as a scalar 32-bit integer value.

**ViewportIndex**

Decorating a variable with the ViewportIndex built-in decoration will make that variable contain the index of the viewport.

In a vertex, tessellation evaluation, or geometry shader, the variable decorated with ViewportIndex can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform and scissor rectangle.

The last active pre-rasterization shader stage (in pipeline order) controls the ViewportIndex that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the ViewportIndex.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with ViewportIndex then the first viewport is used. If a pre-rasterization shader stage shader entry point's interface includes a variable decorated with ViewportIndex, it must write the same value to ViewportIndex for all output vertices of a given primitive.

In a fragment shader, the variable decorated with ViewportIndex contains the viewport index of the primitive that the fragment invocation belongs to.

**Valid Usage**

- VUID-ViewportIndex-ViewportIndex-04404
  The ViewportIndex decoration must be used only within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

- VUID-ViewportIndex-ViewportIndex-04405
  If the shaderOutputViewportIndex feature is not enabled then the ViewportIndex decoration must be used only within the Geometry or Fragment Execution Model

- VUID-ViewportIndex-ViewportIndex-04406
  The variable decorated with ViewportIndex within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model must be declared using the Output Storage Class

- VUID-ViewportIndex-ViewportIndex-04407
  The variable decorated with ViewportIndex within the Fragment Execution Model must be declared using the Input Storage Class

- VUID-ViewportIndex-ViewportIndex-04408
  The variable decorated with ViewportIndex must be declared as a scalar 32-bit integer value

- VUID-ViewportIndex-ViewportIndex-07060
  The variable decorated with ViewportIndex within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration
**WorkgroupId**

Decorating a variable with the `WorkgroupId` built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

**Valid Usage**

- **VUID-WorkgroupId-WorkgroupId-04422**
  The `WorkgroupId` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model`

- **VUID-WorkgroupId-WorkgroupId-04423**
  The variable decorated with `WorkgroupId` **must** be declared using the `Input Storage Class`

- **VUID-WorkgroupId-WorkgroupId-04424**
  The variable decorated with `WorkgroupId` **must** be declared as a three-component vector of 32-bit integer values

**WorkgroupSize**

*Note*

SPIR-V 1.6 deprecated `WorkgroupSize` in favor of using the `LocalSizeId` Execution Mode instead. Support for `LocalSizeId` was added with `VK_KHR_maintenance4` and promoted to core in Version 1.3.

Decorating an object with the `WorkgroupSize` built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the `WorkgroupSize` decoration, this takes precedence over any `LocalSize` or `LocalSizeId` execution mode.

**Valid Usage**

- **VUID-WorkgroupSize-WorkgroupSize-04425**
  The `WorkgroupSize` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model`

- **VUID-WorkgroupSize-WorkgroupSize-04426**
  The variable decorated with `WorkgroupSize` **must** be a specialization constant or a constant

- **VUID-WorkgroupSize-WorkgroupSize-04427**
  The variable decorated with `WorkgroupSize` **must** be declared as a three-component vector of 32-bit integer values

**WorldRayDirectionKHR**

A variable decorated with the `WorldRayDirectionKHR` decoration will specify the direction of the ray being processed, in world space. The value is the parameter passed into the pipeline `trace ray` instruction.
Valid Usage

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428
  The `WorldRayDirectionKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429
  The variable decorated with `WorldRayDirectionKHR` must be declared using the `Input Storage Class`.

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430
  The variable decorated with `WorldRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values.

**WorldRayOriginKHR**

A variable decorated with the `WorldRayOriginKHR` decoration will specify the origin of the ray being processed, in world space. The value is the parameter passed into the pipeline trace ray instruction.

Valid Usage

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431
  The `WorldRayOriginKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432
  The variable decorated with `WorldRayOriginKHR` must be declared using the `Input Storage Class`.

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433
  The variable decorated with `WorldRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values.

**WorldToObjectKHR**

A variable decorated with the `WorldToObjectKHR` decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

Valid Usage

- VUID-WorldToObjectKHR-WorldToObjectKHR-04434
  The `WorldToObjectKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- VUID-WorldToObjectKHR-WorldToObjectKHR-04435
  The variable decorated with `WorldToObjectKHR` must be declared using the `Input Storage Class`.

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with `WorldToObjectKHR` must be declared as a matrix with four
columns of three-component vectors of 32-bit floating-point values
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an `OpTypeImage` (representing a `VkImageView`) or `OpTypeSampledImage` (representing a `VkImageView`, `VkSampler`) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of `OpTypeImage` is ignored.

Note
Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- **OpImageSample** and **OpImageSparseSample** read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.
  - Instructions with `ImplicitLod` in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with `ExplicitLod` in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with `Proj` in the name apply homogeneous projection to the coordinates.
- **OpImageFetch** and **OpImageSparseFetch** return a single texel of the image. No sampler is used.
- **OpImage*Gather** and **OpImageSparse*Gather** read neighboring texels and return a single component of each.
- **OpImageRead** (and **OpImageSparseRead**) and **OpImageWrite** read and write, respectively, a texel in the image. No sampler is used.
- **OpImage*Dref** instructions apply depth comparison on the texel values.
- **OpImageSparse** instructions additionally return a sparse residency code.
- **OpImageQueryLod** returns the LOD parameters that would be used in a sample operation. The actual operation is not performed.

16.1.1. Texel Coordinate Systems

Images are addressed by texel coordinates. There are three texel coordinate systems:

Other image instructions can use either normalized or unnormalized texel coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as `(s,t,r,q,a)`, with the coordinates having the following meanings:

- **s**: Coordinate in the first dimension of an image.
- **t**: Coordinate in the second dimension of an image.
- **r**: Coordinate in the third dimension of an image.
  - (s,t,r) are interpreted as a direction vector for Cube images.
- **q**: Fourth coordinate, for homogeneous (projective) coordinates.
- **a**: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order `(s, [t], [r], q)`, with `t` and `r` being conditionally present based on the `Dim` of the image. For non-Proj instructions, the coordinates are `(s, [t], [r], [a])`, with `t` and `r` being conditionally present based on the `Dim` of the image and `a` being conditionally present based on the `Arrayed` property of the image. Projective image instructions are not supported on `Arrayed` images.

Unnormalized texel coordinates are referred to as `(u,v,w,a)`, with the coordinates having the following meanings:

- **u**: Coordinate in the first dimension of an image.
- **v**: Coordinate in the second dimension of an image.
- **w**: Coordinate in the third dimension of an image.
- **a**: Coordinate for array layer.

Only the `u` and `v` coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-Arrayed) dimensionalities support unnormalized coordinates. The components are in order `(u, [v])`, with `v` being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as `(i,j,k,l,n)`, with the coordinates having the following meanings:
• i: Coordinate in the first dimension of an image.
• j: Coordinate in the second dimension of an image.
• k: Coordinate in the third dimension of an image.
• l: Coordinate for array layer.
• n: Index of the sample within the texel.

They are extracted from the SPIR-V operand in order \((i, j, k, l, n)\), with \(j\) and \(k\) conditionally present based on the \texttt{Dim} of the image, and \(l\) conditionally present based on the \texttt{Arrayed} property of the image. \(n\) is conditionally present and is taken from the \texttt{Sample} image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

![Figure 3. Texel Coordinate Systems, Linear Filtering](image)

The Texel Coordinate Systems - For the example shown of an \(8 \times 4\) texel two dimensional image.

- Normalized texel coordinates:
  - The \(s\) coordinate goes from 0.0 to 1.0.
  - The \(t\) coordinate goes from 0.0 to 1.0.

- Unnormalized texel coordinates:
  - The \(u\) coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The \(v\) coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

- Integer texel coordinates:
  - The \(i\) coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

- Also shown for linear filtering:
  - Given the unnormalized coordinates (u,v), the four texels selected are i_{0j_0}, i_{1j_0}, i_{0j_1}, and i_{1j_1}.
  - The fractions α and β.
  - Given the offset Δ_i and Δ_j, the four texels selected by the offset are i_{0j_{0'}}, i_{1j_{0'}}, i_{0j_{1'}}, and i_{1j_{1'}}.

**Note**
For formats with reduced-resolution components, Δ_i and Δ_j are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution components.

![Figure 4. Texel Coordinate Systems, Nearest Filtering](image)

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Texel coordinates as above. Also shown for nearest filtering:
  - Given the unnormalized coordinates (u,v), the texel selected is ij.
  - Given the offset Δ_i and Δ_j, the texel selected by the offset is ij'.

### 16.2. Conversion Formulas

#### 16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color (red\_shared\_exp, green\_shared\_exp, blue\_shared\_exp, exp\_shared) as follows:
First, the components (red, green, blue) are clamped to \((\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})\) as:

\[
\text{red}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red}))
\]

\[
\text{green}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green}))
\]

\[
\text{blue}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))
\]

where:

\[
\begin{align*}
N &= 9 & \text{number of mantissa bits per component} \\
B &= 15 & \text{exponent bias} \\
E_{\text{max}} &= 31 & \text{maximum possible biased exponent value} \\
\text{sharedexp}_{\text{max}} &= \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)}
\end{align*}
\]

**Note**

NaN, if supported, is handled as in IEEE 754-2008 \(\text{minNum}()\) and \(\text{maxNum}()\). This results in any NaN being mapped to zero.

The largest clamped component, \(\text{max}_{\text{clamped}}\) is determined:

\[
\text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})
\]

A preliminary shared exponent \(\exp’\) is computed:

\[
\exp’ = \begin{cases} 
\lfloor \log_2(\text{max}_{\text{clamped}}) \rfloor + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\
0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)}
\end{cases}
\]

The shared exponent \(\exp_{\text{shared}}\) is computed:

\[
\text{max}_{\text{shared}} = \lfloor \frac{\text{max}_{\text{clamped}}}{2^{\lfloor \exp’ - B - N \rfloor}} + \frac{1}{2} \rfloor
\]

\[
\exp_{\text{shared}} = \begin{cases} 
\exp’ & \text{for } 0 \leq \text{max}_{\text{shared}} < 2^N \\
\exp’ + 1 & \text{for } \text{max}_{\text{shared}} = 2^N
\end{cases}
\]

Finally, three integer values in the range 0 to \(2^N\) are computed:
16.2.2. Shared Exponent to RGB

A shared exponent color \((\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \text{exp}_{\text{shared}})\) is transformed to an RGB color \((\text{red}, \text{green}, \text{blue})\) as follows:

\[
\text{red}_{\text{shared}} = \frac{\text{red}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2}
\]

\[
\text{green}_{\text{shared}} = \frac{\text{green}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2}
\]

\[
\text{blue}_{\text{shared}} = \frac{\text{blue}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2}
\]

where:

- \(N = 9\) (number of mantissa bits per component)
- \(B = 15\) (exponent bias)

16.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- Format conversion
- Texel replacement
- Depth comparison
Conversion to RGBA

Component swizzle

Chroma reconstruction

Y’CbCr conversion

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If Chroma Reconstruction is implicit, Texel Filtering instead takes place during chroma reconstruction, before sampler Y’CbCr conversion occurs.

16.3.1. Texel Input Validation Operations

Texel input validation operations inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction can mismatch with the sampler, the image view, or both, and a number of further cases where the sampler can mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler borderColor is an integer type and the image view format is not one of the VkFormat integer types or a stencil component of a depth/stencil format.
- The sampler borderColor is a float type and the image view format is not one of the VkFormat float types or a depth component of a depth/stencil format.
- The sampler borderColor is one of the opaque black colors (VK BORDER COLOR FLOAT OPAQUE BLACK or VK_BORDER COLOR INT OPAQUE BLACK) and the image view VkComponentSwizzle for any of the VkComponentMapping components is not the identity swizzle.
- The sampler borderColor is a custom color (VK BORDER COLOR FLOAT CUSTOM EXT or VK BORDER COLOR INT CUSTOM EXT) and the supplied VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor is outside the bounds of the values representable in the image view’s format.
- The sampler borderColor is a custom color (VK BORDER COLOR FLOAT CUSTOM EXT or VK BORDER COLOR INT CUSTOM EXT) and the image view VkComponentSwizzle for any of the VkComponentMapping components is not the identity swizzle.
- The VkImageLayout of any subresource in the image view does not match the VkDescriptorImageInfo::imageLayout used to write the image descriptor.
- The SPIR-V Image Format is not compatible with the image view’s format.
- The sampler unnormalizedCoordinates is VK_TRUE and any of the limitations of unnormalized
coordinates are violated.

- The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`.
- The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.
- The SPIR-V instruction is one of the `OpImage*Dref*` instructions, the image view `format` is one of the depth/stencil formats, and the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.
- The SPIR-V instruction’s image variable’s properties are not compatible with the image view:
  - Rules for `viewType`:
    - `VK_IMAGE_VIEW_TYPE_1D` must have Dim = 1D, Arrayed = 0, MS = 0.
    - `VK_IMAGE_VIEW_TYPE_2D` must have Dim = 2D, Arrayed = 0.
    - `VK_IMAGE_VIEW_TYPE_3D` must have Dim = 3D, Arrayed = 0, MS = 0.
    - `VK_IMAGE_VIEW_TYPE_CUBE` must have Dim = Cube, Arrayed = 0, MS = 0.
    - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` must have Dim = 1D, Arrayed = 1, MS = 0.
    - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` must have Dim = 2D, Arrayed = 1.
    - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` must have Dim = Cube, Arrayed = 1, MS = 0.
  - If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have MS = 0.
  - If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have MS = 1.
  - If the Sampled Type of the `OpTypeImage` does not match the SPIR-V Type.
  - If the signedness of any read or sample operation does not match the signedness of the image’s format.
- The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.
- The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified `VkSamplerCustomBorderColorCreateInfoEXT::format`.

Only `OpImageSample*` and `OpImageSparseSample*` can be used with a sampler or image view that enables sampler Y'C₃C₈ conversion.

`OpImageFetch`, `OpImageSparseFetch`, `OpImage*Gather`, and `OpImageSparse*Gather` must not be used with a sampler or image view that enables sampler Y'C₃C₈ conversion.

The `ConstOffset` and `Offset` operands must not be used with a sampler or image view that enables sampler Y'C₃C₈ conversion.

If the underlying `VkImage` format has an X component in its format description, undefined values are read from those bits.

Note
If the \texttt{VkImage} format and \texttt{VkImageView} format are the same, these bits will be unused by format conversion and this will have no effect. However, if the \texttt{VkImageView} format is different, then some bits of the result may be undefined. For example, when a \texttt{VK_FORMAT_R10X6_UNORM_PACK16} \texttt{VkImage} is sampled via a \texttt{VK_FORMAT_R16_UNORM} \texttt{VkImageView}, the low 6 bits of the value before format conversion are undefined and format conversion may return a range of different values.

\textit{Note}

Some implementations will return undefined values in the case where a sampler uses a \texttt{VkSamplerAddressMode} of \texttt{VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT}, the sampler is used with operands \texttt{Offset}, \texttt{ConstOffset}, or \texttt{ConstOffsets}, and the value of the offset is larger than or equal to the corresponding width, height, or depth of any accessed image level.

This behavior was not tested prior to Vulkan conformance test suite version 1.3.8.0. Affected implementations will have a conformance test waiver for this issue.

\textbf{Integer Texel Coordinate Validation}

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\begin{align*}
0 & \leq i < w_s \\
0 & \leq j < h_s \\
0 & \leq k < d_s \\
0 & \leq l < \text{layers} \\
0 & \leq n < \text{samples}
\end{align*}

where:

\begin{align*}
w_s &= \text{width of the image level}
\end{align*}
h_s = height of the image level

d_s = depth of the image level

layers = number of layers in the image

samples = number of samples per texel in the image

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates
   ◦ If the texel coordinates pass validation (that is, the coordinates lie within the image),
     then the texel value comes from the value in image memory.

2. Border Texel
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image sample instruction or image gather instruction, and
   ◦ If the image is not a cube image,
     then the texel is a border texel and texel replacement is performed.

3. Invalid Texel
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image fetch instruction, image read instruction, or atomic
     instruction,
     then the texel is an invalid texel and texel replacement is performed.

4. Cube Map Edge or Corner
   Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face,
   and Cube map edge handling is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face (as described
in the prior section), the following steps are performed. Note that this does not occur when using
VK_FILTER_NEAREST filtering within a mip level, since VK_FILTER_NEAREST is treated as using
VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

• Cube Map Edge Texel
If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates \((i, j)\) and the array layer \(l\) are transformed to select the adjacent texel from the appropriate neighboring face.

**Cube Map Corner Texel**

- If the texel lies beyond the selected cube map face in both \(i\) and \(j\), then there is no unique neighboring face from which to read that texel. The texel **should** be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations **may** replace the cube map corner texel by other methods. The methods are subject to the constraint that if the three available texels have the same value, the resulting filtered texel **must** have that value.

**Sparse Validation**

If the texel reads from an unbound region of a sparse image, the texel is a *sparse unbound texel*, and processing continues with **texel replacement**.

**Layout Validation**

If all planes of a *disjoint* multi-planar image are not in the same image layout, the image **must** not be sampled with sampler **Y’C_bC_a conversion** enabled.

### 16.3.2. Format Conversion

Texels undergo a format conversion from the **VkFormat** of the image view to a vector of either floating-point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- **Color formats** have one, two, three, or four components, according to the format.
- **Depth/stencil formats** are one component. The depth or stencil component is selected by the aspectMask of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each **VkFormat**), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.

If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

### 16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:
• a border texel,
• an invalid texel, or
• a sparse unbound texel.

Border texels are replaced with a value based on the image format and the `borderColor` of the sampler. The border color is:

<table>
<thead>
<tr>
<th>Sampler.borderColor</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>[B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0, 0, 0, 0]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>[B_r, B_g, B_b, B_a] = [0, 0, 0, 1]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>[B_r, B_g, B_b, B_a] = [1, 1, 1, 1]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>[B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a]</td>
</tr>
</tbody>
</table>

The custom border color (U) may be rounded by implementations prior to texel replacement, but the error introduced by such a rounding must not exceed one ULP of the image’s format.

---

**Note**

The names `VK_BORDER_COLOR_*_TRANSPARENT_BLACK`, `VK_BORDER_COLOR_*_OPAQUE_BLACK`, and `VK_BORDER_COLOR_*_OPAQUE_WHITE` are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of `VK_BORDER_COLOR_INT_OPAQUE_WHITE` is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>Component Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>D = B_r</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>S = B_r†</td>
</tr>
<tr>
<td>One component color format</td>
<td>Color_r = B_r</td>
</tr>
<tr>
<td>Two component color format</td>
<td>[Color_r,Color_g] = [B_r,B_g]</td>
</tr>
<tr>
<td>Three component color format</td>
<td>[Color_r,Color_g,Color_b] = [B_r,B_g,B_b]</td>
</tr>
<tr>
<td>Four component color format</td>
<td>[Color_r,Color_g,Color_b,Color_a] = [B_r,B_g,B_b,B_a]</td>
</tr>
<tr>
<td>Single component alpha format</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [0,0,0,B_a]</td>
</tr>
</tbody>
</table>
† $S = B_s$ may be substituted as the replacement method by the implementation when `VkSamplerCreateInfo::borderColor` is `VK_BORDER_COLOR_INT_CUSTOM_EXT` and `VkSamplerCustomBorderColorCreateInfoEXT::format` is `VK_FORMAT_UNDEFINED`. Implementations should use $S = B$, as the replacement method.

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the `robustBufferAccess` feature is enabled. In that case, an invalid texel is replaced as described by the `robustBufferAccess` feature. If the access is to an image resource and the x, y, z, or layer coordinate validation fails and the `robustImageAccess` feature is enabled, then zero must be returned for the R, G, and B components, if present. Either zero or one must be returned for the A component, if present. If only the sample index was invalid, the values returned are undefined.

Additionally, if the `robustImageAccess` feature is enabled, any invalid texels may be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo conversion to RGBA as normal.

If the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If `residencyNonResidentStrict` is `VK_FALSE`, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is an `OpImage*Dref*` instruction, a depth comparison is performed. The result is 1.0 if the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component $D$.

The compare operation is selected by the `VkCompareOp` value set by `VkSamplerCreateInfo::compareOp`. The reference value from the SPIR-V operand $D_{ref}$ and the texel depth value $D_{tex}$ are used as the reference and test values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then $D_{ref}$ is clamped to $[0,1]$ before the compare operation.

### 16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [D,0,0,\text{one}]$</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [S,0,0,\text{one}]$</td>
</tr>
<tr>
<td>One component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r,0,0,\text{one}]$</td>
</tr>
<tr>
<td>Two component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r,\text{Color}_g,0,\text{one}]$</td>
</tr>
<tr>
<td>Texel Aspect or Format</td>
<td>RGBA Color</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------</td>
</tr>
<tr>
<td>Three component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{one}])</td>
</tr>
<tr>
<td>Four component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a])</td>
</tr>
<tr>
<td>One alpha component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [0,0,0,\text{Color}_a])</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.

### 16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the \texttt{VkComponentSwizzle} enums in the \texttt{components} member of the \texttt{VkImageViewCreateInfo} structure for the image being read if \texttt{sampler Y'CbCr} conversion is not enabled, and
- the \texttt{VkComponentSwizzle} enums in the \texttt{components} member of the \texttt{VkSamplerYcbcrConversionCreateInfo} structure for the \texttt{sampler Y'CbCr} conversion if \texttt{sampler Y'CbCr} conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color}'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle}
\end{cases}
\]

where:

\[
\text{one} = \begin{cases} 
1.0f & \text{for floating-point components} \\
1 & \text{for integer components}
\end{cases}
\]

\[
\text{identity} = \begin{cases} 
\text{Color}_r & \text{for component} = r \\
\text{Color}_g & \text{for component} = g \\
\text{Color}_b & \text{for component} = b \\
\text{Color}_a & \text{for component} = a
\end{cases}
\]

If the border color is one of the \texttt{VK_BORDER_COLOR_*_OPAQUE_BLACK} enums and the \texttt{VkComponentSwizzle} is not the identity swizzle for all components, the value of the texel after swizzle is undefined.

If the image view has a depth/stencil format and the \texttt{VkComponentSwizzle} is \texttt{VK_COMPONENT_SWIZZLE_ONE}, and \texttt{VkPhysicalDeviceMaintenance5PropertiesKHR::depthStencilSwizzleOneSupport} is not set to \texttt{VK_TRUE}, the value of the texel after swizzle is
undefined.

16.3.7. Sparse Residency

*OpImageSparse* instructions return a structure which includes a *residency code* indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the *OpImageSparseTexelsResident* instruction which converts the residency code to a boolean value.

16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green component dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.*444*” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.*422*” formats have downsampling in the x dimension (corresponding to *u* or *s* coordinates): they are sampled at half the resolution of luma in that dimension.
- “.*420*” formats have downsampling in the x dimension (corresponding to *u* or *s* coordinates) and the y dimension (corresponding to *v* or *t* coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the *xChromaOffset* and *yChromaOffset* members of the *VkSamplerYcbcrConversionCreateInfo* structure used to create the sampler Y’CbCr conversion.

The following diagrams show the relationship between unnormalized (*u,v*) coordinates and (*ij*) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.

---

*Note*

If the chroma values are reconstructed at the locations of the luma samples by
means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to Wrapping Operation. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for NEAREST sampling is shown as a grid.

Figure 5. 422 downsampling, xChromaOffset=COSITED_EVEN

Figure 6. 422 downsampling, xChromaOffset=MIDPOINT
Figure 7. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN

Figure 8. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the `Explicit Reconstruction` section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the
VkSamplerYcbcrConversionCreateInfo’s forceExplicitReconstruction is set to VK_FALSE, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

Explicit Reconstruction

- If the chromaFilter member of the VkSamplerYcbcrConversionCreateInfo structure is VK_FILTER_NEAREST:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format), the \( \tau_{ijk}[level] \) values accessed by texel filtering are reconstructed as follows:
    
    \[
    \begin{align*}
    \tau_R'(i, j) &= \tau_R([i \times 0.5], j)[level] \\
    \tau_B'(i, j) &= \tau_B([i \times 0.5], j)[level]
    \end{align*}
    \]

  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), the \( \tau_{ijk}[level] \) values accessed by texel filtering are reconstructed as follows:
    
    \[
    \begin{align*}
    \tau_R'(i, j) &= \tau_R([i \times 0.5], [j \times 0.5])[level] \\
    \tau_B'(i, j) &= \tau_B([i \times 0.5], [j \times 0.5])[level]
    \end{align*}
    \]

  *Note* xChromaOffset and yChromaOffset have no effect if chromaFilter is VK_FILTER_NEAREST for explicit reconstruction.

- If the chromaFilter member of the VkSamplerYcbcrConversionCreateInfo structure is VK_FILTER_LINEAR:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format):
    - If xChromaOffset is VK_CHROMA_LOCATION_COSITED_EVEN:
      
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      \tau_{RB}([i \times 0.5], [j \times 0.5])[level], & 0.5 \times i = [0.5 \times i] \\
      0.5 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[level] + \\
      0.5 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])[level], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]

    - If xChromaOffset is VK_CHROMA_LOCATION_MIDPOINT:
      
      \[
      \tau_{RB}'(i, j) = \begin{cases} 
      0.25 \times \tau_{RB}([i \times 0.5] - 1, [j \times 0.5])[level] + \\
      0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[level], & 0.5 \times i = [0.5 \times i] \\
      0.75 \times \tau_{RB}([i \times 0.5], [j \times 0.5])[level] + \\
      0.25 \times \tau_{RB}([i \times 0.5] + 1, [j \times 0.5])[level], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      \]

  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:
In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to \texttt{chromaFilter=VK\_FILTER\_LINEAR}, up to nine chroma samples may be required, depending on the sample location.

### Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that \texttt{chromaFilter} takes precedence for the chroma samples.

If \texttt{chromaFilter} is \texttt{VK\_FILTER\_NEAREST}, an implementation may behave as if \texttt{xChromaOffset} and \texttt{yChromaOffset} were both \texttt{VK\_CHROMA\_LOCATION\_MIDPOINT}, irrespective of the values set.

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

\[
\begin{align*}
i_{RB} &= \begin{cases} 
0.5 \times (i) & \text{xChromaOffset=COSITED\_EVEN} \\
0.5 \times (i - 0.5) & \text{xChromaOffset=MIDPOINT} 
\end{cases} \\
j_{RB} &= \begin{cases} 
0.5 \times (j) & \text{yChromaOffset=COSITED\_EVEN} \\
0.5 \times (j - 0.5) & \text{yChromaOffset=MIDPOINT} 
\end{cases}
\end{align*}
\]

\[
\begin{align*}
i_{floor} &= \lfloor i_{RB} \rfloor \\
j_{floor} &= \lfloor j_{RB} \rfloor \\
i_{frac} &= i_{RB} - i_{floor} \\
j_{frac} &= j_{RB} - j_{floor}
\end{align*}
\]

\[
\begin{align*}
\tau_{RB}(i, j) &= \tau_{RB}(i_{floor}, j_{floor})[\text{level}] \times (1 - i_{frac}) \times (1 - j_{frac}) + \\
\tau_{RB}(1 + i_{floor}, j_{floor})[\text{level}] &= \tau_{RB}(i_{floor}, 1 + j_{floor})[\text{level}] \times (1 - i_{frac}) \times (j_{frac}) + \\
\tau_{RB}(1 + i_{floor}, 1 + j_{floor})[\text{level}] &= \tau_{RB}(i_{frac}) \times (1 - j_{frac}) + \\
\end{align*}
\]
16.3.9. Sampler Y’CBCR Conversion

Sampler Y’CBCR conversion performs the following operations, which an implementation may combine into a single mathematical operation:

- Sampler Y’CBCR Range Expansion
- Sampler Y’CBCR Model Conversion

**Sampler Y’CBCR Range Expansion**

Sampler Y’CBCR range expansion is applied to color component values after all texel input operations which are not specific to sampler Y’CBCR conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y’CBCR range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector C’rgba as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel component values output by the Component Swizzle defined by the `components` member of `VkSamplerYcbcrConversionCreateInfo`. Range expansion applies independently to each component of the image. For the purposes of range expansion and Y’CBCR model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y’CBCR range expansion.

The range expansion to be applied is defined by the `ycbcrRange` member of the `VkSamplerYcbcrConversionCreateInfo` structure:

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_FULL`, the following transformations are applied:

\[
\begin{align*}
Y' &= C'\text{gba}[G] \\
C_B &= C'\text{gba}[B] - \frac{2^{(n-1)}}{2^n - 1} \\
C_R &= C'\text{gba}[R] - \frac{2^{(n-1)}}{2^n - 1}
\end{align*}
\]

*Note*

These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW`, the following transformations are applied:
These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

\[
Y' = \frac{C'_{rgba}[G] \times (2^n - 1) - 16 \times 2^n - 8}{219 \times 2^n - 8}
\]
\[
C_B = \frac{C'_{rgba}[B] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}
\]
\[
C_R = \frac{C'_{rgba}[R] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}
\]

\* \( n \) is the bit-depth of the components in the format.

The precision of the operations performed during range expansion must be at least that of the source format.

An implementation may clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_B \) and \( C_R \) fall in the range \([-0.5, 0.5]\).

**Sampler Y’CₐCₐ Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY**

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; \( Y'C_aC_r \) range expansion is also ignored.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY**

The color components are not modified by the color model conversion and are assumed to be treated as though in \( Y'C_aC_r \) form both in memory and in the shader; \( Y'C_aC_r \) range expansion is applied to the components as for other \( Y'C_aC_r \) models, with the vector \( (C_B, Y', C_B, A) \) provided to the shader.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709**

The color components are transformed from a \( Y'C_aC_r \) representation to an R'G'B' representation as described in the “BT.709 Y’CₐCₐ conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601**

The color components are transformed from a \( Y'C_aC_r \) representation to an R'G'B' representation as described in the “BT.601 Y’CₐCₐ conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020**

The color components are transformed from a \( Y'C_aC_r \) representation to an R'G'B' representation as described in the “BT.2020 Y’CₐCₐ conversion” section of the Khronos Data Format Specification.
In this operation, each output component is dependent on each input component.

An implementation may clamp the R'G'B' results of these conversions to the range [0,1].

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha component is not modified by these model conversions.

Note

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.

- For a minFilter or magFilter of VK_FILTER_NEAREST:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y'CbCr conversion at this location.

- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_0,j_0)\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y'CbCr conversion at this location.
  4. Convert the non-linear A'R'G'B' outputs of the Y'CbCr conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these
operations are redundant and sampling using sampler Y’C_bC_r conversion at the desired sample coordinates will produce the “correct” results without further processing.

16.4. Texel Output Operations

*Texel output instructions* are SPIR-V image instructions that write to an image. *Texel output operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- Texel output format conversion

16.4.1. Texel Output Validation Operations

*Texel output validation operations* inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

**Texel Format Validation**

If the image format of the *OpTypeImage* is not compatible with the *VkImageView’s format*, the write causes the contents of the image’s memory to become undefined.

**Texel Type Validation**

If the *Sampled Type* of the *OpTypeImage* does not match the SPIR-V *Type*, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.

16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the *VkPhysicalDeviceSparseProperties::residencyNonResidentStrict* property is *VK_TRUE*, the sparse unbound texel write has no effect. If *residencyNonResidentStrict* is *VK_FALSE*, then...
the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating-point, signed, or unsigned integer type of the texel data to the VkFormat of the image view. If the number of components in the texel data is larger than the number of components in the format, additional components are discarded.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

If the VkImageView format has an X component in its format description, undefined values are written to those bits.

If the underlying VkImage format has an X component in its format description, undefined values are also written to those bits, even if result format conversion produces a valid value for those bits because the VkImageView format is different.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For Proj image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{ref}\) coordinate are transformed as follows:

\[
\begin{align*}
    s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\
    t &= \frac{t}{q}, & \text{for 2D or 3D image} \\
    r &= \frac{r}{q}, & \text{for 3D image} \\
    D_{ref} &= \frac{D_{ref}}{q}, & \text{if provided}
\end{align*}
\]
16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an ImplicitLod image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\begin{align*}
\frac{\partial s}{\partial x} &= DPdx(s), & \frac{\partial s}{\partial y} &= DPdy(s), & \text{for 1D, 2D, Cube, or 3D image} \\
\frac{\partial t}{\partial x} &= DPdx(t), & \frac{\partial t}{\partial y} &= DPdy(t), & \text{for 2D, Cube, or 3D image} \\
\frac{\partial r}{\partial x} &= DPdx(r), & \frac{\partial r}{\partial y} &= DPdy(r), & \text{for Cube or 3D image}
\end{align*}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand Grad is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the optional SPIR-V operand Lod is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating-point scalar coordinate is directly assigned to λ_base as described in LOD Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and quadDivergentImplicitLod is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If quadDivergentImplicitLod is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector (r_x,r_y,r_z). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system (s_face,t_face). The direction vector is also used to transform the derivatives to per-face derivatives.

16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map’s faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that r_z wins over r_y and r_x, and the second rule that r_y wins over r_x. An implementation may choose other rules, but the rules must be deterministic and depend only on (r_x,r_y,r_z).
The layer number (corresponding to a cube map face), the coordinate selections for $s_c$, $t_c$, $r_c$, and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

### Table 22. Cube map face and coordinate selection

#### 16.5.5. Cube Map Coordinate Transformation

$$s_{\text{face}} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}$$

$$t_{\text{face}} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}$$

#### 16.5.6. Cube Map Derivative Transformation
16.5.7. Scale Factor Operation, LOD Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with `mipmapPrecisionBits` of accuracy.

**Scale Factor Operation**

The magnitude of the derivatives are calculated by:

\[
\frac{\partial s_{face}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right)
\]

\[
\frac{\partial t_{face}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} \right)
\]

\[
\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)
\]

\[
\frac{\partial t_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right)
\]

\[
\frac{\partial s_{face}}{\partial y} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\]

\[
\frac{\partial t_{face}}{\partial y} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\]

\[
\frac{\partial t}{\partial y} = \frac{\partial t}{\partial y} = 0 \text{ (for 1D images)}
\]

where:

\[
\frac{\partial t}{\partial x} = \frac{\partial t}{\partial y} = 0 \text{ (for 1D images)}
\]
\( \frac{\partial r}{\partial x} = \frac{\partial r}{\partial y} = 0 \) (for 1D, 2D or Cube images)

and:

\[
\begin{align*}
\text{w}_{\text{base}} &= \text{image}.w \\
\text{h}_{\text{base}} &= \text{image}.h \\
\text{d}_{\text{base}} &= \text{image}.d
\end{align*}
\]

(for the \text{baseMipLevel}, from the image descriptor).

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) \textbf{should} be the minor and major axes of this ellipse.

The scale factors \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in x and y, are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) \textbf{may} be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

\[
\begin{align*}
\text{f}_x \text{ is continuous and monotonically increasing in each of } m_{ux}, m_{vx}, \text{ and } m_{wx} \\
\text{f}_y \text{ is continuous and monotonically increasing in each of } m_{uy}, m_{vy}, \text{ and } m_{wy}
\end{align*}
\]

\[
\begin{align*}
\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) & \leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|) \\
\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) & \leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|)
\end{align*}
\]

The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) are determined by:

\[
\begin{align*}
\rho_{\text{max}} &= \max(\rho_x, \rho_y) \\
\rho_{\text{min}} &= \min(\rho_x, \rho_y)
\end{align*}
\]

The ratio of anisotropy is determined by:

\[
\eta = \min(\rho_{\text{max}}/\rho_{\text{min}}, \text{maxAniso})
\]

where:

\[
\text{sampler.maxAniso} = \text{maxAnisotropy} \text{ (from sampler descriptor)}
\]
limits.max\textsubscript{Aniso} = maxSamplerAnisotropy (from physical device limits)

max\textsubscript{Aniso} = \min(\text{sampler}.max\textsubscript{Aniso}, \text{limits}.max\textsubscript{Aniso})

If \(\rho_{\text{max}} = \rho_{\text{min}} = 0\), then all the partial derivatives are zero, the fragment’s footprint in texel space is a point, and \(\eta\) should be treated as 1. If \(\rho_{\text{max}} \neq 0\) and \(\rho_{\text{min}} = 0\) then all partial derivatives along one axis are zero, the fragment’s footprint in texel space is a line segment, and \(\eta\) should be treated as \(\text{max}\textsubscript{Aniso}.\) However, anytime the footprint is small in texel space the implementation may use a smaller value of \(\eta\), even when \(\rho_{\text{min}}\) is zero or close to zero. If either \text{VkPhysicalDeviceFeatures::samplerAnisotropy} or \text{VkSamplerCreateInfo::anisotropyEnable} are \text{VK_FALSE}, \(\text{max}\textsubscript{Aniso}\) is set to 1.

If \(\eta = 1\), sampling is isotropic. If \(\eta > 1\), sampling is anisotropic.

The sampling rate (\(N\)) is derived as:

\(N = \lceil\eta\rceil\)

An implementation may round \(N\) up to the nearest supported sampling rate. An implementation may use the value of \(N\) as an approximation of \(\eta\).

**LOD Operation**

The LOD parameter \(\lambda\) is computed as follows:

\[
\lambda_{\text{base}}(x, y) = \begin{cases} 
\text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\
\log_{\frac{\rho_{\text{max}}}{\eta}} & \text{otherwise}
\end{cases}
\]

\[
\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})
\]

\[
\lambda = \begin{cases} 
lod_{\text{max}}, & \lambda' > lod_{\text{max}} \\
\lambda', & lod_{\text{min}} \leq \lambda' \leq lod_{\text{max}} \\
lod_{\text{min}}, & \lambda' < lod_{\text{min}} \\
\text{undefined}, & lod_{\text{min}} > lod_{\text{max}}
\end{cases}
\]

where:

\[
s\text{ampler.bias} = \text{mipLodBias} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.bias} = \begin{cases} 
\text{Bias} & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases}
\]

\[
s\text{ampler.lod}_{\text{min}} = \text{minLod} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.lod}_{\text{min}} = \begin{cases} 
\text{MinLod} & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases}
\]

\[
lod_{\text{min}} = \max(s\text{ampler.lod}_{\text{min}}, \text{shaderOp.lod}_{\text{min}}) \quad \text{(from sampler descriptor)}
\]

\[
lod_{\text{max}} = \max\text{Lod}
\]

and maxSamplerLodBias is the value of the \text{VkPhysicalDeviceLimit} feature \(\text{max}\textsubscript{SamplerLodBias}.\)
Image Level(s) Selection

The image level(s) \( d, d_{hi}, \) and \( d_{lo} \) which texels are read from are determined by an image-level parameter \( d_l \), which is computed based on the LOD parameter, as follows:

\[
d_i = \begin{cases} 
\text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\
\text{d'}, & \text{otherwise}
\end{cases}
\]

where:

\[
d' = \text{level}_{base} + \text{clamp}(\lambda, 0, q)
\]

\[
\text{nearest}(d') = \begin{cases} 
[d' + 0.5] - 1, & \text{preferred} \\
|d' + 0.5|, & \text{alternative}
\end{cases}
\]

and:

\[
\text{level}_{base} = \text{baseMipLevel} \\
q = \text{levelCount} - 1
\]

\text{baseMipLevel} \text{ and } \text{levelCount} \text{ are taken from the } \text{subresourceRange} \text{ of the image view.}

If the sampler’s \text{mipmapMode} is VK_SAMPLER_MIPMAP_MODE_NEAREST, then the level selected is \( d = d_l \).

If the sampler’s \text{mipmapMode} is VK_SAMPLER_MIPMAP_MODE_LINEAR, two neighboring levels are selected:

\[
d_{hi} = \lfloor d_l \rfloor \\
d_{lo} = \min(d_{hi} + 1, \text{level}_{base} + q) \\
\delta = d_l - d_{hi}
\]

\( \delta \) is the fractional value, quantized to the number of \text{mipmap precision bits}, used for \text{linear filtering} between levels.

16.5.8. \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in \text{filtering} (either \( d \), or \( d_{hi} \) and \( d_{lo} \)).

\[
\begin{align*}
    u(x, y) &= s(x, y) \times \text{width}_{scale} + \Delta_i \\
    v(x, y) &= \begin{cases} 
0 & \text{for 1D images} \\
    t(x, y) \times \text{height}_{scale} + \Delta_j & \text{otherwise}
\end{cases} \\
    w(x, y) &= \begin{cases} 
0 & \text{for 2D or Cube images} \\
    r(x, y) \times \text{depth}_{scale} + \Delta_k & \text{otherwise}
\end{cases} \\
a(x, y) &= \begin{cases} 
a(x, y) & \text{for array images} \\
0 & \text{otherwise}
\end{cases}
\end{align*}
\]
where:

\[
\text{width}_{\text{scale}} = \text{width}_{\text{level}}
\]

\[
\text{height}_{\text{scale}} = \text{height}_{\text{level}}
\]

\[
\text{depth}_{\text{scale}} = \text{depth}_{\text{level}}
\]

and where \((\Delta_x, \Delta_y, \Delta_z)\) are taken from the image instruction if it includes a \texttt{ConstOffset} or \texttt{Offset} operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

### 16.6. Unnormalized Texel Coordinate Operations

#### 16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:

\[
l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}
\]

where \(\text{layerCount}\) is the number of layers in the image subresource range of the image view, \(\text{baseArrayLayer}\) is the first layer from the subresource range, and where:

\[
\text{RNE} (a) = \begin{cases} \text{roundTiesToEven} (a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\ |a + 0.5| & \text{alternative} \end{cases}
\]

The sample index \(n\) is assigned the value 0.

Nearest filtering (\texttt{VK\_FILTER\_NEAREST}) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = |u + \text{shift}|
\]

\[
j = |v + \text{shift}|
\]

\[
k = |w + \text{shift}|
\]

where:

\[
\text{shift} = 0.0
\]

Linear filtering (\texttt{VK\_FILTER\_LINEAR}) computes a set of neighboring coordinates which bound the
unnormalized coordinates. The integer texel coordinates are combinations of $i_0$ or $i_1$, $j_0$ or $j_1$, $k_0$ or $k_1$, as well as weights $\alpha$, $\beta$, and $\gamma$.

\[
\begin{align*}
  i_0 &= \lfloor u - \text{shift} \rfloor \\
  i_1 &= i_0 + 1 \\
  j_0 &= \lfloor v - \text{shift} \rfloor \\
  j_1 &= j_0 + 1 \\
  k_0 &= \lfloor w - \text{shift} \rfloor \\
  k_1 &= k_0 + 1
\end{align*}
\]

\[
\alpha = \text{frac} (u - \text{shift}) \\
\beta = \text{frac} (v - \text{shift}) \\
\gamma = \text{frac} (w - \text{shift})
\]

where:

\[
\text{shift} = 0.5
\]

and where:

\[
\text{frac} (x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \texttt{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

### 16.7. Integer Texel Coordinate Operations

The \texttt{OpImageFetch} and \texttt{OpImageFetchSparse} SPIR-V instructions may supply a LOD from which texels are to be fetched using the optional SPIR-V operand \texttt{Lod}. Other integer-coordinate operations must not. If the \texttt{Lod} is provided then it must be an integer.

The image level selected is:

\[
d = level_{base} + \begin{cases} 
  \text{Lod} & \text{(from optional SPIR-V operand)} \\
  0 & \text{otherwise}
\end{cases}
\]

If $d$ does not lie in the range $[\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})$ then any values fetched are undefined, and any writes (if supported) are discarded.

### 16.8. Image Sample Operations

#### 16.8.1. Wrapping Operation

\texttt{Cube} images ignore the wrap modes specified in the sampler. Instead, if \texttt{VK_FILTER_NEAREST} is used within a mip level then \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE} is used, and if \texttt{VK_FILTER_LINEAR} is used within a mip level then sampling at the edges is performed as described earlier in the \texttt{Cube}
map edge handling section.

The first integer texel coordinate \(i\) is transformed based on the `addressModeU` parameter of the sampler.

\[
i = \begin{cases} 
  i \mod \text{size} & \text{for repeat} \\
  (\text{size} - 1) - \text{mirror} \left( (i \mod (2 \times \text{size})) - \text{size} \right) & \text{for mirrored repeat} \\
  \text{clamp} \left( i, 0, \text{size} - 1 \right) & \text{for clamp to edge} \\
  \text{clamp} \left( i, -1, \text{size} \right) & \text{for clamp to border} \\
  \text{clamp} \left( \text{mirror} \left( i \right), 0, \text{size} - 1 \right) & \text{for mirror clamp to edge}
\end{cases}
\]

where:

\[
\text{mirror} \left( n \right) = \begin{cases} 
  n & \text{for } n \geq 0 \\
  -(1 + n) & \text{otherwise}
\end{cases}
\]

\(j\) (for 2D and Cube image) and \(k\) (for 3D image) are similarly transformed based on the `addressModeV` and `addressModeW` parameters of the sampler, respectively.

### 16.8.2. Texel Gathering

SPIR-V instructions with `Gather` in the name return a vector derived from 4 texels in the base level of the image view. The rules for the `VK_FILTER_LINEAR` minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then swizzled. A four-component vector is then assembled by taking the component indicated by the `Component` value in the instruction from the swizzled color value of the four texels. If the operation does not use the `ConstOffsets` image operand then the four texels form the \(2 \times 2\) rectangle used for texture filtering:

\[
\begin{align*}
\tau[R] &= \tau_{i_0,j_0}[level_{base},comp] \\
\tau[G] &= \tau_{i_1,j_0}[level_{base},comp] \\
\tau[B] &= \tau_{i_1,j_0}[level_{base},comp] \\
\tau[A] &= \tau_{i_0,j_0}[level_{base},comp]
\end{align*}
\]

If the operation does use the `ConstOffsets` image operand then the offsets allow a custom filter to be defined:

\[
\begin{align*}
\tau[R] &= \tau_{i_0,j_0} + \Delta_0[level_{base},comp] \\
\tau[G] &= \tau_{i_0,j_0} + \Delta_1[level_{base},comp] \\
\tau[B] &= \tau_{i_0,j_0} + \Delta_2[level_{base},comp] \\
\tau[A] &= \tau_{i_0,j_0} + \Delta_3[level_{base},comp]
\end{align*}
\]

where:
OpImage*Gather must not be used on a sampled image with sampler Y′C₀C₈ conversion enabled.

16.8.3. Texel Filtering

Texel filtering is first performed for each level (either d or dₘ and d₀).

If $\lambda$ is less than or equal to zero, the texture is said to be magnified, and the filter mode within a mip level is selected by the magFilter in the sampler. If $\lambda$ is greater than zero, the texture is said to be minified, and the filter mode within a mip level is selected by the minFilter in the sampler.

Texel Nearest Filtering

Within a mip level, VK_FILTER_NEAREST filtering selects a single value using the $(i, j, k)$ texel coordinates, with all texels taken from layer $l$. 

$$\tau[level] = \begin{cases} 
\tau_{i,j,k}[level], & \text{for 3D image} \\
\tau_{i,j}[level], & \text{for 2D or Cube image} \\
\tau_{i,j}[level], & \text{for 1D image}
\end{cases}$$

Texel Linear Filtering

Within a mip level, VK_FILTER_LINEAR filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

$$w_i = (1 - \alpha)$$
$$w_j = (\alpha)$$
$$w_k = (1 - \beta)$$
$$w_k = (\beta)$$
$$w_{k0} = (1 - \gamma)$$
$$w_{k1} = (\gamma)$$

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The VkSamplerReductionModeCreateInfo::reductionMode can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the reductionMode is set (explicitly or implicitly) to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, a weighted average is computed:
However, if the reduction mode is VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

**VK_SAMPLER_MIPMAP_MODE_NEAREST** filtering returns the value of a single mipmap level, \( \tau = \tau[d] \).

**VK_SAMPLER_MIPMAP_MODE_LINEAR** filtering combines the values of multiple mipmap levels (\( \tau[hi] \) and \( \tau[lo] \)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
\begin{align*}
    w_{hi} &= (1 - \delta) \\
    w_{lo} &= (\delta)
\end{align*}
\]

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The VkSamplerReductionModeCreateInfo::reductionMode can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the reductionMode is set (explicitly or implicitly) to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, a weighted average is computed:

\[
\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]
\]

However, if the reduction mode is VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the anisotropyEnable in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent.
Implementations should consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations should consider `minLod` and `maxLod` of the sampler.

**Note**

For historical reasons, vendor implementations of anisotropic filtering interpret these sampler parameters in different ways, particularly in corner cases such as `magFilter`, `minFilter` of `NEAREST` or `maxAnisotropy` equal to 1.0. Applications should not expect consistent behavior in such cases, and should use anisotropic filtering only with parameters which are expected to give a quality improvement relative to `LINEAR` filtering.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case; implementations may choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, N isotropic samples are sampled within the image footprint of the image level d to approximate an anisotropic filter. The sum $\tau_{2Daniso}$ is defined using the single isotropic $\tau_{2D}(u,v)$ at level d.

$$
\tau_{2Daniso} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}
\left(u\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right), v\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right)\right)
\quad \text{when } \rho_x > \rho_y
$$

$$
\tau_{2Daniso} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}
\left(u\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right), v\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right)\right)
\quad \text{when } \rho_y \geq \rho_x
$$

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- **Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle**: Performed by all instructions except `OpImageWrite`.

- **Depth Comparison**: Performed by `OpImage*Dref` instructions.

- **All Texel output operations**: Performed by `OpImageWrite`.

- **Projection**: Performed by all `OpImage*Proj` instructions.

- **Derivative Image Operations, Cube Map Operations, Scale Factor Operation, LOD Operation and Image Level(s) Selection, and Texel Anisotropic Filtering**: Performed by all `OpImageSample*` and `OpImageSparseSample*` instructions.
(s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all OpImageSample, OpImageSparseSample, and OpImage*Gather instructions.

• Texel Gathering: Performed by OpImage*Gather instructions.

• Texel Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.

• Sparse Residency: Performed by all OpImageSparse* instructions.

16.10. Image Query Instructions

16.10.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, then the value returned is undefined.

16.10.2. LOD Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. The steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, LOD Operation and Image Level(s) Selection. The return value is the vector (λ', d). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Feedback Queries and Timestamp Queries. Performance Queries are supported if the associated extension is available. Transform Feedback Queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

17.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(VkDevice device, const VkQueryPoolCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkQueryPool* pQueryPool);
```

- **device** is the logical device that creates the query pool.
- **pCreateInfo** is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pQueryPool** is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.

**Valid Usage**

- VUID-vkCreateQueryPool-device-09663
  - **device** must support at least one queue family with one of the
Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateQueryPool-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkQueryPoolCreateInfo` structure

- VUID-vkCreateQueryPool-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateQueryPool-pQueryPool-parameter
  
  `pQueryPool` must be a valid pointer to a `VkQueryPool` handle

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkQueryPoolCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryCount` is the number of queries managed by the pool.
• **pipelineStatistics** is a bitmask of **VkQueryPipelineStatisticFlagBits** specifying which counters will be returned in queries on the new pool, as described below in **Pipeline Statistics Queries**.

**pipelineStatistics** is ignored if **queryType** is not **VK_QUERY_TYPE_PIPELINE_STATISTICS**.

### Valid Usage

- **VUID-VkQueryPoolCreateInfo-queryType-00791**
  If the **pipelineStatisticsQuery** feature is not enabled, **queryType** must not be **VK_QUERY_TYPE_PIPELINE_STATISTICS**

- **VUID-VkQueryPoolCreateInfo-queryType-00792**
  If **queryType** is **VK_QUERY_TYPE_PIPELINE_STATISTICS**, **pipelineStatistics** must be a valid combination of **VkQueryPipelineStatisticFlagBits** values

- **VUID-VkQueryPoolCreateInfo-queryType-09534**
  If **queryType** is **VK_QUERY_TYPE_PIPELINE_STATISTICS**, **pipelineStatistics** must not be zero

- **VUID-VkQueryPoolCreateInfo-queryType-03222**
  If **queryType** is **VK_QUERY_TYPE_PIPELINE_STATISTICS**, the **pNext** chain must include a **VkQueryPoolPerformanceCreateInfoKHR** structure

- **VUID-VkQueryPoolCreateInfo-queryCount-02763**
  **queryCount** must be greater than 0

- **VUID-VkQueryPoolCreateInfo-queryType-07133**
  If **queryType** is **VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR**, then the **pNext** chain must include a **VkVideoProfileInfoKHR** structure with **videoCodecOperation** specifying an encode operation

- **VUID-VkQueryPoolCreateInfo-queryType-07906**
  If **queryType** is **VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR**, then the **pNext** chain must include a **VkQueryPoolVideoEncodeFeedbackCreateInfoKHR** structure

- **VUID-VkQueryPoolCreateInfo-queryType-07907**
  If **queryType** is **VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR**, and the **pNext** chain includes a **VkVideoProfileInfoKHR** structure and a **VkQueryPoolVideoEncodeFeedbackCreateInfoKHR** structure, then **VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags** must not contain any bits that are not set in **VkVideoEncodeCapabilitiesKHR::supportedEncodeFeedbackFlags**, as returned by **vkGetPhysicalDeviceVideoCapabilitiesKHR** for the video profile described by **VkVideoProfileInfoKHR** and its **pNext** chain

### Valid Usage (Implicit)

- **VUID-VkQueryPoolCreateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO**

- **VUID-VkQueryPoolCreateInfo-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkQueryPoolPerformanceCreateInfoKHR**
 VkQueryPoolVideoEncodeFeedbackCreateInfoKHR, VkVideoDecodeAV1ProfileInfoKHR, VkVideoDecodeH264ProfileInfoKHR, VkVideoDecodeH265ProfileInfoKHR, VkVideoEncodeH264ProfileInfoKHR, VkVideoEncodeH265ProfileInfoKHR, VkVideoDecodeUsageInfoKHR, VkVideoEncodeUsageInfoKHR, or VkVideoProfileInfoKHR

• VUID-VkQueryPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  flags must be 0

• VUID-VkQueryPoolCreateInfo-queryType-parameter
  queryType must be a valid VkQueryType value

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;

VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:

// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• queueFamilyIndex is the queue family index to create this performance query pool for.
• counterIndexCount is the length of the pCounterIndices array.
• pCounterIndices is a pointer to an array of indices into the vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters to enable in this performance query pool.

Valid Usage

• VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  queueFamilyIndex must be a valid queue family index of the device

• VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  The performanceCounterQueryPools feature must be enabled
Each element of `pCounterIndices` must be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in `queueFamilyIndex`.

**Valid Usage (Implicit)**

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter**
  `pCounterIndices` must be a valid pointer to an array of `counterIndexCount uint32_t values`

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength**
  `counterIndexCount` must be greater than `0`

To query the number of passes required to query a performance query pool on a physical device, call:

```c
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice physicalDevice, const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo, uint32_t* pNumPasses);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.

- `pPerformanceQueryCreateInfo` is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.

- `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` must be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter**
  `pPerformanceQueryCreateInfo` must be a valid pointer to a valid
VkQueryPoolPerformanceCreateInfoKHR structure

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-
  parameter

  `pNumPasses` **must** be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the query pool.
- **queryPool** is the query pool to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to `queryPool` **must** have completed execution

- VUID-vkDestroyQueryPool-queryPool-00794
  If `VkAllocationCallbacks` were provided when `queryPool` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyQueryPool-queryPool-00795
  If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator` **must** be `NULL`

**Note**

Applications **can** verify that `queryPool` **can** be destroyed by checking that `vkGetQueryPoolResults()` without the `VK_QUERY_RESULT_PARTIAL_BIT` flag returns `VK_SUCCESS` for all queries that are used in command buffers submitted for execution.

Valid Usage (Implicit)

- VUID-vkDestroyQueryPool-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyQueryPool-queryPool-parameter
  If `queryPool` is not `VK_NULL_HANDLE`, `queryPool` **must** be a valid `VkQueryPool` handle

- VUID-vkDestroyQueryPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid
VkAllocationCallbacks structure

- VUID-vkDestroyQueryPool-queryPool-parent
  If queryPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to queryPool must be externally synchronized

Possible values of VkQueryPoolCreateInfo::queryType, specifying the type of queries managed by the pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryType {
  VK_QUERY_TYPE_OCCLUSION = 0,
  VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
  VK_QUERY_TYPE_TIMESTAMP = 2,
  // Provided by VK_KHR_video_queue
  VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,
  // Provided by VK_EXT_transform_feedback
  VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,
  // Provided by VK_KHR_performance_query
  VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
  // Provided by VK_KHR_acceleration_structure
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,
  // Provided by VK_KHR_acceleration_structure
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,
  // Provided by VK_KHR_video_encode_queue
  VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR = 1000299000,
  // Provided by VK_KHR_ray_tracing_maintenance1
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR = 1000386000,
  // Provided by VK_KHR_ray_tracing_maintenance1
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR = 1000386001,
  // Provided by VK_EXT_opacity_micromap
  VK_QUERY_TYPE_MICROMAP_SERIALIALIZATION_SIZE_EXT = 1000396000,
  // Provided by VK_EXT_opacity_micromap
  VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT = 1000396001,
} VkQueryType;
```

- **VK_QUERY_TYPE_OCCLUSION** specifies an occlusion query.
- **VK_QUERY_TYPE_PIPELINE_STATISTICS** specifies a pipeline statistics query.
- **VK_QUERY_TYPE_TIMESTAMP** specifies a timestamp query.
- **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** specifies a performance query.
- **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** specifies a transform feedback query.
• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR specifies a acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.

• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZE_SIZE_KHR specifies a serialization acceleration structure size query.

• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR specifies an acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.

• VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZE_BOTTOM_LEVEL_POINTERS_KHR specifies a serialization acceleration structure pointer count query.

• VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR specifies a result status query.

• VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR specifies a video encode feedback query.

17.2. Query Operation

The operation of queries is controlled by the commands vkCmdBeginQuery, vkCmdEndQuery, vkCmdBeginQueryIndexedEXT, vkCmdEndQueryIndexedEXT, vkCmdResetQueryPool, vkCmdCopyQueryPoolResults, vkCmdWriteTimestamp2, and vkCmdWriteTimestamp. In order for a VkCommandBuffer to record query management commands, the queue family for which its VkCommandPool was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either unavailable or available, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via vkCmdResetQueryPool or vkResetQueryPool sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of vkCmdEndQuery, vkCmdEndQueryIndexedEXT, vkCmdWriteTimestamp2, or vkCmdWriteTimestamp. Both the availability status and numerical results can be retrieved by calling either vkGetQueryPoolResults or vkCmdCopyQueryPoolResults.

After query pool creation, each query is in an uninitialized state and must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to vkCmdBeginQuery must execute the corresponding vkCmdEndQuery command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```
• **commandBuffer** is the command buffer into which this command will be recorded.

• **queryPool** is the handle of the query pool managing the queries being reset.

• **firstQuery** is the initial query index to reset.

• **queryCount** is the number of queries to reset.

When executed on a queue, this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable.

This command defines an execution dependency between other query commands that reference the same query.

The first **synchronization scope** includes all commands which reference the queries in queryPool indicated by **firstQuery** and **queryCount** that occur earlier in **submission order**.

The second **synchronization scope** includes all commands which reference the queries in queryPool indicated by **firstQuery** and **queryCount** that occur later in **submission order**.

The operation of this command happens after the first scope and happens before the second scope.

If the **queryType** used to create queryPool was **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable for each pass of queryPool, as indicated by a call to **vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR**.

**Note**

Because **vkCmdResetQueryPool** resets all the passes of the indicated queries, applications must not record a **vkCmdResetQueryPool** command for a queryPool created with **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** in a command buffer that needs to be submitted multiple times as indicated by a call to **vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR**. Otherwise applications will never be able to complete the recorded queries.

---

**Valid Usage**

- **VUID-vkCmdResetQueryPool-firstQuery-09436**
  
  **firstQuery must** be less than the number of queries in **queryPool**

- **VUID-vkCmdResetQueryPool-firstQuery-09437**
  
  The sum of **firstQuery** and **queryCount** **must** be less than or equal to the number of queries in **queryPool**

- **VUID-vkCmdResetQueryPool-None-02841**
  
  All queries used by the command **must** not be active

- **VUID-vkCmdResetQueryPool-firstQuery-02862**
  
  If **queryPool** was created with **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries \([firstQuery, firstQuery + queryCount - 1]\)
Valid Usage (Implicit)

- VUID-vkCmdResetQueryPool-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdResetQueryPool-queryPool-parameter
  
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdResetQueryPool-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdResetQueryPool-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdResetQueryPool-commonparent
  
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

To reset a range of queries in a query pool on the host, call:
```c
void vkResetQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- **device** is the logical device that owns the query pool.
- **queryPool** is the handle of the query pool managing the queries being reset.
- **firstQuery** is the initial query index to reset.
- **queryCount** is the number of queries to reset.

This command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable.

If **queryPool** is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable for each pass.

### Valid Usage

- VUID-vkResetQueryPool-firstQuery-09436
  firstQuery must be less than the number of queries in queryPool

- VUID-vkResetQueryPool-firstQuery-09437
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkResetQueryPool-None-02665
  The hostQueryReset feature must be enabled

- VUID-vkResetQueryPool-firstQuery-02741
  Submitted commands that refer to the range specified by firstQuery and queryCount in queryPool must have completed execution

- VUID-vkResetQueryPool-firstQuery-02742
  The range of queries specified by firstQuery and queryCount in queryPool must not be in use by calls to `vkGetQueryPoolResults` or `vkResetQueryPool` in other threads

### Valid Usage (Implicit)

- VUID-vkResetQueryPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkResetQueryPool-queryPool-parameter
  queryPool must be a validVkQueryPool handle

- VUID-vkResetQueryPool-queryPool-parent
  queryPool must have been created, allocated, or retrieved from device
Once queries are reset and ready for use, query commands can be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a vkCmdBeginQuery command and a vkCmdEndQuery command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query must begin and end in the same command buffer, although if it is a primary command buffer, and the inheritedQueries feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it must set the occlusionQueryEnable, queryFlags, and/or pipelineStatistics members of VkCommandBufferInheritanceInfo to conservative values, as described in the Command Buffer Recording section. A query must either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at query) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view's results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries must accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering must not span subpasses, i.e. they must begin and end in the same subpass.

A query must either begin and end inside the same video coding scope, or must both begin and end outside of a video coding scope and must not contain entire video coding scopes.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer commandBuffer,           
    VkQueryPool queryPool,                   
    uint32_t query,                          
    VkQueryControlFlags flags);
```

- commandBuffer is the command buffer into which this command will be recorded.
- queryPool is the query pool that will manage the results of the query.
- query is the query index within the query pool that will contain the results.
- flags is a bitmask of VkQueryControlFlagBits specifying constraints on the types of queries that can be performed.

If the queryType of the pool is VK_QUERY_TYPE_OCCLUSION and flags contains
**VK_QUERY_CONTROL_PRECISE_BIT**, an implementation must return a result that matches the actual number of samples passed. This is described in more detail in Occlusion Queries.

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the index parameter set to zero.

After beginning a query, that query is considered active within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

Furthermore, if the query is started within a video coding scope, the following command buffer states are initialized for the query type:

- The `active_query_index` is set to the value specified by `query`.
- The `last activatable query index` is also set to the value specified by `query`.

Each video coding operation stores a result to the query corresponding to the current active query index, followed by incrementing the active query index. If the active query index gets incremented past the last activatable query index, issuing any further video coding operations results in undefined behavior.

**Note**
In practice, this means that currently no more than a single video coding operation must be issued between a begin and end query pair.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

---

**Valid Usage**

- VUID-vkCmdBeginQuery-None-00807
  All queries used by the command must be unavailable

- VUID-vkCmdBeginQuery-queryType-02804
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_TIMESTAMP`

- VUID-vkCmdBeginQuery-queryType-04728
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
  `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- VUID-vkCmdBeginQuery-queryType-06741
The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`.

- **VUID-vkCmdBeginQuery-queryType-00800**
  
  If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags must not contain `VK_QUERY_CONTROL_PRECISE_BIT`.

- **VUID-vkCmdBeginQuery-query-00802**
  
  `query` must be less than the number of queries in `queryPool`.

- **VUID-vkCmdBeginQuery-queryType-00803**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginQuery-queryType-00804**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginQuery-queryType-00805**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- **VUID-vkCmdBeginQuery-commandBuffer-01885**
  
  `commandBuffer` must not be a protected command buffer.

- **VUID-vkCmdBeginQuery-query-00808**
  
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`.

- **VUID-vkCmdBeginQuery-queryType-07126**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then the `VkCommandPool` that `commandBuffer` was allocated from must have been created with a queue family index that supports result status queries, as indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport`.

- **VUID-vkCmdBeginQuery-None-07127**
  
  If there is a bound video session, then there must be no active queries.

- **VUID-vkCmdBeginQuery-None-08370**
  
  If there is a bound video session, then it must not have been created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`.

- **VUID-vkCmdBeginQuery-queryType-07128**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with.

- **VUID-vkCmdBeginQuery-queryType-07129**
  
  1100
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there **must** be a bound video session

- **VUID-vkCmdBeginQuery-queryType-07130**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` **must** have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo::pVideoProfile` the bound video session was created with

- **VUID-vkCmdBeginQuery-queryType-07131**
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` or `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there **must** be no bound video session

- **VUID-vkCmdBeginQuery-queryPool-01922**
  `queryPool` **must** have been created with a `queryType` that differs from that of any queries that are active within `commandBuffer`

- **VUID-vkCmdBeginQuery-queryType-02327**
  If the `queryType` used to create `queryPool` was `VKQUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQuery-queryType-02328**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` **must** be supported

- **VUID-vkCmdBeginQuery-queryPool-07289**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` `queryPool` was created with **must** equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from

- **VUID-vkCmdBeginQuery-queryPool-03223**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`

- **VUID-vkCmdBeginQuery-queryPool-03224**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`

- **VUID-vkCmdBeginQuery-queryPool-03225**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the begin command **must** not be recorded within a render pass instance

- **VUID-vkCmdBeginQuery-queryPool-03226**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and
another query pool with a `queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled

- VUID-vkCmdBeginQuery-None-02863
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query

### Valid Usage (Implicit)

- VUID-vkCmdBeginQuery-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQuery-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdBeginQuery-flags-parameter
  `flags` must be a valid combination of `VkQueryControlFlagBits` values

- VUID-vkCmdBeginQuery-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdBeginQuery-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdBeginQuery-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics Compute</td>
<td>Action State</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Decode Encode</td>
<td></td>
</tr>
</tbody>
</table>
To begin an indexed query, call:

```c
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_transform_feedback
    VkQueryPool queryPool,          
    uint32_t query,                 
    VkQueryControlFlags flags,      
    uint32_t index);                
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
- `index` is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur earlier in submission order.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

### Valid Usage

- **VUID-vkCmdBeginQueryIndexedEXT-None-00807**
  All queries used by the command must be unavailable

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-02804**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04728**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-06741**
  The `queryType` used to create `queryPool` must not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or
If the occlusionQueryPrecise feature is not enabled, or the queryType used to create queryPool was not VK_QUERY_TYPE_OCCLUSION, flags must not contain VK_QUERY_CONTROL_PRECISE_BIT.

query must be less than the number of queries in queryPool.

If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any of the pipelineStatistics indicate graphics operations, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any of the pipelineStatistics indicate compute operations, the VkCommandPool that commandBuffer was allocated from must support compute operations.

commandBuffer must not be a protected command buffer.

If called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool.

If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then the VkCommandPool that commandBuffer was allocated from must have been created with a queue family index that supports result status queries, as indicated by VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport.

If there is a bound video session, then there must be no active queries.

If there is a bound video session, then it must not have been created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR.

If the queryType used to create queryPool was VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR, then there must be a bound video session.
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo::pNext` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with.

If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` or `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be no bound video session.

If the `queryPool` was created with the same `queryType` as that of another active query within `commandBuffer`, then `index` must not match the index used for the active query.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT`, the `index` parameter must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` the `index` parameter must be zero.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` `queryPool` was created with must equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin must be the first recorded command in `commandBuffer`.
of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as commandBuffer, the performanceCounterMultipleQueryPools feature must be enabled

- VUID-vkCmdBeginQueryIndexedEXT-None-02863
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a vkCmdResetQueryPool command affecting the same query

### Valid Usage (Implicit)

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdBeginQueryIndexedEXT-flags-parameter
  flags must be a valid combination of VkQueryControlFlagBits values

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdBeginQueryIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of occlusion queries.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;
```

`VkQueryControlFlags` is a bitmask type for setting a mask of zero or more `VkQueryControlFlagBits`.

To end a query after the set of desired drawing or dispatching commands is executed, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.

The command completes the query in `queryPool` identified by `query`, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.
The second synchronization scope includes only the operation of this command.

Calling \texttt{vkCmdEndQuery} is equivalent to calling \texttt{vkCmdEndQueryIndexedEXT} with the index parameter set to zero.

### Valid Usage

- **VUID-vkCmdEndQuery-None-01923**
  All queries used by the command **must** be active

- **VUID-vkCmdEndQuery-query-00810**
  \texttt{query} **must** be less than the number of queries in \texttt{queryPool}

- **VUID-vkCmdEndQuery-commandBuffer-01886**
  \texttt{commandBuffer} **must** not be a protected command buffer

- **VUID-vkCmdEndQuery-query-00812**
  If \texttt{vkCmdEndQuery} is called within a render pass instance, the sum of \texttt{query} and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in \texttt{queryPool}

- **VUID-vkCmdEndQuery-queryPool-03227**
  If \texttt{queryPool} was created with a \texttt{queryType} of \texttt{VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR} and one or more of the counters used to create \texttt{queryPool} was \texttt{VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR}, the \texttt{vkCmdEndQuery} **must** be the last recorded command in \texttt{commandBuffer}

- **VUID-vkCmdEndQuery-queryPool-03228**
  If \texttt{queryPool} was created with a \texttt{queryType} of \texttt{VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR} and one or more of the counters used to create \texttt{queryPool} was \texttt{VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR}, the \texttt{vkCmdEndQuery} **must** not be recorded within a render pass instance

- **VUID-vkCmdEndQuery-None-07007**
  If called within a subpass of a render pass instance, the corresponding \texttt{vkCmdBeginQuery}\* command **must** have been called previously within the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndQuery-commandBuffer-parameter**
  \texttt{commandBuffer} **must** be a valid \texttt{VkCommandBuffer} handle

- **VUID-vkCmdEndQuery-queryPool-parameter**
  \texttt{queryPool} **must** be a valid \texttt{VkQueryPool} handle

- **VUID-vkCmdEndQuery-commandBuffer-recording**
  \texttt{commandBuffer} **must** be in the recording state

- **VUID-vkCmdEndQuery-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdEndQuery-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization
- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

To end an indexed query after the set of desired drawing or dispatching commands is recorded, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndQueryIndexedEXT(
    VkCommandBuffer commandBuffer,            
    VkQueryPool queryPool,                   
    uint32_t query,                          
    uint32_t index);                          
```

- commandBuffer is the command buffer into which this command will be recorded.
- queryPool is the query pool that is managing the results of the query.
- query is the query index within the query pool where the result is stored.
- index is the query type specific index.

The command completes the query in queryPool identified by query and index, and marks it as available.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific index parameter.

This command defines an execution dependency between other query commands that reference the same query index.
The first synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

### Valid Usage

- **VUID-vkCmdEndQueryIndexedEXT-None-02342**
  All queries used by the command **must** be active

- **VUID-vkCmdEndQueryIndexedEXT-query-02343**
  query **must** be less than the number of queries in queryPool

- **VUID-vkCmdEndQueryIndexedEXT-commandBuffer-02344**
  commandBuffer **must** not be a protected command buffer

- **VUID-vkCmdEndQueryIndexedEXT-query-02345**
  If vkCmdEndQueryIndexedEXT is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in queryPool

- **VUID-vkCmdEndQueryIndexedEXT-queryType-06694**
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT the index parameter **must** be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

- **VUID-vkCmdEndQueryIndexedEXT-queryType-06695**
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT index **must** be zero

- **VUID-vkCmdEndQueryIndexedEXT-None-07007**
  If called within a subpass of a render pass instance, the corresponding vkCmdBeginQuery* command **must** have been called previously within the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter**
  commandBuffer **must** be a valid VkCommandBuffer handle

- **VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter**
  queryPool **must** be a valid VkQueryPool handle

- **VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording**
  commandBuffer **must** be in the recording state

- **VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from **must** support graphics, compute, decode, or encode operations
This command **must** only be called outside of a video coding scope.

Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

**Command Properties**

<table>

</table>

An application **can** retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins `stride` bytes later.

- Occlusion queries, pipeline statistics queries, transform feedback queries, video encode feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

- Performance queries store results in a tightly packed array whose type is determined by the `unit` member of the corresponding `VkPerformanceCounterKHR`.

- If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.

- If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is used, the final element of each query's result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the `VkQueryResultStatusKHR` enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the
pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one VkPerformanceCounterResultKHR value for each VkPerformanceCounterKHR in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the transform feedback buffers associated with that vertex stream were large enough. Video encode feedback queries write one or more integer values for each bit that is enabled in VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags when the pool is created, and the feedback values are written in bit order starting from the least significant bit, as described here.

- If more than one query is retrieved and stride is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the query pool managing the queries containing the desired results.
- `firstQuery` is the initial query index.
- `queryCount` is the number of queries to read.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.
- `flags` is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

If no bits are set in `flags`, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. Behavior when not all queries are available is described below.
If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `pData`, along with an extra availability or status value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available. The size of the availability or status values is 64 bits if `VK_QUERY_RESULT_64_BIT` is set in `flags`. Otherwise, it is 32 bits.

If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `pData`, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

`VkQueryResultStatusKHR` defines specific meaning for values returned here, though implementations are free to return other values.

If the status value written is negative, indicating that the operations within the query completed unsuccessfully, then all other results written by this command are undefined unless otherwise specified for any of the results of the used query type.

```
Note
If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` or `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set, the layout of data in the buffer is a `(result,availability)` or `(result,status)` pair for each query returned, and `stride` is the stride between each pair.
```

Results for any available query written by this command are final and represent the final result of the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and, if returned, availability or status values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query’s value overflows the result type, the value may either wrap or saturate. If a signed integer query’s value overflows the result type, the value is undefined. If a floating-point query’s value is not representable as the result type, the value is undefined.

If `VK_QUERY_RESULT_WAIT_BIT` is set, this command defines an execution dependency with any earlier commands that writes one of the identified queries. The first synchronization scope includes all instances of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp` that reference any query in `queryPool` indicated by `firstQuery` and `queryCount`. The second synchronization scope includes the host operations of this command.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` may return `VK_NOT_READY` if there are queries in the unavailable state.
Note
Applications **must** take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications **can** use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status **may** reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Note
Applications **can** double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

---

**Valid Usage**

- VUID-vkGetQueryPoolResults-firstQuery-09436
  
  *firstQuery** must be less than the number of queries in `queryPool`

- VUID-vkGetQueryPoolResults-firstQuery-09437
  
  The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

- VUID-vkGetQueryPoolResults-queryCount-09438
  
  If `queryCount` is greater than 1, `stride` **must** not be zero

- VUID-vkGetQueryPoolResults-queryType-09439
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, flags **must** not contain `VK_QUERY_RESULT_PARTIAL_BIT`

- VUID-vkGetQueryPoolResults-queryType-09440
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, flags **must** not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`, `VK_QUERY_RESULT_PARTIAL_BIT`, or `VK_QUERY_RESULT_64_BIT`

- VUID-vkGetQueryPoolResults-queryType-09441
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` **must** have been recorded once for each pass as retrieved via a call to
vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkGetQueryPoolResults-queryType-09442
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then `flags` must include `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`

- VUID-vkGetQueryPoolResults-flags-09443
  If `flags` includes `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`, then it must not include `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`

- VUID-vkGetQueryPoolResults-None-09401
  All queries used by the command must not be uninitialized

- VUID-vkGetQueryPoolResults-flags-02828
  If `VK_QUERY_RESULT_64_BIT` is not set in `flags` and the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` must be multiples of 4

- VUID-vkGetQueryPoolResults-flags-00815
  If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `pData` and `stride` must be multiples of 8

- VUID-vkGetQueryPoolResults-stride-08993
  If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, `stride` must be large enough to contain the unsigned integer representing availability or status in addition to the query result

- VUID-vkGetQueryPoolResults-queryType-03229
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` must be multiples of the size of `VkPerformanceCounterResultKHR`

- VUID-vkGetQueryPoolResults-queryType-04519
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `stride` must be large enough to contain the `VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount` used to create `queryPool` times the size of `VkPerformanceCounterResultKHR`

- VUID-vkGetQueryPoolResults-dataSize-00817
  `dataSize` must be large enough to contain the result of each query, as described here

**Valid Usage (Implicit)**

- VUID-vkGetQueryPoolResults-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetQueryPoolResults-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkGetQueryPoolResults-pData-parameter
  `pData` must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetQueryPoolResults-flags-parameter
  `flags` must be a valid combination of `VkQueryResultFlagBits` values

- VUID-vkGetQueryPoolResults-dataSize-arraylength
  `dataSize` must be greater than 0

- VUID-vkGetQueryPoolResults-queryPool-parent
queryPool **must** have been created, allocated, or retrieved from device

---

**Return Codes**

**Success**
- VK_SUCCESS
- VK_NOT_READY

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

Bits which **can** be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    // Provided by VK_KHR_video_queue
    VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
} VkQueryResultFlagBits;
```

- **VK_QUERY_RESULT_64_BIT** specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.
- **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query's status to become available before retrieving its results.
- **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.
- **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.
- **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a `VkQueryResultStatusKHR` value. See result status query for information on how an application can determine whether the use of this flag bit is supported.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.
Specific status codes that can be returned from a query are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
} VkQueryResultStatusKHR;
```

- **VK_QUERY_RESULT_STATUS_NOT_READY_KHR** indicates that the query result is not yet available.
- **VK_QUERY_RESULT_STATUS_ERROR_KHR** indicates that operations did not complete successfully.
- **VK_QUERY_RESULT_STATUS_COMPLETE_KHR** indicates that operations completed successfully and the query result is available.
- **VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR** indicates that a video encode operation did not complete successfully due to the destination video bitstream buffer range not being sufficiently large to fit the encoded bitstream data.

To copy query statuses and numerical results directly to buffer memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer, commandBuffer,
    VkQueryPool queryPool, queryPool,
    uint32_t firstQuery, firstQuery,
    uint32_t queryCount, queryCount,
    VkBuffer dstBuffer, dstBuffer,
    VkDeviceSize dstOffset, dstOffset,
    VkDeviceSize stride, stride,
    VkQueryResultFlags flags, flags);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool managing the queries containing the desired results.
- **firstQuery** is the initial query index.
- **queryCount** is the number of queries. **firstQuery** and **queryCount** together define a range of queries.
- **dstBuffer** is a **VkBuffer** object that will receive the results of the copy command.
- **dstOffset** is an offset into **dstBuffer**.
- **stride** is the stride in bytes between results for individual queries within **dstBuffer**. The required size of the backing memory for **dstBuffer** is determined as described above for **vkGetQueryPoolResults**.
- **flags** is a bitmask of **VkQueryResultFlagBits** specifying how and when results are returned.
Any results written for a query are written according to a layout dependent on the query type.

Results for any query in queryPool identified by firstQuery and queryCount that is available are copied to dstBuffer.

If VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set, results for all queries in queryPool identified by firstQuery and queryCount are copied to dstBuffer, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is set, results for all queries in queryPool identified by firstQuery and queryCount are copied to dstBuffer, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

VkQueryResultStatusKHR defines specific meaning for values returned here, though implementations are free to return other values.

If the status value written is negative, indicating that the operations within the query completed unsuccessfully, then all other results written by this command are undefined unless otherwise specified for any of the results of the used query type.

Results for any available query written by this command are final and represent the final result of the query. If VK_QUERY_RESULT_PARTIAL_BIT is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If VK_QUERY_RESULT_64_BIT is set, results and availability or status values for all queries are written as an array of 64-bit values. If the queryPool was created with VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, results for each query are written as an array of the type indicated by VkPerformanceCounterKHR::storage for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value may either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating-point query's value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur earlier in submission order. If flags does not include VK_QUERY_RESULT_WAIT_BIT, vkCmdEndQueryIndexedEXT, vkCmdWriteTimestamp2, vkCmdEndQuery, and vkCmdWriteTimestamp are excluded from this scope.

The second synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur later in submission order.
The operation of this command happens after the first scope and happens before the second scope. `vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory must be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT` before using the results.

### Valid Usage

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-09436**
  
  `firstQuery` must be less than the number of queries in `queryPool`.

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-09437**
  
  The sum of `firstQuery` and `queryCount` must be less than or equal to the number of queries in `queryPool`.

- **VUID-vkCmdCopyQueryPoolResults-queryCount-09438**
  
  If `queryCount` is greater than 1, `stride` must not be zero.

- **VUID-vkCmdCopyQueryPoolResults-queryType-09439**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, flags must not contain `VK_QUERY_RESULT_PARTIAL_BIT`.

- **VUID-vkCmdCopyQueryPoolResults-queryType-09440**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, flags must not contain `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`.

- **VUID-vkCmdCopyQueryPoolResults-queryType-09441**
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then flags must include `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`.

- **VUID-vkCmdCopyQueryPoolResults-flags-09443**
  
  If flags includes `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`, then it must not include `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`.

- **VUID-vkCmdCopyQueryPoolResults-dstOffset-00819**
  
  `dstOffset` must be less than the size of `dstBuffer`.

- **VUID-vkCmdCopyQueryPoolResults-flags-00822**
  
  If `VK_QUERY_RESULT_64_BIT` is not set in flags then `dstOffset` and `stride` must be multiples of 4.

- **VUID-vkCmdCopyQueryPoolResults-flags-00823**
  
  If `VK_QUERY_RESULT_64_BIT` is set in flags then `dstOffset` and `stride` must be multiples of 8.
* VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824
  `dstBuffer` must have enough storage, from `dstOffset`, to contain the result of each query, as described here.

* VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

* VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

* VUID-vkCmdCopyQueryPoolResults-queryType-03232
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies` must be `VK_TRUE`.

* VUID-vkCmdCopyQueryPoolResults-None-07429
  All queries used by the command must not be active.

* VUID-vkCmdCopyQueryPoolResults-None-08752
  All queries used by the command must have been made available by prior executed commands.

---

**Valid Usage (Implicit)**

* VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

* VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle.

* VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle.

* VUID-vkCmdCopyQueryPoolResults-flags-parameter
  `flags` must be a valid combination of `VkQueryResultFlagBits` values.

* VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
  `commandBuffer` must be in the recording state.

* VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

* VUID-vkCmdCopyQueryPoolResults-renderpass
  This command must only be called outside of a render pass instance.

* VUID-vkCmdCopyQueryPoolResults-videocoding
  This command must only be called outside of a video coding scope.

* VUID-vkCmdCopyQueryPoolResults-commonparent
  Each of `commandBuffer`, `dstBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which may include vertices and some not.

17.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

Note

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

Setting `VK_QUERY_CONTROL_PRECISE_BIT` does not guarantee that different implementations return the same number of samples in an occlusion query. Some implementations may kill fragments in the pre-rasterization shader stage, and these killed fragments do not contribute to the final result of the query. It is possible that some implementations generate a zero result value for the query, while others generate a non-zero value.

When an occlusion query finishes, the result for that query is marked as available. The application
can then either copy the result to a buffer (via \texttt{vkCmdCopyQueryPoolResults}) or request it be put into host memory (via \texttt{vkGetQueryPoolResults}).

\begin{itemize}
  \item \texttt{VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT} specifies that queries managed by the
\end{itemize}

**Note**

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

### 17.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of VkPipeline counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the \texttt{pipelineStatisticsQuery} member of the VkPhysicalDeviceFeatures object (see \texttt{vkGetPhysicalDeviceFeatures} and \texttt{vkCreateDevice} for detecting and requesting this query type on a VkDevice).

A pipeline statistics query is begun and ended by calling \texttt{vkCmdBeginQuery} and \texttt{vkCmdEndQuery}, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, or the counter corresponds to a shading stage which is missing from any of the pipelines used while the query is active, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set in \texttt{VkQueryPoolCreateInfo::pipelineStatistics} for query pools and in \texttt{VkCommandBufferInheritanceInfo::pipelineStatistics} for secondary command buffers, individually enabling pipeline statistics counters, are:

```c
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
} VkQueryPipelineStatisticFlagBits;
```

- \texttt{VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT} specifies that queries managed by the
pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter's value is incremented each time a vertex shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive passes the primitive clipping stage. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:
  - If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
  - Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by
the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters may be affected by the issues described in Query Operation.

**Note**
For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has rasterizerDiscardEnable enabled, implementations may discard primitives after the final pre-rasterization shader stage. As a result, if rasterizerDiscardEnable is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via vkCmdCopyQueryPoolResults), or request it be put into host memory (via vkGetQueryPoolResults).

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

** VkQueryPipelineStatisticFlags is a bitmask type for setting a mask of zero or more VkQueryPipelineStatisticFlagBits.**

### 17.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained.
from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.

To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWriteTimestamp2(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `stage`.

The second synchronization scope includes only the timestamp write operation.

**Note**

Implementations may write the timestamp at any stage that is logically later than `stage`.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the `VK_TIME_DOMAIN_DEVICE_KHR` time domain. If an overflow occurs, the timestamp value must wrap back to zero.

**Note**
Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and `VK_KHR_calibrated_timestamps` is enabled.

If `vkCmdWriteTimestamp2` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

### Valid Usage

- **VUID-vkCmdWriteTimestamp2-stage-03929**
  If the `geometryShader` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp2-stage-03930**
  If the `tessellationShader` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp2-stage-03933**
  If the `transformFeedback` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteTimestamp2-stage-07317**
  If the `attachmentFragmentShadingRate` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdWriteTimestamp2-stage-07947**
  If the `rayTracingPipeline` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-vkCmdWriteTimestamp2-synchronization2-03858**
  The `synchronization2` feature must be enabled

- **VUID-vkCmdWriteTimestamp2-stage-03859**
stage must only include a single pipeline stage

- VUID-vkCmdWriteTimestamp2-stage-03860
  stage must only include stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- VUID-vkCmdWriteTimestamp2-queryPool-03861
  queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

- VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
  The command pool's queue family must support a non-zero timestampValidBits

- VUID-vkCmdWriteTimestamp2-query-04903
  query must be less than the number of queries in queryPool

- VUID-vkCmdWriteTimestamp2-None-03864
  All queries used by the command must be unavailable

- VUID-vkCmdWriteTimestamp2-query-03865
  If vkCmdWriteTimestamp2 is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

---

**Valid Usage (Implicit)**

- VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteTimestamp2-stage-parameter
  stage must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-vkCmdWriteTimestamp2-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteTimestamp2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

- VUID-vkCmdWriteTimestamp2-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `pipelineStage`.

The second synchronization scope includes only the timestamp write operation.

*Note*

Implementations may write the timestamp at any stage that is logically later than stage.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the `VK_TIME_DOMAIN_DEVICE_KHR` time domain. If an overflow occurs, the timestamp value must wrap back to zero.
Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and `VK_KHR_calibrated_timestamps` is enabled.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

### Valid Usage

- **VUID-vkCmdWriteTimestamp-pipelineStage-04074**
  
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- **VUID-vkCmdWriteTimestamp-pipelineStage-04075**
  
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdWriteTimestamp-pipelineStage-04076**
  
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdWriteTimestamp-pipelineStage-04079**
  
  If the `transformFeedback` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-vkCmdWriteTimestamp-fragmentShadingRate-07315**
  
  If the `attachmentFragmentShadingRate` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdWriteTimestamp-synchronization2-06489**
  
  If the `synchronization2` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_NONE`.
• VUID-vkCmdWriteTimestamp-rayTracingPipeline-07944
  If the rayTracingPipeline feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-vkCmdWriteTimestamp-queryPool-01416
  queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

• VUID-vkCmdWriteTimestamp-timestampValidBits-00829
  The command pool’s queue family must support a non-zero timestampValidBits

• VUID-vkCmdWriteTimestamp-query-04904
  query must be less than the number of queries in queryPool

• VUID-vkCmdWriteTimestamp-None-00830
  All queries used by the command must be unavailable

• VUID-vkCmdWriteTimestamp-query-00831
  If vkCmdWriteTimestamp is called within a render pass instance, the sum of query and the
  number of bits set in the current subpass’s view mask must be less than or equal to the
  number of queries in queryPool

Valid Usage (Implicit)

• VUID-vkCmdWriteTimestamp-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdWriteTimestamp-pipelineStage-parameter
  pipelineStage must be a valid VkPipelineStageFlagBits value

• VUID-vkCmdWriteTimestamp-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

• VUID-vkCmdWriteTimestamp-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics,
  compute, decode, or encode operations

• VUID-vkCmdWriteTimestamp-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from
  the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized
### 17.6. Performance Queries

**Performance queries** provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

- **Note**
  - This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

- **Note**
  - Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`.

---

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Both</td>
<td>Transfer Graphics</td>
<td>Action</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Compute Decode Encode</td>
<td></td>
</tr>
</tbody>
</table>

**Table: Command Properties**
The `VkPerformanceCounterResultKHR` union is defined as:

```c
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t int32;
    int64_t int64;
    uint32_t uint32;
    uint64_t uint64;
    float float32;
    double float64;
} VkPerformanceCounterResultKHR;
```

- `int32` is a 32-bit signed integer value.
- `int64` is a 64-bit signed integer value.
- `uint32` is a 32-bit unsigned integer value.
- `uint64` is a 64-bit unsigned integer value.
- `float32` is a 32-bit floating-point value.
- `float64` is a 64-bit floating-point value.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. `VkPerformanceCounterKHR::storage` specifies how to parse the counter data.

### 17.6.1. Profiling Lock

To record and submit a command buffer containing a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock must be held while any command buffer containing a performance query pool is in the recording, executable, or pending state. To acquire the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);
```

- `device` is the logical device to profile.
- `pInfo` is a pointer to a `VkAcquireProfilingLockInfoKHR` structure containing information about how the profiling is to be acquired.

Implementations may allow multiple actors to hold the profiling lock concurrently.
Valid Usage (Implicit)

- VUID-vkAcquireProfilingLockKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
pInfo must be a valid pointer to a valid VkAcquireProfilingLockInfoKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_TIMEOUT

The VkAcquireProfilingLockInfoKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- timeout indicates how long the function waits, in nanoseconds, if the profiling lock is not available.

Valid Usage (Implicit)

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR

- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
pNext must be NULL

- VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask
flags must be 0

If timeout is 0, vkAcquireProfilingLockKHR will not block while attempting to acquire the profiling
lock. If \texttt{timeout} is \texttt{UINT64_MAX}, the function will not return until the profiling lock was acquired.

\begin{verbatim}
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
\end{verbatim}

\begin{verbatim}
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
\end{verbatim}

\textbf{VkAcquireProfilingLockFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

\begin{verbatim}
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
\end{verbatim}

- \texttt{device} is the logical device to cease profiling on.

**Valid Usage**

- VUID-vkReleaseProfilingLockKHR-device-03235
  
  The profiling lock of \texttt{device must} have been held via a previous successful call to \texttt{vkAcquireProfilingLockKHR}.

**Valid Usage (Implicit)**

- VUID-vkReleaseProfilingLockKHR-device-parameter
  
  \texttt{device must} be a valid \texttt{VkDevice} handle.

### 17.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during drawing commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling \texttt{vkCmdBeginQuery} and \texttt{vkCmdEndQuery}, respectively to query for vertex stream zero. \texttt{vkCmdBeginQueryIndexedEXT} and \texttt{vkCmdEndQueryIndexedEXT} can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing
command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

### 17.8. Result Status Queries

Result status queries serve a single purpose: allowing the application to determine whether a set of operations have completed successfully or not, as indicated by the `VkQueryResultStatusKHR` value written when retrieving the result of a query using the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Unlike other query types, result status queries do not track or maintain any other data beyond the completion status, thus no other data is written when retrieving their results.

Support for result status queries is indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR`::`queryResultStatusSupport`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` for the queue family in question.

### 17.9. Video Encode Feedback Queries

Video encode feedback queries allow the application to capture feedback values generated by video encode operations. As such, video encode feedback queries are available on queue families supporting video encode operations. The availability of individual video encode feedback values is indicated by the bits of `VkVideoEncodeCapabilitiesKHR`::`supportedEncodeFeedbackFlags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the queries are intended to be used with.

The set of enabled video encode feedback values must be configured on the query pool when it is created using the `encodeFeedbackFlags` member of the `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` included in the `pNext` chain of `VkQueryPoolCreateInfo`.

The `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkQueryPoolVideoEncodeFeedbackCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFeedbackFlagsKHR encodeFeedbackFlags;
} VkQueryPoolVideoEncodeFeedbackCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `encodeFeedbackFlags` is a bitmask of `VkVideoEncodeFeedbackFlagBitsKHR` values specifying the set of enabled video encode feedback values captured by queries of the new pool.
Valid Usage (Implicit)

- **VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_QUERY_POOL_VIDEO_ENCODE_FEEDBACK_CREATE_INFO_KHR`

- **VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-parameter**
  - `encodeFeedbackFlags` **must** be a valid combination of `VkVideoEncodeFeedbackFlagBitsKHR` values

- **VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-requiredbitmask**
  - `encodeFeedbackFlags` **must** not be `0`

Bits which **can** be set in `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` for video encode feedback query pools are:

```c
typedef enum VkVideoEncodeFeedbackFlagBitsKHR {
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR = 0x00000004,
} VkVideoEncodeFeedbackFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR** specifies that queries managed by the pool will capture the byte offset of the bitstream data written by the video encode operation to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` relative to the offset specified in `VkVideoEncodeInfoKHR::dstBufferOffset`. For the first video encode operation issued by any video encode command, this value will always be zero, meaning that bitstream data is always written to the buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` starting from the offset specified in `VkVideoEncodeInfoKHR::dstBufferOffset`.

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR** specifies that queries managed by the pool will capture the number of bytes written by the video encode operation to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer`.

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR** specifies that queries managed by the pool will capture a boolean value indicating that the data written to the bitstream buffer specified in `VkVideoEncodeInfoKHR::dstBuffer` contains overridden parameters.

When retrieving the results of video encode feedback queries, the values corresponding to each enabled video encode feedback are written in the order of the bits defined above, followed by an optional value indicating availability or result status if `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` or `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is specified, respectively.

If the result status of a video encode feedback query is negative, then the results of all enabled video encode feedback values will be undefined.

**Note**
- Thus it is recommended that applications always specify...
VK_QUERY_RESULT_WITH_STATUS_BIT_KHR when retrieving the results of video encode feedback queries and ignore such undefined video encode feedback values for any unsuccessfully completed video encode operations.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFeedbackFlagsKHR;
```

VkVideoEncodeFeedbackFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeFeedbackFlagBitsKHR.
Chapter 18. Clear Commands

18.1. Clearing Images Outside a Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pColor,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-vkCmdClearColorImage-image-00002
  `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdClearColorImage-image-01545
  `image` must not use any of the formats that require a sampler Y′C′bC′r conversion

- VUID-vkCmdClearColorImage-image-00003
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
• VUID-vkCmdClearColorImage-imageLayout-00004
  imageLayout must specify the layout of the image subresource ranges of image specified in
  pRanges at the time this command is executed on a VkDevice

• VUID-vkCmdClearColorImage-imageLayout-01394
  imageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR,
  VK_IMAGE_LAYOUTTRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUTGENERAL

• VUID-vkCmdClearColorImage-aspectMask-02498
  The VkImageSubresourceRange::aspectMask members of the elements of the pRanges array
  must each only include VK_IMAGE_ASPECT_COLOR_BIT

• VUID-vkCmdClearColorImage-baseMipLevel-01470
  The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges
  array must each be less than the mipLevels specified in VkImageCreateInfo when image
  was created

• VUID-vkCmdClearColorImage-pRanges-01692
  For each VkImageSubresourceRange element of pRanges, if the levelCount member is not
  VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than or equal to the
  mipLevels specified in VkImageCreateInfo when image was created

• VUID-vkCmdClearColorImage-baseArrayLayer-01472
  The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges
  array must each be less than the arrayLayers specified in VkImageCreateInfo when image
  was created

• VUID-vkCmdClearColorImage-pRanges-01693
  For each VkImageSubresourceRange element of pRanges, if the layerCount member is not
  VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than or equal to the
  arrayLayers specified in VkImageCreateInfo when image was created

• VUID-vkCmdClearColorImage-image-00007
  image must not have a compressed or depth/stencil format

• VUID-vkCmdClearColorImage-pColor-04961
  pColor must be a valid pointer to a VkClearColorValue union

• VUID-vkCmdClearColorImage-commandBuffer-01805
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  image must not be a protected image

• VUID-vkCmdClearColorImage-commandBuffer-01806
  If commandBuffer is a protected command buffer and protectedNoFault is not supported,
  must not be an unprotected image

• VUID-vkCmdClearColorImage-image-09678
  If image's format has components other than R and G, it must not have a 64-bit component
  width

Valid Usage (Implicit)

• VUID-vkCmdClearColorImage-commandBuffer-parameter
**commandBuffer** must be a valid *VkCommandBuffer* handle

- **VUID-vkCmdClearColorImage-image-parameter**
  *image* must be a valid *VkImage* handle

- **VUID-vkCmdClearColorImage-imageLayout-parameter**
  *imageLayout* must be a valid *VkImageLayout* value

- **VUID-vkCmdClearColorImage-pRanges-parameter**
  *pRanges* must be a valid pointer to an array of *rangeCount* valid *VkImageSubresourceRange* structures

- **VUID-vkCmdClearColorImage-commandBuffer-recording**
  *commandBuffer* must be in the *recording state*

- **VUID-vkCmdClearColorImage-commandBuffer-cmdpool**
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics, or compute operations

- **VUID-vkCmdClearColorImage-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdClearColorImage-vidcoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdClearColorImage-rangeCount-arraylength**
  *rangeCount* must be greater than 0

- **VUID-vkCmdClearColorImage-commonparent**
  Both of *commandBuffer*, and *image* must have been created, allocated, or retrieved from the same *VkDevice*

**Host Synchronization**

- Host access to *commandBuffer* must be externally synchronized

- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>

<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdClearDepthStencilImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearDepthStencilValue* pDepthStencil,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pDepthStencil` is a pointer to a `VkClearDepthStencilValue` structure containing the values that the depth and stencil image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

### Valid Usage

- **VUID-vkCmdClearDepthStencilImage-image-01994**
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-vkCmdClearDepthStencilImage-pRanges-02658**
  If the `aspect` member of any element of `pRanges` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `image` was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create `image`

- **VUID-vkCmdClearDepthStencilImage-pRanges-02659**
  If the `aspect` member of any element of `pRanges` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `image` was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageCreateInfo::usage` used to create `image`

- **VUID-vkCmdClearDepthStencilImage-pRanges-02660**
  If the `aspect` member of any element of `pRanges` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageCreateInfo::usage` used to create `image`

- **VUID-vkCmdClearDepthStencilImage-image-00010**
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00011**
  `imageLayout` must specify the layout of the image subresource ranges of `image` specified in `pRanges` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdClearDepthStencilImage-imageLayout-00012**

---

1141
imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdClearDepthStencilImage-aspectMask-02824
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkCmdClearDepthStencilImage-image-02825
  If the image's format does not have a stencil component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_STENCIL_BIT bit

- VUID-vkCmdClearDepthStencilImage-image-02826
  If the image's format does not have a depth component, then the VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include the VK_IMAGE_ASPECT_DEPTH_BIT bit

- VUID-vkCmdClearDepthStencilImage-baseMipLevel-01474
  The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearDepthStencilImage-pRanges-01694
  For each VkImageSubresourceRange element of pRanges, if the levelCount member is not VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearDepthStencilImage-baseArrayLayer-01476
  The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-vkCmdClearDepthStencilImage-pRanges-01695
  For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

image must have a depth/stencil format

- VUID-vkCmdClearDepthStencilImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdClearDepthStencilImage-image-parameter
  image must be a valid VkImage handle

- VUID-vkCmdClearDepthStencilImage-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

- VUID-vkCmdClearDepthStencilImage-pDepthStencil-parameter
  pDepthStencil must be a valid pointer to a valid VkClearDepthStencilValue structure

- VUID-vkCmdClearDepthStencilImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

- VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearDepthStencilImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearDepthStencilImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
  rangeCount must be greater than 0

- VUID-vkCmdClearDepthStencilImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.
18.2. Clearing Images Inside a Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearAttachments(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t rectCount,
    const VkClearRect* pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

Unlike other clear commands, `vkCmdClearAttachments` is not a transfer command. It performs its operations in rasterization order. For color attachments, the operations are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. For depth/stencil attachments, the operations are executed as depth writes and stencil writes by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

**Note**

It is generally preferable to clear attachments by using the `VK_ATTACHMENT_LOAD_OP_CLEAR` load operation at the start of rendering, as it is more efficient on some implementations.

If any attachment's `aspectMask` to be cleared is not backed by an image view, the clear has no effect on that aspect.

If an attachment being cleared refers to an image view created with an `aspectMask` equal to one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, it is considered to be `VK_IMAGE_ASPECT_COLOR_BIT` for purposes of this command, and **must** be cleared with the `VK_IMAGE_ASPECT_COLOR_BIT` aspect as specified by image view creation.

**Valid Usage**

- `VUID-vkCmdClearAttachments-aspectMask-07884`

If the current render pass instance does not use dynamic rendering, and the `aspectMask`
member of any element of pAttachments contains VK_IMAGE_ASPECT_DEPTH_BIT, the current subpass instance’s depth-stencil attachment must be either VK_ATTACHMENT_UNUSED or the attachment format must contain a depth component

- VUID-vkCmdClearAttachments-aspectMask-07885
  If the current render pass instance does not use dynamic rendering, and the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_STENCIL_BIT, the current subpass instance’s depth-stencil attachment must be either VK_ATTACHMENT_UNUSED or the attachment format must contain a stencil component

- VUID-vkCmdClearAttachments-aspectMask-07271
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_COLOR_BIT, the colorAttachment must be a valid color attachment index in the current render pass instance

- VUID-vkCmdClearAttachments-rect-02682
  The rect member of each element of pRects must have an extent.width greater than 0

- VUID-vkCmdClearAttachments-rect-02683
  The rect member of each element of pRects must have an extent.height greater than 0

- VUID-vkCmdClearAttachments-pRects-00016
  The rectangular region specified by each element of pRects must be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-06937
  The layers specified by each element of pRects must be contained within every attachment that pAttachments refers to, i.e. for each element of pRects, VkClearRect ::baseArrayLayer + VkClearRect::layerCount must be less than or equal to the number of layers rendered to in the current render pass instance

- VUID-vkCmdClearAttachments-layerCount-01934
  The layerCount member of each element of pRects must not be 0

- VUID-vkCmdClearAttachments-commandBuffer-02504
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be a protected image

- VUID-vkCmdClearAttachments-commandBuffer-02505
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be an unprotected image

- VUID-vkCmdClearAttachments-baseArrayLayer-00018
  If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one

- VUID-vkCmdClearAttachments-colorAttachment-09503
  The colorAttachment member of each element of pAttachments must not identify a color attachment that is currently mapped to VK_ATTACHMENT_UNUSED in commandBuffer via VkRenderingAttachmentLocationInfoKHR

- VUID-vkCmdClearAttachments-None-09679
  If the attachment format has components other than R and G, it must not have a 64-bit component width
Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdClearAttachments-pAttachments-parameter
  pAttachments must be a valid pointer to an array of attachmentCount valid
  VkClearAttachment structures

- VUID-vkCmdClearAttachments-pRects-parameter
  pRects must be a valid pointer to an array of rectCount VkClearRect structures

- VUID-vkCmdClearAttachments-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

- VUID-vkCmdClearAttachments-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdClearAttachments-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  attachmentCount must be greater than 0

- VUID-vkCmdClearAttachments-rectCount-arraylength
  rectCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkClearRect structure is defined as:
### VkClearRect

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D             rect;
    uint32_t            baseArrayLayer;
    uint32_t            layerCount;
} VkClearRect;
```

- **rect** is the two-dimensional region to be cleared.
- **baseArrayLayer** is the first layer to be cleared.
- **layerCount** is the number of layers to clear.

The layers \([\text{baseArrayLayer}, \text{baseArrayLayer} + \text{layerCount})\) counting from the base layer of the attachment image view are cleared.

### VkClearAttachment

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags       aspectMask;
    uint32_t                colorAttachment;
    VkClearValue            clearValue;
} VkClearAttachment;
```

- **aspectMask** is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- **colorAttachment** is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index into the currently bound color attachments.
- **clearValue** is the color or depth/stencil value to clear the attachment to, as described in **Clear Values** below.

### Valid Usage

- **VUID-VkClearAttachment-aspectMask-00019**
  If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not include `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkClearAttachment-aspectMask-00020**
  `aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`.

### Valid Usage (Implicit)

- **VUID-VkClearAttachment-aspectMask-parameter**
  `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values.
- **VUID-VkClearAttachment-aspectMask-requiredbitmask**
18.3. Clear Values

The VkClearColorValue structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- **float32** are the color clear values when the format of the image or attachment is one of the numeric formats with a numeric type that is floating-point. Floating-point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- **int32** are the color clear values when the format of the image or attachment has a numeric type that is signed integer (SINT). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- **uint32** are the color clear values when the format of the image or attachment has a numeric type that is unsigned integer (UINT). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

If the image or attachment format has a 64-bit component width, the first 2 array elements of each of the arrays above are reinterpreted as a single 64-bit element for the R component. The next 2 array elements are used in the same way for the G component. In other words, the union behaves as if it had the following additional members:

```c
double float64[2];
int64_t int64[2];
uint64_t uint64[2];
```

The VkClearDepthStencilValue structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;

- depth is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment’s format.
- stencil is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment’s format by taking the appropriate number of LSBs.

### Valid Usage

- VUID-VkClearDepthStencilValue-depth-00022
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, depth must be between 0.0 and 1.0, inclusive.

The `VkClearValue` union is defined as:

// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;

- color specifies the color image clear values to use when clearing a color image or attachment.
- depthStencil specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the `VkRenderPassBeginInfo` structure.

## 18.4. Filling Buffers

To clear buffer data, call:
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **dstBuffer** is the buffer to be filled.
- **dstOffset** is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.
- **size** is the number of bytes to fill, and **must** be either a multiple of 4, or **VK_WHOLE_SIZE** to fill the range from **offset** to the end of the buffer. If **VK_WHOLE_SIZE** is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
- **data** is the 4-byte word written repeatedly to the buffer to fill **size** bytes of data. The data word is written to memory according to the host endianness.

**vkCmdFillBuffer** is treated as a “transfer” operation for the purposes of synchronization barriers. The **VK_BUFFER_USAGE_TRANSFER_DST_BIT** **must** be specified in usage of **VkBufferCreateInfo** in order for the buffer to be compatible with **vkCmdFillBuffer**.

### Valid Usage

- **VUID-vkCmdFillBuffer-dstOffset-00024**
  dstOffset **must** be less than the size of dstBuffer

- **VUID-vkCmdFillBuffer-dstOffset-00025**
  dstOffset **must** be a multiple of 4

- **VUID-vkCmdFillBuffer-size-00026**
  If size is not equal to **VK_WHOLE_SIZE**, size **must** be greater than 0

- **VUID-vkCmdFillBuffer-size-00027**
  If size is not equal to **VK_WHOLE_SIZE**, size **must** be less than or equal to the size of dstBuffer minus dstOffset

- **VUID-vkCmdFillBuffer-size-00028**
  If size is not equal to **VK_WHOLE_SIZE**, size **must** be a multiple of 4

- **VUID-vkCmdFillBuffer-dstBuffer-00029**
  dstBuffer **must** have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-vkCmdFillBuffer-apiVersion-07894**
  If the **VK_KHR_maintenance1** extension is not enabled and **VkPhysicalDeviceProperties::apiVersion** is less than Vulkan 1.1, the **VkCommandPool** that commandBuffer was allocated from **must** support graphics or compute operations

- **VUID-vkCmdFillBuffer-dstBuffer-00031**
  If dstBuffer is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-vkCmdFillBuffer-commandBuffer-01811
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be a protected buffer
- VUID-vkCmdFillBuffer-commandBuffer-01812
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer

### Valid Usage (Implicit)
- VUID-vkCmdFillBuffer-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdFillBuffer-dstBuffer-parameter
  `dstBuffer` **must** be a valid `VkBuffer` handle
- VUID-vkCmdFillBuffer-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdFillBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics or compute operations
- VUID-vkCmdFillBuffer-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdFillBuffer-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdFillBuffer-commonparent
  Both of `commandBuffer`, and `dstBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization
- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>

1151
18.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize dataSize,
    const void* pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` must be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications **can** work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they **should not**.

The source data is copied from `pData` to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

---

1152
Valid Usage

- VUID-vkCmdUpdateBuffer-dstOffset-00032
dstOffset must be less than the size of dstBuffer

- VUID-vkCmdUpdateBuffer-dataSize-00033
dataSize must be less than or equal to the size of dstBuffer minus dstOffset

- VUID-vkCmdUpdateBuffer-dstBuffer-00034
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdUpdateBuffer-dstBuffer-00035
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdUpdateBuffer-dstOffset-00036
dstOffset must be a multiple of 4

- VUID-vkCmdUpdateBuffer-dataSize-00037
dataSize must be less than or equal to 65536

- VUID-vkCmdUpdateBuffer-dataSize-00038
dataSize must be a multiple of 4

- VUID-vkCmdUpdateBuffer-commandBuffer-01813
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer

- VUID-vkCmdUpdateBuffer-commandBuffer-01814
If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstBuffer must not be an unprotected buffer

Valid Usage (Implicit)

- VUID-vkCmdUpdateBuffer-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdUpdateBuffer-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

- VUID-vkCmdUpdateBuffer-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkCmdUpdateBuffer-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdUpdateBuffer-renderpass
This command must only be called outside of a render pass instance

- VUID-vkCmdUpdateBuffer-videocoding
This command must only be called outside of a video coding scope
• VUID-vkCmdUpdateBuffer-dataSize-arraylength
dataSize must be greater than 0

• VUID-vkCmdUpdateBuffer-commonparent
Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

---

*Note*
The pData parameter was of type uint32_t* instead of void* prior to version 1.0.19 of the Specification and VK_HEADER_VERSION 19 of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 19. Copy Commands

An application can copy buffer and image data using several methods described in this chapter, depending on the type of data transfer.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

19.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `srcBuffer` overlaps in memory with any of the specified regions in `dstBuffer`, values read from those overlapping regions are undefined.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01824
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- VUID-vkCmdCopyBuffer-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- VUID-vkCmdCopyBuffer-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- VUID-vkCmdCopyBuffer-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- VUID-vkCmdCopyBuffer-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdCopyBuffer-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- VUID-vkCmdCopyBuffer-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-vkCmdCopyBuffer-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBuffer-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdCopyBuffer-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
• VUID-vkCmdCopyBuffer-renderpass
  This command must only be called outside of a render pass instance
• VUID-vkCmdCopyBuffer-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdCopyBuffer-regionCount-arraylength
  regionCount must be greater than 0
• VUID-vkCmdCopyBuffer-commonparent
  Each of commandBuffer, dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

The VkBufferCopy structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;
```

• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

**Valid Usage**

• VUID-VkBufferCopy-size-01988
  The size must be greater than 0
A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `pCopyBufferInfo` is a pointer to a `VkCopyBufferInfo2` structure describing the copy parameters.

Each source region specified by `pCopyBufferInfo->pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `pCopyBufferInfo->srcBuffer` overlaps in memory with any of the specified regions in `pCopyBufferInfo->dstBuffer`, values read from those overlapping regions are undefined.

### Valid Usage

- VUID-vkCmdCopyBuffer2-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer2-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer2-commandBuffer-01824
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

### Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter
  `pCopyBufferInfo` must be a valid pointer to a valid `VkCopyBufferInfo2` structure

- VUID-vkCmdCopyBuffer2-commandBuffer-recording

1158
**commandBuffer** must be in the **recording state**

- VUID-vkCmdCopyBuffer2-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support transfer, graphics, or compute operations

- VUID-vkCmdCopyBuffer2-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdCopyBuffer2-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tbody>
</table>

The **VkCopyBufferInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferCopy2* pRegions;
} VkCopyBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **srcBuffer** is the source buffer.
• **dstBuffer** is the destination buffer.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of **VkBufferCopy2** structures specifying the regions to copy.

### Valid Usage

- VUID-VkCopyBufferInfo2-srcOffset-00113
  The **srcOffset** member of each element of **pRegions** must be less than the size of **srcBuffer**
- VUID-VkCopyBufferInfo2-dstOffset-00114
  The **dstOffset** member of each element of **pRegions** must be less than the size of **dstBuffer**
- VUID-VkCopyBufferInfo2-size-00115
  The **size** member of each element of **pRegions** must be less than or equal to the size of **srcBuffer** minus **srcOffset**
- VUID-VkCopyBufferInfo2-size-00116
  The **size** member of each element of **pRegions** must be less than or equal to the size of **dstBuffer** minus **dstOffset**
- VUID-VkCopyBufferInfo2-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of **pRegions**, must not overlap in memory
- VUID-VkCopyBufferInfo2-srcBuffer-00118
  **srcBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag
- VUID-VkCopyBufferInfo2-dstBuffer-00119
  If **srcBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object
- VUID-VkCopyBufferInfo2-dstBuffer-00120
  **dstBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag
- VUID-VkCopyBufferInfo2-dstBuffer-00121
  If **dstBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

### Valid Usage (Implicit)

- VUID-VkCopyBufferInfo2-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2**
- VUID-VkCopyBufferInfo2-pNext-pNext
  **pNext** must be NULL
- VUID-VkCopyBufferInfo2-srcBuffer-parameter
  **srcBuffer** must be a valid **VkBuffer** handle
• VUID-VkCopyBufferInfo2-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-VkCopyBufferInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferCopy2 structures

• VUID-VkCopyBufferInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkCopyBufferInfo2-commonparent
Both of dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

The VkBufferCopy2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy2-size-01988
  The size must be greater than 0

Valid Usage (Implicit)

• VUID-VkBufferCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COPY_2
19.2. Copying Data Between Images

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source image to the destination region of the destination image. If any of the specified regions in `srcImage` overlaps in memory with any of the specified regions in `dstImage`, values read from those overlapping regions are undefined.

**Multi-planar images** can only be copied on a per-plane basis, and the subresources used in each region when copying to or from such images must specify only one plane, though different regions can specify different planes. When copying planes of multi-planar images, the format considered is the compatible format for that plane, rather than the format of the multi-planar image.

If the format of the destination image has a different block extent than the source image (e.g. one is a compressed format), the offset and extent for each of the regions specified is scaled according to the block extents of each format to match in size. Copy regions for each image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

Image data can be copied between images with different image types. If one image is `VK_IMAGE_TYPE_3D` and the other image is `VK_IMAGE_TYPE_2D` with multiple layers, then each slice is copied to or from a different layer; depth slices in the 3D image correspond to `layerCount` layers in the 2D image, with an effective depth of 1 used for the 2D image. If `maintenance5` is enabled, all other combinations are allowed and function as if 1D images are 2D images with a height of 1. Otherwise,
other combinations of image types are disallowed.

Valid Usage

- VUID-vkCmdCopyImage-commandBuffer-01825
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

- VUID-vkCmdCopyImage-commandBuffer-01826
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image.

- VUID-vkCmdCopyImage-commandBuffer-01827
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image.

- VUID-vkCmdCopyImage-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- VUID-vkCmdCopyImage-srcImage-01995
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- VUID-vkCmdCopyImage-srcImageLayout-00128
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyImage-srcImageLayout-01917
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-vkCmdCopyImage-srcImage-09460
  If `srcImage` and `dstImage` are the same, and any elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyImage-dstImage-01996
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- VUID-vkCmdCopyImage-dstImageLayout-00133
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdCopyImage-dstImageLayout-01395
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-vkCmdCopyImage-dstImage-01548
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a multi-planar format, the `VkFormat` of each of `srcImage` and `dstImage` must be size-compatible.

- VUID-vkCmdCopyImage-None-01549
  In a copy to or from a plane of a multi-planar image, the `VkFormat` of the image and plane...
**must** be compatible according to the description of compatible planes for the plane being copied

- VUID-vkCmdCopyImage-srcImage-09247
  If the VkFormat of each of srcImage and dstImage is a compressed image format, the formats **must** have the same texel block extent

- VUID-vkCmdCopyImage-srcImage-00136
  The sample count of srcImage and dstImage **must** match

- VUID-vkCmdCopyImage-srcOffset-01783
  The srcOffset and extent members of each element of pRegions **must** respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-dstOffset-01784
  The dstOffset and extent members of each element of pRegions **must** respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask **must** match

- VUID-vkCmdCopyImage-srcImage-08713
  If srcImage has a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask **must** be a single valid multi-planar aspect mask bit

- VUID-vkCmdCopyImage-dstImage-08714
  If dstImage has a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask **must** be a single valid multi-planar aspect mask bit

- VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask **must** be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdCopyImage-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask **must** be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdCopyImage-apiVersion-07932
  If the VK_KHR_maintenance1 extension is not enabled, or VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer **must** both be 0, and srcSubresource.layerCount and dstSubresource.layerCount **must** both be 1

- VUID-vkCmdCopyImage-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer **must** be 0 and srcSubresource.layerCount **must** be 1

- VUID-vkCmdCopyImage-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions,
dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

- VUID-vkCmdCopyImage-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-vkCmdCopyImage-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-vkCmdCopyImage-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcImage-00146
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

- VUID-vkCmdCopyImage-srcImage-00147
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

- VUID-vkCmdCopyImage-dstImage-01786
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

- VUID-vkCmdCopyImage-srcImage-01787
  If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0

- VUID-vkCmdCopyImage-dstImage-01788
  If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0

- VUID-vkCmdCopyImage-apiVersion-07933
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage and dstImage must have the same VkImageType

- VUID-vkCmdCopyImage-apiVersion-08969
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage or dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-vkCmdCopyImage-srcImage-07743
If `srcImage` and `dstImage` have a different `VkImageType`, and maintenance5 is not enabled, one must be `VK_IMAGE_TYPE_3D` and the other must be `VK_IMAGE_TYPE_2D`.

- **VUID-vkCmdCopyImage-srcImage-08793**
  If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, if neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` must match.

- **VUID-vkCmdCopyImage-srcImage-08794**
  If `srcImage` and `dstImage` have the same `VkImageType`, and one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`.

- **VUID-vkCmdCopyImage-srcImage-01790**
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be 1.

- **VUID-vkCmdCopyImage-srcImage-01791**
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `srcSubresource.layerCount`.

- **VUID-vkCmdCopyImage-dstImage-01792**
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`.

- **VUID-vkCmdCopyImage-dstOffset-00150**
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-dstOffset-00151**
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-dstOffset-00152**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.

- **VUID-vkCmdCopyImage-dstOffset-00153**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

- **VUID-vkCmdCopyImage-pRegions-07278**
  For each element of `pRegions`, `srcOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

- **VUID-vkCmdCopyImage-pRegions-07279**
  For each element of `pRegions`, `srcOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

- **VUID-vkCmdCopyImage-pRegions-07280**
For each element of `pRegions`, `srcOffset.z` must be a multiple of the texel block extent \textit{depth} of the \textit{VkFormat} of `srcImage`

- VUID-vkCmdCopyImage-pRegions-07281
  For each element of `pRegions`, `dstOffset.x` must be a multiple of the texel block extent \textit{width} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-pRegions-07282
  For each element of `pRegions`, `dstOffset.y` must be a multiple of the texel block extent \textit{height} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-pRegions-07283
  For each element of `pRegions`, `dstOffset.z` must be a multiple of the texel block extent \textit{depth} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-srcImage-01728
  For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent \textit{width} of the \textit{VkFormat} of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01729
  For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent \textit{height} of the \textit{VkFormat} of `srcImage`

- VUID-vkCmdCopyImage-srcImage-01730
  For each element of `pRegions`, if the sum of `srcOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent \textit{depth} of the \textit{VkFormat} of `srcImage`

- VUID-vkCmdCopyImage-dstImage-01732
  For each element of `pRegions`, if the sum of `dstOffset.x` and `extent.width` does not equal the width of the subresource specified by `dstSubresource`, `extent.width` must be a multiple of the texel block extent \textit{width} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-dstImage-01733
  For each element of `pRegions`, if the sum of `dstOffset.y` and `extent.height` does not equal the height of the subresource specified by `dstSubresource`, `extent.height` must be a multiple of the texel block extent \textit{height} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-dstImage-01734
  For each element of `pRegions`, if the sum of `dstOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `dstSubresource`, `extent.depth` must be a multiple of the texel block extent \textit{depth} of the \textit{VkFormat} of `dstImage`

- VUID-vkCmdCopyImage-aspect-06662
  If the `aspect` member of any element of `pRegions` includes any flag other than \textit{VK_IMAGE_ASPECT_STENCIL_BIT} or `srcImage` was not created with \textit{separate stencil usage}, \textit{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} must have been included in the \textit{VkImageCreateInfo}::\textit{usage} used to create `srcImage`

- VUID-vkCmdCopyImage-aspect-06663
  If the `aspect` member of any element of `pRegions` includes any flag other than \textit{VK_IMAGE_ASPECT_STENCIL_BIT} or `dstImage` was not created with \textit{separate stencil usage},
VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create dstImage

- VUID-vkCmdCopyImage-aspect-06664
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- VUID-vkCmdCopyImage-aspect-06665
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

- VUID-vkCmdCopyImage-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-srcSubresource-07967
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

Valid Usage (Implicit)

- VUID-vkCmdCopyImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdCopyImage-srcImageLayout-parameter
srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyImage-dstImage-parameter
dstImage must be a valid VkImage handle

- VUID-vkCmdCopyImage-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyImage-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkImageCopy structures

- VUID-vkCmdCopyImage-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdCopyImage-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImage-renderpass
This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImage-videocoding
This command must only be called outside of a video coding scope

- VUID-vkCmdCopyImage-regionCount-arraylength
regionCount must be greater than 0

- VUID-vkCmdCopyImage-commonparent
Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

---

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

The VkImageCopy structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy;

• `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.

• `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.

• `extent` is the size in texels of the image to copy in width, height and depth.

Valid Usage

• VUID-VkImageCopy-apiVersion-07940
  If the `VK_KHR_sampler_ycbcr_conversion` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `aspectMask` member of `srcSubresource` and `dstSubresource` must match

• VUID-VkImageCopy-apiVersion-07941
  If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `layerCount` member of `srcSubresource` and `dstSubresource` must match

• VUID-VkImageCopy-extent-06668
  `extent.width` must not be 0

• VUID-VkImageCopy-extent-06669
  `extent.height` must not be 0

• VUID-VkImageCopy-extent-06670
  `extent.depth` must not be 0

Valid Usage (Implicit)

• VUID-VkImageCopy-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

• VUID-VkImageCopy-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

The `VkImageSubresourceLayers` structure is defined as:
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;

- `aspectMask` is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- `mipLevel` is the mipmap level to copy
- `baseArrayLayer` and `layerCount` are the starting layer and number of layers to copy.

**Valid Usage**

- VUID-VkImageSubresourceLayers-aspectMask-00167
  If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it must not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageSubresourceLayers-aspectMask-00168
  `aspectMask` must not contain `VK_IMAGE_ASPECT_METADATA_BIT`

- VUID-VkImageSubresourceLayers-layerCount-09243
  If the `maintenance5` feature is not enabled, `layerCount` must not be `VK_REMAINING_ARRAY_LAYERS`

- VUID-VkImageSubresourceLayers-layerCount-01700
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it must be greater than 0

**Valid Usage (Implicit)**

- VUID-VkImageSubresourceLayers-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
  `aspectMask` must not be 0

A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
void vkCmdCopyImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageInfo` is a pointer to a `VkCopyImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyImage2-commandBuffer-01825**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdCopyImage2-commandBuffer-01826**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyImage2-commandBuffer-01827**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImage2-pCopyImageInfo-parameter**
  `pCopyImageInfo` must be a valid pointer to a valid `VkCopyImageInfo2` structure

- **VUID-vkCmdCopyImage2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImage2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyImage2-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tbody>
</table>

The `VkCopyImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.
Valid Usage

- VUID-VkCopyImageInfo2-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- VUID-VkCopyImageInfo2-srcImage-01995
  The format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- VUID-VkCopyImageInfo2-srcImageLayout-00128
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- VUID-VkCopyImageInfo2-srcImageLayout-01917
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-VkCopyImageInfo2-srcImage-09460
  If `srcImage` and `dstImage` are the same, and any elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- VUID-VkCopyImageInfo2-dstImage-01996
  The format features of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-VkCopyImageInfo2-dstImageLayout-00133
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- VUID-VkCopyImageInfo2-dstImageLayout-01395
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- VUID-VkCopyImageInfo2-srcImage-01548
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a **multi-planar format**, the `VkFormat` of each of `srcImage` and `dstImage` **must** be **size-compatible**

- VUID-VkCopyImageInfo2-None-01549
  In a copy to or from a plane of a **multi-planar image**, the `VkFormat` of the image and plane **must** be compatible according to the description of compatible planes for the plane being copied

- VUID-VkCopyImageInfo2-srcImage-00136
  The sample count of `srcImage` and `dstImage` **must** match

- VUID-VkCopyImageInfo2-srcOffset-01783
  The `srcOffset` and `extent` members of each element of `pRegions` **must** respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`
The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties.

If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match.

If srcImage has a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be a single valid multi-planar aspect mask.

If dstImage has a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be a single valid multi-planar aspect mask.

If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage.

For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage.

For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage.
For each element of \( pRegions \), \( srcOffset.y \) and \( (extent.height + srcOffset.y) \) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of \( pRegions \), srcOffset.y must be 0 and extent.height must be 1.

If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of \( pRegions \), srcOffset.z and \( (extent.depth + srcOffset.z) \) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of \( pRegions \), srcOffset.z must be 0 and extent.depth must be 1.

If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of \( pRegions \), srcOffset.z must be 0.

If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of \( pRegions \), dstOffset.z must be 0 and extent.depth must be 1.

If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of \( pRegions \), dstOffset.z must be 0.

If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage and dstImage must have the same VkImageType.

If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage or dstImage is of type VK_IMAGE_TYPE_2D, then for each element of \( pRegions \), extent.depth must be 1.

If srcImage and dstImage have a different VkImageType, and maintenance5 is not enabled, one must be VK_IMAGE_TYPE_3D and the other must be VK_IMAGE_TYPE_2D.

If srcImage and dstImage have the same VkImageType, for each element of \( pRegions \), if neither of the layerCount members of srcSubresource or dstSubresource are VK_REMAINING_ARRAY_LAYERS, the layerCount members of srcSubresource or dstSubresource must match.

If srcImage and dstImage have the same VkImageType, and one of the layerCount members of srcSubresource or dstSubresource is VK_REMAINING_ARRAY_LAYERS, the other member must be either VK_REMAINING_ARRAY_LAYERS or equal to the arrayLayers member of the
VkImageCreateInfo used to create the image minus baseArrayLayer

- VUID-VkCopyImageInfo2-srcImage-01790
  If srcImage and dstImage are both of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-VkCopyImageInfo2-srcImage-01791
  If srcImage is of type VK_IMAGE_TYPE_2D, and dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, extent.depth must equal srcSubresource.layerCount

- VUID-VkCopyImageInfo2-dstImage-01792
  If dstImage is of type VK_IMAGE_TYPE_2D, and srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, extent.depth must equal dstSubresource.layerCount

- VUID-VkCopyImageInfo2-dstOffset-00150
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2-dstOffset-00151
  For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2-dstImage-00152
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

- VUID-VkCopyImageInfo2-dstOffset-00153
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkCopyImageInfo2-pRegions-07278
  For each element of pRegions, srcOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-pRegions-07279
  For each element of pRegions, srcOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-pRegions-07280
  For each element of pRegions, srcOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-VkCopyImageInfo2-pRegions-07281
  For each element of pRegions, dstOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-pRegions-07282
  For each element of pRegions, dstOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyImageInfo2-pRegions-07283
  For each element of pRegions, dstOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage
For each element of \( \text{pRegions} \), if the sum of \( \text{srcOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the VkFormat of \( \text{srcImage} \).

For each element of \( \text{pRegions} \), if the sum of \( \text{srcOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.height} \) must be a multiple of the texel block extent height of the VkFormat of \( \text{srcImage} \).

For each element of \( \text{pRegions} \), if the sum of \( \text{srcOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the VkFormat of \( \text{srcImage} \).

For each element of \( \text{pRegions} \), if the sum of \( \text{dstOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the VkFormat of \( \text{dstImage} \).

For each element of \( \text{pRegions} \), if the sum of \( \text{dstOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.height} \) must be a multiple of the texel block extent height of the VkFormat of \( \text{dstImage} \).

For each element of \( \text{pRegions} \), if the sum of \( \text{dstOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the VkFormat of \( \text{dstImage} \).

If the aspect member of any element of \( \text{pRegions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{srcImage} \) was not created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} \) must have been included in the VkImageCreateInfo::usage used to create \( \text{srcImage} \).

If the aspect member of any element of \( \text{pRegions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{dstImage} \) was not created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_DST_BIT} \) must have been included in the VkImageCreateInfo::usage used to create \( \text{dstImage} \).

If the aspect member of any element of \( \text{pRegions} \) includes \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \), and \( \text{srcImage} \) was created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} \) must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create \( \text{srcImage} \).

If the aspect member of any element of \( \text{pRegions} \) includes \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \), and \( \text{dstImage} \) was created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_DST_BIT} \) must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create \( \text{dstImage} \).
• **VUID-VkCopyImageInfo2-srcImage-07966**
  If `srcImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-VkCopyImageInfo2-srcSubresource-07967**
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

• **VUID-VkCopyImageInfo2-srcSubresource-07968**
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

• **VUID-VkCopyImageInfo2-dstImage-07966**
  If `dstImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-VkCopyImageInfo2-dstSubresource-07967**
  The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

• **VUID-VkCopyImageInfo2-dstSubresource-07968**
  If `dstSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

**Valid Usage (Implicit)**

• **VUID-VkCopyImageInfo2-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2`.

• **VUID-VkCopyImageInfo2-pNext-pNext**
  `pNext` **must** be `NULL`.

• **VUID-VkCopyImageInfo2-srcImage-parameter**
  `srcImage` **must** be a valid `VkImage` handle.

• **VUID-VkCopyImageInfo2-srcImageLayout-parameter**
  `srcImageLayout` **must** be a valid `VkImageLayout` value.

• **VUID-VkCopyImageInfo2-dstImage-parameter**
  `dstImage` **must** be a valid `VkImage` handle.

• **VUID-VkCopyImageInfo2-dstImageLayout-parameter**
  `dstImageLayout` **must** be a valid `VkImageLayout` value.

• **VUID-VkCopyImageInfo2-pRegions-parameter**
  `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageCopy2` structures.

• **VUID-VkCopyImageInfo2-regionCount-arraylength**
  `regionCount` **must** be greater than 0.
Both of `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkImageCopy2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageCopy2 VkImageCopy2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in `width`, `height` and `depth`.

### Valid Usage

- **VUID-VkImageCopy2-apiVersion-07940**
  If the `VK_KHR_sampler_ycbcr_conversion` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `aspectMask` member of `srcSubresource` and `dstSubresource` must match.

- **VUID-VkImageCopy2-apiVersion-07941**
  If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `layerCount` member of `srcSubresource` and `dstSubresource` must match.

- **VUID-VkImageCopy2-extent-06668**
  `extent.width` must not be 0.

- **VUID-VkImageCopy2-extent-06669**
  `extent.width` must not be 0.
extent.height must not be 0

- VUID-VkImageCopy2-extent-06670
  extent.depth must not be 0

**Valid Usage (Implicit)**

- VUID-VkImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_COPY_2

- VUID-VkImageCopy2-pNext-pNext
  pNext must be NULL

- VUID-VkImageCopy2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageCopy2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

### 19.3. Copying Data Between Buffers and Images

Data can be copied between buffers and images, enabling applications to load and store data between images and application-defined offsets in buffer memory.

When copying between a buffer and an image, whole texel blocks are always copied; each texel block in the specified extent in the image to be copied will be written to a region in the buffer, specified according to the position of the texel block, and the texel block extent and size of the format being copied.

For a set of coordinates (x,y,z,layer), where:

\[
x \text{ is in the range } \left[ \frac{\text{imageOffset.x}}{\text{blockWidth}}, \left\lceil \frac{\text{imageOffset.x} + \text{imageExtent.width}}{\text{blockWidth}} \right\rceil \right],
\]

\[
y \text{ is in the range } \left[ \frac{\text{imageOffset.y}}{\text{blockHeight}}, \left\lceil \frac{\text{imageOffset.y} + \text{imageExtent.height}}{\text{blockHeight}} \right\rceil \right],
\]

\[
z \text{ is in the range } \left[ \frac{\text{imageOffset.z}}{\text{blockDepth}}, \left\lceil \frac{\text{imageOffset.z} + \text{imageExtent.depth}}{\text{blockDepth}} \right\rceil \right],
\]

\[
\text{layer is in the range } \left[ \frac{\text{imageSubresource.baseArrayLayer}}{\text{imageSubresource.layerCount}}, \text{imageSubresource.baseArrayLayer} + \frac{\text{imageSubresource.layerCount}}{\text{imageSubresource.layerCount}} \right],
\]

and where blockWidth, blockHeight, and blockDepth are the dimensions of the texel block extent of the image's format.
For each \((x,y,z,\text{layer})\) coordinate, texels in the image layer selected by \(\text{layer}\) are accessed in the following ranges:

\[
[x \times \text{blockWidth}, \max((x \times \text{blockWidth}) + \text{blockWidth}, \text{imageWidth})] \\
[y \times \text{blockHeight}, \max((y \times \text{blockHeight}) + \text{blockHeight}, \text{imageHeight})] \\
[z \times \text{blockDepth}, \max((z \times \text{blockDepth}) + \text{blockDepth}, \text{imageDepth})]
\]

where \(\text{imageWidth}\), \(\text{imageHeight}\), and \(\text{imageDepth}\) are the dimensions of the image subresource.

For each \((x,y,z,\text{layer})\) coordinate, bytes in the buffer are accessed at offsets in the range \([\text{texelOffset}, \text{texelOffset} + \text{blockSize}]\), where:

\[
\text{texelOffset} = \text{bufferOffset} + (x \times \text{blockSize}) + (y \times \text{rowExtent}) + (z \times \text{sliceExtent}) + (\text{layer} \times \text{layerExtent})
\]

\(\text{blockSize}\) is the size of the block in bytes for the format

\[
\text{rowExtent} = \max(\text{bufferRowLength}, \lceil \text{imageExtent.width} / \text{blockWidth} \rceil \times \text{blockSize})
\]

\[
\text{sliceExtent} = \max(\text{bufferImageHeight}, \text{imageExtent.height} \times \text{rowExtent})
\]

\[
\text{layerExtent} = \text{imageExtent.depth} \times \text{sliceExtent}
\]

When copying between a buffer and the depth or stencil aspect of an image, data in the buffer is assumed to be laid out as separate planes rather than interleaved. Addressing calculations are thus performed for a different format than the base image, according to the aspect, as described in the following table:

\begin{center}
\textbf{Table 24. Depth/Stencil Aspect Copy Table}
\begin{tabular}{|c|c|c|}
\hline
\textbf{Base Format} & \textbf{Depth Aspect Format} & \textbf{Stencil Aspect Format} \\
\hline
VK\_FORMAT\_D16\_UNORM & VK\_FORMAT\_D16\_UNORM & - \\
VK\_FORMAT\_X8\_D24\_UNORM\_PACK32 & VK\_FORMAT\_X8\_D24\_UNORM\_PACK32 & - \\
VK\_FORMAT\_D32\_SFLOAT & VK\_FORMAT\_D32\_SFLOAT & - \\
VK\_FORMAT\_S8\_UINT & - & VK\_FORMAT\_S8\_UINT \\
VK\_FORMAT\_D16\_UNORM\_S8\_UINT & VK\_FORMAT\_D16\_UNORM & VK\_FORMAT\_S8\_UINT \\
VK\_FORMAT\_D24\_UNORM\_S8\_UINT & VK\_FORMAT\_X8\_D24\_UNORM\_PACK32 & VK\_FORMAT\_S8\_UINT \\
\hline
\end{tabular}
\end{center}
When copying between a buffer and any plane of a **multi-planar image**, addressing calculations are performed using the **compatible format for that plane**, rather than the format of the multi-planar image.

Each texel block is copied from one resource to the other according to the above addressing equations.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source buffer to the destination region of the destination image according to the **addressing calculations** for each resource. If any of the specified regions in `srcBuffer` overlaps in memory with any of the specified regions in `dstImage`, values read from those overlapping regions are undefined. If any region accesses a depth aspect in `dstImage` and the **VK_EXT_depth_range_unrestricted** extension is not enabled, values copied from `srcBuffer` outside of the range [0,1] will be written as undefined values to the destination image.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- VUID-vkCmdCopyBufferToImage-dstImage-07966
  If `dstImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object
- VUID-vkCmdCopyBufferToImage-imageSubresource-07967

The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07968**
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07970**
  The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `dstImage`.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07971**
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage`.

- **VUID-vkCmdCopyBufferToImage-imageSubresource-07972**
  For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`.

- **VUID-vkCmdCopyBufferToImage-dstImage-07973**
  `dstImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01828**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer.

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01829**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image.

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01830**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image.

- **VUID-vkCmdCopyBufferToImage-commandBuffer-07737**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

- **VUID-vkCmdCopyBufferToImage-imageOffset-07738**
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

- **VUID-vkCmdCopyBufferToImage-commandBuffer-07739**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pRegions`, the `aspectMask` member of `imageSubresource` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.  

1184
VUID-vkCmdCopyBufferToImage-pRegions-00171

srcBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of pRegions.

VUID-vkCmdCopyBufferToImage-pRegions-00173

The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory.

VUID-vkCmdCopyBufferToImage-srcBuffer-00174

dstImage must have been created with VK_BUFFER_USAGE_TRANSFER_SRC_BIT usage flag.

VUID-vkCmdCopyBufferToImage-dstImage-00176

The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT.

VUID-vkCmdCopyBufferToImage-imageOffset-09104

For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage.

VUID-vkCmdCopyBufferToImage-dstImage-07274

For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage.

VUID-vkCmdCopyBufferToImage-dstImage-07275

For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage.

VUID-vkCmdCopyBufferToImage-dstImage-07276

For each element of pRegions, imageOffset.z must be a multiple of the texel block extent...
depth of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-00207**
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-00208**
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-00209**
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-00208**
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-07981**
  If dstImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- **VUID-vkCmdCopyBufferToImage-dstImage-07983**
  If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- **VUID-vkCmdCopyBufferToImage-dstImage-07986**
  For each element of pRegions, bufferRowLength must be a multiple of the texel block extent width of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-07987**
  For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of dstImage

- **VUID-vkCmdCopyBufferToImage-dstImage-07988**
  For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of dstImage must be less than or equal to $2^{31} - 1$

- **VUID-vkCmdCopyBufferToImage-dstImage-07975**
  If dstImage does not have either a depth/stencil format or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the texel block size

- **VUID-vkCmdCopyBufferToImage-dstImage-07976**
  If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible Formats of Planes of Multi-Planar Formats

- **VUID-vkCmdCopyBufferToImage-dstImage-07978**
  If dstImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4
Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyBufferToImage-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle

- VUID-vkCmdCopyBufferToImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyBufferToImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy structures

- VUID-vkCmdCopyBufferToImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBufferToImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBufferToImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdCopyBufferToImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdCopyBufferToImage-commonparent
  Each of commandBuffer, dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source image to the destination region of the destination buffer according to the addressing calculations for each resource. If any of the specified regions in `srcImage` overlaps in memory with any of the specified regions in `dstBuffer`, values read from those overlapping regions are undefined.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- VUID-vkCmdCopyImageToBuffer-srcImage-07966
  If `srcImage` is non-sparse then the image or the specified `disjoint` plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyImageToBuffer-imageSubresource-07967
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created
If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `srcImage`.

For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `srcImage`.

For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `srcImage`.

`srcImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer.

If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

dstBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.
srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag.

The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT.

dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag.

If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice.

srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1.

For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage.

If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1.

For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage.

For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage.

For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage.

For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage.

For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage.
For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage.

For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage.

If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit.

If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1.

For each element of pRegions, bufferRowLength must be a multiple of the texel block extent width of the VkFormat of srcImage.

For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of srcImage.

For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of srcImage must be less than or equal to $2^{31} - 1$.

If srcImage does not have either a depth/stencil format or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the texel block size.

If srcImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible Formats of Planes of Multi-Planar Formats.

If srcImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4.

Valid Usage (Implicit)

- commandBuffer must be a valid VkCommandBuffer handle
- srcImage must be a valid VkImage handle
- srcImageLayout must be a valid VkImageLayout value
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

For both vkCmdCopyBufferToImage and vkCmdCopyImageToBuffer, each element of pRegions is a structure defined as:
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;

• bufferOffset is the offset in bytes from the start of the buffer object where the image data is copied from or to.

• bufferRowLength and bufferImageHeight specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the imageExtent.

• imageSubresource is a VkImageSubresourceLayers used to specify the specific image subresources of the image used for the source or destination image data.

• imageOffset selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.

• imageExtent is the size in texels of the image to copy in width, height and depth.

Valid Usage

• VUID-VkBufferImageCopy-bufferRowLength-09101
  bufferRowLength must be 0, or greater than or equal to the width member of imageExtent

• VUID-VkBufferImageCopy-bufferImageHeight-09102
  bufferImageHeight must be 0, or greater than or equal to the height member of imageExtent

• VUID-VkBufferImageCopy-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set

• VUID-VkBufferImageCopy-imageExtent-06659
  imageExtent.width must not be 0

• VUID-VkBufferImageCopy-imageExtent-06660
  imageExtent.height must not be 0

• VUID-VkBufferImageCopy-imageExtent-06661
  imageExtent.depth must not be 0

Valid Usage (Implicit)

• VUID-VkBufferImageCopy-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure
More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBufferToImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01828**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01829**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01830**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07737**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyBufferToImageInfo->pRegions` must be a multiple of 4

- **VUID-vkCmdCopyBufferToImage2-imageOffset-07738**
  The `imageOffset` and `imageExtent` members of each element of `pCopyBufferToImageInfo->pRegions` must respect the image transfer granularity requirements of `commandBuffer`’s command pool’s queue family, as described in `VkQueueFamilyProperties`

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07739**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated
from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pCopyBufferToImageInfo->pRegions, the aspectMask member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

Valid Usage (Implicit)

- VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter pCopyBufferToImageInfo must be a valid pointer to a valid VkCopyBufferToImageInfo2 structure
- VUID-vkCmdCopyBufferToImage2-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdCopyBufferToImage2-renderpass This command must only be called outside of a render pass instance
- VUID-vkCmdCopyBufferToImage2-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkCopyBufferToImageInfo2 structure is defined as:
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferToImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyBufferToImageInfo2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **srcBuffer** is the source buffer.
• **dstImage** is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the copy.
• **regionCount** is the number of regions to copy.
• **pRegions** is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

### Valid Usage

- **VUID-VkCopyBufferToImageInfo2-pRegions-04565**
  The image region specified by each element of **pRegions** must be contained within the specified imageSubresource of **dstImage**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00171**
  **srcBuffer** must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of **pRegions**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00174**
  **srcBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkCopyBufferToImageInfo2-dstImage-01997**
  The format features of **dstImage** must contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00176**
If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- `VID-VkCopyBufferToImageInfo2-dstImage-00177` 
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- `VID-VkCopyBufferToImageInfo2-dstImageLayout-00180` 
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- `VID-VkCopyBufferToImageInfo2-dstImageLayout-01396` 
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- `VID-VkCopyBufferToImageInfo2-pRegions-07931` 
  If `VK_EXT_depth_range_unrestricted` is not enabled, for each element of `pRegions` whose `imageSubresource` contains a depth aspect, the data in `srcBuffer` **must** be in the range [0,1]

- `VID-VkCopyBufferToImageInfo2-dstImage-07966` 
  If `dstImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- `VID-VkCopyBufferToImageInfo2-imageSubresource-07967` 
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- `VID-VkCopyBufferToImageInfo2-imageSubresource-07968` 
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer` + `imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

- `VID-VkCopyBufferToImageInfo2-dstImage-07973` 
  `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- `VID-VkCopyBufferToImageInfo2-dstImage-07979` 
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` **must** be 0 and `imageExtent.height` **must** be 1

- `VID-VkCopyBufferToImageInfo2-imageOffset-09104` 
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` **must** both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`

- `VID-VkCopyBufferToImageInfo2-dstImage-07980` 
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` **must** be 0 and `imageExtent.depth` **must** be 1

- `VID-VkCopyBufferToImageInfo2-dstImage-07274` 
  For each element of `pRegions`, `imageOffset.x` **must** be a multiple of the texel block extent width of the `VkFormat` of `dstImage`

- `VID-VkCopyBufferToImageInfo2-dstImage-07275` 
  For each element of `pRegions`, `imageOffset.y` **must** be a multiple of the texel block extent
For each element of \( pRegions \), \( \text{imageOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \).

For each element of \( pRegions \), if the sum of \( \text{imageOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \).

For each element of \( pRegions \), if the sum of \( \text{imageOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \).

For each element of \( pRegions \), \( \text{imageSubresource.aspectMask} \) must specify aspects present in \( \text{dstImage} \).

If \( \text{dstImage} \) has a multi-planar image format, then for each element of \( pRegions \), \( \text{imageSubresource.aspectMask} \) must be a single valid multi-planar aspect mask bit.

If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), for each element of \( pRegions \), \( \text{imageSubresource.baseArrayLayer} \) must be 0 and \( \text{imageSubresource.layerCount} \) must be 1.

For each element of \( pRegions \), \( \text{bufferRowLength} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \).

For each element of \( pRegions \), \( \text{bufferImageHeight} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{dstImage} \).

For each element of \( pRegions \), \( \text{bufferRowLength} \) divided by the texel block extent width and then multiplied by the texel block size of \( \text{dstImage} \) must be less than or equal to \( 2^{31}-1 \).

If \( \text{dstImage} \) does not have either a depth/stencil format or a multi-planar format, then for each element of \( pRegions \), \( \text{bufferOffset} \) must be a multiple of the texel block size.

If \( \text{dstImage} \) has a multi-planar format, then for each element of \( pRegions \), \( \text{bufferOffset} \) must be a multiple of the element size of the compatible format for the format and the aspectMask of the \( \text{imageSubresource} \) as defined in Compatible Formats of Planes of Multi-Planar Formats.
If `dstImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage`.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2`
- `pNext` must be `NULL`
- `srcBuffer` must be a valid `VkBuffer` handle
- `dstImage` must be a valid `VkImage` handle
- `dstImageLayout` must be a valid `VkImageLayout` value
- `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2` structures
- `regionCount` must be greater than 0
- Both of `dstImage`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImageToBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```
```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-07746**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyImageToBufferInfo->pRegions` must be a multiple of 4.

- **VUID-vkCmdCopyImageToBuffer2-imageOffset-07747**
  The `imageOffset` and `imageExtent` members of each element of `pCopyImageToBufferInfo->pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter**
  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool**
The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImageToBuffer2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImageToBuffer2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

The `VkCopyImageToBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the copy.
- **dstBuffer** is the destination buffer.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkBufferImageCopy2** structures specifying the regions to copy.

### Valid Usage

- **VUID-VkCopyImageToBufferInfo2-pRegions-04566**
  The image region specified by each element of **pRegions** must be contained within the specified **imageSubresource** of **srcImage**

- **VUID-VkCopyImageToBufferInfo2-pRegions-00183**
  **dstBuffer** must be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- **VUID-VkCopyImageToBufferInfo2-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkCopyImageToBufferInfo2-srcImage-00186**
  **srcImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkCopyImageToBufferInfo2-srcImage-01998**
  The **format features** of **srcImage** must contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00191**
  **dstBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00192**
  If **dstBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397**
  **srcImageLayout** must be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**

- **VUID-VkCopyImageToBufferInfo2-srcImage-07966**
  If **srcImage** is non-sparse then the image or the specified **disjoint** plane must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07967**
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07968**
  If **imageSubresource.layerCount** is not **VK_REMAINING_ARRAY_LAYERS**,
imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

• VUID-VkCopyImageToBufferInfo2-srcImage-07973
  srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

• VUID-VkCopyImageToBufferInfo2-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-VkCopyImageToBufferInfo2-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

• VUID-VkCopyImageToBufferInfo2-srcImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-09105
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

• VUID-VkCopyImageToBufferInfo2-srcImage-07981
  If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31}-1$.

If `srcImage` does not have either a depth/stencil format or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the texel block size.

If `srcImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible Formats of Planes of Multi-Planar Formats.

If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `srcImage`.

For each element of `pRegions` not containing `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `srcImage`.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2`
- `pNext` must be `NULL`
- `srcImage` must be a valid `VkImage` handle
srcImageLayout must be a valid VkImageLayout value

- VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

- VUID-VkCopyImageToBufferInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy2 structures

- VUID-VkCopyImageToBufferInfo2-regionCount-arraylength
regionCount must be greater than 0

- VUID-VkCopyImageToBufferInfo2-commonparent
Both of dstBuffer, and srcImage must have been created, allocated, or retrieved from the same VkDevice

For both vkCmdCopyBufferToImage2 and vkCmdCopyImageToBuffer2, each element of pRegions is a structure defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkBufferImageCopy2 {
  VkStructureType sType;
  const void* pNext;
  VkDeviceSize bufferOffset;
  uint32_t bufferRowLength;
  uint32_t bufferImageHeight;
  VkImageSubresourceLayers imageSubresource;
  VkOffset3D imageOffset;
  VkExtent3D imageExtent;
} VkBufferImageCopy2;
```

or the equivalent

```
// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- bufferOffset is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- bufferRowLength and bufferImageHeight specify in texels a subregion of a larger two- or threedimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the imageExtent.
- imageSubresource is a VkImageSubresourceLayers used to specify the specific image subresources of the image used for the source or destination image data.
- imageOffset selects the initial x, y, z offsets in texels of the sub-region of the source or
destination image data.

- **imageExtent** is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to **VkBufferImageCopy**, but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

### Valid Usage

- **VUID-VkBufferImageCopy2-bufferRowLength-09101**
  bufferRowLength **must** be 0, or greater than or equal to the width member of imageExtent

- **VUID-VkBufferImageCopy2-bufferImageHeight-09102**
  bufferImageHeight **must** be 0, or greater than or equal to the height member of imageExtent

- **VUID-VkBufferImageCopy2-aspectMask-09103**
  The aspectMask member of imageSubresource **must** only have a single bit set

- **VUID-VkBufferImageCopy2-imageExtent-06659**
  imageExtent.width **must** not be 0

- **VUID-VkBufferImageCopy2-imageExtent-06660**
  imageExtent.height **must** not be 0

- **VUID-VkBufferImageCopy2-imageExtent-06661**
  imageExtent.depth **must** not be 0

### Valid Usage (Implicit)

- **VUID-VkBufferImageCopy2-sType-sType**
  sType **must** be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2

- **VUID-VkBufferImageCopy2-pNext-pNext**
  pNext **must** be NULL

- **VUID-VkBufferImageCopy2-imageSubresource-parameter**
  imageSubresource **must** be a valid VkImageSubresourceLayers structure

The following commands can be used to copy between host memory and images.

To copy data from host memory to an image object, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkCopyMemoryToImageEXT(
    VkDevice device,
    const VkCopyMemoryToImageInfoEXT* pCopyMemoryToImageInfo);
```

- **device** is the device which owns pCopyMemoryToImageInfo->dstImage.

- **pCopyMemoryToImageInfo** is a pointer to a VkCopyMemoryToImageInfoEXT structure describing the copy parameters.
This command is functionally similar to `vkCmdCopyBufferToImage2`, except it is executed on the host and reads from host memory instead of a buffer. The memory of `pCopyMemoryToImageInfo->dstImage` is accessed by the host as if coherent.

**Note**
Because queue submissions automatically make host memory visible to the device, there would not be a need for a memory barrier before using the results of this copy operation on the device.

### Valid Usage
- VUID-vkCopyMemoryToImageEXT-hostImageCopy-09058
  The `hostImageCopy` feature **must** be enabled

### Valid Usage (Implicit)
- VUID-vkCopyMemoryToImageEXT-device-parameter
device **must** be a valid `VkDevice` handle
- VUID-vkCopyMemoryToImageEXT-pCopyMemoryToImageInfo-parameter
  `pCopyMemoryToImageInfo` **must** be a valid pointer to a valid `VkCopyMemoryToImageInfoEXT` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_MEMORY_MAP_FAILED`

The `VkCopyMemoryToImageInfoEXT` structure is defined as:
typedef struct VkCopyMemoryToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkMemoryToImageCopyEXT* pRegions;
} VkCopyMemoryToImageInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkHostImageCopyFlagBitsEXT values describing additional copy parameters.
• dstImage is the destination image.
• dstImageLayout is the layout of the destination image subresources for the copy.
• regionCount is the number of regions to copy.
• pRegions is a pointer to an array of VkMemoryToImageCopyEXT structures specifying the regions to copy.

vkCopyMemoryToImageEXT does not check whether the device memory associated with dstImage is currently in use before performing the copy. The application must guarantee that any previously submitted command that reads from or writes to the copy regions has completed before the host performs the copy.

Copy regions for the image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

Valid Usage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09109
  If dstImage is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09111
  If the stencil aspect of dstImage is accessed, and dstImage was not created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09112
  If the stencil aspect of dstImage is accessed, and dstImage was created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageStencilUsageCreateInfo::stencilUsage

• VUID-VkCopyMemoryToImageInfoEXT-dstImage-09113
If non-stencil aspects of dstImage are accessed, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage

- **VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09114**
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the imageOffset member of each element of pRegions must be 0.

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09115**
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the imageExtent member of each element of pRegions must equal the extents of dstImage identified by imageSubresource.

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-07966**
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07967**
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07968**
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07970**
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of dstImage.

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07971**
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage.

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07972**
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage.

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-07973**
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-07979**
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1.

- **VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09104**
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage.

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-07980**
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of
pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-09105
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07981
  If dstImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07983
  If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-VkCopyMemoryToImageInfoEXT-memoryRowLength-09106
  For each element of pRegions, memoryRowLength must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-memoryImageHeight-09107
  For each element of pRegions, memoryImageHeight must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-memoryRowLength-09108
  For each element of pRegions, memoryRowLength divided by the texel block extent width and then multiplied by the texel block size of dstImage must be less than or equal to 2^{31} - 1

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-09059
  dstImageLayout must specify the current layout of the image subresources of dstImage
specified in pRegions

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-09060
dstImageLayout must be one of the image layouts returned in
VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts

- VUID-VkCopyMemoryToImageInfoEXT-flags-09393
If flags includes VK_HOST_IMAGE_COPY_MEMCPY_EXT, for each region in pRegions,
memoryRowLength and memoryImageHeight must both be 0

Valid Usage (Implicit)

- VUID-VkCopyMemoryToImageInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_IMAGE_INFO_EXT

- VUID-VkCopyMemoryToImageInfoEXT-pNext-pNext
pNext must be NULL

- VUID-VkCopyMemoryToImageInfoEXT-flags-parameter
flags must be a valid combination of VkHostImageCopyFlagBitsEXT values

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-parameter
dstImage must be a valid VkImage handle

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

- VUID-VkCopyMemoryToImageInfoEXT-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid
VkMemoryToImageCopyEXT structures

- VUID-VkCopyMemoryToImageInfoEXT-regionCount-arraylength
regionCount must be greater than 0

Each element of VkCopyMemoryToImageInfoEXT::pRegions is a structure defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkMemoryToImageCopyEXT {
    VkStructureType sType;
    const void* pNext;
    const void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkMemoryToImageCopyEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **pHostPointer** is the host memory address which is the source of the copy.

• **memoryRowLength** and **memoryImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the **imageExtent**.

• **imageSubresource** is a **VkImageSubresourceLayers** used to specify the specific image subresources of the image used for the source or destination image data.

• **imageOffset** selects the initial x, y, z offsets in texels of the sub-region of the destination image data.

• **imageExtent** is the size in texels of the image to copy in width, height and depth.

This structure is functionally similar to **VkBufferImageCopy2**, except it defines host memory as the source of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

---

**Valid Usage**

- VUID-VkMemoryToImageCopyEXT-pHostPointer-09061
  **pHostPointer** must point to memory that is large enough to contain all memory locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- VUID-VkMemoryToImageCopyEXT-pRegions-09062
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- VUID-VkMemoryToImageCopyEXT-memoryRowLength-09101
  **memoryRowLength** must be 0, or greater than or equal to the **width** member of **imageExtent**

- VUID-VkMemoryToImageCopyEXT-memoryImageHeight-09102
  **memoryImageHeight** must be 0, or greater than or equal to the **height** member of **imageExtent**

- VUID-VkMemoryToImageCopyEXT-aspectMask-09103
  The **aspectMask** member of **imageSubresource** must only have a single bit set

- VUID-VkMemoryToImageCopyEXT-imageExtent-06659
  **imageExtent.width** must not be 0

- VUID-VkMemoryToImageCopyEXT-imageExtent-06660
  **imageExtent.height** must not be 0

- VUID-VkMemoryToImageCopyEXT-imageExtent-06661
  **imageExtent.depth** must not be 0

**Valid Usage (Implicit)**

- VUID-VkMemoryToImageCopyEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_MEMORY_TO_IMAGE_COPY_EXT**

- VUID-VkMemoryToImageCopyEXT-pNext-pNext
pNext must be NULL

- VUID-VkMemoryToImageCopyEXT-pHostPointer-parameter
  pHostPointer must be a pointer value

- VUID-VkMemoryToImageCopyEXT-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

To copy data from an image object to host memory, call:

```
// Provided by VK_EXT_host_image_copy
VkResult vkCopyImageToMemoryEXT(
    VkDevice device,
    const VkCopyImageToMemoryInfoEXT* pCopyImageToMemoryInfo);
```

- device is the device which owns pCopyImageToMemoryInfo->srcImage.

- pCopyImageToMemoryInfo is a pointer to a VkCopyImageToMemoryInfoEXT structure describing the copy parameters.

This command is functionally similar to vkCmdCopyImageToBuffer2, except it is executed on the host and writes to host memory instead of a buffer. The memory of pCopyImageToMemoryInfo->srcImage is accessed by the host as if coherent.

Note

If the device has written to the image memory, it is not automatically made available to the host. Before this copy command can be called, a memory barrier for this image must have been issued on the device with the second synchronization scope including VK_PIPELINE_STAGE_HOST_BIT and VK_ACCESS_HOST_READ_BIT.

Valid Usage

- VUID-vkCopyImageToMemoryEXT-hostImageCopy-09063
  The hostImageCopy feature must be enabled

Valid Usage (Implicit)

- VUID-vkCopyImageToMemoryEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkCopyImageToMemoryEXT-pCopyImageToMemoryInfo-parameter
  pCopyImageToMemoryInfo must be a valid pointer to a valid VkCopyImageToMemoryInfoEXT structure
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_INITIALIZATION_FAILED
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_MEMORY_MAP_FAILED

The VkCopyImageToMemoryInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyImageToMemoryInfoEXT {
    VkStructureType sType;
    const void*pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    uint32_t regionCount;
    const VkImageToMemoryCopyEXT* pRegions;
} VkCopyImageToMemoryInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkHostImageCopyFlagBitsEXT` values describing additional copy parameters.
• `srcImage` is the source image.
• `srcImageLayout` is the layout of the source image subresources for the copy.
• `regionCount` is the number of regions to copy.
• `pRegions` is a pointer to an array of `VkImageToMemoryCopyEXT` structures specifying the regions to copy.

`vkCopyImageToMemoryEXT` does not check whether the device memory associated with `srcImage` is currently in use before performing the copy. The application must guarantee that any previously submitted command that writes to the copy regions has completed before the host performs the copy.

Copy regions for the image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.
Valid Usage

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09109
  If srcImage is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory.

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09111
  If the stencil aspect of srcImage is accessed, and srcImage was not created with separate stencil usage, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09112
  If the stencil aspect of srcImage is accessed, and srcImage was created with separate stencil usage, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageStencilUsageCreateInfo::stencilUsage.

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09113
  If non-stencil aspects of srcImage are accessed, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage.

• VUID-VkCopyImageToMemoryInfoEXT-imageOffset-09114
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the imageOffset member of each element of pRegions must be 0.

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-09115
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the imageExtent member of each element of pRegions must equal the extents of srcImage identified by imageSubresource.

• VUID-VkCopyImageToMemoryInfoEXT-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07967
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07968
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07970
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of srcImage.

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07971
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage.

• VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07972
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y)
must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07973
  srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

- VUID-VkCopyImageToMemoryInfoEXT-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07981
  If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07983
  If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit
If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1

- **VUID-VkCopyImageToMemoryInfoEXT-memoryRowLength-09106**
  For each element of `pRegions`, `memoryRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToMemoryInfoEXT-memoryImageHeight-09107**
  For each element of `pRegions`, `memoryImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToMemoryInfoEXT-memoryRowLength-09108**
  For each element of `pRegions`, `memoryRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to `2^{31}-1`

- **VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-09064**
  `srcImageLayout` must specify the current layout of the image subresources of `srcImage` specified in `pRegions`

- **VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-09065**
  `srcImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`

- **VUID-VkCopyImageToMemoryInfoEXT-flags-09394**
  If `flags` includes `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, for each region in `pRegions`, `memoryRowLength` and `memoryImageHeight` must both be 0

### Valid Usage (Implicit)

- **VUID-VkCopyImageToMemoryInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_MEMORY_INFO_EXT`

- **VUID-VkCopyImageToMemoryInfoEXT-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkCopyImageToMemoryInfoEXT-flags-parameter**
  `flags` must be a valid combination of `VkHostImageCopyFlagBitsEXT` values

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-parameter**
  `srcImage` must be a valid `VkImage` handle

- **VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-parameter**
  `srcImageLayout` must be a valid `VkImageLayout` value

- **VUID-VkCopyImageToMemoryInfoEXT-pRegions-parameter**
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageToMemoryCopyEXT` structures

- **VUID-VkCopyImageToMemoryInfoEXT-regionCount-arraylength**
  `regionCount` must be greater than 0

Each element of `VkCopyImageToMemoryInfoEXT::pRegions` is a structure defined as:
// Provided by VK_EXT_host_image_copy

typedef struct VkImageToMemoryCopyEXT {
    VkStructureType sType;
    const void* pNext;
    void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkImageToMemoryCopyEXT;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• pHostPointer is the host memory address which is the destination of the copy.

• memoryRowLength and memoryImageHeight specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the imageExtent.

• imageSubresource is a VkImageSubresourceLayers used to specify the specific image subresources of the image used for the source or destination image data.

• imageOffset selects the initial x, y, z offsets in texels of the sub-region of the source image data.

• imageExtent is the size in texels of the image to copy in width, height and depth.

This structure is functionally similar to VkBufferImageCopy2, except it defines host memory as the target of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

**Valid Usage**

• VUID-VkImageToMemoryCopyEXT-pHostPointer-09066
  pHostPointer must point to memory that is large enough to contain all memory locations that are accessed according to Buffer and Image Addressing, for each element of pRegions

• VUID-VkImageToMemoryCopyEXT-pRegions-09067
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

• VUID-VkImageToMemoryCopyEXT-memoryRowLength-09101
  memoryRowLength must be 0, or greater than or equal to the width member of imageExtent

• VUID-VkImageToMemoryCopyEXT-memoryImageHeight-09102
  memoryImageHeight must be 0, or greater than or equal to the height member of imageExtent

• VUID-VkImageToMemoryCopyEXT-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set
• VUID-VkImageToMemoryCopyEXT-imageExtent-06659
  imageExtent.width must not be 0
• VUID-VkImageToMemoryCopyEXT-imageExtent-06660
  imageExtent.height must not be 0
• VUID-VkImageToMemoryCopyEXT-imageExtent-06661
  imageExtent.depth must not be 0

Valid Usage (Implicit)

• VUID-VkImageToMemoryCopyEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY_EXT
• VUID-VkImageToMemoryCopyEXT-pNext-pNext
  pNext must be NULL
• VUID-VkImageToMemoryCopyEXT-pHostPointer-parameter
  pHostPointer must be a pointer value
• VUID-VkImageToMemoryCopyEXT-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

Bits which can be set in VkCopyMemoryToImageInfoEXT::flags, VkCopyImageToMemoryInfoEXT::flags, and VkCopyImageToImageInfoEXT::flags, specifying additional copy parameters are:

```c
// Provided by VK_EXT_host_image_copy
typedef enum VkHostImageCopyFlagBitsEXT {
  VK_HOST_IMAGE_COPY_MEMCPY_EXT = 0x00000001,
} VkHostImageCopyFlagBitsEXT;
```

• **VK_HOST_IMAGE_COPY_MEMCPY_EXT** specifies that no memory layout swizzling is to be applied during data copy. For copies between memory and images, this flag indicates that image data in host memory is swizzled in exactly the same way as the image data on the device. Using this flag indicates that the implementations may use a simple memory copy to transfer the data between the host memory and the device memory. The format of the swizzled data in host memory is platform dependent and is not defined in this specification.

```c
// Provided by VK_EXT_host_image_copy
typedef VkFlags VkHostImageCopyFlagsEXT;
```

**VkHostImageCopyFlagsEXT** is a bitmask type for setting a mask of zero or more **VkHostImageCopyFlagBitsEXT**.

To copy data from an image object to another image object using the host, call:
// Provided by VK_EXT_host_image_copy

VkResult vkCopyImageToImageEXT(VkDevice device, const VkCopyImageToImageInfoEXT* pCopyImageToImageInfo);

- **device** is the device which owns `pCopyImageToImageInfo->srcImage` and `pCopyImageToImageInfo->dstImage`.
- **pCopyImageToImageInfo** is a pointer to a `VkCopyImageToImageInfoEXT` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyImage2`, except it is executed on the host. The memory of `pCopyImageToImageInfo->srcImage` and `pCopyImageToImageInfo->dstImage` is accessed by the host as if coherent.

**Note**

If the device has written to the memory of `pCopyImageToImageInfo->srcImage`, it is not automatically made available to the host. Before this copy command can be called, a memory barrier for this image must have been issued on the device with the second synchronization scope including `VK_PIPELINE_STAGE_HOST_BIT` and `VK_ACCESS_HOST_READ_BIT`.

Because queue submissions automatically make host memory visible to the device, there would not be a need for a memory barrier before using the results of this copy operation in `pCopyMemoryToImageInfo->dstImage` on the device.

**Valid Usage**

- VUID-vkCopyImageToImageEXT-hostImageCopy-09068

  The hostImageCopy feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCopyImageToImageEXT-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkCopyImageToImageEXT-pCopyImageToImageInfo-parameter

  `pCopyImageToImageInfo` must be a valid pointer to a valid `VkCopyImageToImageInfoEXT` structure

**Return Codes**

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The VkCopyImageToImageInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyImageToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageToImageInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkHostImageCopyFlagBitsEXT` values describing additional copy parameters.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.

`vkCopyImageToImageInfoEXT` does not check whether the device memory associated with `srcImage` or `dstImage` is currently in use before performing the copy. The application must guarantee that any previously submitted command that writes to the copy regions has completed before the host performs the copy.

Valid Usage

- VUID-VkCopyImageToImageInfoEXT-srcImage-09069
  `srcImage` and `dstImage` must have been created with identical image creation parameters
- VUID-VkCopyImageToImageInfoEXT-srcImage-09109
If \textit{srcImage} is sparse then all memory ranges accessed by the copy command must be bound as described in \textit{Binding Resource Memory}.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09111**
  If the stencil aspect of \textit{srcImage} is accessed, and \textit{srcImage} was not created with separate stencil usage, \textit{srcImage} must have been created with \textit{VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT} set in \textit{VkImageCreateInfo}::\textit{usage}.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09112**
  If the stencil aspect of \textit{srcImage} is accessed, and \textit{srcImage} was created with separate stencil usage, \textit{srcImage} must have been created with \textit{VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT} set in \textit{VkImageStencilUsageCreateInfo}::\textit{stencilUsage}.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09113**
  If non-stencil aspects of \textit{srcImage} are accessed, \textit{srcImage} must have been created with \textit{VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT} set in \textit{VkImageCreateInfo}::\textit{usage}.

- **VUID-VkCopyImageToImageInfoEXT-srcOffset-09114**
  If \textit{flags} contains \textit{VK_HOST_IMAGE_COPY_MEMCPY_EXT}, the \textit{x}, \textit{y}, and \textit{z} members of the \textit{srcOffset} member of each element of \textit{pRegions} must be 0.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09115**
  If \textit{flags} contains \textit{VK_HOST_IMAGE_COPY_MEMCPY_EXT}, the \textit{extent} member of each element of \textit{pRegions} must equal the extents of \textit{srcImage} identified by \textit{srcSubresource}.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-07966**
  If \textit{srcImage} is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single \textit{VkDeviceMemory} object.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07967**
  The \textit{srcSubresource.mipLevel} member of each element of \textit{pRegions} must be less than the \textit{mipLevels} specified in \textit{VkImageCreateInfo} when \textit{srcImage} was created.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07968**
  If \textit{srcSubresource.layerCount} is not \textit{VK_REMAINING_ARRAY_LAYERS}, \textit{srcSubresource.baseArrayLayer} + \textit{srcSubresource.layerCount} of each element of \textit{pRegions} must be less than or equal to the \textit{arrayLayers} specified in \textit{VkImageCreateInfo} when \textit{srcImage} was created.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07970**
  The image region specified by each element of \textit{pRegions} must be contained within the specified \textit{srcSubresource} of \textit{srcImage}.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07971**
  For each element of \textit{pRegions}, \textit{srcOffset.x} and \textit{extent.width + srcOffset.x} must both be greater than or equal to 0 and less than or equal to the width of the specified \textit{srcSubresource} of \textit{srcImage}.

- **VUID-VkCopyImageToImageInfoEXT-srcSubresource-07972**
  For each element of \textit{pRegions}, \textit{srcOffset.y} and \textit{extent.height + srcOffset.y} must both be greater than or equal to 0 and less than or equal to the height of the specified \textit{srcSubresource} of \textit{srcImage}.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-07979**
If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1

- VUID-VkCopyImageToImageInfoEXT-srcOffset-09104
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-07980
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1

- VUID-VkCopyImageToImageInfoEXT-srcImage-07274
  For each element of `pRegions`, `srcOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-07275
  For each element of `pRegions`, `srcOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-07276
  For each element of `pRegions`, `srcOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-00207
  For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-00208
  For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-00209
  For each element of `pRegions`, if the sum of `srcOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-09105
  For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`

- VUID-VkCopyImageToImageInfoEXT-srcImage-07981
  If `srcImage` has a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` must be a single valid multi-planar aspect mask bit

- VUID-VkCopyImageToImageInfoEXT-srcImage-07983
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1

- VUID-VkCopyImageToImageInfoEXT-dstImage-09109
  If `dstImage` is sparse then all memory ranges accessed by the copy command must be bound as described in Binding Resource Memory
• VUID-VkCopyImageToImageInfoEXT-dstImage-09111
  If the stencil aspect of dstImage is accessed, and dstImage was not created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage

• VUID-VkCopyImageToImageInfoEXT-dstImage-09112
  If the stencil aspect of dstImage is accessed, and dstImage was created with separate stencil usage, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageStencilUsageCreateInfo::stencilUsage

• VUID-VkCopyImageToImageInfoEXT-dstImage-09113
  If non-stencil aspects of dstImage are accessed, dstImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage

• VUID-VkCopyImageToImageInfoEXT-dstOffset-09114
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the dstOffset member of each element of pRegions must be 0

• VUID-VkCopyImageToImageInfoEXT-dstOffset-09115
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the extent member of each element of pRegions must equal the extents of dstImage identified by dstSubresource

  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1
For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

For each element of pRegions, dstOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

For each element of pRegions, dstOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

For each element of pRegions, dstOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

For each element of pRegions, if the sum of dstOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

For each element of pRegions, if the sum of dstOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

For each element of pRegions, if the sum of dstOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

If dstImage has a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be a single valid multi-planar aspect mask bit

If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

srcImageLayout must specify the current layout of the image subresources of srcImage specified in pRegions

dstImageLayout must specify the current layout of the image subresources of dstImage specified in pRegions
• VUID-VkCopyImageToImageInfoEXT-srcImageLayout-09072
  srcImageLayout must be one of the image layouts returned in
  VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts

• VUID-VkCopyImageToImageInfoEXT-dstImageLayout-09073
  dstImageLayout must be one of the image layouts returned in
  VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts

Valid Usage (Implicit)

• VUID-VkCopyImageToImageInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_TO_IMAGE_INFO_EXT

• VUID-VkCopyImageToImageInfoEXT-pNext-pNext
  pNext must be NULL

• VUID-VkCopyImageToImageInfoEXT-flags-parameter
  flags must be a valid combination of VkHostImageCopyFlagBitsEXT values

• VUID-VkCopyImageToImageInfoEXT-srcImage-parameter
  srcImage must be a valid VkImage handle

• VUID-VkCopyImageToImageInfoEXT-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

• VUID-VkCopyImageToImageInfoEXT-dstImage-parameter
  dstImage must be a valid VkImage handle

• VUID-VkCopyImageToImageInfoEXT-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

• VUID-VkCopyImageToImageInfoEXT-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageCopy2 structures

• VUID-VkCopyImageToImageInfoEXT-regionCount-arraylength
  regionCount must be greater than 0

• VUID-VkCopyImageToImageInfoEXT-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

19.4. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);

• `commandBuffer` is the command buffer into which the command will be recorded.
• `srcImage` is the source image.
• `srcImageLayout` is the layout of the source image subresources for the blit.
• `dstImage` is the destination image.
• `dstImageLayout` is the layout of the destination image subresources for the blit.
• `regionCount` is the number of regions to blit.
• `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
• `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` must not be used for multisampled source or destination images. Use `vkCmdResolveImage` for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

  \[
  u_{\text{base}} = i + \frac{1}{2} \\
  v_{\text{base}} = j + \frac{1}{2} \\
  w_{\text{base}} = k + \frac{1}{2}
  \]

• These base coordinates are then offset by the first destination offset:

  \[
  u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}} \\
  v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}
  \]
\[ w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}} \]

\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

- The scale is determined from the source and destination regions, and applied to the offset coordinates:

\[ \text{scale}_u = \frac{(x_{\text{src1}} - x_{\text{src0}})}{(x_{\text{dst1}} - x_{\text{dst0}})} \]

\[ \text{scale}_v = \frac{(y_{\text{src1}} - y_{\text{src0}})}{(y_{\text{dst1}} - y_{\text{dst0}})} \]

\[ \text{scale}_w = \frac{(z_{\text{src1}} - z_{\text{src0}})}{(z_{\text{dst1}} - z_{\text{dst0}})} \]

\[ u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u \]

\[ v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

- Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \( \text{srcImage} \):

\[ u = u_{\text{scaled}} + x_{\text{src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of \( \text{filter} \), a mipmap mode of \texttt{VK_SAMPLER_MIPMAP_MODE_NEAREST} and an address mode of \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}. Implementations must clamp at the edge of the source image, and may additionally clamp to the
Blits are done layer by layer starting with the `baseArrayLayer` member of `srcSubresource` for the source and `dstSubresource` for the destination. `layerCount` layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by `dstOffsets[0].z` and `dstOffsets[1].z` are sampled from slices in the source region bounded by `srcOffsets[0].z` and `srcOffsets[1].z`. If the `filter` parameter is `VK_FILTER_LINEAR` then the value sampled from the source image is taken by doing linear filtering using the interpolated `z` coordinate represented by `w` in the previous equations. If the `filter` parameter is `VK_FILTER_NEAREST` then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats can only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats must match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

  commandBuffer must be in the recording state

- VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBlitImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdBlitImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

---

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The `VkImageBlit` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- **VUID-VkImageBlit-aspectMask-00238**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match.

- **VUID-VkImageBlit-layerCount-08800**
  If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` must match.

- **VUID-VkImageBlit-layerCount-08801**
  If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`.

### Valid Usage (Implicit)

- **VUID-VkImageBlit-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure.

- **VUID-VkImageBlit-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure.

A more extensible version of the blit image command is defined below.
To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBlitImage2(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdBlitImage2-commandBuffer-01834**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01835**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01836**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdBlitImage2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBlitImage2-pBlitImageInfo-parameter**
  `pBlitImageInfo` **must** be a valid pointer to a valid `VkBlitImageInfo2` structure

- **VUID-vkCmdBlitImage2-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdBlitImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics
operations

- VUID-vkCmdBlitImage2-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdBlitImage2-videocoding
  This command **must** only be called outside of a video coding scope

## Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

The **VkBlitImageInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBlitImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageBlit2* pRegions;
    VkFilter filter;
} VkBlitImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• **srcImage** is the source image.
• **srcImageLayout** is the layout of the source image subresources for the blit.
• **dstImage** is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the blit.
• **regionCount** is the number of regions to blit.
• **pRegions** is a pointer to an array of **VkImageBlit2** structures specifying the regions to blit.
• **filter** is a **VkFilter** specifying the filter to apply if the blits require scaling.

### Valid Usage

• **VUID-VkBlitImageInfo2-pRegions-00215**
  The source region specified by each element of **pRegions** must be a region that is contained within **srcImage**

• **VUID-VkBlitImageInfo2-pRegions-00216**
  The destination region specified by each element of **pRegions** must be a region that is contained within **dstImage**

• **VUID-VkBlitImageInfo2-pRegions-00217**
  The union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory with any texel that may be sampled during the blit operation

• **VUID-VkBlitImageInfo2-srcImage-01999**
  The format features of **srcImage** must contain **VK_FORMAT_FEATURE_BLIT_SRC_BIT**

• **VUID-VkBlitImageInfo2-srcImage-06421**
  **srcImage** must not use a format that requires a sampler **Y’C_bC_r** conversion

• **VUID-VkBlitImageInfo2-srcImage-00219**
  **srcImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag

• **VUID-VkBlitImageInfo2-srcImage-00220**
  If **srcImage** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

• **VUID-VkBlitImageInfo2-srcImageLayout-00221**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

• **VUID-VkBlitImageInfo2-srcImageLayout-01398**
  **srcImageLayout** must be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** or **VK_IMAGE_LAYOUT_GENERAL**

• **VUID-VkBlitImageInfo2-srcImage-09459**
  If **srcImage** and **dstImage** are the same, and an elements of **pRegions** contains the srcSubresource and dstSubresource with matching mipLevel and overlapping array layers, then the **srcImageLayout** and **dstImageLayout** must be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

• **VUID-VkBlitImageInfo2-dstImage-02000**
  The format features of **dstImage** must contain **VK_FORMAT_FEATURE_BLIT_DST_BIT**
VUID-VkBlitImageInfo2-dstImage-06422
dstImage must not use a format that requires a sampler YCbCr conversion

VUID-VkBlitImageInfo2-dstImage-00224
dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

VUID-VkBlitImageInfo2-dstImage-00225
If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

VUID-VkBlitImageInfo2-dstImageLayout-00226
dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

VUID-VkBlitImageInfo2-dstImageLayout-01399
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

VUID-VkBlitImageInfo2-srcImage-00229
If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

VUID-VkBlitImageInfo2-srcImage-00230
If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

VUID-VkBlitImageInfo2-srcImage-00231
If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format

VUID-VkBlitImageInfo2-srcImage-00232
If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

VUID-VkBlitImageInfo2-srcImage-00233
srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

VUID-VkBlitImageInfo2-dstImage-00234
dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

VUID-VkBlitImageInfo2-filter-02001
If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

VUID-VkBlitImageInfo2-srcSubresource-01705
The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

VUID-VkBlitImageInfo2-dstSubresource-01706
The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

VUID-VkBlitImageInfo2-srcSubresource-01707
If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created
If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1.

For each element of `pRegions`, `dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions`, `dstOffsets[0].y` and `dstOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffsets[0].y`
must be 0 and dstOffsets[1].y must be 1

- VUID-VkBlitImageInfo2-dstOffset-00251
  For each element of pRegions, dstOffsets[0].z and dstOffsets[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1

Valid Usage (Implicit)

- VUID-VkBlitImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2

- VUID-VkBlitImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkBlitImageInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-VkBlitImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkBlitImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-VkBlitImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-VkBlitImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageBlit2 structures

- VUID-VkBlitImageInfo2-filter-parameter
  filter must be a valid VkFilter value

- VUID-VkBlitImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkBlitImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageBlit2 structure is defined as:
typedef struct VkImageBlit2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2;

or the equivalent

typedef VkImageBlit2 VkImageBlit2KHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcSubresource is the subresource to blit from.
- srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the source region within srcSubresource.
- dstSubresource is the subresource to blit into.
- dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.

For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.

Valid Usage

- VUID-VkImageBlit2-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match.

- VUID-VkImageBlit2-layerCount-08800
  If neither of the layerCount members of srcSubresource or dstSubresource are VK_REMAINING_ARRAY_LAYERS, the layerCount members of srcSubresource or dstSubresource must match.

- VUID-VkImageBlit2-layerCount-08801
  If one of the layerCount members of srcSubresource or dstSubresource is VK_REMAINING_ARRAY_LAYERS, the other member must be either VK_REMAINING_ARRAY_LAYERS or equal to the arrayLayers member of the VkImageCreateInfo used to create the image minus baseArrayLayer.
19.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
define void vkCmdResolveImage(  
    VkCommandBuffer commandBuffer,  
    VkImage srcImage,  
    VkImageLayout srcImageLayout,  
    VkImage dstImage,  
    VkImageLayout dstImageLayout,  
    uint32_t regionCount,  
    const VkImageResolve* pRegions);
```

- commandBuffer is the command buffer into which the command will be recorded.
- srcImage is the source image.
- srcImageLayout is the layout of the source image subresources for the resolve.
- dstImage is the destination image.
- dstImageLayout is the layout of the destination image subresources for the resolve.
- regionCount is the number of regions to resolve.
- pRegions is a pointer to an array of VkImageResolve structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample's value is selected for each pixel.

srcOffset and dstOffset select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. extent is the size in texels of the source image to resolve in width, height and depth. Each element of pRegions must be a region that is contained within its corresponding image.
Resolves are done layer by layer starting with baseArrayLayer member of srcSubresource for the source and dstSubresource for the destination. layerCount layers are resolved to the destination image.

### Valid Usage

- **VUID-vkCmdResolveImage-commandBuffer-01837**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01838**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01839**
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image

- **VUID-vkCmdResolveImage-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- **VUID-vkCmdResolveImage-srcImage-00256**
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdResolveImage-srcImage-00257**
  srcImage must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- **VUID-vkCmdResolveImage-dstImage-00258**
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdResolveImage-dstImage-00259**
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- **VUID-vkCmdResolveImage-srcImageLayout-00260**
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- **VUID-vkCmdResolveImage-srcImageLayout-01400**
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- **VUID-vkCmdResolveImage-dstImageLayout-00262**
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- **VUID-vkCmdResolveImage-dstImageLayout-01401**
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- **VUID-vkCmdResolveImage-dstImage-02003**
The **format features** of *dstImage** must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

- **VUID-vkCmdResolveImage-srcImage-01386**
  *srcImage* and *dstImage** must have been created with the same image format

- **VUID-vkCmdResolveImage-srcSubresource-01709**
The *srcSubresource.mipLevel* member of each element of *pRegions** must be less than the *mipLevels* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-vkCmdResolveImage-dstSubresource-01710**
The *dstSubresource.mipLevel* member of each element of *pRegions** must be less than the *mipLevels* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-vkCmdResolveImage-srcSubresource-01711**
  If *srcSubresource.layerCount* is not `VK_REMAINING_ARRAY_LAYERS`, *srcSubresource.baseArrayLayer + srcSubresource.layerCount* of each element of *pRegions** must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-vkCmdResolveImage-dstSubresource-01712**
  If *dstSubresource.layerCount* is not `VK_REMAINING_ARRAY_LAYERS`, *dstSubresource.baseArrayLayer + dstSubresource.layerCount* of each element of *pRegions** must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-vkCmdResolveImage-srcImage-04446**
  If *dstImage* is of type `VK_IMAGE_TYPE_3D`, then for each element of *pRegions*, *srcSubresource.layerCount** must be 1

- **VUID-vkCmdResolveImage-srcImage-04447**
  If *dstImage* is of type `VK_IMAGE_TYPE_3D`, then for each element of *pRegions*, *dstSubresource.baseArrayLayer** must be 0 and *dstSubresource.layerCount** must be 1

- **VUID-vkCmdResolveImage-srcOffset-00269**
  For each element of *pRegions*, *srcOffset.x* and (*extent.width + srcOffset.x*) **must both be greater than or equal to 0 and less than or equal to the width of the specified *srcSubresource of srcImage*

- **VUID-vkCmdResolveImage-srcOffset-00270**
  For each element of *pRegions*, *srcOffset.y* and (*extent.height + srcOffset.y*) **must both be greater than or equal to 0 and less than or equal to the height of the specified *srcSubresource of srcImage*

- **VUID-vkCmdResolveImage-srcOffset-00271**
  If *srcImage* is of type `VK_IMAGE_TYPE_1D`, then for each element of *pRegions*, *srcOffset.y** must be 0 and *extent.height** must be 1

- **VUID-vkCmdResolveImage-srcOffset-00272**
  For each element of *pRegions*, *srcOffset.z* and (*extent.depth + srcOffset.z*) **must both be greater than or equal to 0 and less than or equal to the depth of the specified *srcSubresource of srcImage*

- **VUID-vkCmdResolveImage-srcImage-00273**
  If *srcImage* is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of *pRegions*, *srcOffset.z** must be 0 and *extent.depth** must be 1
For each element of \text{pRegions}, \text{dstOffset.x} and \ (\text{extent.width} + \text{dstOffset.x}) \ must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of \text{dstImage}.

For each element of \text{pRegions}, \text{dstOffset.y} and \ (\text{extent.height} + \text{dstOffset.y}) \ must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of \text{dstImage}.

If \text{dstImage} is of type \text{VK_IMAGE_TYPE_1D}, then for each element of \text{pRegions}, \text{dstOffset.y} \ must be 0 and \text{extent.height} \ must be 1.

For each element of \text{pRegions}, \text{dstOffset.z} and \ (\text{extent.depth} + \text{dstOffset.z}) \ must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of \text{dstImage}.

If \text{dstImage} is of type \text{VK_IMAGE_TYPE_1D} or \text{VK_IMAGE_TYPE_2D}, then for each element of \text{pRegions}, \text{dstOffset.z} \ must be 0 and \text{extent.depth} \ must be 1.

\text{srcImage} \ must have been created with \text{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} usage flag.

The format features of \text{srcImage} \ must contain \text{VK_FORMAT_FEATURE_TRANSFER_SRC_BIT}.

\text{dstImage} \ must have been created with \text{VK_IMAGE_USAGE_TRANSFER_DST_BIT} usage flag.

The format features of \text{dstImage} \ must contain \text{VK_FORMAT_FEATURE_TRANSFER_DST_BIT}.

**Valid Usage (Implicit)**

\text{commandBuffer} \ must be a valid \text{VkCommandBuffer} handle.

\text{srcImage} \ must be a valid \text{VkImage} handle.

\text{srcImageLayout} \ must be a valid \text{VkImageLayout} value.

\text{dstImage} \ must be a valid \text{VkImage} handle.

\text{dstImageLayout} \ must be a valid \text{VkImageLayout} value.

\text{pRegions} \ must be a valid pointer to an array of \text{regionCount} valid \text{VkImageResolve} structures.
• VUID-vkCmdResolveImage-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdResolveImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdResolveImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdResolveImage-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdResolveImage-regionCount-arraylength
  regionCount must be greater than 0

• VUID-vkCmdResolveImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

The VkImageResolve structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve;
```

• srcSubresource and dstSubresource are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively.
Resolve of depth/stencil images is not supported.

- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in width, height and depth.

## Valid Usage

- **VUID-VkImageResolve-aspectMask-00266**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageResolve-layerCount-08803**
  If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` member of `srcSubresource` and `dstSubresource` must match.

- **VUID-VkImageResolve-layerCount-08804**
  If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

## Valid Usage (Implicit)

- **VUID-VkImageResolve-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageResolve-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```
• **commandBuffer** is the command buffer into which the command will be recorded.

• **pResolveImageInfo** is a pointer to a **VkResolveImageInfo2** structure describing the resolve parameters.

This command is functionally identical to **vkCmdResolveImage**, but includes extensible sub-structures that include **sType** and **pNext** parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdResolveImage2-commandBuffer-01837**
  
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcImage** **must** not be a protected image

- **VUID-vkCmdResolveImage2-commandBuffer-01838**
  
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstImage** **must** not be a protected image

- **VUID-vkCmdResolveImage2-commandBuffer-01839**
  
  If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstImage** **must** not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdResolveImage2-commandBuffer-parameter**
  
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdResolveImage2-pResolveImageInfo-parameter**
  
  **pResolveImageInfo** **must** be a valid pointer to a valid **VkResolveImageInfo2** structure

- **VUID-vkCmdResolveImage2-commandBuffer-recording**
  
  **commandBuffer** **must** be in the recording state

- **VUID-vkCmdResolveImage2-commandBuffer-cmdpool**
  
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations

- **VUID-vkCmdResolveImage2-renderpass**
  
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdResolveImage2-videocoding**
  
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

</tr>
</tbody>
</table>

The `VkResolveImageInfo2` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2* pRegions;
} VkResolveImageInfo2;
```

or the equivalent

```
// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve2` structures specifying the regions to resolve.

Valid Usage

- VUID-VkResolveImageInfo2-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.
If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`srcImage` must have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`.

If `dstImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`dstImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

`srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

`srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

`dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

`dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

The format features of `dstImage` must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

`srcImage` and `dstImage` must have been created with the same image format.

The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

If `dstSubresource.layerCount` is not `VK_REMAINING_ARRAY LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.
If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.layerCount` must be 1.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

For each element of `pRegions, srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions, srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, srcOffset.y` must be 0 and `extent.height` must be 1.

For each element of `pRegions, srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions, srcOffset.z` must be 0 and `extent.depth` must be 1.

For each element of `pRegions, dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions, dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions, dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, dstOffset.y` must be 0 and `extent.height` must be 1.

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions, dstOffset.z` must be 0 and `extent.depth` must be 1.
**Valid Usage (Implicit)**

- **VUID-VkResolveImageInfo2-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2`

- **VUID-VkResolveImageInfo2-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkResolveImageInfo2-srcImage-parameter**
  
  `srcImage` **must** be a valid `VkImage` handle

- **VUID-VkResolveImageInfo2-srcImageLayout-parameter**
  
  `srcImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkResolveImageInfo2-dstImage-parameter**
  
  `dstImage` **must** be a valid `VkImage` handle

- **VUID-VkResolveImageInfo2-dstImageLayout-parameter**
  
  `dstImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkResolveImageInfo2-pRegions-parameter**
  
  `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageResolve2` structures

- **VUID-VkResolveImageInfo2-regionCount-arraylength**
  
  `regionCount` **must** be greater than 0

- **VUID-VkResolveImageInfo2-commonparent**
  
  Both of `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`
```c
// Provided by VK_VERSION_1_3
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the source image to resolve in width, height and depth.

### Valid Usage

- **VUID-VkImageResolve2-aspectMask-00266**
  The aspectMask member of srcSubresource and dstSubresource must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageResolve2-layerCount-08803**
  If neither of the layerCount members of srcSubresource or dstSubresource are `VK_REMAINING_ARRAY_LAYERS`, the layerCount member of srcSubresource and dstSubresource must match

- **VUID-VkImageResolve2-layerCount-08804**
  If one of the layerCount members of srcSubresource or dstSubresource is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the arrayLayers member of the `VkImageCreateInfo` used to create the image minus baseArrayLayer

### Valid Usage (Implicit)

- **VUID-VkImageResolve2-sType-sType**
sType must be VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2

- VUID-VkImageResolve2-pNext-pNext
  pNext must be NULL

- VUID-VkImageResolve2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageResolve2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure
Chapter 20. Drawing Commands

Drawing commands (commands with `Draw` in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline, or if the `shaderObject` feature is enabled, any `shader objects` bound to graphics stages. A graphics pipeline or a combination of one or more graphics shader objects **must** be bound to a command buffer before any drawing commands are recorded in that command buffer.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```c
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `topology` is a `VkPrimitiveTopology` defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed` and `vkCmdDrawIndexedIndirect`), and the special index value is either 0xFFFFFFFF when the `indexType` parameter of `vkCmdBindIndexBuffer2KHR` or `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`, 0xFF when `indexType` is equal to `VK_INDEX_TYPE_UINT8_KHR`, or 0xFFFF when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies, unless one of the features `primitiveTopologyPatchListRestart` (for `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`) or `primitiveTopologyListRestart` (for all other list topologies) is enabled.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the `vertexOffset` value to the index value.
Valid Usage

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252
  If the primitiveTopologyListRestart feature is not enabled, and topology is
  VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST,
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, primitiveRestartEnable must be
  VK_FALSE

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253
  If the primitiveTopologyPatchListRestart feature is not enabled, and topology is
  VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, primitiveRestartEnable must be VK_FALSE

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
  If the geometryShader feature is not enabled, topology must not be any of
  VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY,
  VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY,
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY
  or
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430
  If the tessellationShader feature is not enabled, topology must not be
  VK_PRIMITIVE_TOPOLOGY_PATCH_LIST

• VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, topology must
  not be VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN

Valid Usage (Implicit)

• VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO

• VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask
  flags must be 0

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
  topology must be a valid VkPrimitiveTopology value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;

VkPipelineInputAssemblyStateCreateFlags is a bitmask type for setting a mask, but is currently
reserved for future use.
To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`.

This command sets the primitive restart enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders.

The primitive topologies defined by `VkPrimitiveTopology` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- `VK_PRIMITIVE_TOPOLOGY_POINT_LIST` specifies a series of separate point primitives.
- `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` specifies a series of separate line primitives.
- `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP` specifies a series of connected line primitives with
consecutive lines sharing a vertex.

- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all triangles sharing a common vertex. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, then triangle fans are not supported by the implementation, and **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** must not be used.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** specifies a series of separate line primitives with adjacency.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY** specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** specifies a series of separate triangle primitives with adjacency.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY** specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST** specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th></th>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
<td>Sequence position of a vertex within the provided vertex data.</td>
</tr>
<tr>
<td>![red dot]</td>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td>------</td>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td>-------</td>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td>![triangle]</td>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices ($v$) and primitives ($p$) are numbered starting from 0; $v_0$ is the first vertex in the provided data and $p_0$ is the first primitive in the set of primitives defined by the vertices and topology.

To dynamically set primitive topology, call:
```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveTopology(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetPrimitiveTopology-None-08971**
  At least one of the following must be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter**
  `primitiveTopology` must be a valid `VkPrimitiveTopology` value
- **VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetPrimitiveTopology-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

20.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

Table 25. Topology classes

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</code></td>
</tr>
<tr>
<td>Line</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY</code>, <code>VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</code></td>
</tr>
<tr>
<td>Triangle</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY</code>, <code>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</code></td>
</tr>
<tr>
<td>Patch</td>
<td><code>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</code></td>
</tr>
</tbody>
</table>

20.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated
is equal to $\text{vertexCount}$.

![Diagram showing line list topology]

**20.1.3. Line Lists**

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

$$p_i = \{v_{2i}, v_{2i+1}\}$$

The number of primitives generated is equal to $\lfloor \text{vertexCount}/2 \rfloor$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{2i}$.

![Diagram showing line list topology with first vertex provoking]

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{2i+1}$.

![Diagram showing line list topology with last vertex provoking]

**20.1.4. Line Strips**

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:
\[ p_i = \{v_i, v_{i+1}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_i \).

\begin{center}
\begin{tikzpicture}
    \node (0) at (0,0) {0};
    \node (1) at (2,0) {1};
    \node (2) at (4,0) {2};
    \node (3) at (6,0) {3};
    \draw (0) -- (1);
    \draw (1) -- (2);
    \draw (2) -- (3);
\end{tikzpicture}
\end{center}

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{i+1} \).

\begin{center}
\begin{tikzpicture}
    \node (0) at (0,0) {0};
    \node (1) at (2,0) {1};
    \node (2) at (4,0) {2};
    \node (3) at (6,0) {3};
    \draw (0) -- (1);
    \draw (1) -- (2);
    \draw (2) -- (3);
\end{tikzpicture}
\end{center}

### 20.1.5. Triangle Lists

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST}, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[ p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\} \]

The number of primitives generated is equal to \[ \lfloor \text{vertexCount}/3 \rfloor \].

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{3i} \).

\begin{center}
\begin{tikzpicture}
    \node (0) at (0,0) {0};
    \node (1) at (2,2) {1};
    \node (2) at (4,0) {2};
    \node (3) at (6,2) {3};
    \node (4) at (8,0) {4};
    \draw (0) -- (1) -- (2) -- (0);
    \draw (3) -- (4) -- (2) -- (3);
\end{tikzpicture}
\end{center}

When the \texttt{provokingVertexMode} is \texttt{VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT}, the provoking vertex for \( p_i \) is \( v_{3i+2} \).

\begin{center}
\begin{tikzpicture}
    \node (0) at (0,0) {0};
    \node (1) at (2,2) {1};
    \node (2) at (4,0) {2};
    \node (3) at (6,2) {3};
    \node (4) at (8,0) {4};
    \draw (0) -- (1) -- (2) -- (0);
    \draw (3) -- (4) -- (2) -- (3);
\end{tikzpicture}
\end{center}
20.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\} \]

The number of primitives generated is equal to \(\max(0, \text{vertexCount}-2)\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_i\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_{i+2}\).

![Diagram of Triangle Strips]

**Note**

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

20.1.7. Triangle Fans

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{v_{i+1}, v_{i+2}, v_0\} \]

The number of primitives generated is equal to \(\max(0, \text{vertexCount}-2)\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_{i+1}\).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` **must** not be used.

### 20.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[
\begin{align*}
    p_i &= \{ v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3} \}
\end{align*}
\]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lceil \text{vertexCount}/4 \rceil \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+1} \).
for $p_i$ is $v_{4i+2}$.

20.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

$$p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\}$$

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to $\max(0, \text{vertexCount}-3)$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+1}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$.

20.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

$$p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}$$

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to $\lfloor \text{vertexCount}/6 \rfloor$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex
for $p_i$ is $v_{6i}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{6i+4}$.

### 20.1.11. Triangle Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, $n$, is equal to $\lceil \max(0, \text{vertexCount} - 4)/2 \rceil$.

If $n=1$, the primitive is defined as:

$$p = \{v_0, v_1, v_2, v_5, v_4, v_3\}$$

If $n>1$, the total primitive consists of different vertices according to where it is in the strip:

$$p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0$$

$$p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1$$
\[ p_i = \{v_{2i}, v_{2i-2}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0 \]

\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=1 \]

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i-2}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0 \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a **geometry shader**.

**Note**

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the **provokingVertexMode** is **VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT**, the provoking vertex for \( p_i \) is always \( v_{2i} \).

When the **provokingVertexMode** is **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT**, the provoking vertex for \( p_i \) is always \( v_{2i+4} \).
20.1.12. Patch Lists

When the primitive topology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, each consecutive set of \( m \) vertices defines a single patch primitive, according to the equation:

\[
p_i = \{v_{m_i}, v_{m_i+1}, \ldots, v_{m_i+(m-2)}, v_{m_i+(m-1)}\}
\]

where \( m \) is equal to VkPipelineTessellationStateCreateInfo::patchControlPoints.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \frac{\text{vertexCount}}{m} \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

20.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the
VkDrawIndirectCommand are stored in buffer, from lower indirect buffer addresses to higher addresses.

3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered vertexIndex to a higher numbered vertexIndex.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.

6. If geometry shading is active, by the order new primitives are generated by geometry shading.

7. If the polygon mode is not VK_POLYGON_MODE_FILL, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.

### 20.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
  - vkCmdDrawIndirectCount
  - vkCmdDrawIndirectCountKHR
- Indexed drawing commands read index values from an index buffer and use this to compute the
vertexIndex value for the vertex shader. These commands are:

- `vkCmdDrawIndexed`
- `vkCmdDrawIndexedIndirect`
- `vkCmdDrawIndexedIndirectCount`
- `vkCmdDrawIndexedIndirectCountKHR`

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkIndexType indexType);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `indexType` is a `VkIndexType` value specifying the size of the indices.

If the `maintenance6` feature is enabled, `buffer` can be `VK_NULL_HANDLE`.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer-offset-08782**  
  `offset` must be less than the size of `buffer`  

- **VUID-vkCmdBindIndexBuffer-offset-08783**  
  The sum of `offset` and the base address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the size of the type indicated by `indexType`  

- **VUID-vkCmdBindIndexBuffer-buffer-08784**  
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag  

- **VUID-vkCmdBindIndexBuffer-buffer-08785**  
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object  

- **VUID-vkCmdBindIndexBuffer-indexType-08786**  
  `indexType` must not be `VK_INDEX_TYPE_NONE_KHR`  

- **VUID-vkCmdBindIndexBuffer-indexType-08787**  
  If `indexType` is `VK_INDEX_TYPE_UINT8_KHR`, the `indexTypeUint8` feature must be enabled  

- **VUID-vkCmdBindIndexBuffer-None-09493**  
  `buffer` must not be `VK_NULL_HANDLE`  

- **VUID-vkCmdBindIndexBuffer-buffer-09494**  
  If `buffer` is `VK_NULL_HANDLE`, `offset` must be zero
Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindIndexBuffer-buffer-parameter
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must be a valid `VkBuffer` handle

- VUID-vkCmdBindIndexBuffer-indexType-parameter
  `indexType` must be a valid `VkIndexType` value

- VUID-vkCmdBindIndexBuffer-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindIndexBuffer-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindIndexBuffer-commonparent
  Both of `buffer`, and `commandBuffer` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To bind an index buffer, along with its size, to a command buffer, call:
// Provided by VK_KHR_maintenance5

void vkCmdBindIndexBuffer2KHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer, 
    VkDeviceSize offset, 
    VkDeviceSize size, 
    VkIndexType indexType);

• **commandBuffer** is the command buffer into which the command is recorded.

• **buffer** is the buffer being bound.

• **offset** is the starting offset in bytes within **buffer** used in index buffer address calculations.

• **size** is the size in bytes of index data bound from **buffer**.

• **indexType** is a **VkIndexType** value specifying the size of the indices.

**size** specifies the bound size of the index buffer starting from **offset**. If **size** is **VK_WHOLE_SIZE** then the bound size is from **offset** to the end of the **buffer**.

If the **maintenance6** feature is enabled, **buffer** can be **VK_NULL_HANDLE**.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer2KHR-offset-08782**
  
  **offset must** be less than the size of **buffer**

- **VUID-vkCmdBindIndexBuffer2KHR-offset-08783**
  
  The sum of **offset** and the base address of the range of **VkDeviceMemory** object that is backing **buffer**, **must** be a multiple of the size of the type indicated by **indexType**

- **VUID-vkCmdBindIndexBuffer2KHR-buffer-08784**
  
  **buffer must** have been created with the **VK_BUFFER_USAGE_INDEX_BUFFER_BIT** flag

- **VUID-vkCmdBindIndexBuffer2KHR-buffer-08785**
  
  If **buffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdBindIndexBuffer2KHR-indexType-08786**
  
  **indexType must** not be **VK_INDEX_TYPE_NONE_KHR**

- **VUID-vkCmdBindIndexBuffer2KHR-indexType-08787**
  
  If **indexType** is **VK_INDEX_TYPE_UINT8_KHR**, the **indexTypeUint8** feature **must** be enabled

- **VUID-vkCmdBindIndexBuffer2KHR-None-09493**
  
  **buffer must** not be **VK_NULL_HANDLE**

- **VUID-vkCmdBindIndexBuffer2KHR-buffer-09494**
  
  If **buffer** is **VK_NULL_HANDLE**, **offset must** be zero

- **VUID-vkCmdBindIndexBuffer2KHR-size-08767**
  
  If **size** is not **VK_WHOLE_SIZE**, **size must** be a multiple of the size of the type indicated by **indexType**
• VUID-vkCmdBindIndexBuffer2KHR-size-08768
If size is not VK_WHOLE_SIZE, the sum of offset and size must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindIndexBuffer2KHR-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

• VUID-vkCmdBindIndexBuffer2KHR-indexType-parameter
  indexType must be a valid VkIndexType value

• VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindIndexBuffer2KHR-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindIndexBuffer2KHR-commonparent
  Both of buffer, and commandBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of vkCmdBindIndexBuffer2KHR::indexType and vkCmdBindIndexBuffer::indexType, specifying the size of indices, are:
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
    // Provided by VK_KHR_index_type_uint8
    VK_INDEX_TYPE_UINT8_KHR = 1000265000,
} VkIndexType;

• VK_INDEX_TYPE_UINT16 specifies that indices are 16-bit unsigned integer values.
• VK_INDEX_TYPE_UINT32 specifies that indices are 32-bit unsigned integer values.
• VK_INDEX_TYPE_NONE_KHR specifies that no indices are provided.
• VK_INDEX_TYPE_UINT8_KHR specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as indirect drawing commands.

All drawing commands interact with the robustBufferAccess feature.

To record a non-indexed draw, call:

```c
void vkCmdDraw( VkCommandBuffer commandBuffer,
                uint32_t vertexCount, 
                uint32_t instanceCount,
                uint32_t firstVertex, 
                uint32_t firstInstance);
```

• commandBuffer is the command buffer into which the command is recorded.
• vertexCount is the number of vertices to draw.
• instanceCount is the number of instances to draw.
• firstVertex is the index of the first vertex to draw.
• firstInstance is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and vertexCount consecutive vertex indices with the first vertexIndex value equal to firstVertex. The primitives are drawn instanceCount times with instanceIndex starting with firstInstance and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.
Valid Usage

- **VUID-vkCmdDraw-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDraw-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1

- **VUID-vkCmdDraw-unnormalizedCoordinates-09636**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- **VUID-vkCmdDraw-None-06479**
  If a `VkImageView` is sampled with `depth comparison`, the image view's `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDraw-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDraw-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features`
must contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDraw-OpTypeImage-07027**
  For any **VkImageView** being written as a storage image where the image format field of the **OpTypeImage** is **Unknown**, the view's **format features** must contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDraw-OpTypeImage-07028**
  For any **VkImageView** being read as a storage image where the image format field of the **OpTypeImage** is **Unknown**, the view's **format features** must contain **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDraw-OpTypeImage-07029**
  For any **VkBufferView** being written as a storage texel buffer where the image format field of the **OpTypeImage** is **Unknown**, the view's **buffer features** must contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDraw-OpTypeImage-07030**
  Any **VkBufferView** being read as a storage texel buffer where the image format field of the **OpTypeImage** is **Unknown** then the view's **buffer features** must contain **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDraw-None-08600**
  For each set **n** that is statically used by a **bound shader**, a descriptor set must have been bound to **n** at the same pipeline bind point, with a **VkPipelineLayout** that is compatible for set **n**, with the **VkPipelineLayout** used to create the current **VkPipeline** or the **VkDescriptorSetLayout** array used to create the current **VkShaderEXT**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdDraw-None-08601**
  For each push constant that is statically used by a **bound shader**, a push constant value must have been set for the same pipeline bind point, with a **VkPipelineLayout** that is compatible for push constants, with the **VkPipelineLayout** used to create the current **VkPipeline** or the **VkDescriptorSetLayout** array used to create the current **VkShaderEXT**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdDraw-maintenance4-08602**
  If the **maintenance4** feature is not enabled, then for each push constant that is statically used by a **bound shader**, a push constant value must have been set for the same pipeline bind point, with a **VkPipelineLayout** that is compatible for push constants, with the **VkPipelineLayout** used to create the current **VkPipeline** or the **VkDescriptorSetLayout** and **VkPushConstantRange** arrays used to create the current **VkShaderEXT**, as described in **Pipeline Layout Compatibility**

- **VUID-vkCmdDraw-None-08114**
  Descriptors in each bound descriptor set, specified via **vkCmdBindDescriptorSets**, must be valid as described by **descriptor validity** if they are statically used by a **bound shader**

- **VUID-vkCmdDraw-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDraw-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not
have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDraw-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDraw-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDraw-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDraw-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdDraw-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDraw-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDraw-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDraw-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer,
it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDraw-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

• VUID-vkCmdDraw-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C’B’C conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDraw-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C’B’C conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdDraw-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

• VUID-vkCmdDraw-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

• VUID-vkCmdDraw-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDraw-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

• VUID-vkCmdDraw-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDraw-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDraw-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

• VUID-vkCmdDraw-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDraw-subpass-02685
The subpass index of the current render pass **must** be equal to the subpass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDraw-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDraw-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- **VUID-vkCmdDraw-None-07469**
  Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

- **VUID-vkCmdDraw-pDepthInputAttachmentIndex-09595**
  Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

- **VUID-vkCmdDraw-pDepthInputAttachmentIndex-09596**
  Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are non-NULL.

- **VUID-vkCmdDraw-InputAttachmentIndex-09597**
  If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

- **VUID-vkCmdDraw-None-06537**
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDraw-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

  - the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
• there is no currently bound graphics pipeline or
• the currently bound graphics pipeline was created with
  
  \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT}

it \textbf{must} not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDraw-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} image layout, and either:

  ◦ the \texttt{VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} is set on the currently bound pipeline or
  ◦ the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included \texttt{VK_IMAGE_ASPECT_DEPTH_BIT} and

  • there is no currently bound graphics pipeline or
  • the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT}

it \textbf{must} not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDraw-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT} image layout, and either:

  ◦ the \texttt{VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT} is set on the currently bound pipeline or
  ◦ the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included \texttt{VK_IMAGE_ASPECT_STENCIL_BIT} and

  • there is no currently bound graphics pipeline or
  • the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT}

it \textbf{must} not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDraw-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it \textbf{must} not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDraw-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command \textbf{must} not write to that image subresource as an attachment

• VUID-vkCmdDraw-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, \textbf{depth writes} \textbf{must} be disabled
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE,
vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not
subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07835
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants
must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetColorBlendEnableEXT in the current command buffer set any element of
pColorBlendEnables to VK_TRUE, and the most recent call to
vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of
pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor
member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR,
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been
called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDraw-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS
dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then
vkCmdSetDepthBounds must have been called and not subsequently invalidated in the
current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08622
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetDepthBoundsTestEnable in the current command buffer set
depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called and
not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07837
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCILCOMPARE_MASK dynamic state enabled, and if the current
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been
called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDraw-None-08623
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07838
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08624
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07839
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08625
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDraw-None-07840
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08627
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07841
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE
dynamic state enabled then \texttt{vkCmdSetFrontFace} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetFrontFace} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07843**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthTestEnable} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthTestEnable} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07844**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE} dynamic state enabled then \texttt{vkCmdSetDepthWriteEnable} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthWriteEnable} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07845**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_COMPARE_OP} dynamic state enabled then \texttt{vkCmdSetDepthCompareOp} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetDepthTestEnable} in the current command buffer set \texttt{depthTestEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetDepthCompareOp} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07846**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE} dynamic state enabled then
vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08632**
  If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07847**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07848**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then vkCmdSetStencilOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- **VUID-vkCmdDraw-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline
If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of
vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDraw-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDraw-None-08643
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,

  then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDraw-None-08644
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE,

  then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- VUID-vkCmdDraw-None-08876
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdDraw-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDraw-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDraw-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment.

- VUID-vkCmdDraw-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

- VUID-vkCmdDraw-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

- VUID-vkCmdDraw-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

- VUID-vkCmdDraw-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask.

- VUID-vkCmdDraw-colorAttachmentCount-06179
  If the dynamicRenderingUnusedAttachments feature is not enabled and the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount.

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08910
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline.

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08912
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED.

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08911
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED.
::pColorAttachments array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

- **VUID-vkCmdDraw-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07881**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08913**
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08919**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08918**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDraw-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdDraw-multisampledRenderToSingleSampled-07285**
If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- **VUID-vkCmdDraw-multisampledRenderToSingleSampled-07286**
  If `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDraw-multisampledRenderToSingleSampled-07287**
  If `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDraw-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDraw-pColorAttachments-08963**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-pDepthAttachment-08964**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-pStencilAttachment-08965**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-09237
  If a shader object is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage, then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08650
  If the depthClamp feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthClampEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07621
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_POLYGON_MODE_EXT dynamic state enabled then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08651
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07622
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT dynamic state enabled then vkCmdSetRasterizationSamplesEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08652
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetRasterizationSamplesEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07623
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT dynamic state enabled then vkCmdSetSampleMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetSampleMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• VUID-vkCmdDraw-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDraw-None-08654
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDraw-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08655
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08656
If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
• VUID-vkCmdDraw-None-07633
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08663
If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07636
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08665
If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07637
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08666
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08667
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08668
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a
shader object that outputs line primitives is bound to the
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and
the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer
set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must
have been called and not subsequently invalidated in the current command buffer prior to
this drawing command

• VUID-vkCmdDraw-None-07638
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then
vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated
in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08669
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to
VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called and
not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08670
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any
line topology, then vkCmdSetLineStippleEnableEXT must have been called and not
subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08671
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object that outputs line primitives is bound to the
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and
the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer
set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07849
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled then vkCmdSetLineStippleKHR
must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08672
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetLineStippleEnableEXT in the current command buffer set stippledLineEnable to VK_TRUE, then vkCmdSetLineStippleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view’s format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

- **VUID-vkCmdDraw-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDraw-samples-07472**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDraw-samples-07473**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the rasterizationSamples parameter in the last call to vkCmdSetRasterizationSamplesEXT.

- **VUID-vkCmdDraw-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDraw-firstAttachment-07476**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09417**
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDraw-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDraw-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDraw-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

- **VUID-vkCmdDraw-stippledLineEnable-07495**
  If the bound graphics pipeline state was created with the...
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature
must be enabled

• VUID-vkCmdDraw-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
  VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature must
  be enabled

• VUID-vkCmdDraw-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
  VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature
must be enabled

• VUID-vkCmdDraw-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or
  VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current
stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is
VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature must
be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

• VUID-vkCmdDraw-None-08686
  If there is no bound graphics pipeline, the tessellationShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSellation_CONTROL_BIT

• VUID-vkCmdDraw-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_GEOMETRY_SHADER

• VUID-vkCmdDraw-None-08688
  If there is no bound graphics pipeline, and the geometryShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT
with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDraw-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-vkCmdDraw-None-08698**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

- **VUID-vkCmdDraw-None-08699**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

- **VUID-vkCmdDraw-None-08878**
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

- **VUID-vkCmdDraw-None-08879**
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

- **VUID-vkCmdDraw-None-08880**
  If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

- **VUID-vkCmdDraw-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

- **VUID-vkCmdDraw-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of
VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

- VUID-vkCmdDraw-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

- VUID-vkCmdDraw-None-09548
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline

- VUID-vkCmdDraw-None-09549
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR

- VUID-vkCmdDraw-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDraw-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDraw-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

- VUID-vkCmdDraw-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDraw-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDraw-Draft-02721
  If robustBufferAccess is not enabled, then for a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description
• VUID-vkCmdDraw-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

• VUID-vkCmdDraw-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called and not subsequently invalidated in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

• VUID-vkCmdDraw-None-04914
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetVertexInputEXT must have been called and not subsequently invalidated in the current command buffer prior to this draw command.

• VUID-vkCmdDraw-Input-07939
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

• VUID-vkCmdDraw-Input-08734
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format.

• VUID-vkCmdDraw-format-08936
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

• VUID-vkCmdDraw-format-08937
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.

• VUID-vkCmdDraw-None-09203
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format.
If there is a shader object bound to the \text{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then \text{vkCmdSetPrimitiveRestartEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the \text{primitiveTopologyListRestart} feature is not enabled, the topology is \text{VK\_PRIMITIVE\_TOPOLOGY\_POINT\_LIST}, \text{VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST}, \text{VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST}, \text{VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST\_WITH\_ADJACENCY}, or \text{VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST\_WITH\_ADJACENCY}, there is a shader object bound to the \text{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then \text{vkCmdSetPrimitiveRestartEnable} must be set to \text{VK\_FALSE}.

If the bound graphics pipeline state was created with \text{VkPipelineVertexInputDivisorStateCreateInfoKHR} in the \text{pNext} chain of \text{VkGraphicsPipelineCreateInfo::pVertexInputState}, any member of \text{VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors} has a value other than 1 in \text{divisor}, and \text{VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance} is \text{VK\_FALSE}, then \text{firstInstance} must be 0.

If shader objects are used for drawing or the bound graphics pipeline state was created with the \text{VK\_DYNAMIC\_STATE\_VERTEX\_INPUT\_EXT} dynamic state enabled, any member of the \text{pVertexBindingDescriptions} parameter to the \text{vkCmdSetVertexInputEXT} call that sets this dynamic state has a value other than 1 in \text{divisor}, and \text{VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance} is \text{VK\_FALSE}, then \text{firstInstance} must be 0.

Valid Usage (Implicit)

- \text{commandBuffer} must be a valid \text{VkCommandBuffer} handle.
- \text{commandBuffer} must be in the recording state.
- The \text{VkCommandPool} that \text{commandBuffer} was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- This command must only be called outside of a video coding scope.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer2KHR::indexType` or the `vkCmdBindIndexBuffer::indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex \times indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` or `vkCmdBindIndexBuffer2KHR`, and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_KHR` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the
vertexIndex value.

The primitives are drawn instanceCount times with instanceIndex starting with firstInstance and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

**Valid Usage**

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equals to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT.

- **VUID-vkCmdDrawIndexed-magFilter-09598**
  
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT.

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equals to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT.

- **VUID-vkCmdDrawIndexed-mipmapMode-09599**
  
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT.

- **VUID-vkCmdDrawIndexed-unnormalizedCoordinates-09635**
  
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount must be 1.

- **VUID-vkCmdDrawIndexed-unnormalizedCoordinates-09636**
  
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType must be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D.

- **VUID-vkCmdDrawIndexed-None-06479**
  
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT.

- **VUID-vkCmdDrawIndexed-None-02691**
  
  If a VkImageView is accessed using atomic operations as a result of this command, then...
the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawIndexed-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexed-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled,
that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders **must** not be a protected resource

- **VUID-vkCmdDrawIndexed-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y’C’C’R conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDrawIndexed-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y’C’C’R conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDrawIndexed-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDrawIndexed-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- **VUID-vkCmdDrawIndexed-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndexed-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components

- **VUID-vkCmdDrawIndexed-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndexed-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDrawIndexed-None-09600**
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written
The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass' pInputAttachments [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility.

Input attachment views accessed in a dynamic render pass with a InputAttachmentIndex referenced by VkRenderingInputAttachmentIndexInfoKHR, or no InputAttachmentIndex if VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex or VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are NULL, must be created with a VkImageView that is compatible with the corresponding color, depth, or stencil attachment in VkRenderingInfo.

Input attachment views accessed in a dynamic render pass via a shader object must have an InputAttachmentIndex if both VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex and VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are non-NULL.

If an input attachment view accessed in a dynamic render pass via a shader object has an InputAttachmentIndex, the InputAttachmentIndex must match an index in VkRenderingInputAttachmentIndexInfoKHR.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

It **must** not be accessed in any way other than as an attachment by this command.

- VUID-vkCmdDrawIndexed-None-09001
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT`
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

It **must** not be accessed in any way other than as an attachment by this command.

- VUID-vkCmdDrawIndexed-None-09002
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT`
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

It **must** not be accessed in any way other than as an attachment by this command.

- VUID-vkCmdDrawIndexed-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

- VUID-vkCmdDrawIndexed-None-06539
If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an
attachment, this command **must** not write to that image subresource as an attachment

- **VUID-vkCmdDrawIndexed-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled

- **VUID-vkCmdDrawIndexed-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- **VUID-vkCmdDrawIndexed-None-07831**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07832**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07833**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08617**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08618**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08619**
  If a shader object that outputs line primitives is bound to the **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, **vkCmdSetLineWidth must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07834**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled then **vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must** have
been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08620**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08621**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set...
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07841
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08628
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07843
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08629
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07844
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08630
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07845
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then vkCmdSetDepthCompareOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08631
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthTestEnable in the current command buffer set depthTestEnable to VK_TRUE,
then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- **VUID-vkCmdDrawIndexed-scissorCount-03418**
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the primitiveFragmentShadingRateWithMultipleViewportsWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1.
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must...
must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexed-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexed-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexed-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexed-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexed-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

- VUID-vkCmdDrawIndexed-colorAttachmentCount-06179
  If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

- VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08910
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08912
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
discardRectangleEnable to VK_TRUE, then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08918**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and...
VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexed-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndexed-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexed-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexed-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexed-None-07619
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT dynamic state enabled then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• **VUID-vkCmdDrawIndexed-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexed-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetSampleMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07624
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToCoverageEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic state enabled, and alphaToCoverageEnable was VK_TRUE in the last call to vkCmdSetAlphaToCoverageEnableEXT, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexed-None-08654
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToCoverageEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetAlphaToCoverageEnableEXT in the current command buffer set alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexed-None-07625
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToOneEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08655
If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToOneEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07626
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08656
If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07627
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled then 
\texttt{vkCmdSetColorBlendEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08657
If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and both the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then 
\texttt{vkCmdSetColorBlendEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07628
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT} dynamic state enabled then 
\texttt{vkCmdSetColorBlendEquationEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08658
If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
\texttt{vkCmdSetColorBlendEnableEXT} for any attachment set that attachment’s value in 
\texttt{pColorBlendEnables} to VK_TRUE, then \texttt{vkCmdSetColorBlendEquationEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07629
If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT} dynamic state enabled then 
\texttt{vkCmdSetColorWriteMaskEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08659
If the \texttt{geometryStreams} feature is enabled, and a shader object is bound to the
VK_SHADER_STAGE_GEOMETRY_BIT stage, then **vkCmdSetRasterizationStreamEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-07633**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT** dynamic state enabled then **vkCmdSetDepthClipEnableEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-08663**
  If the **depthClipEnable** feature is enabled, and a shader object is bound to any graphics stage, then **vkCmdSetDepthClipEnableEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-07636**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** dynamic state enabled then **vkCmdSetProvokingVertexModeEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-08665**
  If the **VK_EXT_provoking_vertex** extension is enabled, and a shader object is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, then **vkCmdSetProvokingVertexModeEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-07637**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** dynamic state enabled then **vkCmdSetLineRasterizationModeEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-08666**
  If the **VK_KHR_line_rasterization** or **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, then **vkCmdSetLineRasterizationModeEXT** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

• **VUID-vkCmdDrawIndexed-None-08667**
  If the **VK_KHR_line_rasterization** or **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, then **vkCmdSetLineRasterizationModeEXT** must have been called and not
subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08668
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
  shader object that outputs line primitives is bound to the
  VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and
  the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer
  set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must
  have been called and not subsequently invalidated in the current command buffer prior
  to this drawing command

- VUID-vkCmdDrawIndexed-None-07638
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then
  vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
  shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, and the most recent call to
  vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to
  VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called and not
  subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
  shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, and the most recent call to
  vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any
  line topology, then vkCmdSetLineStippleEnableEXT must have been called and not
  subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08671
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a
  shader object that outputs line primitives is bound to the
  VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and
  the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer
  set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have
  been called and not subsequently invalidated in the current command buffer prior to this
drawing command

- VUID-vkCmdDrawIndexed-None-07849
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled then
  vkCmdSetLineStippleKHR must have been called and not subsequently invalidated in the
current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08672
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawIndexed-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawIndexed-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawIndexed-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawIndexed-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexed-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable.
for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` *must* have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls *must* specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexed-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` *must* have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls *must* specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` *must* have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls *must* specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawIndexed-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` *must* have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls *must* specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` *must* have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls *must* specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexed-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to
\texttt{vkCmdSetRasterizationStreamEXT} must have set the \texttt{rasterizationStream} to zero

- VUID-vkCmdDrawIndexed-stippledLineEnable-07495
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR}, then the \texttt{stippledRectangularLines} feature must be enabled

- VUID-vkCmdDrawIndexed-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR}, then the \texttt{stippledBresenhamLines} feature must be enabled

- VUID-vkCmdDrawIndexed-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR}, then the \texttt{stippledSmoothLines} feature must be enabled

- VUID-vkCmdDrawIndexed-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR}, then the \texttt{stippledRectangularLines} feature must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK_TRUE}

- VUID-vkCmdDrawIndexed-None-08877
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT} dynamic state \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08684
  If there is no bound graphics pipeline, \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK_SHADER_STAGE_VERTEX_BIT}

- VUID-vkCmdDrawIndexed-None-08685
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT}

- VUID-vkCmdDrawIndexed-None-08686
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT}
If there is no bound graphics pipeline, and the geometryShader feature is enabled, *vkCmdBindShadersEXT must* have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`.

If there is no bound graphics pipeline, *vkCmdBindShadersEXT must* have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call *must* also be bound.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call *must* not have any `VkShaderEXT` bound.

All bound graphics shader objects *must* have been created with identical or identically defined push constant ranges.

All bound graphics shader objects *must* have been created with identical or identically defined arrays of descriptor set layouts.

If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT must` have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo ::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable must be VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo ::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask must be 0`.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline
was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

- **VUID-vkCmdDrawIndexed-maxFragmentDualSrcAttachments-09239**
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

- **VUID-vkCmdDrawIndexed-None-09548**
  If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations` set by `vkCmdSetRenderingAttachmentLocationsKHR` must match the value set for the corresponding element in the currently bound pipeline.

- **VUID-vkCmdDrawIndexed-None-09549**
  If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via `VkRenderingInputAttachmentIndexInfoKHR`.

- **VUID-vkCmdDrawIndexed-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and protectedNoFault is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.

- **VUID-vkCmdDrawIndexed-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource.

- **VUID-vkCmdDrawIndexed-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.

- **VUID-vkCmdDrawIndexed-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDrawIndexed-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndexed-None-02721**
If robustBufferAccess is not enabled, then for a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- VUID-vkCmdDrawIndexed-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexed-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

- VUID-vkCmdDrawIndexed-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called and not subsequently invalidated in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

- VUID-vkCmdDrawIndexed-None-04914
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetVertexInputEXT must have been called and not subsequently invalidated in the current command buffer prior to this draw command.

- VUID-vkCmdDrawIndexed-Input-07939
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

- VUID-vkCmdDrawIndexed-Input-08734
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format.

- VUID-vkCmdDrawIndexed-format-08936
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

- VUID-vkCmdDrawIndexed-format-08937
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.

- VUID-vkCmdDrawIndexed-None-09203
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format

• VUID-vkCmdDrawIndexed-None-04879
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-09637
  If the primitiveTopologyListRestart feature is not enabled, the topology is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must be set to VK_FALSE

• VUID-vkCmdDrawIndexed-None-07312
  valid index buffer must be bound

• VUID-vkCmdDrawIndexed-robustBufferAccess2-07825
  If robustBufferAccess2 is not enabled, (indexSize × (firstIndex + indexCount) + offset) must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via vkCmdBindIndexBuffer

• VUID-vkCmdDrawIndexed-pNext-09461
  If the bound graphics pipeline state was created with VkPipelineVertexInputDivisorStateCreateInfoKHR in the pNext chain of VkGraphicsPipelineCreateInfo::pVertexInputState, any member of VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0

• VUID-vkCmdDrawIndexed-None-09462
  If shader objects are used for drawing or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, any member of the pVertexBindingDescriptions parameter to the vkCmdSetVertexInputEXT call that sets this dynamic state has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0

• VUID-vkCmdDrawIndexed-robustBufferAccess2-08798
  If robustBufferAccess2 is not enabled, (indexSize × (firstIndex + indexCount) + offset) must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via vkCmdBindIndexBuffer or vkCmdBindIndexBuffer2KHR. If vkCmdBindIndexBuffer2KHR is used to bind the index buffer, the size of the bound index buffer is vkCmdBindIndexBuffer2KHR::size
Valid Usage (Implicit)

- VUID-vkCmdDrawIndexed-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

- VUID-vkCmdDrawIndexed-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state.

- VUID-vkCmdDrawIndexed-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations.

- VUID-vkCmdDrawIndexed-renderpass
  This command \textbf{must} only be called inside of a render pass instance.

- VUID-vkCmdDrawIndexed-videocoding
  This command \textbf{must} only be called outside of a video coding scope.

Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized.

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized.

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- \texttt{commandBuffer} is the command buffer into which the command is recorded.
- \texttt{buffer} is the buffer containing draw parameters.
- \texttt{offset} is the byte offset into \texttt{buffer} where parameters begin.
• **drawCount** is the number of draws to execute, and can be zero.

• **stride** is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from buffer starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

### Valid Usage

- **VUID-vkCmdDrawIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirect-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDrawIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirect-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDrawIndirect-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1

- **VUID-vkCmdDrawIndirect-unnormalizedCoordinates-09636**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- **VUID-vkCmdDrawIndirect-None-06479**
  If a `VkImageView` is sampled with `depth comparison`, the image view's format features
must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawIndirect-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawIndirect-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDrawIndirect-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirect-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirect-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirect-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirect-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorsetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirect-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorsetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirect-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorsetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by **descriptor validity** if they are statically used by a bound shader.

If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders **must** not be a protected resource.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C a C C R conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C a C C R conversion, that object **must** not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view’s viewType **must** match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage **must** match.

If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view’s format.

If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format.

Any shader invocation executed by this command **must** terminate.

If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

- VUID-vkCmdDrawIndirect-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndirect-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawIndirect-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndirect-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass.

- VUID-vkCmdDrawIndirect-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass’ pInputAttachments [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility.

- VUID-vkCmdDrawIndirect-pDepthInputAttachmentIndex-09595
  Input attachment views accessed in a dynamic render pass with a InputAttachmentIndex referenced by VkRenderingInputAttachmentIndexInfoKHR, or no InputAttachmentIndex if VkRenderingInputAttachmentIndexInfoKHR::pDepthInputAttachmentIndex or VkRenderingInputAttachmentIndexInfoKHR::pStencilInputAttachmentIndex are NULL, must be created with a VkImageView that is compatible with the corresponding color, depth, or stencil attachment in VkRenderingInfo.

- VUID-vkCmdDrawIndirect-pDepthInputAttachmentIndex-09596
  Input attachment views accessed in a dynamic render pass via a shader object must have an InputAttachmentIndex if both VkRenderingInputAttachmentIndexInfoKHR::pDepthInputAttachmentIndex and VkRenderingInputAttachmentIndexInfoKHR::pStencilInputAttachmentIndex are non-NULL.

- VUID-vkCmdDrawIndirect-InputAttachmentIndex-09597
  If an input attachment view accessed in a dynamic render pass via a shader object has an InputAttachmentIndex, the InputAttachmentIndex must match an index in VkRenderingInputAttachmentIndexInfoKHR.

- VUID-vkCmdDrawIndirect-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- VUID-vkCmdDrawIndirect-None-09000
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

it must not be accessed in any way other than as an attachment by this command

**VUID-vkCmdDrawIndirect-None-09001**

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

it must not be accessed in any way other than as an attachment by this command

**VUID-vkCmdDrawIndirect-None-09002**

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

it must not be accessed in any way other than as an attachment by this command

**VUID-vkCmdDrawIndirect-None-09003**

If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an
attachment, storage image, or sampled image by this command

- VUID-vkCmdDrawIndirect-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

- VUID-vkCmdDrawIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

- VUID-vkCmdDrawIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndirect-None-07831
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-07832
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-07833
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirect-None-08619
  If a shader object that outputs line primitives is bound to the **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.
command

• VUID-vkCmdDrawIndirect-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07835
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08621
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07836
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07837
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-07839**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- **VUID-vkCmdDrawIndirect-None-07840**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not
subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08627
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07841
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08628
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07843
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08629
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07844
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08630
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07845
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then vkCmdSetDepthCompareOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• **VUID-vkCmdDrawIndirect-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer.
prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirect-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndirect-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

- VUID-vkCmdDrawIndirect-None-08635
  If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

- VUID-vkCmdDrawIndirect-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08639
  If a shader object is bound to any graphics stage, then vkCmdSetRasterizerDiscardEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08640
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the
bound graphics pipeline was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must be 1

- \textbf{VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-08642}
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, and any shader object bound to a graphics stage writes to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must be 1

- \textbf{VUID-vkCmdDrawIndirect-blendEnable-04727}
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK_FALSE}

- \textbf{VUID-vkCmdDrawIndirect-none-08643}
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then for each color attachment in the render pass, if the corresponding image view’s \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the corresponding member of \texttt{pColorBlendEnables} in the most recent call to \texttt{vkCmdSetColorBlendEnableEXT} in the current command buffer that affected that attachment index must have been \texttt{VK_FALSE}

- \textbf{VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07284}
  If rasterization is not disabled in the bound graphics pipeline, then \texttt{rasterizationSamples} for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- \textbf{VUID-vkCmdDrawIndirect-none-08644}
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then the most recent call to \texttt{vkCmdSetRasterizationSamplesEXT} in the current command buffer must have set \texttt{rasterizationSamples} to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- \textbf{VUID-vkCmdDrawIndirect-none-08876}
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with \texttt{vkCmdBeginRendering}

- \textbf{VUID-vkCmdDrawIndirect-imageView-06172}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command must
not write any values to the depth attachment

• **VUID-vkCmdDrawIndirect-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• **VUID-vkCmdDrawIndirect-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment

• **VUID-vkCmdDrawIndirect-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• **VUID-vkCmdDrawIndirect-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

• **VUID-vkCmdDrawIndirect-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• **VUID-vkCmdDrawIndirect-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

• **VUID-vkCmdDrawIndirect-colorAttachmentCount-06179**
  If the dynamicRenderingUnusedAttachments feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

• **VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08910**
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

• **VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08912**
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08911
  If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawIndirect-None-07751
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`

- VUID-vkCmdDrawIndirect-None-07880
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-rasterizerDiscardEnable-09236
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08648
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07881
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently
If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.
...::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo ::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED.

- VUID-vkCmdDrawIndirect-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline.

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView.

- VUID-vkCmdDrawIndirect-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE.

- VUID-vkCmdDrawIndirect-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- VUID-vkCmdDrawIndirect-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- VUID-vkCmdDrawIndirect-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must...
• VUID-vkCmdDrawIndirect-None-07619

  If the bound graphics pipeline state was created with the
If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
• VUID-vkCmdDrawIndirect-None-07630
If the bound graphics pipeline state was created with the 
\texttt{VK\_DYNAMIC\_STATE\_RASTERIZATION\_STREAM\_EXT} dynamic state enabled then 
\texttt{vkCmdSetRasterizationStreamEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08660
If the \texttt{geometryStreams} feature is enabled, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_GEOMETRY\_BIT} stage, then \texttt{vkCmdSetRasterizationStreamEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07633
If the bound graphics pipeline state was created with the 
\texttt{VK\_DYNAMIC\_STATE\_DEPTH\_CLIP\_ENABLE\_EXT} dynamic state enabled then 
\texttt{vkCmdSetDepthClipEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08663
If the \texttt{depthClipEnable} feature is enabled, and a shader object is bound to any graphics stage, then \texttt{vkCmdSetDepthClipEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07636
If the bound graphics pipeline state was created with the 
\texttt{VK\_DYNAMIC\_STATE\_PROVOKING\_VERTEX\_MODE\_EXT} dynamic state enabled then 
\texttt{vkCmdSetProvokingVertexModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08665
If the \texttt{VK\_EXT\_provoking\_vertex} extension is enabled, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetProvokingVertexModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07637
If the bound graphics pipeline state was created with the 
\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic state enabled then 
\texttt{vkCmdSetLineRasterizationModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08666
If the \texttt{VK\_KHR\_line\_rasterization} or \texttt{VK\_EXT\_line\_rasterization} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, and the most recent call to 
\texttt{vkCmdSetPolygonModeEXT} in the current command buffer set \texttt{polygonMode} to \texttt{VK\_POLYGON\_MODE\_LINE}, then \texttt{vkCmdSetLineRasterizationModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls **must** specify an enable for all active color attachments in the current subpass.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls **must** specify an enable for all active color attachments in the current subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls **must** specify the color write mask for all active color attachments in the current subpass.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls **must** specify the color write mask for all active color attachments in the current subpass.
attachments in the current subpass

- **VUID-vkCmdDrawIndirect-primitivesGeneratedQueryWithNonZeroStreams-07481**
  
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

- **VUID-vkCmdDrawIndirect-stippledLineEnable-07495**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `stippledRectangularLines` feature must be enabled.

- **VUID-vkCmdDrawIndirect-stippledLineEnable-07496**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature must be enabled.

- **VUID-vkCmdDrawIndirect-stippledLineEnable-07497**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature must be enabled.

- **VUID-vkCmdDrawIndirect-stippledLineEnable-07498**
  
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`.

- **VUID-vkCmdDrawIndirect-None-08684**
  
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-vkCmdDrawIndirect-None-08685**
  
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`.
with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- **VUID-vkCmdDrawIndirect-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-vkCmdDrawIndirect-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDrawIndirect-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-vkCmdDrawIndirect-None-08698**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound

- **VUID-vkCmdDrawIndirect-None-08699**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound

- **VUID-vkCmdDrawIndirect-None-08878**
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

- **VUID-vkCmdDrawIndirect-None-08879**
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

- **VUID-vkCmdDrawIndirect-None-08880**
  If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`

- **VUID-vkCmdDrawIndirect-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`
::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0

- VUID-vkCmdDrawIndirect-None-09116
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

- VUID-vkCmdDrawIndirect-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

- VUID-vkCmdDrawIndirect-None-09548
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline

- VUID-vkCmdDrawIndirect-None-09549
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR

- VUID-vkCmdDrawIndirect-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndirect-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndirect-None-02721
  If robustBufferAccess is not enabled, then for a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndirect-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the
dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter
of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline
VkPipelineInputAssemblyStateCreateInfo::topology state

• VUID-vkCmdDrawIndirect-pStrides-04913
If the bound graphics pipeline was created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then
vkCmdBindVertexBuffer2EXT must have been called and not subsequently invalidated
in the current command buffer prior to this draw command, and the pStrides parameter
of vkCmdBindVertexBuffer2EXT must not be NULL

• VUID-vkCmdDrawIndirect-None-04914
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then
vkCmdSetVertexInputEXT must have been called and not subsequently invalidated
in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndirect-Input-07939
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then all variables
with the Input storage class decorated with Location in the Vertex Execution Model
OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

• VUID-vkCmdDrawIndirect-Input-08734
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric
type associated with all Input variables of the corresponding Location in the Vertex
Execution Model OpEntryPoint must be the same as
VkVertexInputAttributeDescription2EXT::format

• VUID-vkCmdDrawIndirect-format-08936
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar
width associated with all Input variables of the corresponding Location in the Vertex
Execution Model OpEntryPoint must be 64-bit

• VUID-vkCmdDrawIndirect-format-08937
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar
width associated with a Location decorated Input variable in the Vertex Execution Model
OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT
::format must have a 64-bit component

• VUID-vkCmdDrawIndirect-None-09203
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input
variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must
not use components that are not present in the format

• VUID-vkCmdDrawIndirect-None-09637
If the primitiveTopologyListRestart feature is not enabled, the topology is
VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then `vkCmdSetPrimitiveRestartEnable` must be set to VK_FALSE.

- **VUID-vkCmdDrawIndirect-buffer-02708**
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-vkCmdDrawIndirect-buffer-02709**
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

- **VUID-vkCmdDrawIndirect-offset-02710**
  offset must be a multiple of 4.

- **VUID-vkCmdDrawIndirect-commandBuffer-02711**
  commandBuffer must not be a protected command buffer.

- **VUID-vkCmdDrawIndirect-drawCount-02718**
  If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1.

- **VUID-vkCmdDrawIndirect-drawCount-02719**
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount.

- **VUID-vkCmdDrawIndirect-drawCount-00476**
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand).

- **VUID-vkCmdDrawIndirect-drawCount-00487**
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

- **VUID-vkCmdDrawIndirect-drawCount-00488**
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndirect-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle.

- **VUID-vkCmdDrawIndirect-buffer-parameter**
  buffer must be a valid VkBuffer handle.

- **VUID-vkCmdDrawIndirect-commandBuffer-recording**
  commandBuffer must be in the recording state.

- **VUID-vkCmdDrawIndirect-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations.

- **VUID-vkCmdDrawIndirect-renderpass**
  This command must only be called inside of a render pass instance.
This command **must** only be called outside of a video coding scope.

Both of `buffer` and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>

The `VkDrawIndirectCommand` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t    vertexCount;
    uint32_t    instanceCount;
    uint32_t    firstVertex;
    uint32_t    firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

### Valid Usage

- **VUID-VkDrawIndirectCommand-pNext-09461**
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of...
VkGraphicsPipelineCreateInfo::pVertexInputState, any member of VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0

- VUID-VkDrawIndirectCommand-None-09462
  If shader objects are used for drawing or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, any member of the pVertexBindingDescriptions parameter to the vkCmdSetVertexInputEXT call that sets this dynamic state has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0

- VUID-VkDrawIndirectCommand-None-00500
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-VkDrawIndirectCommand-firstInstance-00501
  If the drawIndirectFirstInstance feature is not enabled, firstInstance must be 0

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
• countBuffer is the buffer containing the draw count.
• countBufferOffset is the byte offset into countBuffer where the draw count begins.
• maxDrawCount specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in countBuffer and maxDrawCount.
• stride is the byte stride between successive sets of draw parameters.

vkCmdDrawIndirectCount behaves similarly to vkCmdDrawIndirect except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from countBuffer located at countBufferOffset and use this as the draw count.

Valid Usage

• VUID-vkCmdDrawIndirectCount-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndirectCount-magFilter-09598
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

• VUID-vkCmdDrawIndirectCount-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndirectCount-mipmapMode-09599
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

• VUID-vkCmdDrawIndirectCount-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's levelCount and layerCount must be 1

• VUID-vkCmdDrawIndirectCount-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view's viewType must be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D
If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and
 VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirectCount-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDrawIndirectCount-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirectCount-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndirectCount-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirectCount-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage
corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDrawIndirectCount-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDrawIndirectCount-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDrawIndirectCount-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDrawIndirectCount-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

- **VUID-vkCmdDrawIndirectCount-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndirectCount-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- **VUID-vkCmdDrawIndirectCount-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndirectCount-None-07288**
Any shader invocation executed by this command **must** terminate

- VUID-vkCmdDrawIndirectCount-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written.

- VUID-vkCmdDrawIndirectCount-renderPass-02684
  The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawIndirectCount-subpass-02685
  The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawIndirectCount-None-07748
  If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07468
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- VUID-vkCmdDrawIndirectCount-None-07469
  Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImage` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

- VUID-vkCmdDrawIndirectCount-pDepthInputAttachmentIndex-09595
  Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR::pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR::pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

- VUID-vkCmdDrawIndirectCount-pDepthInputAttachmentIndex-09596
  Input attachment views accessed in a dynamic render pass via a shader object **must** have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR::pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR::pStencilInputAttachmentIndex` are non-NULL.

- VUID-vkCmdDrawIndirectCount-InputAttachmentIndex-09597
  If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` **must** match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

- VUID-vkCmdDrawIndirectCount-None-06537
Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndirectCount-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  
  - the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
    
    - there is no currently bound graphics pipeline or
    
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

  it must not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndirectCount-None-09001**
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or

  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
    
    - there is no currently bound graphics pipeline or
    
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

  it must not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDrawIndirectCount-None-09002**
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or

  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
    
    - there is no currently bound graphics pipeline or
    
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

  it must not be accessed in any way other than as an attachment by this command
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command.

If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, **vkCmdSetLineWidth** must have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command.

If a shader object that outputs line primitives is bound to the **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, and...
the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07835
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08621
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07836
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called and
not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07839**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
vkCmdSetDepthCompareOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08631
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthTestEnable in the current command buffer set depthTestEnable to VK_TRUE, then vkCmdSetDepthCompareOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07846
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE dynamic state enabled then vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08632
  If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07847
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08633
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08634
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then **vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **VkPipelineViewportStateCreateInfo::scissorCount** of the pipeline

- **VUID-vkCmdDrawIndirectCount-scissorCount-03418**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **scissorCount** parameter of **vkCmdSetScissorWithCount** must match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

- **VUID-vkCmdDrawIndirectCount-viewportCount-03419**
  If the bound graphics pipeline state was created with both the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**

- **VUID-vkCmdDrawIndirectCount-None-08635**
  If a shader object is bound to any graphics stage, then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**

- **VUID-vkCmdDrawIndirectCount-None-04876**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** dynamic state enabled then **vkCmdSetRasterizerDiscardEnable** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-04877**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, then **vkCmdSetDepthBiasEnable** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-04878**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** dynamic state enabled then **vkCmdSetDepthBiasEnable** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08639**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, then **vkCmdSetDepthBiasEnable** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of

---

1380
VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08912
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08911
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectCount-None-07751
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount

- VUID-vkCmdDrawIndirectCount-None-07880
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09236
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08648
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07881
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`. 
If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

If `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL.Handle`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a
graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectCount-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
• **VUID-vkCmdDrawIndirectCount-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• **VUID-vkCmdDrawIndirectCount-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-alphaToCoverageEnable-08920**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• **VUID-vkCmdDrawIndirectCount-None-07625**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-None-08655**
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then...
vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07630
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08660
  If the geometryStreams feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage, then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07633
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT dynamic state enabled then vkCmdSetDepthClipEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08663
  If the depthClipEnable feature is enabled, and a shader object is bound to any graphics stage, then vkCmdSetDepthClipEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07636
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT dynamic state enabled then vkCmdSetProvokingVertexModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08665
  If the VK_EXT_provoking_vertex extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetProvokingVertexModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07637
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic state enabled then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08666
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT must have been called
and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08667**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08668**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-07638**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08669**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08670**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08671**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer
set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-07849**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08672**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawIndirectCount-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawIndirectCount-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawIndirectCount-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawIndirectCount-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are
enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndirectCount-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer sets `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirectCount-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer sets `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndirectCount-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer sets...
rasterizerDiscardEnable to VK_FALSE, then **vkCmdSetColorWriteMaskEXT** must have been called in the current command buffer prior to this drawing command, and the attachments specified by the **firstAttachment** and **attachmentCount** parameters of **vkCmdSetColorWriteMaskEXT** calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirectCount-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the **primitivesGeneratedQueryWithNonZeroStreams** feature is not enabled and the **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT** query is active, and the bound graphics pipeline was created with **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** state enabled, the last call to **vkCmdSetRasterizationStreamEXT** must have set the **rasterizationStream** to zero.

- **VUID-vkCmdDrawIndirectCount-stippledLineEnable-07495**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** or **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** dynamic states enabled, and if the current **stippledLineEnable** state is VK_TRUE and the current **lineRasterizationMode** state is **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR**, then the **stippledRectangularLines** feature must be enabled.

- **VUID-vkCmdDrawIndirectCount-stippledLineEnable-07496**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** or **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** dynamic states enabled, and if the current **stippledLineEnable** state is VK_TRUE and the current **lineRasterizationMode** state is **VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR**, then the **stippledBresenhamLines** feature must be enabled.

- **VUID-vkCmdDrawIndirectCount-stippledLineEnable-07497**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** or **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** dynamic states enabled, and if the current **stippledLineEnable** state is VK_TRUE and the current **lineRasterizationMode** state is **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR**, then the **stippledSmoothLines** feature must be enabled.

- **VUID-vkCmdDrawIndirectCount-stippledLineEnable-07498**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT** or **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT** dynamic states enabled, and if the current **stippledLineEnable** state is VK_TRUE and the current **lineRasterizationMode** state is **VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR**, then the **stippledRectangularLines** feature must be enabled and **VkPhysicalDeviceLimits::strictLines** must be VK_TRUE.

- **VUID-vkCmdDrawIndirectCount-None-08684**
  If there is no bound graphics pipeline, **vkCmdBindShadersEXT** must have been called in the

• **VUID-vkCmdDrawIndirectCount-None-08877**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** dynamic state **vkCmdSetAttachmentFeedbackLoopEnableEXT** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirectCount-None-08684**
  If there is no bound graphics pipeline, **vkCmdBindShadersEXT** must have been called in the
current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT}

- VUID-vkCmdDrawIndirectCount-None-08685
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_CONTROL\_BIT}

- VUID-vkCmdDrawIndirectCount-None-08686
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT}

- VUID-vkCmdDrawIndirectCount-None-08687
  If there is no bound graphics pipeline, and the \texttt{geometryShader} feature is enabled, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_GEOMETRY\_BIT}

- VUID-vkCmdDrawIndirectCount-None-08688
  If there is no bound graphics pipeline, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT}

- VUID-vkCmdDrawIndirectCount-None-08698
  If any graphics shader is bound which was created with the \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag, then all shaders created with the \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag in the same \texttt{vkCreateShadersEXT} call \textbf{must} also be bound

- VUID-vkCmdDrawIndirectCount-None-08699
  If any graphics shader is bound which was created with the \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag, any stages in between stages whose shaders which did not create a shader with the \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag as part of the same \texttt{vkCreateShadersEXT} call \textbf{must} not have any \texttt{VkShaderEXT} bound

- VUID-vkCmdDrawIndirectCount-None-08878
  All bound graphics shader objects \textbf{must} have been created with identical or identically defined push constant ranges

- VUID-vkCmdDrawIndirectCount-None-08879
  All bound graphics shader objects \textbf{must} have been created with identical or identically defined arrays of descriptor set layouts

- VUID-vkCmdDrawIndirectCount-None-08880
  If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK\_FALSE}, then \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} \textbf{must} have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-pDynamicStates-08715
  If the bound graphics pipeline state includes a fragment shader stage, was created with \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_WRITE\_ENABLE} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}, and the fragment shader declares the \texttt{EarlyFragmentTests} execution mode and uses \texttt{OpDepthAttachmentReadEXT}, the \texttt{depthWriteEnable} parameter in the last call
to \texttt{vkCmdSetDepthWriteEnable} \textbf{must} be \texttt{VK_FALSE}

- **VUID-vkCmdDrawIndirectCount-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with \texttt{VK_DYNAMIC_STATE_STENCIL_WRITE_MASK} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}, and the fragment shader declares the \texttt{EarlyFragmentTests} execution mode and uses \texttt{OpStencilAttachmentReadEXT}, the \texttt{writeMask} parameter in the last call to \texttt{vkCmdSetStencilWriteMask} \textbf{must} be \texttt{0}

- **VUID-vkCmdDrawIndirectCount-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT}, and the format of any color attachment is \texttt{VK_FORMAT_E5B9G9R9_UFLOAT_PACK32}, the corresponding element of the \texttt{pColorWriteMasks} parameter of \texttt{vkCmdSetColorWriteMaskEXT} \textbf{must} either include all of \texttt{VK_COLOR_COMPONENT_R_BIT}, \texttt{VK_COLOR_COMPONENT_G_BIT}, and \texttt{VK_COLOR_COMPONENT_B_BIT}, or none of them

- **VUID-vkCmdDrawIndirectCount-maxFragmentDualSrcAttachments-09239**
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of \texttt{Location} for any output attachment \textbf{statically used} in the \textit{Fragment Execution Model} executed by this command \textbf{must} be less than \texttt{maxFragmentDualSrcAttachments}

- **VUID-vkCmdDrawIndirectCount-None-09548**
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, the value of each element of \texttt{VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations} set by \texttt{vkCmdSetRenderingAttachmentLocationsKHR} \textbf{must} match the value set for the corresponding element in the currently bound pipeline

- **VUID-vkCmdDrawIndirectCount-None-09549**
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline \textbf{must} match those set for the current render pass instance via \texttt{VkRenderingInputAttachmentIndexInfoKHR}

- **VUID-vkCmdDrawIndirectCount-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface \textbf{must} have either valid or \texttt{VK_NULL_HANDLE} buffers bound

- **VUID-vkCmdDrawIndirectCount-None-04008**
  If the \texttt{nullDescriptor} feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface \textbf{must} not be \texttt{VK_NULL_HANDLE}

- **VUID-vkCmdDrawIndirectCount-None-02721**
  If \texttt{robustBufferAccess} is not enabled, then for a given vertex buffer binding, any attribute data fetched \textbf{must} be entirely contained within the corresponding vertex buffer binding, as described in \textit{Vertex Input Description}

- **VUID-vkCmdDrawIndirectCount-None-07842**
  If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage then
vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic state enabled and the **dynamicPrimitiveTopologyUnrestricted** is **VK_FALSE**, then the **primitiveTopology** parameter of **vkCmdSetPrimitiveTopology** must be of the same topology class as the pipeline **VkPipelineInputAssemblyStateCreateInfo::topology** state.

- **VUID-vkCmdDrawIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** must have been called and not subsequently invalidated in the current command buffer prior to this draw command, and the **pStrides** parameter of **vkCmdBindVertexBuffers2EXT** must not be NULL.

- **VUID-vkCmdDrawIndirectCount-None-04914**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then **vkCmdSetVertexInputEXT** must have been called and not subsequently invalidated in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndirectCount-Input-07939**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then all variables with the **Input** storage class decorated with **Location** in the **Vertex Execution Model OpEntryPoint** must contain a location in **VkVertexInputAttributeDescription2EXT::location**.

- **VUID-vkCmdDrawIndirectCount-Input-08734**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then the numeric type associated with all **Input** variables of the corresponding **Location** in the **Vertex Execution Model OpEntryPoint** must be the same as **VkVertexInputAttributeDescription2EXT::format**.

- **VUID-vkCmdDrawIndirectCount-format-08936**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage and **VkVertexInputAttributeDescription2EXT::format** has a 64-bit component, then the scalar width associated with all **Input** variables of the corresponding **Location** in the **Vertex Execution Model OpEntryPoint** must be 64-bit.

- **VUID-vkCmdDrawIndirectCount-format-08937**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage and the scalar width associated with a **Location** decorated **Input** variable in the **Vertex Execution Model OpEntryPoint** is 64-bit, then the corresponding **VkVertexInputAttributeDescription2EXT::format** must have a 64-bit component.

- **VUID-vkCmdDrawIndirectCount-None-09203**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage and **VkVertexInputAttributeDescription2EXT::format** has a 64-bit component, then all **Input** variables at the corresponding **Location** in the **Vertex Execution Model OpEntryPoint** must not use components that are not present in the format.

- **VUID-vkCmdDrawIndirectCount-None-04879**
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then
vkCmdSetPrimitiveRestartEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectCount-None-09637
  If the primitiveTopologyListRestart feature is not enabled, the topology is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must be set to VK_FALSE.

- VUID-vkCmdDrawIndirectCount-Buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdDrawIndirectCount-Buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

- VUID-vkCmdDrawIndirectCount-Offset-02710
  offset must be a multiple of 4.

- VUID-vkCmdDrawIndirectCount-CommandBuffer-02711
  commandBuffer must not be a protected command buffer.

- VUID-vkCmdDrawIndirectCount-CountBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdDrawIndirectCount-CountBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

- VUID-vkCmdDrawIndirectCount-CountBufferOffset-02716
  countBufferOffset must be a multiple of 4.

- VUID-vkCmdDrawIndirectCount-CountBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount.

- VUID-vkCmdDrawIndirectCount-CountBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer.

- VUID-vkCmdDrawIndirectCount-None-04445
  If drawIndirectCount is not enabled this function must not be used.

- VUID-vkCmdDrawIndirectCount-Stride-03110
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand).

- VUID-vkCmdDrawIndirectCount-MaxDrawCount-03111
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

- VUID-vkCmdDrawIndirectCount-CountBuffer-03121
  If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.
If the count stored in `countBuffer` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof(VkDrawIndirectCommand)})\) must be less than or equal to the size of `buffer`.

**Valid Usage (Implicit)**

- VUID-vkCmdDrawIndirectCount-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdDrawIndirectCount-buffer-parameter
  - `buffer` must be a valid `VkBuffer` handle.
- VUID-vkCmdDrawIndirectCount-countBuffer-parameter
  - `countBuffer` must be a valid `VkBuffer` handle.
- VUID-vkCmdDrawIndirectCount-commandBuffer-recording
  - `commandBuffer` must be in the recording state.
- VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- VUID-vkCmdDrawIndirectCount-renderpass
  - This command must only be called inside of a render pass instance.
- VUID-vkCmdDrawIndirectCount-videocoding
  - This command must only be called outside of a video coding scope.
- VUID-vkCmdDrawIndirectCount-commonparent
  - Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tbody>
</table>

To record an indexed indirect drawing command, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer containing draw parameters.
- **offset** is the byte offset into **buffer** where parameters begin.
- **drawCount** is the number of draws to execute, and can be zero.
- **stride** is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from **buffer** starting at **offset** and increasing by **stride** bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, **stride** is ignored.

### Valid Usage

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a **VkSampler** created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-magFilter-09598**
  If a **VkSampler** created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a **VkSampler** created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-09599**
  If a **VkSampler** created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

1397
**VK_SAMPLER_REDUCTION_MODE_MAX** is used to sample a *VkImageView* as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT**

- **VUID-vkCmdDrawIndexedIndirect-unnormalizedCoordinates-09635**
  If a *VkSampler* created with **unnormalizedCoordinates** equal to **VK_TRUE** is used to sample a *VkImageView* as a result of this command, then the image view's **levelCount** and **layerCount** must be 1

- **VUID-vkCmdDrawIndexedIndirect-unnormalizedCoordinates-09636**
  If a *VkSampler* created with **unnormalizedCoordinates** equal to **VK_TRUE** is used to sample a *VkImageView* as a result of this command, then the image view's **viewType** must be **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**

- **VUID-vkCmdDrawIndexedIndirect-None-06479**
  If a *VkImageView* is sampled with depth comparison, the image view's format features must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a *VkImageView* is accessed using atomic operations as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirect-None-07888**
  If a **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07027**
  For any *VkImageView* being written as a storage image where the image format field of the **OpTypeImage** is Unknown, the view's format features must contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07028**
  For any *VkImageView* being read as a storage image where the image format field of the **OpTypeImage** is Unknown, the view's format features must contain **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07029**
  For any *VkBufferView* being written as a storage texel buffer where the image format field of the **OpTypeImage** is Unknown, the view's buffer features must contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07030**
  Any *VkBufferView* being read as a storage texel buffer where the image format field of the **OpTypeImage** is Unknown then the view's buffer features must contain **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-None-08600**
  For each set *n* that is statically used by a bound shader, a descriptor set must have been bound to *n* at the same pipeline bind point, with a *VkPipelineLayout* that is compatible for set *n*, with the *VkPipelineLayout* used to create the current *VkPipeline* or the *VkDescriptorSetLayout* array used to create the current *VkShaderEXT*, as described in Pipeline Layout Compatibility
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipeline or the VkDescriptorSetLayout array used to create the current VkPipeline or the VkShaderEXT, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind.
point used by this command, or a valid combination of valid and \texttt{VK_NULL_HANDLE} shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexedIndirect-uniformBuffers-06935**
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and the \texttt{robustBufferAccess} feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirect-None-08612**
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirect-storageBuffers-06936**
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and the \texttt{robustBufferAccess} feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirect-None-08613**
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-02707**
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, any resource accessed by bound shaders must not be a protected resource.

- **VUID-vkCmdDrawIndexedIndirect-None-06550**
  If a bound shader accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \texttt{sampler Y'C_aC_bC_r} conversion, that object must only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions.

- **VUID-vkCmdDrawIndexedIndirect-ConstOffset-06551**
  If a bound shader accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \texttt{sampler Y'C_aC_bC_r} conversion, that object must not use the \texttt{ConstOffset} and \texttt{Offset} operands.

- **VUID-vkCmdDrawIndexedIndirect-viewType-07752**
  If a \texttt{VkImageView} is accessed as a result of this command, then the image view's \texttt{viewType} must match the \texttt{Dim} operand of the \texttt{OpTypeImage} as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDrawIndexedIndirect-format-07753**
  If a \texttt{VkImageView} is accessed as a result of this command, then the numeric type of the image view's \texttt{format} and the \texttt{Sampled Type} operand of the \texttt{OpTypeImage} must match.

- **VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08795**
  If a \texttt{VkImageView} created with a format other than \texttt{VK_FORMAT_A8_UNORM_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction must have at least as many components as the image view's \texttt{format}. 

---

1400
If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format.

Any shader invocation executed by this command **must** terminate.

If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written.

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor **must** be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[inputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR: pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR: pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.

Input attachment views accessed in a dynamic render pass with a `InputAttachmentIndex` referenced by `VkRenderingInputAttachmentIndexInfoKHR`, or no `InputAttachmentIndex` if `VkRenderingInputAttachmentIndexInfoKHR: pDepthInputAttachmentIndex` or `VkRenderingInputAttachmentIndexInfoKHR: pStencilInputAttachmentIndex` are NULL, **must** be created with a `VkImageView` that is compatible with the corresponding color, depth, or stencil attachment in `VkRenderingInfo`.
Input attachment views accessed in a dynamic render pass via a shader object must have an `InputAttachmentIndex` if both `VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex` and `VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex` are non-NULL.

- **VUID-vkCmdDrawIndexedIndirect-InputAttachmentIndex-09597**
  If an input attachment view accessed in a dynamic render pass via a shader object has an `InputAttachmentIndex`, the `InputAttachmentIndex` must match an index in `VkRenderingInputAttachmentIndexInfoKHR`.

- **VUID-vkCmdDrawIndexedIndirect-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndexedIndirect-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndexedIndirect-None-09001**
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndexedIndirect-None-09002**
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the
currently bound pipeline or
• the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  • there is no currently bound graphics pipeline or
  • the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`

It must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirect-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawIndexedIndirect-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexedIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndexedIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`

• VUID-vkCmdDrawIndexedIndirect-None-07831
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07832
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set polygonMode to `VK_POLYGON_MODE_LINE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08618
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-08619
  If a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetLineWidth` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-07835
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-08621
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirect-None-07836
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS`
dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set depthBoundsTestEnable to VK_TRUE, then `vkCmdSetDepthBounds` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07837**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set stencilTestEnable to VK_TRUE, then `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07838**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set stencilTestEnable to VK_TRUE, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07839**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawIndexedIndirect-None-07840
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08627
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07841
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08628
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07843
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08629
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07844
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawIndexedIndirect-None-08635**
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawIndexedIndirect-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-04877**
  If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** dynamic state enabled then
`vkCmdSetDepthBiasEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08640**
  - If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552**
  - If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawIndexedIndirect-blendEnable-04727**
  - If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's **format features** do not contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT**, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndexedIndirect-None-08644**
  - If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s **format features** do not contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT**, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`.

- **VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07284**
  - If rasterization is not disabled in the bound graphics pipeline, then **rasterizationSamples** for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexedIndirect-None-08644**
  - If a shader object is bound to any graphics stage, and the most recent call to
`vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirect-None-08876**
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`

- **VUID-vkCmdDrawIndexedIndirect-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

- **VUID-vkCmdDrawIndexedIndirect-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexedIndirect-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexedIndirect-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

- **VUID-vkCmdDrawIndexedIndirect-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexedIndirect-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- **VUID-vkCmdDrawIndexedIndirect-colorAttachmentCount-06179**
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

- **VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08910**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08912**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08911**
  If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexedIndirect-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT`::`discardRectangleCount`.

- **VUID-vkCmdDrawIndexedIndirect-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set...
discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08648
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07881
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled then vkCmdSetDiscardRectangleModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08649
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08913
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo
::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirect-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndexedIndirect-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not
VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- **VUID-vkCmdDrawIndexedIndirect-pDepthAttachment-08964**
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- **VUID-vkCmdDrawIndexedIndirect-pStencilAttachment-08965**
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED.

- **VUID-vkCmdDrawIndexedIndirect-None-07619**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT dynamic state enabled then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07620**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT dynamic state enabled then vkCmdSetDepthClampEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-09237**
  If a shader object is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage, then vkCmdSetTessellationDomainOriginEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08650**
  If the depthClamp feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthClampEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07621**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_POLYGON_MODE_EXT dynamic state enabled then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetPolygonModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
• VUID-vkCmdDrawIndexedIndirect-None-07622
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-None-08652
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-None-07623
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-None-08653
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawIndexedIndirect-None-08654
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawIndexedIndirect-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08655**
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07626**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08656**
  If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07627**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08657**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07628**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08658**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the geometryStreams feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage, then vkCmdSetRasterizationStreamEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT dynamic state enabled then vkCmdSetDepthClipEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the depthClipEnable feature is enabled, and a shader object is bound to any graphics stage, then vkCmdSetDepthClipEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the boundary graphics pipeline state was created with the VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT dynamic state enabled then vkCmdSetProvokingVertexModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the VK_EXT_provoking_vertex extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetProvokingVertexModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08666**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08667**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08668**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07638**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08669**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08670**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a
shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any 
line topology, then vkCmdSetLineStippleEnableEXT must have been called and not 
subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08671
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a 
shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07849
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STENCIL_KHR dynamic state enabled then vkCmdSetLineStippleKHR must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08672
If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a 
shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetLineStippleEnableEXT in the current command buffer set stippledLineEnable to 
VK_TRUE, then vkCmdSetLineStippleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-pColorBlendEnables-07470
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to 
vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, 
then for those attachments in the subpass the corresponding image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

• VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-07471
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to 
vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-attachment subpass

• VUID-vkCmdDrawIndexedIndirect-samples-07472
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to 
vkCmdSetSampleMaskEXT must be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create
the bound graphics pipeline

- **VUID-vkCmdDrawIndexedIndirect-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexedIndirect-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.
enabled

• VUID-vkCmdDrawIndexedIndirect-firstAttachment-07478
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

• VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09419
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

• VUID-vkCmdDrawIndexedIndirect-primitivesGeneratedQueryWithNonZeroStreams-07481
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

• VUID-vkCmdDrawIndexedIndirect-stippledLineEnable-07495
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `stippledRectangularLines` feature must be enabled.

• VUID-vkCmdDrawIndexedIndirect-stippledLineEnable-07496
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature must be enabled.

• VUID-vkCmdDrawIndexedIndirect-stippledLineEnable-07497
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature must be enabled.

• VUID-vkCmdDrawIndexedIndirect-stippledLineEnable-07498
If the bound graphics pipeline state was created with the
or

\textit{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current 
\textit{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \textit{lineRasterizationMode} state is 
\textit{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_KHR}, then the \textit{stippledRectangularLines} feature must 
be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK\_TRUE}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08877}
  If the bound graphics pipeline state was created with the 
  \textit{VK\_DYNAMIC\_STATE\_ATTACHMENT\_FEEDBACK\_LOOP\_ENABLE\_EXT} dynamic state 
  \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} must have been called and not 
  subsequently invalidated in the current command buffer prior to this drawing command

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08684}
  If there is no bound graphics pipeline, \texttt{vkCmdBindShadersEXT} must have been called in the 
  current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08685}
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, 
  \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} 
  with an element of \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_CONTROL\_BIT}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08686}
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, 
  \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} 
  with an element of \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08687}
  If there is no bound graphics pipeline, and the \texttt{geometryShader} feature is enabled, 
  \texttt{vkCmdBindShadersEXT} must have been called in the current command buffer with \texttt{pStages} 
  with an element of \texttt{VK\_SHADER\_STAGE\_GEOMETRY\_BIT}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08688}
  If there is no bound graphics pipeline, \texttt{vkCmdBindShadersEXT} must have been called in the 
  current command buffer with \texttt{pStages} with an element of \texttt{VK\_SHADER\_STAGE\_FRAGMENT\_BIT}

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08698}
  If any graphics shader is bound which was created with the 
  \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag, then all shaders created with the 
  \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag in the same \texttt{vkCreateShadersEXT} call must also 
  be bound

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08699}
  If any graphics shader is bound which was created with the 
  \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag, any stages in between stages whose shaders 
  which did not create a shader with the \texttt{VK\_SHADER\_CREATE\_LINK\_STAGE\_BIT\_EXT} flag as part of 
  the same \texttt{vkCreateShadersEXT} call must not have any \texttt{VkShaderEXT} bound

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08878}
  All bound graphics shader objects must have been created with identical or identically 
  defined push constant ranges

- \texttt{VUID-vkCmdDrawIndexedIndirect-None-08879}
  All bound graphics shader objects must have been created with identical or identically 
  defined arrays of descriptor set layouts
If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE.

If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline.

If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers.
bound

- **VUID-vkCmdDrawIndexedIndirect-None-04008**
  If the *nullDescriptor* feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be *VK_NULL_HANDLE*

- **VUID-vkCmdDrawIndexedIndirect-None-02721**
  If *robustBufferAccess* is not enabled, then for a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in *Vertex Input Description*

- **VUID-vkCmdDrawIndexedIndirect-None-07842**
  If there is a shader object bound to the *VK_SHADER_STAGE_VERTEX_BIT* stage then *vkCmdSetPrimitiveTopology* **must** have been called and not subsequently *invalidated* in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-dynamicPrimitiveTopologyUnrestricted-07500**
  If the bound graphics pipeline state was created with the *VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY* dynamic state enabled and the *dynamicPrimitiveTopologyUnrestricted* is *VK_FALSE*, then the *primitiveTopology* parameter of *vkCmdSetPrimitiveTopology* **must** be of the same *topology class* as the pipeline *VkPipelineInputAssemblyStateCreateInfo::*topology* state

- **VUID-vkCmdDrawIndexedIndirect-pStrides-04913**
  If the bound graphics pipeline was created with the *VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT* dynamic state enabled, then *vkCmdBindVertexBuffers2EXT* **must** have been called and not subsequently *invalidated* in the current command buffer prior to this draw command, and the *pStrides* parameter of *vkCmdBindVertexBuffers2EXT* **must** not be *NULL*

- **VUID-vkCmdDrawIndexedIndirect-None-04914**
  If there is a shader object bound to the *VK_SHADER_STAGE_VERTEX_BIT* stage then *vkCmdSetVertexInputEXT* **must** have been called and not subsequently *invalidated* in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirect-Input-07939**
  If there is a shader object bound to the *VK_SHADER_STAGE_VERTEX_BIT* stage then all variables with the *Input* storage class decorated with *Location* in the *Vertex Execution Model OpEntryPoint* **must** contain a location in *VkVertexInputAttributeDescription2EXT::*location*

- **VUID-vkCmdDrawIndexedIndirect-Input-08734**
  If there is a shader object bound to the *VK_SHADER_STAGE_VERTEX_BIT* stage then all variables with the *Input* storage class decorated with *Location* in the *Vertex Execution Model OpEntryPoint* **must** be the same as *VkVertexInputAttributeDescription2EXT::*format*

- **VUID-vkCmdDrawIndexedIndirect-format-08936**
  If there is a shader object bound to the *VK_SHADER_STAGE_VERTEX_BIT* stage and *VkVertexInputAttributeDescription2EXT::*format* has a 64-bit component, then the scalar width associated with all *Input* variables of the corresponding *Location* in the *Vertex Execution Model OpEntryPoint* **must** be 64-bit

- **VUID-vkCmdDrawIndexedIndirect-format-08937**
If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage and the scalar width associated with a \texttt{Location} decorated \texttt{Input} variable in the \texttt{Vertex Execution Model OpEntryPoint} is 64-bit, then the corresponding \texttt{VkVertexInputAttributeDescription2EXT}::\texttt{format} must have a 64-bit component

- \textbf{VUID-vkCmdDrawIndexedIndirect-None-09203}
  If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage and \texttt{VkVertexInputAttributeDescription2EXT}::\texttt{format} has a 64-bit component, then all \texttt{Input} variables at the corresponding \texttt{Location} in the \texttt{Vertex Execution Model OpEntryPoint} must not use components that are not present in the format

- \textbf{VUID-vkCmdDrawIndexedIndirect-None-04879}
  If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then \texttt{vkCmdSetPrimitiveRestartEnable} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- \textbf{VUID-vkCmdDrawIndexedIndirect-None-09637}
  If the \texttt{primitiveTopologyListRestart} feature is not enabled, the topology is \texttt{VK\_PRIMITIVE\_TOPOLOGY\_POINT\_LIST}, \texttt{VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST}, \texttt{VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST}, \texttt{VK\_PRIMITIVE\_TOPOLOGY\_LINE\_LIST\_WITH\_ADJACENCY}, or \texttt{VK\_PRIMITIVE\_TOPOLOGY\_TRIANGLE\_LIST\_WITH\_ADJACENCY}, there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then \texttt{vkCmdSetPrimitiveRestartEnable} must be set to \texttt{VK\_FALSE}

- \textbf{VUID-vkCmdDrawIndexedIndirect-buffer-02708}
  If \texttt{buffer} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- \textbf{VUID-vkCmdDrawIndexedIndirect-buffer-02709}
  \texttt{buffer} must have been created with the \texttt{VK\_BUFFER\_USAGE\_INDIRECT\_BUFFER\_BIT} bit set

- \textbf{VUID-vkCmdDrawIndexedIndirect-offset-02710}
  \texttt{offset} must be a multiple of 4

- \textbf{VUID-vkCmdDrawIndexedIndirect-commandBuffer-02711}
  \texttt{commandBuffer} must not be a protected command buffer

- \textbf{VUID-vkCmdDrawIndexedIndirect-drawCount-02718}
  If the \texttt{multiDrawIndirect} feature is not enabled, \texttt{drawCount} must be 0 or 1

- \textbf{VUID-vkCmdDrawIndexedIndirect-drawCount-02719}
  \texttt{drawCount} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDrawIndirectCount}

- \textbf{VUID-vkCmdDrawIndexedIndirect-None-07312}
  Valid index buffer must be bound

- \textbf{VUID-vkCmdDrawIndexedIndirect-robustBufferAccess2-07825}
  If \texttt{robustBufferAccess2} is not enabled, \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with \texttt{indexSize} being based on the type specified by \texttt{indexType}, where the index buffer, \texttt{indexType}, and \texttt{offset} are specified via \texttt{vkCmdBindIndexBuffer}

- \textbf{VUID-vkCmdDrawIndexedIndirect-drawCount-00528}
  If \texttt{drawCount} is greater than 1, \texttt{stride} must be a multiple of 4 and \texttt{must} be greater than or
equal to \( \text{sizeof(VkDrawIndexedIndirectCommand)} \)

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00539**
  If \( \text{drawCount} \) is equal to 1, \((\text{offset} + \text{sizeof(VkDrawIndexedIndirectCommand)})\) must be less than or equal to the size of \( \text{buffer} \)

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00540**
  If \( \text{drawCount} \) is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof (VkDrawIndexedIndirectCommand)})\) must be less than or equal to the size of \( \text{buffer} \)

### Valid Usage (Implicit)

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter**
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- **VUID-vkCmdDrawIndexedIndirect-buffer-parameter**
  \( \text{buffer} \) must be a valid \( \text{VkBuffer} \) handle

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording**
  \( \text{commandBuffer} \) must be in the recording state

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool**
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics operations

- **VUID-vkCmdDrawIndexedIndirect-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndexedIndirect-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdDrawIndexedIndirect-commonparent**
  Both of \( \text{buffer} \), and \( \text{commandBuffer} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)

### Host Synchronization

- Host access to \( \text{commandBuffer} \) must be externally synchronized

- Host access to the \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

The `VkDrawIndexedIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

### Valid Usage

- **VUID-VkDrawIndexedIndirectCommand-pNext-09461**
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.

- **VUID-VkDrawIndexedIndirectCommand-None-09462**
  If shader objects are used for drawing or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.

- **VUID-VkDrawIndexedIndirectCommand-robustBufferAccess2-08798**
  If `robustBufferAccess2` is not enabled, `(indexSize \times (firstIndex + indexCount) + offset)` must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer` or `vkCmdBindIndexBuffer2KHR`. If `vkCmdBindIndexBuffer2KHR` is used to bind the index buffer, the size of the bound index buffer is `vkCmdBindIndexBuffer2KHR::size`.

- **VUID-VkDrawIndexedIndirectCommand-None-00552**

1427
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- VUID-VkDrawIndexedIndirectCommand-firstInstance-00554
  If the drawIndirectFirstInstance feature is not enabled, firstInstance must be 0

To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- commandBuffer is the command buffer into which the command is recorded.
- buffer is the buffer containing draw parameters.
- offset is the byte offset into buffer where parameters begin.
- countBuffer is the buffer containing the draw count.
- countBufferOffset is the byte offset into countBuffer where the draw count begins.
- maxDrawCount specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in countBuffer and maxDrawCount.
- stride is the byte stride between successive sets of draw parameters.

vkCmdDrawIndexedIndirectCount behaves similarly to vkCmdDrawIndexedIndirect except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from countBuffer located at countBufferOffset and use this as the draw count.
Valid Usage

- VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-magFilter-09598
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-09599
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-unnormalizedCoordinates-09635
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1

- VUID-vkCmdDrawIndexedIndirectCount-unnormalizedCoordinates-09636
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- VUID-vkCmdDrawIndexedIndirectCount-None-06479
  If a `VkImageView` is sampled with `depth comparison`, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawIndexedIndirectCount-None-07888
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features...
must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDrawIndexedIndirectCount-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not
have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndexedIndirectCount-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDrawIndexedIndirectCount-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDrawIndexedIndirectCount-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndexedIndirectCount-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndexedIndirectCount-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexedIndirectCount-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexedIndirectCount-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexedIndirectCount-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer,
it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

• VUID-vkCmdDrawIndexedIndirectCount-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDrawIndexedIndirectCount-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdDrawIndexedIndirectCount-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

• VUID-vkCmdDrawIndexedIndirectCount-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDrawIndexedIndirectCount-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDrawIndexedIndirectCount-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

• VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndexedIndirectCount-subpass-02685
The subpass index of the current render pass must be equal to the subpass member of the 
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to 
VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexedIndirectCount-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to 
  the pipeline via a descriptor set

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim 
  operand of SubpassData, it must be decorated with an InputAttachmentIndex that 
  corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndexedIndirectCount-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat 
  as the corresponding subpass definition, and be created with a VkImageView that is 
  compatible with the attachment referenced by the subpass' pInputAttachments 
  [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment 
  Input Attachment Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-pDepthInputAttachmentIndex-09595
  Input attachment views accessed in a dynamic render pass with a InputAttachmentIndex 
  referenced by VkRenderingInputAttachmentIndexInfoKHR, or no InputAttachmentIndex if 
  VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex or 
  VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are NULL, must 
  be created with a VkImageView that is compatible with the corresponding color, depth, or 
  stencil attachment in VkRenderingInfo

- VUID-vkCmdDrawIndexedIndirectCount-pDepthInputAttachmentIndex-09596
  Input attachment views accessed in a dynamic render pass via a shader object must have 
  an InputAttachmentIndex if both VkRenderingInputAttachmentIndexInfoKHR 
  :pDepthInputAttachmentIndex and VkRenderingInputAttachmentIndexInfoKHR 
  :pStencilInputAttachmentIndex are non-NUL

- VUID-vkCmdDrawIndexedIndirectCount-InputAttachmentIndex-09597
  If an input attachment view accessed in a dynamic render pass via a shader object has an 
  InputAttachmentIndex, the InputAttachmentIndex must match an index in 
  VkRenderingInputAttachmentIndexInfoKHR

- VUID-vkCmdDrawIndexedIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass 
  must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, 
  store, or resolve operations for this subpass, it is not in the 
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  ◦ the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently 
    bound pipeline or
  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included 
    VK_IMAGE_ASPECT_COLOR_BIT and
• there is no currently bound graphics pipeline or
• the currently bound graphics pipeline was created with
  `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`
it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09001
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

  ◦ the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  ◦ the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included
    `VK_IMAGE_ASPECT_DEPTH_BIT` and
    • there is no currently bound graphics pipeline or
    • the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`
it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09002
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

  ◦ the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  ◦ the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included
    `VK_IMAGE_ASPECT_STENCIL_BIT` and
    • there is no currently bound graphics pipeline or
    • the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT`
it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-06539
If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexedIndirectCount-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must be** VK_STENCIL_OP_KEEP.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then **vkCmdSetViewport** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then **vkCmdSetScissor** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then **vkCmdSetLineWidth** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, **vkCmdSetLineWidth** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set primitiveTopology to any line topology, **vkCmdSetLineWidth** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to VK_FALSE, **vkCmdSetLineWidth** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT** must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set...
rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08622
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07837
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08623
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07838
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07839
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawIndexedIndirectCount-None-07840
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08627
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07841
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then...
vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08632
  If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetDepthBoundsTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07847
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08633
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetStencilTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07848
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then vkCmdSetStencilOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08634
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline
If the bound graphics pipeline state was created with both the 
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic 
states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount 
**must** have been called in the current command buffer prior to this drawing command, 
and the viewportCount parameter of vkCmdSetViewportWithCount **must** match the 
scissorCount parameter of vkCmdSetScissorWithCount.

If a shader object is bound to any graphics stage, then both 
vkCmdSetViewportWithCount and vkCmdSetScissorWithCount **must** have been called in the current command buffer 
prior to this drawing command, and the viewportCount parameter of 
vkCmdSetViewportWithCount **must** match the scissorCount parameter of 
vkCmdSetScissorWithCount.

If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then 
vkCmdSetRasterizerDiscardEnable **must** have been called and not subsequently 
invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, then 
vkCmdSetRasterizerDiscardEnable **must** have been called and not subsequently 
invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then 
vkCmdSetDepthBiasEnable **must** have been called and not subsequently 
invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable **must** have been 
called and not subsequently invalidated in the current command buffer prior to this 
drawing command.

If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the 
bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT 
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write 
to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount **must** have 
been called in the current command buffer prior to this drawing command, and the 
viewportCount parameter of vkCmdSetViewportWithCount **must** be 1.

If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and any 
shader object bound to a graphics stage writes to the PrimitiveShadingRateKHR built-in,
then \texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must be 1

- **VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK_FALSE}

- **VUID-vkCmdDrawIndexedIndirectCount-None-08643**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then for each color attachment in the render pass, if the corresponding image view's \texttt{format features} do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the corresponding member of \texttt{pColorBlendEnables} in the most recent call to \texttt{vkCmdSetColorBlendEnableEXT} in the current command buffer that affected that attachment index must have been \texttt{VK_FALSE}

- **VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07284**
  If rasterization is not disabled in the bound graphics pipeline,

  
  then \texttt{rasterizationSamples} for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirectCount-None-08644**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE},

  then the most recent call to \texttt{vkCmdSetRasterizationSamplesEXT} in the current command buffer must have set \texttt{rasterizationSamples} to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirectCount-None-08876**
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with \texttt{vkCmdBeginRendering}

- **VUID-vkCmdDrawIndexedIndirectCount-imageView-06172**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command must not write any values to the depth attachment

- **VUID-vkCmdDrawIndexedIndirectCount-imageView-06173**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexedIndirectCount-imageView-06174**
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06175
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

- VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachment Formats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08911
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass
instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingInfo::colorAttachmentCount} greater than 0, then each element of the \texttt{VkRenderingInfo::pColorAttachments} array with an \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} must have been created with a \texttt{VkFormat} equal to the corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats} used to create the currently bound graphics pipeline, or the corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats}, if it exists, must be \texttt{VK_FORMAT_UNDEFINED}.

\begin{itemize}
  \item **VUID-vkCmdDrawIndexedIndirectCount-None-07751**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT} dynamic state enabled then \texttt{vkCmdSetDiscardRectangleEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command for each discard rectangle in \texttt{VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount}.

  \item **VUID-vkCmdDrawIndexedIndirectCount-None-07880**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetDiscardRectangleEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

  \item **VUID-vkCmdDrawIndexedIndirectCount-rasterizerDiscardEnable-09236**
  If the \texttt{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetDiscardRectangleEnableEXT} in the current command buffer set \texttt{discardRectangleEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetDiscardRectangleEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

  \item **VUID-vkCmdDrawIndexedIndirectCount-None-08648**
  If the \texttt{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDiscardRectangleEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

  \item **VUID-vkCmdDrawIndexedIndirectCount-None-07881**
  If the \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT} dynamic state enabled then \texttt{vkCmdSetDiscardRectangleModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

  \item **VUID-vkCmdDrawIndexedIndirectCount-None-08649**
  If the \texttt{VK_EXT_discard_rectangles} extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to \texttt{vkCmdSetDiscardRectangleEnableEXT} in the current command buffer set \texttt{discardRectangleEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetDiscardRectangleModeEXT} must have been called and not subsequently invalidated in the current command buffer prior to this
drawing command

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08913
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06183
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with...
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07286
  If `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07287
  If `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- VUID-vkCmdDrawIndexedIndirectCount-renderPass-06198
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- VUID-vkCmdDrawIndexedIndirectCount-pColorAttachments-08963
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-08964
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-08965
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- VUID-vkCmdDrawIndexedIndirectCount-None-07619
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirectCount-None-07620
If the bound graphics pipeline state was created with the
`VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then
`vkCmdSetDepthClampEnableEXT` must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then
  `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage,
  and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command
  buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently
  invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07621**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then
  `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07622**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then
  `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07623**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been
called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07624
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetAlphaToCoverageEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic state enabled, and \texttt{alphaToCoverageEnable} was \texttt{VK_TRUE} in the last call to \texttt{vkCmdSetAlphaToCoverageEnableEXT}, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexedIndirectCount-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetAlphaToCoverageEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetAlphaToCoverageEnableEXT} in the current command buffer set \texttt{alphaToCoverageEnable} to \texttt{VK_TRUE}, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexedIndirectCount-None-07625
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08655
  If the \texttt{alphaToOne} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07626
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08656
  If the \texttt{logicOp} feature is enabled, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetLogicOpEnableEXT} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

1447
called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07627**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08657**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07628**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08658**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08659**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-07630**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have
been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07633
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08663
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07636
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08665
  If the `VK_EXT_proving_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07637
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08666
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08667
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command
If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and themost recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
shader object is bound to any graphics stage, and the most recent call to
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
rasterizerDiscardEnable to \texttt{VK_FALSE}, and the most recent call to
\texttt{vkCmdSetLineStippleEnableEXT} in the current command buffer set stippledLineEnable to
\texttt{VK_TRUE}, then \texttt{vkCmdSetLineStippleEXT} must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} state enabled and the last call to
  \texttt{vkCmdSetColorBlendEnableEXT} set \texttt{pColorBlendEnables} for any attachment to \texttt{VK_TRUE},
  then for those attachments in the subpass the corresponding image view's format features
  must contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}

- VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state enabled, and the current subpass does
  not use any color and/or depth/stencil attachments, then the \texttt{rasterizationSamples} in the
  last call to \texttt{vkCmdSetRasterizationSamplesEXT} must follow the rules for a zero-
  attachment subpass

- VUID-vkCmdDrawIndexedIndirectCount-samples-07472
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT} state enabled and the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT}
  state disabled, then the \texttt{samples} parameter in
  the last call to \texttt{vkCmdSetSampleMaskEXT} must be greater or equal to the
  \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} parameter used to create
  the bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirectCount-samples-07473
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_SAMPLE_MASK_EXT} state and \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT}
  states enabled, then the \texttt{samples} parameter in the last call to \texttt{vkCmdSetSampleMaskEXT}
  must be greater or equal to the \texttt{rasterizationSamples} parameter in the last call to
  \texttt{vkCmdSetRasterizationSamplesEXT}

- VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-07474
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} state enabled, and neither the
  \texttt{VK_AMD_mixed_attachment_samples} nor the \texttt{VK_NV_framebuffer_mixed_samples} extensions are
  enabled, then the \texttt{rasterizationSamples} in the last call to
  \texttt{vkCmdSetRasterizationSamplesEXT} must be the same as the current subpass color and/or
  depth/stencil attachments

- VUID-vkCmdDrawIndexedIndirectCount-firstAttachment-07476
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled then
  \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer
  prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and
  \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable
  for all active color attachments in the current subpass
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.
If the bound graphics pipeline state was created with the "VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT" or "VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT" dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is "VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR" or "VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR" or "VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR" or "VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR" and strictLines is VK_TRUE, then the stippledRectangularLines feature must be enabled.

If there is no bound graphics pipeline or the tessellationShader feature is enabled, then the tessellationShader feature must be enabled.
If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08698**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08699**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08878**
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08879**
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08880**
  If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndexedIndirectCount-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color
attachment is \texttt{VK\_FORMAT\_E5B9G9R9\_UFLOAT\_PACK32}, the corresponding element of the \texttt{pColorWriteMasks} parameter of \texttt{vkCmdSetColorWriteMaskEXT} must either include all of \texttt{VK\_COLOR\_COMPONENT\_R\_BIT}, \texttt{VK\_COLOR\_COMPONENT\_G\_BIT}, and \texttt{VK\_COLOR\_COMPONENT\_B\_BIT}, or none of them.

- VUID-vkCmdDrawIndexedIndirectCount-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

- VUID-vkCmdDrawIndexedIndirectCount-None-09548
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, the value of each element of \texttt{VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations} set by \texttt{vkCmdSetRenderingAttachmentLocationsKHR} must match the value set for the corresponding element in the currently bound pipeline.

- VUID-vkCmdDrawIndexedIndirectCount-None-09549
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via \texttt{VkRenderingInputAttachmentIndexInfoKHR}.

- VUID-vkCmdDrawIndexedIndirectCount-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or \texttt{VK\_NULL\_HANDLE} buffers bound.

- VUID-vkCmdDrawIndexedIndirectCount-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be \texttt{VK\_NULL\_HANDLE}.

- VUID-vkCmdDrawIndexedIndirectCount-None-02721
  If robustBufferAccess is not enabled, then for a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- VUID-vkCmdDrawIndexedIndirectCount-None-07842
  If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then \texttt{vkCmdSetPrimitiveTopology} must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_PRIMITIVE\_TOPOLOGY} dynamic state enabled and the \texttt{dynamicPrimitiveTopologyUnrestricted} is \texttt{VK\_FALSE}, then the \texttt{primitiveTopology} parameter of \texttt{vkCmdSetPrimitiveTopology} must be of the same topology class as the pipeline \texttt{VkPipelineInputAssemblyStateCreateInfo::topology} state.

- VUID-vkCmdDrawIndexedIndirectCountCount-pStrides-04913
  If the bound graphics pipeline was created with the
VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT  dynamic state enabled, then
vkCmdBindVertexBuffers2EXT must have been called and not subsequently invalidated
in the current command buffer prior to this draw command, and the pStrides parameter
of vkCmdBindVertexBuffers2EXT must not be NULL.

- VUID-vkCmdDrawIndexedIndirectCount-None-04914
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then
  vkCmdSetVertexInputEXT must have been called and not subsequently invalidated
  in the current command buffer prior to this draw command.

- VUID-vkCmdDrawIndexedIndirectCount-Input-07939
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then
  all variables with the Input storage class decorated with Location in the Vertex Execution Model
  OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

- VUID-vkCmdDrawIndexedIndirectCount-Input-08734
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then
  the numeric type associated with all Input variables of the corresponding Location in the Vertex
  Execution Model OpEntryPoint must be the same as
  VkVertexInputAttributeDescription2EXT::format.

- VUID-vkCmdDrawIndexedIndirectCount-format-08936
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
  VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar
  width associated with all Input variables of the corresponding Location in the Vertex
  Execution Model OpEntryPoint must be 64-bit.

- VUID-vkCmdDrawIndexedIndirectCount-format-08937
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar
  width associated with a Location decorated Input variable in the Vertex Execution Model
  OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT
  ::format must have a 64-bit component.

- VUID-vkCmdDrawIndexedIndirectCount-None-09203
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
  VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input
  variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must
  not use components that are not present in the format.

- VUID-vkCmdDrawIndexedIndirectCount-None-04879
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then
  vkCmdSetPrimitiveRestartEnable must have been called and not subsequently invalidated
  in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexedIndirectCount-None-09637
  If the primitiveTopologyListRestart feature is not enabled, the topology is
  VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST,
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, there is a shader object bound to the
  VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must be set to
  VK_FALSE.

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02708
If \textit{buffer} is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- VUID-vkCmdDrawIndexedIndirectCount-buffer-02709
  \textit{buffer} \textbf{must} have been created with the VK\_BUFFER\_USAGE\_INDIRECT\_BUFFER\_BIT bit set.

- VUID-vkCmdDrawIndexedIndirectCount-offset-02710
  \textit{offset} \textbf{must} be a multiple of 4.

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711
  \textit{commandBuffer} \textbf{must} not be a protected command buffer.

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714
  If \textit{countBuffer} is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

  - VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715
    \textit{countBuffer} \textbf{must} have been created with the VK\_BUFFER\_USAGE\_INDIRECT\_BUFFER\_BIT bit set.

  - VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716
    \textit{countBufferOffset} \textbf{must} be a multiple of 4.

  - VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717
    The count stored in \textit{countBuffer} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceLimits}::maxDrawIndirectCount.

  - VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129
    \((\textit{countBufferOffset} + \sizeof\texttt{uint32\_t})\) \textbf{must} be less than or equal to the size of \textit{countBuffer}.

- VUID-vkCmdDrawIndexedIndirectCount-None-04445
  If \textit{drawIndirectCount} is not enabled this function \textbf{must} not be used.

- VUID-vkCmdDrawIndexedIndirectCount-None-07312
  \textbf{valid index buffer} \textbf{must} be bound.

- VUID-vkCmdDrawIndexedIndirectCount-robustBufferAccess2-07825
  If \textit{robustBufferAccess2} is not enabled, \((\texttt{indexSize} \times (\texttt{firstIndex} + \texttt{indexCount}) + \textit{offset})\) \textbf{must} be less than or equal to the size of the bound index buffer, with \texttt{indexSize} being based on the type specified by \texttt{indexType}, where the index buffer, \texttt{indexType}, and \textit{offset} are specified via \texttt{vkCmdBindIndexBuffer}.

- VUID-vkCmdDrawIndexedIndirectCount-stride-03142
  \texttt{stride} \textbf{must} be a multiple of 4 and \textbf{must} be greater than or equal to \sizeof\texttt{VkDrawIndexedIndirectCommand}.

- VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
  If \textit{maxDrawCount} is greater than or equal to 1, \((\texttt{stride} \times (\texttt{maxDrawCount} - 1) + \textit{offset} + \sizeof\texttt{VkDrawIndexedIndirectCommand})\) \textbf{must} be less than or equal to the size of \textit{buffer}.

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03153
  If count stored in \textit{countBuffer} is equal to 1, \((\textit{offset} + \sizeof\texttt{VkDrawIndexedIndirectCommand})\) \textbf{must} be less than or equal to the size of \textit{buffer}.

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03154
  If count stored in \textit{countBuffer} is greater than 1, \((\texttt{stride} \times (\texttt{drawCount} - 1) + \textit{offset} + \sizeof\texttt{VkDrawIndexedIndirectCommand})\) \textbf{must} be less than or equal to the size of \textit{buffer}.
Valid Usage (Implicit)

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter
  countBuffer must be a valid VkBuffer handle
- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdDrawIndexedIndirectCount-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawIndexedIndirectCount-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdDrawIndexedIndirectCount-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

20.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The
source access is `VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT` respectively. The value written to the counter buffer by `vkCmdEndTransformFeedbackEXT` can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for `vkCmdEndTransformFeedbackEXT` and `vkCmdDrawIndirectByteCountEXT` where the source access is `VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT` and the destination access is `VK_ACCESS_INDIRECT_COMMAND_READ_BIT` for the pipeline stages `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT` and `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT` respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t instanceCount,
    uint32_t firstInstance,
    VkBuffer counterBuffer,
    VkDeviceSize counterBufferOffset,
    uint32_t counterOffset,
    uint32_t vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the `XfbStride`.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```c
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address + counterBufferOffset;
```
vertexCount = \text{floor}(\max(0, (*\text{counterBufferPtr} - \text{counterOffset}))/\text{vertexStride});

The effective \text{firstVertex} is zero.

**Valid Usage**

- **VUID-vkCmdDrawIndirectByteCountEXT-magFilter-04553**
  If a \text{VkSampler} created with \text{magFilter} or \text{minFilter} equal to \text{VK\_FILTER\_LINEAR}, \text{reductionMode} equal to \text{VK\_SAMPLER\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE}, and \text{compareEnable} equal to \text{VK\_FALSE} is used to sample a \text{VkImageView} as a result of this command, then the image view’s format features must contain \text{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}.

- **VUID-vkCmdDrawIndirectByteCountEXT-magFilter-09598**
  If a \text{VkSampler} created with \text{magFilter} or \text{minFilter} equal to \text{VK\_FILTER\_LINEAR} and \text{reductionMode} equal to either \text{VK\_SAMPLER\_REDUCTION\_MODE\_MIN} or \text{VK\_SAMPLER\_REDUCTION\_MODE\_MAX} is used to sample a \text{VkImageView} as a result of this command, then the image view’s format features must contain \text{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_MINMAX\_BIT}.

- **VUID-vkCmdDrawIndirectByteCountEXT-mipmapMode-04770**
  If a \text{VkSampler} created with \text{mipmapMode} equal to \text{VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR}, \text{reductionMode} equal to \text{VK\_SAMPLER\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE}, and \text{compareEnable} equal to \text{VK\_FALSE} is used to sample a \text{VkImageView} as a result of this command, then the image view’s format features must contain \text{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}.

- **VUID-vkCmdDrawIndirectByteCountEXT-mipmapMode-09599**
  If a \text{VkSampler} created with \text{mipmapMode} equal to \text{VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR} and \text{reductionMode} equal to either \text{VK\_SAMPLER\_REDUCTION\_MODE\_MIN} or \text{VK\_SAMPLER\_REDUCTION\_MODE\_MAX} is used to sample a \text{VkImageView} as a result of this command, then the image view’s format features must contain \text{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_MINMAX\_BIT}.

- **VUID-vkCmdDrawIndirectByteCountEXT-unnormalizedCoordinates-09635**
  If a \text{VkSampler} created with \text{unnormalizedCoordinates} equal to \text{VK\_TRUE} is used to sample a \text{VkImageView} as a result of this command, then the image view’s \text{levelCount} and \text{layerCount} must be 1.

- **VUID-vkCmdDrawIndirectByteCountEXT-unnormalizedCoordinates-09636**
  If a \text{VkSampler} created with \text{unnormalizedCoordinates} equal to \text{VK\_TRUE} is used to sample a \text{VkImageView} as a result of this command, then the image view’s \text{viewType} must be \text{VK\_IMAGE\_VIEW\_TYPE\_1D} or \text{VK\_IMAGE\_VIEW\_TYPE\_2D}.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06479**
  If a \text{VkImageView} is sampled with \text{depth comparison}, the image view’s format features must contain \text{VK\_FORMAT\_FEATURE\_2\_SAMPLED\_IMAGE\_DEPTH\_COMPARISON\_BIT}.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02691**
  If a \text{VkImageView} is accessed using atomic operations as a result of this command, then the image view’s format features must contain
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.
If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirectByteCountEXT-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndirectByteCountEXT-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDrawIndirectByteCountEXT-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_b conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDrawIndirectByteCountEXT-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDrawIndirectByteCountEXT-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07288**
  Any shader invocation executed by this command must terminate

- **VUID-vkCmdDrawIndirectByteCountEXT-None-09600**
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

- **VUID-vkCmdDrawIndirectByteCountEXT-renderPass-02684**
The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectByteCountEXT-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectByteCountEXT-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirectByteCountEXT-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndirectByteCountEXT-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass’ pInputAttachments [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility

- VUID-vkCmdDrawIndirectByteCountEXT-pDepthInputAttachmentIndex-09595
  Input attachment views accessed in a dynamic render pass with a InputAttachmentIndex referenced by VkRenderingInputAttachmentIndexInfoKHR, or no InputAttachmentIndex if VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex or VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are NULL, must be created with a VkImageView that is compatible with the corresponding color, depth, or stencil attachment in VkRenderingInfo

- VUID-vkCmdDrawIndirectByteCountEXT-pDepthInputAttachmentIndex-09596
  Input attachment views accessed in a dynamic render pass via a shader object must have an InputAttachmentIndex if both VkRenderingInputAttachmentIndexInfoKHR:pDepthInputAttachmentIndex and VkRenderingInputAttachmentIndexInfoKHR:pStencilInputAttachmentIndex are non-NULL

- VUID-vkCmdDrawIndirectByteCountEXT-InputAttachmentIndex-09597
  If an input attachment view accessed in a dynamic render pass via a shader object has an InputAttachmentIndex, the InputAttachmentIndex must match an index in VkRenderingInputAttachmentIndexInfoKHR

- VUID-vkCmdDrawIndirectByteCountEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectByteCountEXT-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or

the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_COLOR_BIT and

• there is no currently bound graphics pipeline or
  • the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectByteCountEXT-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  • the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or

  • the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_DEPTH_BIT and

     • there is no currently bound graphics pipeline or
     • the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

  it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectByteCountEXT-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  • the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or

  • the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_STENCIL_BIT and

     • there is no currently bound graphics pipeline or
     • the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT

  it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectByteCountEXT-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawIndirectByteCountEXT-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment.
attachment, this command **must** not write to that image subresource as an attachment.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back **writeMask** are not zero, and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07831**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT** dynamic state enabled then **vkCmdSetViewport must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07832**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR** dynamic state enabled then **vkCmdSetScissor must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07833**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH** dynamic state enabled then **vkCmdSetLineWidth must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08617**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode** to **VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08618**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology** to any line topology, **vkCmdSetLineWidth must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08619**
  If a shader object that outputs line primitives is bound to the **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, **vkCmdSetLineWidth must** have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07834**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_DEPTH_BIAS** dynamic state enabled then **vkCmdSetDepthBias** or **vkCmdSetDepthBias2EXT must** have
been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08621
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07836
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07837
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called and not subsequently invalidated in the current command buffer prior to this
drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-08623
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to **VK_TRUE**, `vkCmdSetStencilCompareMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07838
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** dynamic state enabled, and if the current `stencilTestEnable` state is **VK_TRUE**, then `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to **VK_TRUE**, `vkCmdSetStencilWriteMask` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07839
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_REFERENCE** dynamic state enabled, and if the current `stencilTestEnable` state is **VK_TRUE**, then `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to **VK_TRUE**, `vkCmdSetStencilReference` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07840
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_CULL_MODE** dynamic state enabled then `vkCmdSetCullMode` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08627
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set...
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07841**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07843**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08629**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then vkCmdSetDepthTestEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08630**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then vkCmdSetDepthWriteEnable must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthTestEnable in the current command buffer set depthTestEnable to VK_TRUE,
then `vkCmdSetDepthCompareOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- **VUID-vkCmdDrawIndirectByteCountEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCount must have been called in the current command buffer prior
to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount
must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03419
If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT
dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount
must have been called in the current command buffer prior to this drawing command, and the
viewportCount parameter of vkCmdSetViewportWithCount must match the
scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-None-08635
If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount
and vkCmdSetScissorWithCount must have been called in the current command buffer
prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount
must match the scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-None-04876
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then
vkCmdSetRasterizerDiscardEnable must have been called and not subsequently
invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08639
If a shader object is bound to any graphics stage, then vkCmdSetRasterizerDiscardEnable
must have been called and not subsequently invalidated in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-04877
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then
vkCmdSetDepthBiasEnable must have been called and not subsequently invalidated in
the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08640
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBiasEnable must have been
called and not subsequently invalidated in the current command buffer prior to this
drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-
primitiveFragmentShadingRateWithMultipleViewports-04552
If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the
bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write
to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have
been called in the current command buffer prior to this drawing command, and the
viewportCount parameter of `vkCmdSetViewportWithCount` must be 1

- VUID-vkCmdDrawIndirectByteCountEXT-primitiveFragmentShadingRateWithMultipleViewports-08642
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- VUID-vkCmdDrawIndirectByteCountEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- VUID-vkCmdDrawIndirectByteCountEXT-none-08643
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`

- VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,

  then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirectByteCountEXT-none-08644
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirectByteCountEXT-none-08876
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06172
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06173
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

• VUID-vkCmdDrawIndirectByteCountEXT-imageView-06174
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

• VUID-vkCmdDrawIndirectByteCountEXT-imageView-06175
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

• VUID-vkCmdDrawIndirectByteCountEXT-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

• VUID-vkCmdDrawIndirectByteCountEXT-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

• VUID-vkCmdDrawIndirectByteCountEXT-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

• VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

• VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline
::pColorAttachments array with an imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08911
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkPipelineRenderingCreateInfo::pColorAttachments array with an imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-None-07751
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-07880
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-rasterizerDiscardEnable-09236
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-08648
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-07881
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled then vkCmdSetDiscardRectangleModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-None-08649
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any...
graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08916**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawIndirectByteCountEXT-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`
::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirectByteCountEXT-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndirectByteCountEXT-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectByteCountEXT-None-07619
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07620
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-09237
If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08650
If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07621
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08651
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07622
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-08652
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-07623
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.
prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08653
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

• VUID-vkCmdDrawIndirectByteCountEXT-None-08654
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

• VUID-vkCmdDrawIndirectByteCountEXT-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08655
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called and not subsequently `invalidated` in the current command buffer prior to this drawing command
If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorBlendEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT for any attachment set that attachment's value in pColorBlendEnables to VK_TRUE, then vkCmdSetColorBlendEquationEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and both the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE and there are color attachments bound, then vkCmdSetColorWriteMaskEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled then
`vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07633**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08663**
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-07636**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08665**
  If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08666**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08667**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08668
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07638
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-08671
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectByteCountEXT-None-07849
  If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_LINE_STIPPLE_KHR** dynamic state enabled then **vkCmdSetLineStippleKHR** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08672**
  If the **VK_KHR_line_rasterization** or **VK_EXT_line_rasterization** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetLineStippleEnableEXT** in the current command buffer set **stippledLineEnable** to **VK_TRUE**, then **vkCmdSetLineStippleEXT** **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** state enabled and the last call to **vkCmdSetColorBlendEnableEXT** set **pColorBlendEnables** for any attachment to **VK_TRUE**, then for those attachments in the subpass the corresponding image view's **format features** **must** contain **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT**

- **VUID-vkCmdDrawIndirectByteCountEXT-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the **rasterizationSamples** in the last call to **vkCmdSetRasterizationSamplesEXT** **must** follow the rules for a zero-attachment subpass

- **VUID-vkCmdDrawIndirectByteCountEXT-samples-07472**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state disabled, then the **samples** parameter in the last call to **vkCmdSetSampleMaskEXT** **must** be greater or equal to the **VkPipelineMultisampleStateCreateInfo::rasterizationSamples** parameter used to create the bound graphics pipeline

- **VUID-vkCmdDrawIndirectByteCountEXT-samples-07473**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** state and **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** states enabled, then the **samples** parameter in the last call to **vkCmdSetSampleMaskEXT** **must** be greater or equal to the **rasterizationSamples** parameter in the last call to **vkCmdSetRasterizationSamplesEXT**

- **VUID-vkCmdDrawIndirectByteCountEXT-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, and neither the **VK_AMD_mixed_attachment_samples** nor the **VK_NV_framebuffer_mixed_samples** extensions are enabled, then the **rasterizationSamples** in the last call to **vkCmdSetRasterizationSamplesEXT** **must** be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndirectByteCountEXT-firstAttachment-07476**
  If the bound graphics pipeline state was created with the

1482
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and both the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE` and there are color attachments bound, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass where blending is enabled.
• VUID-vkCmdDrawIndirectByteCountEXT-primitivesGeneratedQueryWithNonZeroStreams-07481
  If the \texttt{primitivesGeneratedQueryWithNonZeroStreams} feature is not enabled and the \texttt{VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT} query is active, and the bound graphics pipeline was created with \texttt{VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT} state enabled, the last call to \texttt{vkCmdSetRasterizationStreamEXT} \textbf{must} have set the \texttt{rasterizationStream} to zero.

• VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07495
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR}, then the \texttt{stippledRectangularLines} feature \textbf{must} be enabled.

• VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR}, then the \texttt{stippledBresenhamLines} feature \textbf{must} be enabled.

• VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR}, then the \texttt{stippledSmoothLines} feature \textbf{must} be enabled.

• VUID-vkCmdDrawIndirectByteCountEXT-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT} or \texttt{VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT} dynamic states enabled, and if the current \texttt{stippledLineEnable} state is \texttt{VK_TRUE} and the current \texttt{lineRasterizationMode} state is \texttt{VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR}, then the \texttt{stippledRectangularLines} feature \textbf{must} be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} \textbf{must} be \texttt{VK_TRUE}.

• VUID-vkCmdDrawIndirectByteCountEXT-None-08877
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT} dynamic state \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} \textbf{must} have been called and not subsequently \texttt{invalidated} in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectByteCountEXT-None-08684
  If there is no bound graphics pipeline, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages} with an element of \texttt{VK_SHADER_STAGE_VERTEX_BIT}.

• VUID-vkCmdDrawIndirectByteCountEXT-None-08685
  If there is no bound graphics pipeline, and the \texttt{tessellationShader} feature is enabled, \texttt{vkCmdBindShadersEXT} \textbf{must} have been called in the current command buffer with \texttt{pStages}.
with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08686**
  If there is no bound graphics pipeline, and the **tessellationShader** feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08687**
  If there is no bound graphics pipeline, and the **geometryShader** feature is enabled, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` **must** have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08698**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call **must** also be bound

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08699**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call **must** not have any `VkShaderEXT` bound

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08878**
  All bound graphics shader objects **must** have been created with identical or identically defined push constant ranges

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08879**
  All bound graphics shader objects **must** have been created with identical or identically defined arrays of descriptor set layouts

- **VUID-vkCmdDrawIndirectByteCountEXT-None-08880**
  If the **attachmentFeedbackLoopDynamicState** feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` **must** have been called and not subsequently **invalidated** in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectByteCountEXT-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the **EarlyFragmentTests** execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` **must** be `VK_FALSE`

- **VUID-vkCmdDrawIndirectByteCountEXT-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`
::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0

- VUID-vkCmdDrawIndirectByteCountEXT-None-09116
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

- VUID-vkCmdDrawIndirectByteCountEXT-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

- VUID-vkCmdDrawIndirectByteCountEXT-None-09548
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-None-09549
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR

- VUID-vkCmdDrawIndirectByteCountEXT-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndirectByteCountEXT-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

- VUID-vkCmdDrawIndirectByteCountEXT-None-02721
  If robustBufferAccess is not enabled, then for a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-vkCmdDrawIndirectByteCountEXT-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called and not subsequently invalidated in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectByteCountEXT-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline was created with the
\texttt{VK_DYNAMIC\_STATE\_VERTEX\_INPUT\_BINDING\_STRIDE\_EXT} dynamic state enabled, then
\texttt{vkCmdBindVertexBuffers2\_EXT} must have been called and not subsequently invalidated
in the current command buffer prior to this draw command, and the \texttt{pStrides} parameter
of \texttt{vkCmdBindVertexBuffers2\_EXT} must not be \texttt{NULL}.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then
\texttt{vkCmdSetVertexInput\_EXT} must have been called and not subsequently invalidated
in the current command buffer prior to this draw command.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then all variables
with the \texttt{Input} storage class decorated with \texttt{Location} in the \texttt{Vertex Execution Model}
\texttt{OpEntryPoint} must contain a location in \texttt{VkVertexInputAttributeDescription2\_EXT::location}.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then the numeric
type associated with all \texttt{Input} variables of the corresponding \texttt{Location} in the \texttt{Vertex}
Execution Model \texttt{OpEntryPoint} must be the same as \texttt{VkVertexInputAttributeDescription2\_EXT::format}.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage and
\texttt{VkVertexInputAttributeDescription2\_EXT::format} has a 64-bit component, then the scalar
width associated with all \texttt{Input} variables of the corresponding \texttt{Location} in the \texttt{Vertex}
Execution Model \texttt{OpEntryPoint} must be 64-bit.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage and the scalar
width associated with a \texttt{Location} decorated \texttt{Input} variable in the \texttt{Vertex Execution Model}
\texttt{OpEntryPoint} is 64-bit, then the corresponding \texttt{VkVertexInputAttributeDescription2\_EXT::format} must have a 64-bit component.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage and
\texttt{VkVertexInputAttributeDescription2\_EXT::format} has a 64-bit component, then all \texttt{Input}
variables at the corresponding \texttt{Location} in the \texttt{Vertex Execution Model \texttt{OpEntryPoint}} must not use components that are not present in the format.

If there is a shader object bound to the \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT} stage then
\texttt{vkCmdSetPrimitiveRestartEnable} must have been called and not subsequently invalidated
in the current command buffer prior to this drawing command.

If the \texttt{primitiveTopologyListRestart} feature is not enabled, the topology is
VK_PRIMITIVE_TOPOLOGY_POINT_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then `vkCmdSetPrimitiveRestartEnable` must be set to VK_FALSE

- VUID-vkCmdDrawIndirectByteCountEXT-pNext-09461
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is VK_FALSE, then `firstInstance` must be 0

- VUID-vkCmdDrawIndirectByteCountEXT-None-09462
  If shader objects are used for drawing or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is VK_FALSE, then `firstInstance` must be 0

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedback-02287
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedbackDraw-02288
  The implementation must support `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw`

- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-02289
  `vertexStride` must be greater than 0 and less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataStride`

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-04567
  If `counterBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-02290
  `counterBuffer` must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirectByteCountEXT-counterBufferOffset-04568
  `counterBufferOffset` must be a multiple of 4

- VUID-vkCmdDrawIndirectByteCountEXT-counterOffset-09474
  `counterOffset` must be a multiple of 4

- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-09475
  `vertexStride` must be a multiple of 4

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02646
  `commandBuffer` must not be a protected command buffer
**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter**
  
  `counterBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDrawIndirectByteCountEXT-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndirectByteCountEXT-videocoding**
  
  This command must only be called outside of a video coding scope

- **VUID-vkCmdDrawIndirectByteCountEXT-commonparent**
  
  Both of `commandBuffer`, and `counterBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 21. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

21.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The Component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL example

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

SPIR-V example

```spirv
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```

1490
21.1.1. Attribute Location and Component Assignment

The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a Location, its value(s) are taken from the components of the input attribute specified with the corresponding 
\texttt{VkVertexInputAttributeDescription::location}. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single Location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

If an implementation supports 
\texttt{storageInputOutput16}, vertex shader input variables can have a width of 16 bits.

\textit{Table 26. Input attribute components accessed by 16-bit and 32-bit input variables}

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>

<td>1</td>
<td>(o, y, z, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>2</td>
<td>(o, o, z, w)</td>
</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating-point matrix type is assigned a Location \( i \), its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The VkVertexInputAttributeDescription::format must be specified with a VkFormat that corresponds to the appropriate type of column vector. The Component decoration must not be used with matrix types.

<table>
<thead>

</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location $i$, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the location immediately following the last Location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same Location slot only if their Component words do not overlap. If multiple variables share the same Location slot, they must all have the same SPIR-V floating-point component type or all have the same width scalar type components.

### 21.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
• **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.

• **pVertexBindingDescriptions** is a pointer to an array of `VkVertexInputBindingDescription` structures.

• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.

• **pVertexAttributeDescriptions** is a pointer to an array of `VkVertexInputAttributeDescription` structures.

---

**Valid Usage**

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613**
  
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614**
  
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkPipelineVertexInputStateCreateInfo-binding-00615**
  
  For every `binding` specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` **must** exist in `pVertexBindingDescriptions` with the same value of `binding`.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616**
  
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617**
  
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations.

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`

- **VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext**
  
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfoKHR`

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain **must** be unique.

- **VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask**
  
  `flags` **must** be 0.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter**
  
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` **must** be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter**

---

1495
If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription structures.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;

VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the VkVertexInputBindingDescription structure, defined as:

// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;

- binding is the binding number that this structure describes.
- stride is the byte stride between consecutive elements within the buffer.
- inputRate is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618 binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings
- VUID-VkVertexInputBindingDescription-stride-00619 stride must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindingStride
- VUID-VkVertexInputBindingDescription-stride-04456 If the VK_KHR_portability_subset extension is enabled, stride must be a multiple of, and at least as large as, VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment

Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter inputRate must be a valid VkVertexInputRate value

Possible values of VkVertexInputBindingDescription::inputRate, specifying the rate at which vertex attributes are pulled from buffers, are:
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;

- **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.
- **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription-location-00620**  
  *location* must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription-binding-00621**  
  *binding* must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription-offset-00622**  
  *offset* must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription-format-00623**  
  The format features of *format* must contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`

- **VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457**  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of *offset* plus the size of the vertex attribute data described by *format*...
must not be greater than stride in the VkVertexInputBindingDescription referenced in binding

Valid Usage (Implicit)

• VUID-VkVertexInputAttributeDescription-format-parameter
  format must be a valid VkFormat value

To dynamically set the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer,
    uint32_t vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
    uint32_t vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

• commandBuffer is the command buffer into which the command will be recorded.
• vertexBindingDescriptionCount is the number of vertex binding descriptions provided in pVertexBindingDescriptions.
• pVertexBindingDescriptions is a pointer to an array of VkVertexInputBindingDescription2EXT structures.
• vertexAttributeDescriptionCount is the number of vertex attribute descriptions provided in pVertexAttributeDescriptions.
• pVertexAttributeDescriptions is a pointer to an array of VkVertexInputAttributeDescription2EXT structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkGraphicsPipelineCreateInfo::pVertexInputState values used to create the currently active pipeline.

If drawing using shader objects, or if the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE dynamic state enabled, then vkCmdBindVertexBuffers2 can be used instead of vkCmdSetVertexInputEXT to dynamically set the stride.

Valid Usage

• VUID-vkCmdSetVertexInputEXT-None-08547
  The shaderObject feature must be enabled
• VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  vertexBindingDescriptionCount must be less than or equal to VkPhysicalDeviceLimits
maxVertexInputBindings

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  vertexAttributeDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributes

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of pVertexAttributeDescriptions, a VkVertexInputBindingDescription2EXT must exist in pVertexBindingDescriptions with the same value of binding

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of pVertexBindingDescriptions must describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of pVertexAttributeDescriptions must describe distinct attribute locations

Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetVertexInputEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

**Valid Usage**

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription2EXT-stride-04797
  `stride` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, `divisor` must not be
If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` must be 1.

`divisor` must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive.

If `divisor` is not 1 then `inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`.
- `inputRate` must be a valid `VkVertexInputRate` value.

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType     sType;
    void*                pNext;
    uint32_t             location;
    uint32_t             binding;
    VkFormat             format;
    uint32_t             offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`.
- `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`.
offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

The format features of format must contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT.

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is VK_FALSE, the sum of offset plus the size of the vertex attribute data described by format must not be greater than stride in the VkVertexInputBindingDescription2EXT referenced in binding.

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  format must be a valid VkFormat value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
  VkCommandBuffer commandBuffer,
  uint32_t firstBinding,
  uint32_t bindingCount,
  const VkBuffer* pBuffers,
  const VkDeviceSize* pOffsets);
```

- commandBuffer is the command buffer into which the command is recorded.
- firstBinding is the index of the first vertex input binding whose state is updated by the command.
- bindingCount is the number of vertex input bindings whose state is updated by the command.
- pBuffers is a pointer to an array of buffer handles.
- pOffsets is a pointer to an array of buffer offsets.

The values taken from elements i of pBuffers and pOffsets replace the current state for the vertex input binding firstBinding + i, for i in [0, bindingCount). The vertex input binding is updated to start at the offset indicated by pOffsets[i] from the start of the buffer pBuffers[i]. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands.
Valid Usage

• VUID-vkCmdBindVertexBuffers-firstBinding-00624
  firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

• VUID-vkCmdBindVertexBuffers-firstBinding-00625
  The sum of firstBinding and bindingCount must be less than or equal to
  VkPhysicalDeviceLimits::maxVertexInputBindings

• VUID-vkCmdBindVertexBuffers-pOffsets-00626
  All elements of pOffsets must be less than the size of the corresponding element in
  pBuffers

• VUID-vkCmdBindVertexBuffers-pBuffers-00627
  All elements of pBuffers must have been created with the
  VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

• VUID-vkCmdBindVertexBuffers-pBuffers-00628
  Each element of pBuffers that is non-sparse must be bound completely and contiguously
  to a single VkDeviceMemory object

• VUID-vkCmdBindVertexBuffers-pBuffers-04001
  If the nullDescriptor feature is not enabled, all elements of pBuffers must not be
  VK_NULL_HANDLE

Valid Usage (Implicit)

• VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindVertexBuffers-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE
  VkBuffer handles

• VUID-vkCmdBindVertexBuffers-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindVertexBuffers-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

• VUID-vkCmdBindVertexBuffers-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
  bindingCount must be greater than 0

• VUID-vkCmdBindVertexBuffers-commonparent
  Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored
  parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

or the equivalent command:

```c
// Provided by VK_EXT_shader_object
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
• `pBuffers` is a pointer to an array of buffer handles.
• `pOffsets` is a pointer to an array of buffer offsets.
• `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
• `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for i in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. If `pSizes[i]` is `VK_WHOLE_SIZE` then the bound size is from `pBuffers[i]` plus `pOffsets[i]` to the end of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands.

This command also **dynamically sets** the byte strides between consecutive elements within buffer `pBuffers[i]` to the corresponding `pStrides[i]` value when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If drawing using shader objects then `vkCmdSetVertexInputEXT` can be used instead of `vkCmdBindVertexBuffers2` to set the stride.

**Note**
Unlike the static state to set the same, `pStrides` must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.

---

**Valid Usage**

• **VUID-vkCmdBindVertexBuffers2-firstBinding-03355**
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

• **VUID-vkCmdBindVertexBuffers2-firstBinding-03356**
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

• **VUID-vkCmdBindVertexBuffers2-pOffsets-03357**
  If `pSizes` is not `NULL`, all elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

• **VUID-vkCmdBindVertexBuffers2-pSizes-03358**
  If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes`, where `pSizes` is not `VK_WHOLE_SIZE`, must be less than or equal to the size of the corresponding element in `pBuffers`

• **VUID-vkCmdBindVertexBuffers2-pBuffers-03359**
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag
Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`.

If `pStrides` is not NULL each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`.

If `pStrides` is not NULL each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size.

---

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles.
- `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- If `pSizes` is not NULL, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- If `pStrides` is not NULL, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called outside of a video coding scope.
- If any of `pSizes` or `pStrides` are not NULL, `bindingCount` must be greater than 0.
- Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

21.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionKHR* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionKHR` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_KHR`
pVertexBindingDivisors must be a valid pointer to an array of VkVertexInputBindingDivisorDescriptionKHR structures

- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-vertexBindingDivisorCount-arraylength
  vertexBindingDivisorCount must be greater than 0

The individual divisor values per binding are specified using the VkVertexInputBindingDivisorDescriptionKHR structure which is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionKHR {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionKHR;
```

- binding is the binding number for which the divisor is specified.
- divisor is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor. A value of 0 can be used for the divisor if the vertexAttributeInstanceRateZeroDivisor feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

**Valid Usage**

- VUID-VkVertexInputBindingDivisorDescriptionKHR-binding-01869
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateZeroDivisor-02228
  If the vertexAttributeInstanceRateZeroDivisor feature is not enabled, divisor must not be 0

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateDivisor-02229
  If the vertexAttributeInstanceRateDivisor feature is not enabled, divisor must be 1

- VUID-VkVertexInputBindingDivisorDescriptionKHR-divisor-01870
  divisor must be a value between 0 and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor, inclusive

- VUID-VkVertexInputBindingDivisorDescriptionKHR-inputRate-01871
  VkVertexInputBindingDescription::inputRate must be of type VK_VERTEX_INPUT_RATE_INSTANCE for this binding
21.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.
- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex + vertexCount` for `vkCmdDraw`, or a value taken from the index buffer plus `vertexOffset` for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance + instanceCount`).
- Let `offset` be an array of offsets into the currently bound vertex buffers specified during `vkCmdBindVertexBuffers` or `vkCmdBindVertexBuffers2` with `pOffsets`.
- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescriptionKHR::binding` equal to `attribDesc.binding`. If the vertex binding state is dynamically set, instead let `divisor` be the member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call with `VkVertexInputBindingDescription2EXT::binding` equal to `attribDesc.binding`.
- Let `stride` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions->stride` unless there is dynamic state causing the value to be ignored. In this case the value is set from the last value from one of the following:
  - `vkCmdSetVertexInputEXT::pVertexBindingDescriptions->stride`
  - `vkCmdBindVertexBuffers2EXT::pStride`, if not `NULL`

```c
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

21.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription`'s `format` to either floating-point, unsigned integer, or signed integer based on the numeric type of `format`. The numeric type of `format` must match the numeric
type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if format is a 64-bit data type. If format is a packed format, attribAddress must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, attribAddress must be a multiple of the size in bytes of the component type indicated by format (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 22. Tessellation

Tessellation involves three pipeline stages. First, a **tessellation control shader** transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a **tessellation evaluation shader** transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

22.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the **built-in variables** `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an **OpExecutionMode** instruction using one of the **Triangles**, **Quads**, or **IsoLines** execution modes. When using shader objects, this instruction **must** be specified in the tessellation evaluation shader, and **may** also be specified in the tessellation control shader. When using pipelines, this instruction **may** be specified in either the tessellation evaluation or tessellation control shader. When using shader objects, tessellation-related modes that are **required must** be specified in the tessellation evaluation shader, and **may** also be specified in the tessellation control shader. Other tessellation-related modes **may** be specified in the tessellation evaluation shader. When using pipelines, other tessellation-related execution modes **can** also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders **must** be the same.

Tessellation execution modes include:

- **Triangles, Quads, and IsoLines.** These control the type of subdivision and topology of the output primitives. When using shader objects, one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation shader stages. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation, and **IsoLines must** not be used in either tessellation shader stage.

- **VertexOrderCw and VertexOrderCcw.** These control the orientation of triangles generated by the tessellator. When using shader objects, one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation
shader stages.

- **PointMode.** Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. When using shader objects, if **PointMode** is set in the tessellation control stage, it **must** be identically set in the tessellation evaluation stage. If the **VK_KHR_portability_subset** extension is enabled, and **VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode** is **VK_FALSE**, then point mode tessellation is not supported by the implementation, and **PointMode** **must** not be used in either tessellation shader stage.

- **SpacingEqual, SpacingFractionalEven, and SpacingFractionalOdd.** Controls the spacing of segments on the edges of tessellated primitives. When using shader objects, one mode **must** be set in at least the tessellation evaluation stage. When using pipelines, one mode **must** be set in at least one of the tessellation shader stages.

- **OutputVertices.** Controls the size of the output patch of the tessellation control shader. When using shader objects, one value **must** be set in at least the tessellation control stage. When using pipelines, one value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in **TessCoord** are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures **Domain parameterization for tessellation primitive modes (upper-left origin)** and **Domain parameterization for tessellation primitive modes (lower-left origin)**. The domain space can have either an upper-left or lower-left origin, selected by the **domainOrigin** member of **VkPipelineTessellationDomainOriginStateCreateInfo**.
Figure 11. Domain parameterization for tessellation primitive modes (upper-left origin)
Figure 12. Domain parameterization for tessellation primitive modes (lower-left origin)

Caption

In the domain parameterization diagrams, the coordinates illustrate the value of \texttt{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

22.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For Quads, all four outer levels are relevant. For Triangles and IsoLines, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 22.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an OpExecutionMode in the tessellation control or tessellation evaluation shader using one of the identifiers SpacingEqual, SpacingFractionalEven, or SpacingFractionalOdd.

If SpacingEqual is used, the floating-point tessellation level is first clamped to $[1, \text{maxLevel}]$, where maxLevel is the implementation-dependent maximum tessellation level ($\text{VkPhysicalDeviceLimits}::\text{maxTessellationGenerationLevel}$). The result is rounded up to the nearest integer $n$, and the corresponding edge is divided into $n$ segments of equal length in (u,v) space.

If SpacingFractionalEven is used, the tessellation level is first clamped to $[2, \text{maxLevel}]$ and then rounded up to the nearest even integer $n$. If SpacingFractionalOdd is used, the tessellation level is clamped to $[1, \text{maxLevel} - 1]$ and then rounded up to the nearest odd integer $n$. If $n$ is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into $n - 2$ segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with $n - f$, where $f$ is the clamped floating-point tessellation level. When $n - f$ is zero, the additional segments will have equal length to the other segments. As $n - f$ approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of $f$.

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 22.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
22.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the *Triangles* or *Quads* modes), the orientation of all triangles is specified with an OpExecutionMode of *VertexOrderCw* or *VertexOrderCcw* in the tessellation control or tessellation evaluation shaders. If the order is *VertexOrderCw*, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is *VertexOrderCcw*, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

*Note*  
The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In *Triangles* mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

22.6. Triangle Tessellation

If the tessellation primitive mode is *Triangles*, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with (\( u,v,w \)) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision *may* produce *inner vertices* positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Diagram of Inner Triangle Tessellation](image)

**Figure 13. Inner Triangle Tessellation**

**Caption**

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric \((u,v,w)\) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in \((u,v,w)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 22.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the \( u = 0 \) and \( u = 1 \) (vertical) and \( v = 0 \) and \( v = 1 \) (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), \( u = 1 \) (right), and \( v = 1 \) (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the \( u = 0 \) and \( u = 1 \) edges of the outer rectangle into \( m \) segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The \( v = 0 \) and \( v = 1 \) edges are subdivided into \( n \) segments using the second inner tessellation level. Each vertex on the \( u = 0 \) and \( v = 0 \) edges are joined with the corresponding vertex on the \( u = 1 \) and \( v = 1 \) edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Figure 14. Inner Quad Tessellation](image)

**Caption**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator **must** produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the u = 0, v = 0, u = 1, and v = 1 edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in (u,v) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

## 22.8. Isoline Tessellation

If the tessellation primitive mode is Isolines, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called isolines, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range \([0,1]\). The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \(u = 0\) and \(u = 1\) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \(u = 0\) rectangle edge to the corresponding vertex on the \(u = 1\) rectangle edge, except that no line is drawn between \((0,1)\) and \((1,1)\). If the number of isolines on the subdivided \(u = 0\) and \(u = 1\) edges is \(n\), this process will result in \(n\) equally spaced lines with constant v coordinates of 0, \(\frac{1}{n}\), \(\frac{2}{n}\), \ldots, \(\frac{n-1}{n}\).

Each of the \(n\) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \(m\) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then isoline tessellation is not supported by the implementation.

## 22.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the OpExecutionMode PointMode, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then tessellation point mode is not supported by the implementation.
22.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

### Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  `patchControlPoints` must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType             sType;
    const void*                 pNext;
    VkTessellationDomainOrigin  domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
    VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
  `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:
or the equivalent

```
// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- **VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT** specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).
- **VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT** specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the VertexOrderCw and VertexOrderCcw tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To dynamically set the origin of the tessellation domain space, call:

```
// Provided by VK_EXT_extended_dynamic_state3 with VK_KHR_maintenance2 or VK_VERSION_1_1, VK_EXT_shader_object
void vkCmdSetTessellationDomainOriginEXT(
    VkCommandBuffer commandBuffer,
    VkTessellationDomainOrigin domainOrigin);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **domainOrigin** specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin** value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetTessellationDomainOriginEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3TessellationDomainOrigin` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter
  `domainOrigin` must be a valid `VkTessellationDomainOrigin` value
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetTessellationDomainOriginEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 23. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

23.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline’s `primitive topology` if tessellation is inactive, or the `tessellation mode` if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the `point list topology` or `tessellation in point mode`.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the `line list topology` or `line strip topology`, or by `isoline tessellation`.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the `line list with adjacency topology` or `line strip with adjacency topology`.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the `triangle list topology`, `triangle strip topology`, or `triangle fan topology`, or by `triangle` or `quad tessellation`. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the `triangle list with adjacency topology` or `triangle strip with adjacency topology`. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
23.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

23.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least $n$ times for each input primitive, where $n$ is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

23.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
Chapter 24. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Flat shading (see Flat Shading).
- Primitive clipping, including application-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

24.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended
according to the winding order described by the primitive topology defined by the 
VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

- If geometry shading is active, vertices within a primitive are appended according to the winding 
order described by the primitive topology defined by the OutputPoints, OutputLineStrip, or 
OutputTriangleStrip execution mode.

- If tessellation shading is active but geometry shading is not, vertices within a primitive are 
appended according to the winding order defined by triangle tessellation, quad tessellation, and 
isoline tessellation.

When transformFeedbackPreservesProvokingVertex is enabled, then in addition to writing vertices 
with a consistent winding order, the vertex order must preserve the provoking vertex of each 
primitive:

- When the pipeline’s provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT, the 
primitive’s provoking vertex must be the first vertex written.

- When the pipeline’s provoking vertex mode is VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT, the 
primitive’s provoking vertex must be the last vertex written.

If transformFeedbackPreservesTriangleFanProvokingVertex is VK_FALSE, neither geometry nor 
tessellation shading is active, and the primitive topology is VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, 
then the first vertex written from each primitive is implementation-defined even when 
transformFeedbackPreservesProvokingVertex is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by 
the XfbStride decoration, indicates the number of bytes of storage reserved for each vertex in the 
transform feedback buffer. For every vertex captured, each output attribute with a Offset 
decoration will be written to the storage reserved for the vertex at the associated transform 
feedback buffer. When writing output variables that are arrays or structures, individual array 
elements or structure members are written tightly packed in order. For vector types, individual 
components are written in order. For matrix types, outputs are written as an array of column 
vectors.

If any component of an output with an assigned transform feedback offset was not written to by its 
shader, the value recorded for that component is undefined. All components of an output variable 
must be written at an offset aligned to the size of the component. The size of each component of an 
output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved 
storage not associated with an output variable with an assigned transform feedback offset will be 
unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer 
handle and counter buffer offset in the pCounterBuffers and pCounterBufferOffsets arrays, writes to 
the corresponding transform feedback buffer will start at the byte offset represented by the value 
stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately. 
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be
assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,  // Command buffer into which the command is recorded.
    uint32_t firstBinding,          // Index of the first transform feedback binding whose state is updated by the command.
    uint32_t bindingCount,          // Number of transform feedback bindings whose state is updated by the command.
    const VkBuffer* pBuffers,       // Pointer to an array of buffer handles.
    const VkDeviceSize* pOffsets,   // Pointer to an array of buffer offsets.
    const VkDeviceSize* pSizes);    // Pointer to an array of buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is NULL, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is NULL or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is NULL, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`.
Valid Usage

• VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

• VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  firstBinding must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  The sum of firstBinding and bindingCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  All elements of pOffsets must be a multiple of 4

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  All elements of pBuffers must have been created with the VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT flag

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  If the optional pSize array is specified, each element of pSizes must either be VK_WHOLE_SIZE, or be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  All elements of pSizes must be either VK_WHOLE_SIZE, or less than or equal to the size of the corresponding buffer in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  All elements of pOffsets plus pSizes, where the pSizes, element is not VK_WHOLE_SIZE, must be less than or equal to the size of the corresponding buffer in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  Transform feedback must not be active when the vkCmdBindTransformFeedbackBuffersEXT command is recorded

Valid Usage (Implicit)

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid VkBuffer handles
Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized.
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized.

Command Properties

<table>
<thead>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- \texttt{commandBuffer} is the command buffer into which the command is recorded.
- \texttt{firstCounterBuffer} is the index of the first transform feedback buffer corresponding to \texttt{pCounterBuffers[0]} and \texttt{pCounterBufferOffsets[0]}. 

VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
\texttt{pOffsets} must be a valid pointer to an array of \texttt{bindingCountVkDeviceSize} values.

VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
\texttt{commandBuffer} must be in the recording state.

VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations.

VUID-vkCmdBindTransformFeedbackBuffersEXT-videcoding
This command must only be called outside of a video coding scope.

VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
\texttt{bindingCount} must be greater than 0.

VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
Both of \texttt{commandBuffer}, and the elements of \texttt{pBuffers} must have been created, allocated, or retrieved from the same \texttt{VkDevice}. 

• **counterBufferCount** is the size of the **pCounterBuffers** and **pCounterBufferOffsets** arrays.

• **pCounterBuffers** is **NULL** or a pointer to an array of **VkBuffer** handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using **vkCmdEndTransformFeedbackEXT** it can be used to resume transform feedback from the previous location. If **pCounterBuffers** is **NULL**, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of **pCounterBuffers** that is **VK_NULL_HANDLE**, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• **pCounterBufferOffsets** is **NULL** or a pointer to an array of **VkDeviceSize** values specifying offsets within each of the **pCounterBuffers** where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If **pCounterBufferOffsets** is **NULL**, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding **XfbBuffer** in the bound graphics pipeline. Any **XfbBuffer** emitted that does not output to an active transform feedback buffer will not be captured.

---

**Valid Usage**

• VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

• VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  Transform feedback must not be active

• VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  If counterBufferCount is not 0, and pCounterBuffers is not **NULL**, pCounterBuffers must be a valid pointer to an array of counterBufferCount **VkBuffer** handles that are either valid or **VK_NULL_HANDLE**

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  For each buffer handle in the array, if it is not **VK_NULL_HANDLE** it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the pCounterBufferOffsets array

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  If pCounterBuffer is **NULL**, then pCounterBufferOffsets must also be **NULL**

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  For each buffer handle in the pCounterBuffers array that is not **VK_NULL_HANDLE** it must
have been created with a \texttt{usage} value containing \texttt{VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT}.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-09630}
  The sum of \texttt{firstCounterBuffer} and \texttt{counterBufferCount} \textbf{must} be less than or equal to the number of transform feedback buffers currently bound by \texttt{vkCmdBindTransformFeedbackBuffersEXT}.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-None-06233}
  If the \texttt{shaderObject} feature is not enabled, a valid graphics pipeline \textbf{must} be bound to \texttt{VK_PIPELINE_BIND_POINT_GRAPHICS}.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-None-04128}
  The last \texttt{pre-rasterization shader stage} of the bound graphics pipeline \textbf{must} have been declared with the \texttt{Xfb} execution mode.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-None-02373}
  Transform feedback \textbf{must} not be made active in a render pass instance with multiview enabled.

### Valid Usage (Implicit)

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter}
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter}
  If \texttt{counterBufferCount} is not 0, and \texttt{pCounterBufferOffsets} is not NULL, \texttt{pCounterBufferOffsets} \textbf{must} be a valid pointer to an array of \texttt{counterBufferCount} \texttt{VkDeviceSize} values.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording}
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-renderpass}
  This command \textbf{must} only be called inside of a render pass instance.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-videocoding}
  This command \textbf{must} only be called outside of a video coding scope.

- \textbf{VUID-vkCmdBeginTransformFeedbackEXT-commonparent}
  Both of \texttt{commandBuffer}, and the elements of \texttt{pCounterBuffers} that are valid handles of non-ignored parameters \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}.

### Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized.

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized.
Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0].`.
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is NULL or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is NULL or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is NULL, then it is assumed the offsets are zero.

### Valid Usage

- VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled
- VUID-vkCmdEndTransformFeedbackEXT-None-02375
  Transform feedback must be active
• VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376
  *firstCounterBuffer** must be less than *VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers*

• VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02377
  The sum of *firstCounterBuffer* and *counterBufferCount** must be less than or equal to *VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers*

• VUID-vkCmdEndTransformFeedbackEXT-counterBufferCount-02608
  If *counterBufferCount* is not 0, and *pCounterBuffers* is not NULL, *pCounterBuffers** must be a valid pointer to an array of *counterBufferCount* VkBuffer handles that are either valid or VK_NULL_HANDLE

• VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-02378
  For each buffer handle in the array, if it is not VK_NULL_HANDLE it **must** reference a buffer large enough to hold 4 bytes at the corresponding offset from the *pCounterBufferOffsets* array

• VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffer-02379
  If *pCounterBuffer* is NULL, then *pCounterBufferOffsets** must also be NULL

• VUID-vkCmdEndTransformFeedbackEXT-pCounterBuffers-02380
  For each buffer handle in the *pCounterBuffers* array that is not VK_NULL_HANDLE it **must** have been created with a usage value containing VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

---

**Valid Usage (Implicit)**

• VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-parameter
  *commandBuffer** must be a valid VkCommandBuffer handle

• VUID-vkCmdEndTransformFeedbackEXT-pCounterBufferOffsets-parameter
  If *counterBufferCount* is not 0, and *pCounterBufferOffsets* is not NULL, *pCounterBufferOffsets** must be a valid pointer to an array of *counterBufferCount* VkDeviceSize values

• VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-recording
  *commandBuffer** must be in the recording state

• VUID-vkCmdEndTransformFeedbackEXT-commandBuffer-cmdpool
  The VkCommandPool that *commandBuffer* was allocated from **must** support graphics operations

• VUID-vkCmdEndTransformFeedbackEXT-renderpass
  This command **must** only be called inside of a render pass instance

• VUID-vkCmdEndTransformFeedbackEXT-videocoding
  This command **must** only be called outside of a video coding scope

• VUID-vkCmdEndTransformFeedbackEXT-commonparent
  Both of *commandBuffer*, and the elements of *pCounterBuffers* that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

24.2. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as `Flat`.

If neither *geometry* nor *tessellation shading* is active, the provoking vertex is determined by the *primitive topology* defined by `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.

If *geometry shading* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` execution mode.

If *tessellation shading* is active but *geometry shading* is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure in the `VkPipelineRasterizationStateCreateInfo::pNext` chain when creating the pipeline.

The `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **provokingVertexMode** is a `VkProvokingVertexModeEXT` value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` mode.

If the **provokingVertexModePerPipeline** limit is `VK_FALSE`, then all pipelines bound within a render pass instance must have the same `provokingVertexMode`.

### Valid Usage

- **VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883**
  
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled.

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`.

- **VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter provokingVertexMode**
  
  `provokingVertexMode` must be a valid `VkProvokingVertexModeEXT` value.

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` are:

```cpp
// Provided by VK_EXT_provoking_vertex
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- **VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT** specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.

- **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT** specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in **Primitive Topologies**.

To dynamically set the `provokingVertexMode` state, call:
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_provoking_vertex,
// VK_EXT_provoking_vertex with VK_EXT_shader_object

```c
void vkCmdSetProvokingVertexModeEXT(
    VkCommandBuffer commandBuffer, 
    VkProvokingVertexModeEXT provokingVertexMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `providingVertexMode` specifies the `provokingVertexMode` state.

This command sets the `provokingVertexMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetProvokingVertexModeEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3ProvokingVertexMode` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetProvokingVertexModeEXT-providingVertexMode-07447
  If `providingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetProvokingVertexModeEXT-providingVertexMode-parameter
  `providingVertexMode` must be a valid `VkProvokingVertexModeEXT` value

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetProvokingVertexModeEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

24.3. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[-w_c \leq x_c \leq w_c\]
\[-w_c \leq y_c \leq w_c\]
\[-w_c \leq z_c \leq w_c\]

where \(z_m\) is equal to zero.

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` application-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` application-defined half-spaces (if no application-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader must write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` application-defined half-spaces with the view volume (if no application-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader must write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space \(i\) is then given by the set of points satisfying the inequality

\(c_i(P) \geq 0\)
where \( \mathbf{c}_i(\mathbf{P}) \) is the clip distance at point \( \mathbf{P} \). For point primitives, \( \mathbf{c}_i(\mathbf{P}) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections Basic Line Segment Rasterization and Basic Polygon Rasterization, using the perspective interpolation equations.

The number of application-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays \( \text{ClipDistance} \) and \( \text{CullDistance} \), respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} \) is present in the graphics pipeline state then depth clipping is disabled if \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} :: \text{depthClipEnable} \) is \( \text{VK_FALSE} \). Otherwise, if \( \text{VkPipelineRasterizationDepthClipStateCreateInfoEXT} \) is not present, depth clipping is disabled when \( \text{VkPipelineRasterizationStateCreateInfo} :: \text{depthClampEnable} \) is \( \text{VK_TRUE} \).

To dynamically set enable or disable depth clamping, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClampEnable);
```

- \( \text{commandBuffer} \) is the command buffer into which the command will be recorded.
- \( \text{depthClampEnable} \) specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \( \text{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} \) set in \( \text{VkPipelineDynamicStateCreateInfo} :: \text{pDynamicStates} \). Otherwise, this state is specified by the \( \text{VkPipelineRasterizationStateCreateInfo} :: \text{depthClampEnable} \) value used to create the currently active pipeline.

If the depth clamping state is changed dynamically, and the pipeline was not created with \( \text{VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT} \) enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

### Valid Usage

- **VUID-vkCmdSetDepthClampEnableEXT-None-09423**
  At least one of the following must be true:
  - The \text{extendedDynamicState3DepthClampEnable} feature is enabled
  - The \text{shaderObject} feature is enabled

- **VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449**
  If the \text{depthClamp} feature is not enabled, \text{depthClampEnable} must be \text{VK_FALSE}
Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthClampEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** enable or disable depth clipping, call:

```c
void vkCmdSetDepthClipEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClipEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClipEnable` specifies whether depth clipping is enabled.

This command sets whether depth clipping is enabled or disabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` value used to create the currently active pipeline, or is set to the inverse of
VkPipelineRasterizationStateCreateInfo::depthClampEnable

if VkPipelineRasterizationDepthClipStateCreateInfoEXT is not specified.

Valid Usage

- VUID-vkCmdSetDepthClipEnableEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3DepthClipEnable feature is enabled
  - The shaderObject feature is enabled
- VUID-vkCmdSetDepthClipEnableEXT-depthClipEnable-07451
  The depthClipEnable feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthClipEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

When depth clipping is disabled, the plane equation
\[ z_m \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR = 
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR = 
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- `VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES` specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- `VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY` specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \( 0 \leq t \leq 1 \), for each clipped vertex. If the coordinates of a clipped vertex are \( \mathbf{P} \) and the unclipped line segment's vertex coordinates are \( \mathbf{P}_1 \) and \( \mathbf{P}_2 \), then \( t \) satisfies the following equation

\[
\mathbf{P} = t \mathbf{P}_1 + (1-t) \mathbf{P}_2.
\]

\( t \) is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip
volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon **must** include a point on this boundary edge.

Primitives rendered with application-defined half-spaces **must** satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex $i$ has a single specified clip distance $d_i$ (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by $-d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives **must** not be missing any pixels, and pixels **must** not be drawn twice in regions where those primitives are cut by the clip planes.

### 24.4. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices $P_1$ and $P_2$ of an unclipped edge be $c_1$ and $c_2$. The value of $t$ (see *Primitive Clipping*) for a clipped point $P$ is used to obtain the output value associated with $P$ as

$$c = t \cdot c_1 + (1-t) \cdot c_2.$$  

(Multiplying an output value by a scalar means multiplying each of $x, y, z,$ and $w$ by the scalar.)

Since this computation is performed in clip space before division by $w_c$, clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with *NoPerspective*, the value of $t$ used to obtain the output value associated with $P$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see *Basic Line Segment Rasterization* and *Basic Polygon Rasterization*), and no interpolation is performed. The output value $c$ is taken from either $c_1$ or $c_2$, since flat shading has already occurred and the two values are identical.
24.5. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*. Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see *Controlling the Viewport*) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

then the vertex’s normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \begin{pmatrix}
  x_c \\
  w_c \\
  y_c \\
  w_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

24.6. Controlling the Viewport

The viewport transformation is determined by the selected viewport’s width and height in pixels, \( p_x \) and \( p_y \), respectively, and its center \((o_x, o_y)\) (also in pixels), as well as its depth range min and max determining a depth range scale value \( p_z \) and a depth range bias value \( o_z \) (defined below). The vertex’s framebuffer coordinates \((x_f, y_f, z_f)\) are given by

\[
x_f = (p_x/2) x_d + o_x
\]

\[
y_f = (p_y/2) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to \( \text{VkPhysicalDeviceLimits::maxViewports} \) minus one. The number of viewports used by a pipeline is controlled by the *viewportCount* member of the *VkPipelineViewportStateCreateInfo* structure used in pipeline creation.

\( x_f \) and \( y_f \) have limited precision, where the number of fractional bits retained is specified by \( \text{VkPhysicalDeviceLimits::subPixelPrecisionBits} \). When rasterizing *line segments*, the number of fractional bits is specified by \( \text{VkPhysicalDeviceLineRasterizationPropertiesKHR::lineSubPixelPrecisionBits} \).
The `VkPipelineViewportStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of scissors and must match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

### Valid Usage

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the `multiViewport` feature is not enabled, `viewportCount` must not be greater than 1

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the `multiViewport` feature is not enabled, `scissorCount` must not be greater than 1

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  `viewportCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  `scissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- VUID-VkPipelineViewportStateCreateInfo-x-02821
  The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0

- VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

- VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`
• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
If `scissorCount` and `viewportCount` are both not dynamic, then `scissorCount` and `viewportCount` must be identical.

• VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set then `viewportCount` must be 0, otherwise `viewportCount` must be greater than 0.

• VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` must be 0, otherwise `scissorCount` must be greater than 0.

Valid Usage (Implicit)

• VUID-VkPipelineViewportStateCreateInfo-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`.

• VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
`pNext` must be NULL.

• VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask
`flags` must be 0.

To dynamically set the viewport count and viewports, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

or the equivalent command:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `viewportCount` specifies the viewport count.
• `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo`
ViewportCount and pViewports values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetViewportWithCount-None-08971
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3
- VUID-vkCmdSetViewportWithCount-viewportCount-03394
  viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive
- VUID-vkCmdSetViewportWithCount-viewportCount-03395
  If the multiViewport feature is not enabled, viewportCount must be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  pViewports must be a valid pointer to an array of viewportCount valid VkViewport structures
- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetViewportWithCount-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To **dynamically set** the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetScissorWithCount-None-08971**
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
If the `multiViewport` feature is not enabled, `scissorCount` must be 1.

The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0.

Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`.

Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pScissors` must be a valid pointer to an array of `scissorCount` `VkRect2D` structures.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called outside of a video coding scope.
- `scissorCount` must be greater than 0.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>
**typedef** VkFlags VkPipelineViewportStateCreateFlags;

`VkPipelineViewportStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A **pre-rasterization shader stage** can direct each primitive to one of several viewports. The destination viewport for a primitive is selected by the last active **pre-rasterization shader stage** that has an output variable decorated with `ViewportIndex`. The viewport transform uses the viewport corresponding to the value assigned to `ViewportIndex`, and taken from an implementation-dependent vertex of each primitive. If `ViewportIndex` is outside the range zero to `viewportCount` minus one for a primitive, or if the last active **pre-rasterization shader stage** did not assign a value to `ViewportIndex` for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last **pre-rasterization shader stage** does not have an output decorated with `ViewportIndex`, the viewport numbered zero is used by the viewport transformation.

A single vertex **can** be used in more than one individual primitive, in primitives such as `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`. In this case, the viewport transformation is applied separately for each primitive.

To **dynamically set** the viewport transformation parameters, call:

```c
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer, commandBuffer,  
    uint32_t firstViewport,       
    uint32_t viewportCount,       
    const VkViewport* pViewports);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstViewport** is the index of the first viewport whose parameters are updated by the command.
- **viewportCount** is the number of viewports whose parameters are updated by the command.
- **pViewports** is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)`. 

1551
Valid Usage

- VUID-vkCmdSetViewport-firstViewport-01223
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- VUID-vkCmdSetViewport-firstViewport-01224
  If the `multiViewport` feature is not enabled, `firstViewport` must be 0.

- VUID-vkCmdSetViewport-viewportCount-01225
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1.

Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetViewport-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures.

- VUID-vkCmdSetViewport-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetViewport-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdSetViewport-viewportCount-arraylength
  `viewportCount` must be greater than 0.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- `x` and `y` are the viewport’s upper left corner (x, y).
- `width` and `height` are the viewport’s width and height, respectively.
- `minDepth` and `maxDepth` are the depth range for the viewport.

**Note**
Despite their names, `minDepth` can be less than, equal to, or greater than `maxDepth`.

The framebuffer depth coordinate `z` may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value \( \frac{k}{2^m - 1} \), where \( k \in \{0, 1, \ldots, 2^m - 1\} \), as `k` (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
    o_x = x + \frac{width}{2}
\]

\[
    o_y = y + \frac{height}{2}
\]

\[
    o_z = \text{minDepth}
\]

\[
    p_x = \text{width}
\]

\[
    p_y = \text{height}
\]

\[
    p_z = \text{maxDepth} - \text{minDepth}
\]
The application can specify a negative term for height, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative height, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative height allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

Valid Usage

- **VUID-VkViewport-width-01770**
  width must be greater than 0.0

- **VUID-VkViewport-width-01771**
  width must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[0]

- **VUID-VkViewport-apiVersion-07917**
  If the VK_KHR_maintenance1 extension is not enabled, the VK_AMD_negative_viewport_height extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, height must be greater than 0.0

- **VUID-VkViewport-height-01773**
  The absolute value of height must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[1]

- **VUID-VkViewport-x-01774**
  x must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-x-01232**
  (x + width) must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01775**
  y must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-y-01776**
  y must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01777**
  (y + height) must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-y-01233**
  (y + height) must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-minDepth-01234**
  If the VK_EXT_depth_range_unrestricted extension is not enabled, minDepth must be between 0.0 and 1.0, inclusive

- **VUID-VkViewport-maxDepth-01235**
  If the VK_EXT_depth_range_unrestricted extension is not enabled, maxDepth must be between 0.0 and 1.0, inclusive
Chapter 25. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in *Depth Test*. If the pipeline is not created with `VkPipelineRasterizationDepthClipStateCreateInfoEXT` present then enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in *Primitive Clipping*. Otherwise depth clipping is controlled by the state set in `VkPipelineRasterizationDepthClipStateCreateInfoEXT`.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See `VkPolygonMode`.

• **cullMode** is the triangle facing direction used for primitive culling. See `VkCullModeFlagBits`.

• **frontFace** is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment's slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the **depthClamp** feature is not enabled, **depthClampEnable** **must** be **VK_FALSE**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the **fillModeNonSolid** feature is not enabled, **polygonMode** **must** be **VK_POLYGON_MODE_FILL**

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the **VK_KHR_portability_subset** extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons` is **VK_FALSE**, and **rasterizerDiscardEnable** is **VK_FALSE**, **polygonMode** **must** not be **VK_POLYGON_MODE_POINT**

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  **sType** **must** be **VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO**

- **VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`, `VkPipelineRasterizationDepthClipStateCreateInfoEXT`, `VkPipelineRasterizationLineStateCreateInfoKHR`, `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`, or `VkPipelineRasterizationStateStreamCreateInfoEXT`

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-unique**
The sType value of each struct in the pNext chain must be unique

- VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask flags must be 0
- VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter polygonMode must be a valid VkPolygonMode value
- VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter cullMode must be a valid combination of VkCullModeFlagBits values
- VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter frontFace must be a valid VkFrontFace value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;

VkPipelineRasterizationStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

If the pNext chain of VkPipelineRasterizationStateCreateInfo includes a VkPipelineRasterizationDepthClipStateCreateInfoEXT structure, then that structure controls whether depth clipping is enabled or disabled.

The VkPipelineRasterizationDepthClipStateCreateInfoEXT structure is defined as:

// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- depthClipEnable controls whether depth clipping is enabled as described in Primitive Clipping.

Valid Usage (Implicit)

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType stype must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT
- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask flags must be 0
**VkPipelineRasterizationDepthClipStateCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```c
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization. This value is ignored for the purposes of setting the number of samples used in rasterization if the pipeline is created with the **VK_DYNAMIC_STATE_RASTERIZATIONSAMPLES_EXT** dynamic state set, but if **VK_DYNAMIC_STATE_SAMPLEMASK_EXT** dynamic state is not set, it is still used to define the size of the **pSampleMask** array as described below.
- **sampleShadingEnable** can be used to enable Sample Shading.
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
- **pSampleMask** is a pointer to an array of **VkSampleMask** values used in the sample mask test.
- **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.
- **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit $b$ for mask word $w$ in the sample mask corresponds to sample index $i$, where $i = 32 \times w + b$. **pSampleMask** has a length equal to $\lceil \frac{\text{rasterizationSamples}}{32} \rceil$ words.

If **pSampleMask** is **NULL**, it is treated as if the mask has all bits set to 1.
Valid Usage

- VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784
  If the `sampleRateShading` feature is not enabled, `sampleShadingEnable` must be `VK_FALSE`.

- VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`.

- VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786
  `minSampleShading` must be in the range [0,1].

Valid Usage (Implicit)

- VUID-VkPipelineMultisampleStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO`.

- VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask
  `flags` must be `0`.

- VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter
  `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter
  If `pSampleMask` is not `NULL`, `pSampleMask` must be a valid pointer to an array of `VkSampleMask` values.

// Provided by VK_VERSION_1_0

typedef VkFlags VkPipelineMultisampleStateCreateFlags;

VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type `VkSampleMask`, each representing 32 bits of coverage information:

// Provided by VK_VERSION_1_0

typedef uint32_t VkSampleMask;

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated
Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To **dynamically enable** whether primitives are discarded before the rasterization stage, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo` ::pDynamicStates. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo` ::rasterizerDiscardEnable value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRasterizerDiscardEnable-None-08970
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
25.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions OpEndPrimitive and OpEndStreamPrimitive can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams streams, which is at least 1. The individual streams are numbered 0 through maxTransformFeedbackStreams minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize and VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader’s XfbBuffer, XfbStride, and Offsets decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the GeometryStreams capability must be specified.
By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the `OutputPoints` output primitive type. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` property it is possible to emit `OutputLineStrip` or `OutputTriangleStrip` in addition to `OutputPoints`.

The vertex stream used for rasterization is specified by adding a `VkPipelineRasterizationStateStreamCreateInfoEXT` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateStreamCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationStream` is the vertex stream selected for rasterization.

If this structure is not present, `rasterizationStream` is assumed to be zero.

**Valid Usage**

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324 `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` must be enabled
- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325 `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`
- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326 `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is VK_FALSE

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask flags must be 0

```c
// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;
```

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the `rasterizationStream` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_transform_feedback,
// VK_EXT_shader_object with VK_EXT_transform_feedback
void vkCmdSetRasterizationStreamEXT(
    VkCommandBuffer commandBuffer,
    uint32_t rasterizationStream);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationStream` specifies the `rasterizationStream` state.

This command sets the `rasterizationStream` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` set in `VkPipelineDynamicStateCreateInfo`::pDynamicStates. Otherwise, this state is specified by the `VkPipelineRasterizationStateStreamCreateInfoEXT`::rasterizationStream value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetRasterizationStreamEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3RasterizationStream` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetRasterizationStreamEXT-transformFeedback-07411
  The `transformFeedback` feature must be enabled

- VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07412
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT`::maxTransformFeedbackStreams

- VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07413
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT`::transformFeedbackRasterizationStreamSelect is VK_FALSE
Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetRasterizationStreamEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

25.3. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. Fragment operations, in the order defined
2. Blending, logic operations, and color writes

Execution of these operations for each primitive in a subpass occurs in primitive order.

25.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations
apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with Sample and Input, the data associated with those variables will be assigned independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with Sample and Input need not be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments have one set of samples. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by VkPipelineMultisampleStateCreateInfo::rasterizationSamples. Each sample in a set is assigned a unique sample index i in the range [0, rasterizationSamples).

To dynamically set the rasterizationSamples, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer commandBuffer, 
    VkSampleCountFlagBits rasterizationSamples);
```

- commandBuffer is the command buffer into which the command will be recorded.
- rasterizationSamples specifies rasterizationSamples.

This command sets the rasterizationSamples for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::rasterizationSamples value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetRasterizationSamplesEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3RasterizationSamples feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>

Each sample in a fragment is also assigned a unique coverage index \( j \) in the range \([0, n \times \text{rasterizationSamples})\), where \( n \) is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index.

If the fragment shading rate is set, the coverage index \( j \) is determined as a function of the pixel index \( p \), the sample index \( i \), and the number of rasterization samples \( r \) as:
\[ j = i + r \times ((f_w \times f_h) - 1 - p) \]

where the pixel index \( p \) is determined as a function of the pixel's framebuffer location \((x,y)\) and the fragment size \((f_w,f_h)\):

\[ p_x = x \; \% \; f_w \]

\[ p_y = y \; \% \; f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 29. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Diagram 1x1]</td>
<td>![Diagram 1x2]</td>
<td>![Diagram 1x4]</td>
</tr>
</tbody>
</table>

**Table 30. Pixel indices - 2 wide**
The coverage mask includes B bits packed into W words, defined as:

\[ B = n \times \text{rasterizationSamples} \]

\[ W = \lceil B/32 \rceil \]

Bit b in coverage mask word w is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the ith entry in the table corresponding to sample index i. `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.
<table>

<td>(0.375, 0.125)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_8_BIT</td>
<td>(0.5625, 0.3125)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_16_BIT</td>
<td>(0.5625, 0.5625)</td>
</tr>
</tbody>
</table>
25.5. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the application to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` must be greater than or equal to 1.
- The value of `fragmentSize.width` must be a power-of-two.
- The value of `fragmentSize.height` must be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` must be greater than or equal to 1.
- The value of `fragmentSize.height` must be a power-of-two.
- The highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateRasterizationSamples`. 
The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th>sampleCounts</th>
<th>fragmentSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT {2,2}</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT {2,1}</td>
</tr>
<tr>
<td>∼0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates must also include `VK_SAMPLE_COUNT_2_BIT`.

Note
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts are supported for this rate.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  pFragmentShadingRateCount must be a valid pointer to a `uint32_t` value.
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount `VkPhysicalDeviceFragmentShadingRateKHR` structures.

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **sampleCounts** is a bitmask of sample counts for which the shading rate described by **fragmentSize** is supported.
• **fragmentSize** is a `VkExtent2D` describing the width and height of a supported shading rate.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR`
• VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
  **pNext** must be NULL

Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 25.5.1. Pipeline Fragment Shading Rate

The **pipeline fragment shading rate** can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **fragmentSize** specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

### Valid Usage (Implicit)

- **VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`.

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507**
  
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` must be 1.

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508**
  
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` must be 1.

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509**
  
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or
**attachmentFragmentShadingRate** **must** be enabled

- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
  If the **primitiveFragmentShadingRate** feature is not enabled, `combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the **attachmentFragmentShadingRate** feature is not enabled, `combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the **fragmentSizeNonTrivialCombinerOps** limit is not supported, elements of `combinerOps` **must** be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width` **must** be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height` **must** be greater than or equal to 1

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width` **must** be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  `pFragmentSize->height` **must** be a power-of-two value

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  `pFragmentSize->width` **must** be less than or equal to 4

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  `pFragmentSize->height` **must** be less than or equal to 4

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  `pFragmentSize` **must** be a valid pointer to a valid `VkExtent2D` structure

- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of `combinerOps` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  `commandBuffer` **must** be in the **recording** state

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

25.5.2. Primitive Fragment Shading Rate

The *primitive fragment shading rate* can be set via the `PrimitiveShadingRateKHR` built-in in the last active pre-rasterization shader stage. The rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive's *provoking vertex*.

25.5.3. Attachment Fragment Shading Rate

The *attachment shading rate* can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a *fragment shading rate attachment*. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x)
\]

\[
y' = \text{floor}(y / \text{region}_y)
\]

where \(x'\) and \(y'\) are the coordinates of a texel in the fragment shading rate attachment, \(x\) and \(y\) are the coordinates of the pixel in the framebuffer, and \(\text{region}_x\) and \(\text{region}_y\) are the size of the region each texel corresponds to, as defined by the `shadingRateAttachmentTexelSize` member of `VkFragmentShadingRateAttachmentInfoKHR`.

If *multiview is enabled* and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the `ViewIndex` built-in. If *multiview is disabled*, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the `Layer` built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:
size_w = 2^{(texel/3)}

size_h = 2^{(texel/3)}

where texel is the value in the first component of the identified texel, and size_w and size_h are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as size_w = size_h = 1. Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

25.5.4. Combining the Fragment Shading Rates

The final rate \( (C_{xy}) \) used for fragment shading must be one of the rates returned by \( \text{vkGetPhysicalDeviceFragmentShadingRatesKHR} \) for the sample count used by rasterization.

If any of the following conditions are met, \( C_{xy} \) must be set to \{1,1\} by the implementation:

- If Sample Shading is enabled.
- The fragmentShadingRateWithSampleMask limit is not supported, and \( \text{VkPipelineMultisampleStateCreateInfo::pSampleMask} \) contains a zero value in any bit used by fragment operations.
- The fragmentShadingRateWithShaderSampleMask is not supported, and the fragment shader has SampleMask in the input or output interface.
- The fragmentShadingRateWithShaderDepthStencilWrites limit is not supported, and the fragment shader declares the \( \text{FragDepth} \) or \( \text{FragStencilRefEXT} \) built-in.
- The fragment shader declares any of the \( \text{TileImageColorReadAccessEXT}, \text{TileImageDepthReadAccessEXT}, \) or \( \text{TileImageStencilReadAccessEXT} \) capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of \( C_{xy} \). As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by \( \text{VkFragmentShadingRateCombinerOpKHR} \):

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```
VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \).

VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = B_{xy} \).

VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy}) \).

VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy}) \).

VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy} \).

where \( \text{combine}(A_{xy}, B_{xy}) \) is the combine operation, and \( A_{xy} \) and \( B_{xy} \) are the inputs to the operation.

If \( \text{fragmentShadingRateStrictMultiplyCombiner} \) is \( \text{VK_FALSE} \), using VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR with values of 1 for both \( A \) and \( B \) in the same dimension results in the value 2 being produced for that dimension. See the definition of fragmentShadingRateStrictMultiplyCombiner for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy}, B_{xy})
\]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the ShadingRateKHR built-in.

Implementations should clamp the inputs to the combiner operations \( A_{xy} \) and \( B_{xy} \), and must do so if VkPhysicalDeviceMaintenance6PropertiesKHR::fragmentShadingRateClampCombinerInputs is set to VK_TRUE. All implementations must clamp the result of the second combiner operation.

A fragment shading rate \( R_{xy} \) representing any of \( A_{xy} \), \( B_{xy} \) or \( C_{xy} \) is clamped as follows. If \( R_{xy} \) is one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count used by rasterization, the clamped shading rate \( R_{xy'} \) is \( R_{xy} \). Otherwise, the clamped shading rate is selected from the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( R_{x'} \leq R_x \) and \( R_{y'} \leq R_y \).
   - Implementations may also keep rates where \( R_{x'} \leq R_y \) and \( R_{y'} \leq R_x \).
2. Keep only rates with the highest area \((R_x' \times R_y')\).
3. Keep only rates with the lowest aspect ratio \((R_x' + R_y')\).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation **may** choose either rate. However, it **must** choose this rate consistently for the same shading rates, and combiner operations for the lifetime of the \texttt{VkDevice}.

### 25.6. Sample Shading

Sample shading **can** be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation **must** invoke the fragment shader at least \(\max(\lceil \texttt{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \rceil, 1)\) times per fragment. If \texttt{VkPipelineMultisampleStateCreateInfo::sampleShadingEnable} is set to \texttt{VK_TRUE}, sample shading is enabled.

If a fragment shader entry point **statically uses** an input variable decorated with a \texttt{BuiltIn} of \texttt{SampleId} or \texttt{SamplePosition}, sample shading is enabled and a value of \texttt{1.0} is used instead of \texttt{minSampleShading}. If a fragment shader entry point **statically uses** an input variable decorated with \texttt{Sample}, sample shading **may** be enabled and a value of \texttt{1.0} will be used instead of \texttt{minSampleShading} if it is.

**Note**

If a shader decorates an input variable with \texttt{Sample} and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than \texttt{covered samples}, implementations **may** include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a \texttt{helper invocation} covers at least one sample.

### 25.7. Barycentric Interpolation

When the \texttt{fragmentShaderBarycentric} feature is enabled, the \texttt{PerVertexKHR} interpolation decoration **can** be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs **can** only be accessed in a fragment shader using an array index whose value \((0, 1, \text{or } 2)\) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices \texttt{1} and \texttt{2} for point primitives will be equal to those of index \texttt{0}, and the per-vertex values of index \texttt{2} for line primitives will be equal to those of index \texttt{1}.
When tessellation and geometry shading are not active, fragment shader inputs decorated with PerVertexKHR will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT for index values of 0, 1, and 2. If an input decorated with PerVertexKHR is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline is not VK_POLYGON_MODE_FILL, an undefined value is returned.

When geometry shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry shader. In this case, the vertices used for fragment shader inputs decorated with `PerVertexKHR` are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with `PerVertexKHR`, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR`.

Fragment shader inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For `BaryCoordKHR`, the values are obtained using perspective interpolation. For `BaryCoordNoPerspKHR`, the values are obtained using linear interpolation. The values of `BaryCoordKHR` and `BaryCoordNoPerspKHR` are undefined while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`.

### 25.8. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
• the vertex shader, otherwise

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0], \text{pointSizeRange}[1]]\). The value written to PointSize must be greater than zero. If maintenance5 is enabled, and a value is not written to PointSize, the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the pointSizeRange and pointSizeGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

### 25.8.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point's \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in PointCoord contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):

\[
\begin{align*}
    s &= \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}} \\
    t &= \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\end{align*}
\]

where size is the point's size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 25.9. Line Segments

Line segment rasterization options are controlled by the VkPipelineRasterizationLineStateCreateInfoKHR structure.

The VkPipelineRasterizationLineStateCreateInfoKHR structure is defined as:
typedef struct VkPipelineRasterizationLineStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeKHR lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• lineRasterizationMode is a VkLineRasterizationModeKHR value selecting the style of line rasterization.
• stippledLineEnable enables stippled line rasterization.
• lineStippleFactor is the repeat factor used in stippled line rasterization.
• lineStipplePattern is the bit pattern used in stippled line rasterization.

If stippledLineEnable is VK_FALSE, the values of lineStippleFactor and lineStipplePattern are ignored.

Valid Usage

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02768
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the rectangularLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02769
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the bresenhamLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02770
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the smoothLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02771
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02772
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02773
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature
must be enabled

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02774
  If stippledLineEnable is VK_TRUE and lineRasterizationMode is
  VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature must
  be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

Valid Usage (Implicit)

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPLINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR

• VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-parameter
  lineRasterizationMode must be a valid VkLineRasterizationModeKHR value

Possible values of VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode are:

// Provided by VK_KHR_line_rasterization
typedef enum VkLineRasterizationModeKHR {
  VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR = 0,
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR = 1,
  VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR = 2,
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR = 3,
  VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR,
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT =
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR,
  VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT =
  VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR,
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT =
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR,
} VkLineRasterizationModeKHR;

• VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR is equivalent to
  VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR if VkPhysicalDeviceLimits::strictLines is VK_TRUE,
  otherwise lines are drawn as non-strictLines parallelograms. Both of these modes are defined
  in Basic Line Segment Rasterization.

• VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR specifies lines drawn as if they were rectangles
  extruded from the line

• VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR specifies lines drawn by determining which pixel
  diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

• VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR specifies lines drawn if they were
  rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To dynamically set the lineRasterizationMode state, call:
void vkCmdSetLineRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkLineRasterizationModeEXT lineRasterizationMode);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineRasterizationMode` specifies the lineRasterizationMode state.

This command sets the lineRasterizationMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineRasterizationModeEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3LineRasterizationMode feature is enabled
  - The shaderObject feature is enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07418
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the rectangularLines feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07419
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the bresenhamLines feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07420
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the smoothLines feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-parameter
  lineRasterizationMode must be a valid VkLineRasterizationModeEXT value

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
operations

• VUID-vkCmdSetLineRasterizationModeEXT-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

To dynamically set the stippledLineEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_line_rasterization,
// VK_EXT_line_rasterization with VK_EXT_shader_object
void vkCmdSetLineStippleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stippledLineEnable);
```

• commandBuffer is the command buffer into which the command will be recorded.
• stippledLineEnable specifies the stippledLineEnable state.

This command sets the stippledLineEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationLineStateCreateInfoKHR::stippledLineEnable value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetLineStippleEnableEXT-None-09423
At least one of the following must be true:
  ◦ The extendedDynamicState3LineStippleEnable feature is enabled
  ◦ The shaderObject feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer,
    float lineWidth);
```

- commandBuffer is the command buffer into which the command will be recorded.
- lineWidth is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_LINE_WIDTH set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::lineWidth value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788
  If the \textit{wideLines} feature is not enabled, \textit{lineWidth} must be \textit{1.0}

Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \textit{VkCommandBuffer} handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
  \textit{commandBuffer} must be in the \textit{recording state}
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  The \textit{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics operations
- VUID-vkCmdSetLineWidth-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized
- Host access to the \textit{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Not all line widths need be supported for line segment rasterization, but width \textit{1.0} antialiased segments must be provided. The range and gradations are obtained from the \textit{lineWidthRange} and \textit{lineWidthGranularity} members of \textit{VkPhysicalDeviceLimits}. If, for instance, the size range is from \textit{0.1} to \textit{2.0} and the gradation size is \textit{0.1}, then the sizes \textit{0.1}, \textit{0.2}, ..., \textit{1.9}, \textit{2.0} are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

25.9.1. Basic Line Segment Rasterization

If the \textit{lineRasterizationMode} member of \textit{VkPipelineRasterizationLineStateCreateInfoKHR} is \textit{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR}, rasterized line segments produce fragments which
intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
  t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{\| p_b - p_a \|^2}
\]

(Note that \( t = 0 \) at \( p_a \) and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If `strictLines` is `VK_TRUE`, line segments are rasterized using perspective or linear interpolation.

**Perspective interpolation** for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value \( f \) can be determined by

\[
  f = \frac{(1 - t)f_a / w_a + tf_b / w_b}{(1 - t) / w_a + t / w_b}
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip w coordinates of the starting and ending endpoints of the segment, respectively.

**Linear interpolation** for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
  f = (1 - t) f_a + t f_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

The above description documents the preferred method of line rasterization, and must be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`.

By default, when `strictLines` is `VK_FALSE`, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the
greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in Non strict lines, and each is lineWidth long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.

Only when strictLines is VK_FALSE implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

If VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictSinglePixelWideLinesUseParallelogram is VK_TRUE, and strictLines is VK_FALSE, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

If VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictWideLinesUseParallelogram is VK_TRUE, and strictLines is VK_FALSE, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

### 25.9.2. Bresenham Line Segment Rasterization

If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.
Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either x-major or y-major. x-major line segments have slope in the closed interval [-1,1]; all other line segments are y-major (slope is determined by the segment’s endpoints). We specify rasterization only for x-major segments except in cases where the modifications for y-major segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment f with center at framebuffer coordinates $x_f$ and $y_f$, define a diamond-shaped region that is the intersection of four half planes:

$$R_f = \{(x, y) | |x - x_f| + |y - y_f| \leq \frac{1}{2}\}$$

Essentially, a line segment starting at $p_a$ and ending at $p_b$ produces those fragments f for which the segment intersects $R_f$, except if $p_b$ is contained in $R_f$.

![Figure 16. Visualization of Bresenham's algorithm](image)

To avoid difficulties when an endpoint lies on a boundary of $R_f$ we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p_a'$ given by $(x_a, y_a) - (\delta, \delta^2)$ and $p_b'$ given by $(x_b, y_b) - (\delta, \delta^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments f for which the segment starting at $p_a'$ and ending on $p_b'$ intersects $R_f$, except if $p_b'$ is contained in $R_f$. $\delta$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\epsilon$ for any $0 < \delta \leq \epsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that
the final fragment (corresponding to \( p_b \)) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations **may** use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm **must** not deviate by more than one unit in either \( x \) or \( y \) framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.

- The total number of fragments produced by the algorithm **must** not differ from that produced by the diamond-exit rule by more than one.

- For an \( x \)-major line, two fragments that lie in the same framebuffer-coordinate column **must** not be produced (for a \( y \)-major line, two fragments that lie in the same framebuffer-coordinate row **must** not be produced).

- If two line segments share a common endpoint, and both segments are either \( x \)-major (both left-to-right or both right-to-left) or \( y \)-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments **must** not produce duplicate fragments. Fragments also **must** not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent lineWidthRange (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an \( x \)-major line, the minor direction is \( y \), and for a \( y \)-major line, the minor direction is \( x \)) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a \( y \)-major segment) is produced at each \( x \) (\( y \) for \( y \)-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \text{FragCoord} which is interpolated as usual. Implementations **may** instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations **may** all be treated as being at the pixel center (this **may** affect attribute and depth interpolation).

---

**Note**

The sample locations described above are **not** used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that
Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

### 25.9.3. Line Stipple

If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, then lines are rasterized with a **line stipple** determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let

\[
    b = \left\lfloor \frac{s}{r} \right\rfloor \mod 16
\]

Then a fragment is produced if the \( b \)'th bit of \( p \) is 1, and discarded otherwise. The bits of \( p \) are numbered with 0 being the least significant and 15 being the most significant.

The initial value of \( s \) is zero. For `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR` lines, \( s \) is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` and `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` lines, the rectangular region is subdivided into adjacent unit-length rectangles, and \( s \) is incremented once for each rectangle. Rectangles with a value of \( s \) such that the \( b \)'th bit of \( p \) is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of \( s \) (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

\( s \) is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of \( s \) at the beginning of the line segment is implementation-dependent.

To **dynamically set** the line stipple state, call:

```c
// Provided by VK_KHR_line_rasterization
void vkCmdSetLineStippleKHR(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
• **lineStipplePattern** is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoKHR::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfoKHR::lineStipplePattern` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleKHR-lineStippleFactor-02776
  
  *lineStippleFactor must be in the range [1,256]*

### Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleKHR-commandBuffer-parameter
  
  *commandBuffer must be a valid `VkCommandBuffer` handle*

- VUID-vkCmdSetLineStippleKHR-commandBuffer-recording
  
  *commandBuffer must be in the recording state*

- VUID-vkCmdSetLineStippleKHR-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetLineStippleKHR-videoencoding
  
  *This command must only be called outside of a video coding scope*

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

</tbody>
</table>
25.9.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` lines. The rules for determining which pixels are covered are implementation-dependent, and **may** include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

Note
---
The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.

25.10. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

25.10.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is **back-facing** or **front-facing**. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[
a = \frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1}^f - x_{i+1}^f y_i^f
\]

where \(x_i^f\) and \(y_i^f\) are the x and y framebuffer coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \mod n\).

The interpretation of the sign of \(a\) is determined by the `VkPipelineRasterizationStateCreateInfo` ::`frontFace` property of the currently active pipeline. Possible values are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
• **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To **dynamically set** the front face orientation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,  
    VkFrontFace frontFace);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,   
    VkFrontFace frontFace);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_FRONT_FACE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::frontFace** value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetFrontFace-None-08971**
  At least one of the following **must** be true:
  - the **shaderObject** feature is enabled
  - the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** parent of **commandBuffer** is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- **VUID-vkCmdSetFrontFace-commandBuffer-parameter**
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle
- **VUID-vkCmdSetFrontFace-frontFace-parameter**
  **frontFace** **must** be a valid **VkFrontFace** value
- **VUID-vkCmdSetFrontFace-commandBuffer-recording**
  **commandBuffer** **must** be in the **recording state**
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the `VkPipelineRasterizationStateCreateInfo::cullMode` property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- `VK_CULL_MODE_NONE` specifies that no triangles are discarded.
- `VK_CULL_MODE_FRONT_BIT` specifies that front-facing triangles are discarded.
- `VK_CULL_MODE_BACK_BIT` specifies that back-facing triangles are discarded.
- `VK_CULL_MODE_FRONT_AND_BACK` specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```
VkCullModeFlags is a bitmask type for setting a mask of zero or more VkCullModeFlagBits.

To dynamically set the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `cullMode` specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_CULL_MODE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::cullMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCullMode-None-08971**
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetCullMode-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetCullMode-cullMode-parameter**
  `cullMode` **must** be a valid combination of `VkCullModeFlagBits` values

- **VUID-vkCmdSetCullMode-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetCullMode-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
VUID-vkCmdSetCullMode-videocoding
This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

The rule for determining which fragments are produced by polygon rasterization is called **point sampling**. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons **must** result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

**Barycentric coordinates** are a set of three numbers, a, b, and c, each in the range [0,1], with \( a + b + c = 1 \). These coordinates uniquely specify any point \( p \) within the triangle or on the triangle’s boundary as

\[
p = a p_a + b p_b + c p_c
\]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. \( a, b, \) and \( c \) are determined by:

\[
a = \frac{A(p_p b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p_a p_d p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p_a p_d p_b)}{A(p_a p_b p_c)}
\]

where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n \).

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c \), respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates.
An interpolated value \( f \) can be determined by

\[
f = \frac{af_a / w_a + bf_b / w_b + cf_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c, \) respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced.

Linear interpolation for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a f_a + b f_b + c f_c
\]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i. \) For each \( i, 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1. \) The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i, a_i = 1 \) and \( a_j = 0 \) for \( j \neq i. \)

\( \text{Note} \)

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

25.10.2. Polygon Mode

Possible values of the \( \text{VkPipelineRasterizationStateCreateInfo}::\text{polygonMode} \) property of the currently active pipeline, specifying the method of rasterization for polygons, are:
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
} VkPolygonMode;

• VK_POLYGON_MODE_POINT specifies that polygon vertices are drawn as points.
• VK_POLYGON_MODE_LINE specifies that polygon edges are drawn as line segments.
• VK_POLYGON_MODE_FILL specifies that polygons are rendered using the polygon rasterization rules in this section.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize is set to VK_TRUE, the point size of the final rasterization of polygons is taken from PointSize when polygon mode is VK_POLYGON_MODE_POINT.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize is set to VK_FALSE, the point size of the final rasterization of polygons is 1.0 when polygon mode is VK_POLYGON_MODE_POINT.

To dynamically set the polygon mode, call:

void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,
    VkPolygonMode polygonMode);

• commandBuffer is the command buffer into which the command will be recorded.
• polygonMode specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_POLYGON_MODE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::polygonMode value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetPolygonModeEXT-None-09423
  At least one of the following must be true:
  ◦ The extendedDynamicState3PolygonMode feature is enabled
  ◦ The shaderObject feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-fillModeNonSolid-07424
  If the fillModeNonSolid feature is not enabled, polygonMode must be VK_POLYGON_MODE_FILL

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter
  polygonMode must be a valid VkPolygonMode value

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetPolygonModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

25.10.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value \( c \) that is computed for that polygon.

Depth Bias Enable

The depth bias computation is enabled by the depthBiasEnable set with vkCmdSetDepthBiasEnable or the corresponding VkPipelineRasterizationStateCreateInfo::depthBiasEnable value used to create the currently active pipeline. If the depth bias enable is VK_FALSE, no bias is applied and the fragment’s depth values are unchanged.
To **dynamically enable** whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBiasEnable-None-08970**
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetDepthBiasEnable-videocoding**
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

<table>
<thead>
<tr>

</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope \( m \) of the polygon
- `depthBiasConstantFactor` scales the parameter \( r \) of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` can each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` and `vkCmdSetDepthBias2EXT` below.

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}
\]

where \((x_0, y_0, z_0)\) is a point on the triangle. \( m \) may be approximated as

\[
m = \max\left(\frac{\partial z_f}{\partial x_f}, \frac{\partial z_f}{\partial y_f}\right)
\]

In a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`, \( r \), for the given primitive is defined as

\[
r = 1
\]

Otherwise \( r \) is the minimum resolvable difference that depends on the depth attachment representation. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_FALSE` it is the smallest difference in framebuffer coordinate \( z \) values that is guaranteed to remain distinct throughout
polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z \) values that differ by \( r \), will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`, \( r \) is constant throughout the range of the entire depth attachment. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_TRUE`, then its value must be

\[
r = 2^n
\]

Otherwise its value is implementation-dependent but must be at most

\[
r = 2 \times 2^n
\]

where \( n \) is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as

\[
r = 2^e
\]

If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times depthBiasSlopeFactor + r \times depthBiasConstantFactor)
\]

where \( \text{dbclamp}(x) = \begin{cases} x & \text{depthBiasClamp} = 0 \text{ or } NaN \\ \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\ \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 \end{cases} \)

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Calling this function is equivalent to calling `vkCmdSetDepthBias2EXT` without a `VkDepthBiasRepresentationInfoEXT` in the pNext chain of `VkDepthBiasInfoEXT`.

### Valid Usage

- VUID-vkCmdSetDepthBias-depthBiasClamp-00790
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

### Command Properties

<table>
<thead>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkDepthBiasRepresentationInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32 depthBiasExact;
}
VkDepthBiasRepresentationInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `depthBiasRepresentation` is a `VkDepthBiasRepresentationEXT` value specifying the depth bias representation.
• `depthBiasExact` specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

---

### Valid Usage

• VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947
  If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`

• VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948
  If the `floatRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`

• VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949
  If the `depthBiasExact` feature is not enabled, `depthBiasExact` must be `VK_FALSE`
Valid Usage (Implicit)

• VUID-VkDepthBiasRepresentationInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT

• VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter
  depthBiasRepresentation must be a valid VkDepthBiasRepresentationEXT value

Possible values of VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation, specifying the depth bias representation are:

```c
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```

• VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT specifies that the depth bias representation is a factor of the format’s r as described in Depth Bias Computation.

• VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT specifies that the depth bias representation is a factor of a constant r defined by the bit-size or mantissa of the format as described in Depth Bias Computation.

• VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT specifies that the depth bias representation is a factor of constant r equal to 1.

The VkDepthBiasInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• depthBiasConstantFactor is a scalar factor controlling the constant depth value added to each fragment.

• depthBiasClamp is the maximum (or minimum) depth bias of a fragment.

• depthBiasSlopeFactor is a scalar factor applied to a fragment’s slope in depth bias calculations.
If `pNext` does not contain a `VkDepthBiasRepresentationInfoEXT` structure, then this command is equivalent to including a `VkDepthBiasRepresentationInfoEXT` with `depthBiasExact` set to `VK_FALSE` and `depthBiasRepresentation` set to `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`.

### Valid Usage

- **VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950**
  
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0.

### Valid Usage (Implicit)

- **VUID-VkDepthBiasInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT`.

- **VUID-VkDepthBiasInfoEXT-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`.

- **VUID-VkDepthBiasInfoEXT-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

To **dynamically set** the depth bias parameters, call:

```c
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer commandBuffer,
    const VkDepthBiasInfoEXT* pDepthBiasInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pDepthBiasInfo` is a pointer to a `VkDepthBiasInfoEXT` structure specifying depth bias parameters.

This command is functionally identical to `vkCmdSetDepthBias`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter**
  
  `pDepthBiasInfo` must be a valid pointer to a valid `VkDepthBiasInfoEXT` structure.

- **VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics.
operations

- VUID-vkCmdSetDepthBias2EXT-videocoding

This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

Chapter 26. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Sample mask test
4. Certain Fragment shading operations:
   - Sample Mask Accesses
   - Tile Image Reads
   - Depth Replacement
   - Stencil Reference Replacement
5. Multisample coverage
6. Depth bounds test
7. Stencil test
8. Depth test
9. Sample counting
10. Coverage reduction

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- `OpTerminateInvocation`
- `OpDemoteToHelperInvocationEXT`
- `OpKill`.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting` is set to `VK_TRUE` and there is a fragment shader which declares the `EarlyFragmentTests` execution mode, fragment shading and multisample coverage operations must be performed after sample counting.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting` is not set to `VK_TRUE`, any fragment shader which declares the `EarlyFragmentTests` execution mode must not perform fragment shading or multisample coverage operations after sample counting.
::earlyFragmentMultisampleCoverageAfterSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting, but may be performed before sample counting.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode sample mask test operations must follow the order of fragment operations from above.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations should follow the order of fragment operations from above but may instead be performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthLess execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

the implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

### 26.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a VkRect2D. These values are either set by the VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\). If the test is set to be inclusive, samples that are not inside any of
the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The VkPipelineDiscardRectangleStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a VkDiscardRectangleModeEXT value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of VkRect2D structures defining discard rectangles.

If the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT dynamic state is not enabled for the pipeline the presence of this structure in the VkGraphicsPipelineCreateInfo chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles must enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode must be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of VkGraphicsPipelineCreateInfo, it defines parameters of the discard rectangle test. If the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

**Valid Usage**

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582 `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`
Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask
  
  `flags` must be `0`

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
  
  `discardRectangleMode` must be a valid `VkDiscardRectangleModeEXT` value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

`VkPipelineDiscardRectangleStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

`VkDiscardRectangleModeEXT` values are:

// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
  VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
  VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

- `VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT` specifies that the discard rectangle test is inclusive.
- `VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT` specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstDiscardRectangle,
  uint32_t discardRectangleCount,
  const VkRect2D* pDiscardRectangles);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstDiscardRectangle` is the index of the first discard rectangle whose state is updated by the command.
- `discardRectangleCount` is the number of discard rectangles whose state are updated by the command.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures specifying discard rectangles.

The discard rectangle taken from element `i` of `pDiscardRectangles` replace the current state for the
This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of firstDiscardRectangle and discardRectangleCount must be less than or equal to VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of offset in each VkRect2D element of pDiscardRectangles must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of (offset.x + extent.width) in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of (offset.y + extent.height) in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

### Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter**
  pDiscardRectangles must be a valid pointer to an array of discardRectangleCount VkRect2D structures

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdSetDiscardRectangleEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength**
  discardRectangleCount must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least specVersion 2 of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDiscardRectangleEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

26.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\). Samples with coordinates outside the scissor rectangle at the
corresponding ViewportIndex will have their coverage set to 0.

To dynamically set the scissor rectangles, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element i of `pScissors` replace the current state for the scissor index `firstScissor + i`, for i in `[0, scissorCount)`.

This command sets the scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of `firstScissor` and `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the `multiViewport` feature is not enabled, `firstScissor` must be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the `multiViewport` feature is not enabled, `scissorCount` must be 1

- VUID-vkCmdSetScissor-x-00595
  The x and y members of `offset` member of any element of `pScissors` must be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissor-offset-00597
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`
Valid Usage (Implicit)

- **VUID-vkCmdSetScissor-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetScissor-pScissors-parameter**
  `pScissors` must be a valid pointer to an array of `scissorCount` `VkRect2D` structures.

- **VUID-vkCmdSetScissor-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetScissor-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetScissor-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdSetScissor-scissorCount-arraylength**
  `scissorCount` must be greater than 0.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

26.3. Sample Mask Test

The sample mask test compares the `coverage mask` for a fragment with the `sample mask` defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

To **dynamically set** the sample mask, call:
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits samples,
    const VkSampleMask* pSampleMask);

• commandBuffer is the command buffer into which the command will be recorded.
• samples specifies the number of sample bits in the pSampleMask.
• pSampleMask is a pointer to an array of VkSampleMask values, where the array size is based on the samples parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_SAMPLE_MASK_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::pSampleMask value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetSampleMaskEXT-None-09423
  At least one of the following must be true:
  ◦ The extendedDynamicState3SampleMask feature is enabled
  ◦ The shaderObject feature is enabled

Valid Usage (Implicit)

• VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetSampleMaskEXT-samples-parameter
  samples must be a valid VkSampleCountFlagBits value
• VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  pSampleMask must be a valid pointer to an array of $\frac{\text{samples}}{32}$ VkSampleMask values
• VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
• VUID-vkCmdSetSampleMaskEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

26.4. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
  - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments may be shaded by one fragment shader invocation. This may affect `VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT` results, but must otherwise not be visible behavior to applications.
- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
Each covered sample **must** be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values **may** be written to all color attachment outputs during this fragment operation.

**Note**

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

### 26.4.1. Sample Mask

Reading from the `SampleMask` built-in in the `Input` storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If `sample shading` is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in `SampleMask` which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the `SampleMask` built-in in the `Output` storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

### 26.4.2. Fragment Shader Tile Image Reads

If the `VK_EXT_shader_tile_image` extension is enabled, implementations divide the framebuffer into a grid of tiles. A tile image is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by `vkCmdBeginRenderingKHR`, fragment shader invocations **can** read the framebuffer color, depth, and stencil values at the fragment location via tile images.

**Note**

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

- Tile dimensions will be exposed in a future extension
- Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.
Enabling shaderTileImageColorReadAccess, shaderTileImageDepthReadAccess, shaderTileImageStencilReadAccess enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with OpColorAttachmentReadEXT. Tile image variables are linked to specific color attachments using Location decoration. See Fragment Tile Image Interface for more details.

Depth values are read with OpDepthAttachmentReadEXT.

Stencil values are read with OpStencilAttachmentReadEXT.

The sample to read is specified by a sample index value specified as the Sample operand to OpColorAttachmentReadEXT, OpDepthAttachmentReadEXT, or OpStencilAttachmentReadEXT.

If sample shading is disabled, a fragment invocation can read from all sample locations associated with the fragment regardless of the fragment's coverage. This functionality is supported for VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1 when VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation is VK_TRUE.

If sample shading is enabled, and minSampleShading is 1.0, a fragment invocation must only read from the coverage index sample. Tile image access must not be used if the value of minSampleShading is not 1.0.

If the fragment shader declares the EarlyFragmentTests execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation is VK_FALSE, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

OpDepthAttachmentReadEXT returns an undefined value if no depth attachment is present. OpStencilAttachmentReadEXT returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without data race with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let Rc be the set of components being read from an attachment A in a draw call
- Let Wc be the set of components being written to A by the draw call

The samples which qualify for coherent tile image reads from an attachment A are:

- All samples in a pixel when Rc is disjoint with Wc.
- The samples with coverage in a fragment when Rc is not disjoint with Wc. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.
A fragment shader can declare NonCoherentColorAttachmentReadEXT, NonCoherentDepthAttachmentReadEXT, or NonCoherentStencilAttachmentReadEXT execution modes to enable non-coherent tile image reads which require an explicit vkCmdPipelineBarrier2 call for the writes to an attachment to be made visible via tile image reads.

When VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated is VK_TRUE, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.

**Note**

In practice, the most common tile image reads usage patterns fall under one of the following:

- **Programmable blending** - each fragment reads from a single sample (SampleID) at its location. Per-sample shading is typically enabled when multisampled render targets are used.
- **G-buffer generation and shading in one render pass** - in the shading phase a fragment reads from a single sample at its location.
- **Programmable resolve** - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.
- **1:1 texturing with LOD** - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

### 26.4.3. Depth Replacement

Writing to the FragDepth built-in will replace the fragment's calculated depth values for each sample in the input SampleMask. Depth testing performed after the fragment shader for this fragment will use this new value as \( z_f \).

### 26.4.4. Stencil Reference Replacement

Writing to the FragStencilRefEXT built-in will replace the fragment's stencil reference value for each sample in the input SampleMask. Stencil testing performed after the fragment shader for this fragment will use this new value as \( s_r \).
26.5. Multisample Coverage

If a fragment shader is active and its entry point’s interface includes a built-in output variable decorated with `SampleMask`, the coverage mask is ANDed with the bits of the `SampleMask` built-in to generate a new coverage mask. If sample shading is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, and the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To dynamically set the `alphaToCoverageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToCoverageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToCoverageEnable` specifies the `alphaToCoverageEnable` state.

This command sets the `alphaToCoverageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` value used to create the currently active pipeline.

### Valid Usage

- `VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3AlphaToCoverageEnable` feature is enabled
  - The `shaderObject` feature is enabled`

### Valid Usage (Implicit)

- `VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle`
- `VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state`
- `VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool`
The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>

<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To *dynamically set* the alphaToOneEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToOneEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- alphaToOneEnable specifies the alphaToOneEnable state.

This command sets the alphaToOneEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::alphaToOneEnable value used to create the currently active pipeline.

---

**Valid Usage**

- VUID-vkCmdSetAlphaToOneEnableEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3AlphaToOneEnable feature is enabled
  - The shaderObject feature is enabled
- VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607
If the `alphaToOne` feature is not enabled, `alphaToOneEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetAlphaToOneEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>

</table>

All alpha values in this section refer only to the alpha component of the fragment shader output that has a `Location` and `Index` decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If `alphaToCoverageEnable` is enabled, a temporary coverage mask is generated where each bit is determined by the fragment’s alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1’s in this value be proportional to the alpha value (clamped to [0,1]), with all 1’s corresponding to a value of 1.0 and all 0’s corresponding to 0.0. The algorithm may be
different at different framebuffer coordinates.

**Note**

Using different algorithms at different framebuffer coordinates **may** help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

## 26.6. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the `VkPipelineDepthStencilStateCreateInfo` structure.

The `VkPipelineDepthStencilStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkBool32 stencilTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `depthTestEnable` controls whether depth testing is enabled.
- `depthWriteEnable` controls whether depth writes are enabled when `depthTestEnable` is `VK_TRUE`. Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator to use in the Depth Comparison step of the depth test.
- `depthBoundsTestEnable` controls whether depth bounds testing is enabled.
- `stencilTestEnable` controls whether stencil testing is enabled.
- `front` and `back` are `VkStencilOpState` values controlling the corresponding parameters of the
stencil test.

- `minDepthBounds` is the minimum depth bound used in the depth bounds test.
- `maxDepthBounds` is the maximum depth bound used in the depth bounds test.

### Valid Usage

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  
  If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` must be `VK_FALSE`.

- VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `VkPipelineRasterizationStateCreateInfo::cullMode` is `VK_CULL_MODE_NONE`, the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` must be the same.

### Valid Usage (Implicit)

- VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`.

- VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext
  
  `pNext` must be `NULL`.

- VUID-VkPipelineDepthStencilStateCreateInfo-flags-zerobitmask
  
  `flags` must be `0`.

- VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter
  
  `depthCompareOp` must be a valid `VkCompareOp` value.

- VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter
  
  `front` must be a valid `VkStencilOpState` structure.

- VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter
  
  `back` must be a valid `VkStencilOpState` structure.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

## 26.7. Depth Bounds Test

The depth bounds test compares the depth value $z_i$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds.

The depth bounds are determined by two floating-point values defining a minimum (`minDepthBounds`) and a maximum (`maxDepthBounds`) depth bound used in the depth bounds test.
minDepthBounds) and maximum (maxDepthBounds) depth value. These values are either set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by vkCmdSetDepthBoundsTestEnable and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if \( z_a \) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(VkCommandBuffer commandBuffer, VkBool32 depthBoundsTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(VkCommandBuffer commandBuffer, VkBool32 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
**commandBuffer** must be a valid **VkCommandBuffer** handle

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  **commandBuffer** must be in the **recording state**

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- VUID-vkCmdSetDepthBoundsTestEnable-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **minDepthBounds** is the minimum depth bound.
- **maxDepthBounds** is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_DEPTH_BOUNDS** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineDepthStencilStateCreateInfo::minDepthBounds** and **VkPipelineDepthStencilStateCreateInfo::maxDepthBounds** values used to create the currently active pipeline.
Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, `minDepthBounds` must be between 0.0 and 1.0, inclusive.

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, `maxDepthBounds` must be between 0.0 and 1.0, inclusive.

Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetDepthBounds-videocoding**
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

</table>

26.8. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a stencil reference value.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or
VkPipelineDepthStencilStateCreateInfo::stencilTestEnable, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the VkCompareOp value set by vkCmdSetStencilOp::compareOp, or by VkStencilOpState::compareOp during pipeline creation.

The compare mask \( s_c \) and stencil reference value \( s_r \) of the front or the back stencil state set determine arguments of the comparison operation. \( s_c \) is set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or by the vkCmdSetStencilCompareMask command. \( s_r \) is set by VkPipelineDepthStencilStateCreateInfo or by vkCmdSetStencilReference.

\( s_r \) and \( s_a \) are each independently combined with \( s_c \) using a bitwise AND operation to create masked reference and attachment values \( s'_r \) and \( s'_a \), \( s'_r \) and \( s'_a \) are used as the reference and test values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value \( s_g \) is generated according to a stencil operation defined by VkStencilOp parameters set by vkCmdSetStencilOp or VkPipelineDepthStencilStateCreateInfo. If the stencil test fails, failOp defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, VkPipelineDepthStencilStateCreateInfo::passOp is used, otherwise VkPipelineDepthStencilStateCreateInfo::depthFailOp is used.

The stencil attachment value \( s_a \) is then updated with the generated stencil value \( s_g \) according to the write mask \( s_w \) defined by writeMask in VkPipelineDepthStencilStateCreateInfo::front and VkPipelineDepthStencilStateCreateInfo::back as:

\[
 s_a = (s_a & \neg s_w) | (s_g & s_w)
\]

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

or the equivalent command
// Provided by VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilTestEnable-videcoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To *dynamically set* the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the
corresponding `VkPipelineDepthStencilStateCreateInfo::failOp, passOp, depthFailOp, and compareOp`
values used to create the currently active pipeline, for both front and back faces.

### Valid Usage

- **VUID-vkCmdSetStencilOp-None-08971**
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilOp-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetStencilOp-faceMask-parameter**
  `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values

- **VUID-vkCmdSetStencilOp-faceMask-requiredbitmask**
  `faceMask` **must** not be 0

- **VUID-vkCmdSetStencilOp-failOp-parameter**
  `failOp` **must** be a valid `VkStencilOp` value

- **VUID-vkCmdSetStencilOp-passOp-parameter**
  `passOp` **must** be a valid `VkStencilOp` value

- **VUID-vkCmdSetStencilOp-depthFailOp-parameter**
  `depthFailOp` **must** be a valid `VkStencilOp` value

- **VUID-vkCmdSetStencilOp-compareOp-parameter**
  `compareOp` **must** be a valid `VkCompareOp` value

- **VUID-vkCmdSetStencilOp-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetStencilOp-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetStencilOp-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- **Host access to `commandBuffer`** **must** be externally synchronized

- **Host access to the `VkCommandPool` that `commandBuffer` was allocated from** **must** be externally synchronized
The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

### Valid Usage (Implicit)

- **VUID-VkStencilOpState-failOp-parameter**
  - `failOp` must be a valid `VkStencilOp` value
- **VUID-VkStencilOpState-passOp-parameter**
  - `passOp` must be a valid `VkStencilOp` value
- **VUID-VkStencilOpState-depthFailOp-parameter**
  - `depthFailOp` must be a valid `VkStencilOp` value
- **VUID-VkStencilOpState-compareOp-parameter**
  - `compareOp` must be a valid `VkCompareOp` value
To dynamically set the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the compare mask.

- `compareMask` is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkStencilOpState::compareMask` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetStencilCompareMask-faceMask-parameter**
  - `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- **VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask**
  - `faceMask` must not be 0

- **VUID-vkCmdSetStencilCompareMask-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetStencilCompareMask-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Command Properties

**VkStencilFaceFlagBits** values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- **VK_STENCIL_FACE_FRONT_BIT** specifies that only the front set of stencil state is updated.
- **VK_STENCIL_FACE_BACK_BIT** specifies that only the back set of stencil state is updated.
- **VK_STENCIL_FACE_FRONT_AND_BACK** is the combination of **VK_STENCIL_FACE_FRONT_BIT** and **VK_STENCIL_FACE_BACK_BIT**, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

**VkStencilFaceFlags** is a bitmask type for setting a mask of zero or more **VkStencilFaceFlagBits**.

To **dynamically set** the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t writeMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the write mask, as described above for **vkCmdSetStencilCompareMask**.
- **writeMask** is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the
The `writeMask` value used to create the currently active pipeline, for both `VkPipelineDepthStencilStateCreateInfo::front` and `VkPipelineDepthStencilStateCreateInfo::back` faces.

### Valid Usage (Implicit)

- **VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetStencilWriteMask-faceMask-parameter**
  - `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values.

- **VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmapmask**
  - `faceMask` must not be 0.

- **VUID-vkCmdSetStencilWriteMask-commandBuffer-recording**
  - `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetStencilWriteMask-vidcoding**
  - This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

To dynamically set the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```
• `commandBuffer` is the command buffer into which the command will be recorded.

• `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.

• `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  
  `commandBuffer must` be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilReference-faceMask-parameter
  
  `faceMask must` be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilReference-faceMask-required bitmask
  
  `faceMask must` not be 0

- VUID-vkCmdSetStencilReference-commandBuffer-recording
  
  `commandBuffer must` be in the recording state

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- VUID-vkCmdSetStencilReference-videocoding
  
  This command `must` only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what
happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- **VK_STENCIL_OP_KEEP** keeps the current value.
- **VK_STENCIL_OP_ZERO** sets the value to 0.
- **VK_STENCIL_OP_REPLACE** sets the value to reference.
- **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
- **VK_STENCIL_OP_DECREMENT_AND_CLAMP** decrements the current value and clamps to 0.
- **VK_STENCIL_OP_INVERT** bitwise-inverts the current value.
- **VK_STENCIL_OP_INCREMENT_AND_WRAP** increments the current value and wraps to 0 when the maximum value would have been exceeded.
- **VK_STENCIL_OP_DECREMENT_AND_WRAP** decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

### 26.9. Depth Test

The depth test compares the depth value $z_i$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against the sample's depth value $z_f$. If there is no depth attachment then the depth test is skipped.

The depth test occurs in three stages, as detailed in the following sections.

#### 26.9.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, $z_i$ is clamped to $[z_{\text{min}}, z_{\text{max}}]$, where $z_{\text{min}} = \min(n, f)$, $z_{\text{max}} = \max(n, f)$, and $n$ and $f$ are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.

Following depth clamping:

- If $z_i$ is not in the range $[z_{\text{min}}, z_{\text{max}}]$, then $z_i$ is undefined following this step.
• If the depth attachment has a fixed-point format and \( z_f \) is not in the range \([0, 1]\), then \( z_f \) is undefined following this step.

## 26.9.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnable` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetDepthCompareOp`, or by `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. \( z_f \) and \( z_a \) are used as the reference and test values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

## 26.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnable` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample's depth value \( z_f \). If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_3
    VkBool32 depthTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_shader_object
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following must be true:
  - the shaderFeature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDepthTestEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td>Both</td>
<td>Outside</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,  
    VkCompareOp depthCompareOp);  
```
or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer, 
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthCompareOp-None-08971**
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter**
  `depthCompareOp` **must** be a valid `VkCompareOp` value

- **VUID-vkCmdSetDepthCompareOp-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetDepthCompareOp-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

</tbody>
</table>

To **dynamically set** the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthWriteEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetDepthWriteEnable-None-08971**
  At least one of the following must be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
Valid Usage (Implicit)

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthWriteEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

26.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.

26.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.
26.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique `sample index`. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel’s coverage consists of the coverage samples with a `pixel index` matching that pixel, and each sample retains its unique `sample index i`.

26.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of `rasterizationSamples` is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same `sample index i` is covered.
Chapter 27. The Framebuffer

27.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **logicOpEnable** controls whether to apply Logical Operations.
- **logicOp** selects which logical operation to apply.
- **attachmentCount** is the number of `VkPipelineColorBlendAttachmentState` elements in `pAttachments`. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or `advancedBlendCoherentOperations` is not enabled on the device.
- **pAttachments** is a pointer to an array of `VkPipelineColorBlendAttachmentState` structures defining blend state for each color attachment. It is ignored if the pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, and `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states set, and either `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set or `advancedBlendCoherentOperations` is not enabled on the device.
- **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the blend factor.

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the independentBlend feature is not enabled, all elements of `pAttachments` must be identical.
- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the logicOp feature is not enabled, `logicOpEnable` must be `VK_FALSE`.
- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If `logicOpEnable` is `VK_TRUE`, `logicOp` must be a valid `VkLogicOp` value.
- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**
  If `attachmentCount` is not 0, and any of `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` are not set, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`.
- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  `pNext` must be `NULL`.
- **VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask**
  `flags` must be 0.
- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter**
  1650
If `attachmentCount` is not 0, and `pAttachments` is not NULL, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineColorBlendAttachmentState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- **blendEnable** controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- **srcColorBlendFactor** selects which blend factor is used to determine the source factors $(S_r, S_g, S_b)$.
- **dstColorBlendFactor** selects which blend factor is used to determine the destination factors $(D_r, D_g, D_b)$.
- **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor $S_a$.
- **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor $D_a$.
- **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.
- **colorWriteMask** is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

**Valid Usage**

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
  If the **dualSrcBlend** feature is not enabled, `srcColorBlendFactor` must not be
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609
  If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

**Valid Usage (Implicit)**

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
  srcColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter
  dstColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter
  colorBlendOp must be a valid VkBlendOp value

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp must be a valid VkBlendOp value

- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask must be a valid combination of VkColorComponentFlagBits values
To **dynamically set** `blendEnable`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkBool32* pColorBlendEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blending enable applies.
- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.
- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::blendEnable` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetColorBlendEnableEXT-None-09423**
  - At least one of the following **must** be true:
    - The `extendedDynamicState3ColorBlendEnable` feature is enabled
    - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter**
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter**
  - `pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values
- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording**
  - `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetColorBlendEnableEXT-videocoding**
  - This command **must** only be called outside of a video coding scope
• VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tbody>
</table>

To dynamically set color blend factors and operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstAttachment,
  uint32_t attachmentCount,
  const VkColorBlendEquationEXT* pColorBlendEquations);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color blend factors and operations apply to.
- attachmentCount the number of VkColorBlendEquationEXT elements in the pColorBlendEquations array.
- pColorBlendEquations an array of VkColorBlendEquationEXT structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::srcColorBlendFactor, VkPipelineColorBlendAttachmentState::dstColorBlendFactor, VkPipelineColorBlendAttachmentState::colorBlendOp, VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor, VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor, and VkPipelineColorBlendAttachmentState::alphaBlendOp values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetColorBlendEquationEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEquation` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkColorBlendEquationEXT` structure is defined as:
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;

• srcColorBlendFactor selects which blend factor is used to determine the source factors ($S_s$, $S_g$, $S_b$).
• dstColorBlendFactor selects which blend factor is used to determine the destination factors ($D_r$, $D_g$, $D_b$).
• colorBlendOp selects which blend operation is used to calculate the RGB values to write to the color attachment.
• srcAlphaBlendFactor selects which blend factor is used to determine the source factor $S_a$.
• dstAlphaBlendFactor selects which blend factor is used to determine the destination factor $D_a$.
• alphaBlendOp selects which blend operation is use to calculate the alpha values to write to the color attachment.

Valid Usage

• VUID-VkColorBlendEquationEXT-dualSrcBlend-07357
  If the dualSrcBlend feature is not enabled, srcColorBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

• VUID-VkColorBlendEquationEXT-dualSrcBlend-07358
  If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

• VUID-VkColorBlendEquationEXT-dualSrcBlend-07359
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

• VUID-VkColorBlendEquationEXT-dualSrcBlend-07360
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR,
  VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

• VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is
  VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
  VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

### Valid Usage (Implicit)

- **VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter**
  - `srcColorBlendFactor` must be a valid `VkBlendFactor` value.
- **VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter**
  - `dstColorBlendFactor` must be a valid `VkBlendFactor` value.
- **VUID-VkColorBlendEquationEXT-colorBlendOp-parameter**
  - `colorBlendOp` must be a valid `VkBlendOp` value.
- **VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter**
  - `srcAlphaBlendFactor` must be a valid `VkBlendFactor` value.
- **VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter**
  - `dstAlphaBlendFactor` must be a valid `VkBlendFactor` value.
- **VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter**
  - `alphaBlendOp` must be a valid `VkBlendOp` value.

To dynamically set the color write masks, call:

```c
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer,  
    uint32_t firstAttachment,       
    uint32_t attachmentCount,       
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of `VkColorComponentFlags` values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of `VkColorComponentFlags` values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.

Note
Formats with bits that are shared between components specified by `VkColorComponentFlagBits`, such as `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, cannot have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.

### Valid Usage

- **VUID-vkCmdSetColorWriteMaskEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3ColorWriteMask` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter**
  `pColorWriteMasks` must be a valid pointer to an array of `attachmentCount` valid combinations of `VkColorComponentFlagBits` values

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetColorWriteMaskEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength**
  `attachmentCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
27.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ((S_r,S_g,S_b)) or ((D_r,D_g,D_b))</th>
<th>Alpha Blend Factor ((S_a\text{ or } D_a))</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>((0,0,0))</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>((1,1,1))</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>((R_{s0},G_{s0},B_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VkBlendFactor</td>
<td>RGB Blend Factors ((S_r,S_g,S_b)) or ((D_r,D_g,D_b))</td>
<td>Alpha Blend Factor ((S_a) or (D_a))</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR</td>
<td>((1-R_{s0},1-G_{s0},1-B_{s0}))</td>
<td>1-(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_COLOR</td>
<td>((R_d,G_d,B_d))</td>
<td>(A_d)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR</td>
<td>((1-R_d,1-G_d,1-B_d))</td>
<td>1-(A_d)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA</td>
<td>((A_{s0},A_{s0},A_{s0}))</td>
<td>(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA</td>
<td>((1-A_{s0},1-A_{s0},1-A_{s0}))</td>
<td>1-(A_{s0})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_DST_ALPHA</td>
<td>((A_{d},A_{d},A_{d}))</td>
<td>(A_{d})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA</td>
<td>((1-A_{d},1-A_{d},1-A_{d}))</td>
<td>1-(A_{d})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_COLOR</td>
<td>((R_c,G_c,B_c))</td>
<td>(A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR</td>
<td>((1-R_c,1-G_c,1-B_c))</td>
<td>1-(A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_ALPHA</td>
<td>((A_c,A_c,A_c))</td>
<td>(A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA</td>
<td>((1-A_c,1-A_c,1-A_c))</td>
<td>1-(A_c)</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA_SATURATE</td>
<td>((f,f,f); f = \min(A_{s0},1-A_d))</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_COLOR</td>
<td>((R_{s1},G_{s1},B_{s1}))</td>
<td>(A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR</td>
<td>((1-R_{s1},1-G_{s1},1-B_{s1}))</td>
<td>1-(A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_ALPHA</td>
<td>((A_{s1},A_{s1},A_{s1}))</td>
<td>(A_{s1})</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA</td>
<td>((1-A_{s1},1-A_{s1},1-A_{s1}))</td>
<td>1-(A_{s1})</td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0},G_{s0},B_{s0}\) and \(A_{s0}\) represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- \(R_{s1},G_{s1},B_{s1}\) and \(A_{s1}\) represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- \(R_d,G_d,B_d\) and \(A_d\) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \(R_c,G_c,B_c\) and \(A_c\) represent the blend constant R, G, B, and A components, respectively.

To dynamically set and change the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **blendConstants** is a pointer to an array of four values specifying the R_c, G_c, B_c, and A_c components of the blend constant color used in blending, depending on the **blend factor**.

This command sets blend constants for subsequent drawing commands when when drawing using **shader objects**, or the graphics pipeline is created with **VK_DYNAMIC_STATE_BLEND_CONSTANTS** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineColorBlendStateCreateInfo::blendConstants** values used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  ```
  commandBuffer must be a valid VkCommandBuffer handle
  ```

- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  ```
  commandBuffer must be in the recording state
  ```

- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  ```
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
  ```

- VUID-vkCmdSetBlendConstants-videocoding
  ```
  This command must only be called outside of a video coding scope
  ```

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 27.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1}, G_{s1}, B_{s1}, A_{s1})\) (VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.
The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

Color outputs can be bound to the first and second inputs of the blender using the `Index` decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

### 27.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
} VkBlendOp;
```
The semantics of the basic blend operations are described in the table below:

### Table 34. Basic Blend Operations

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
</table>
| VK_BLEND_OP_ADD         | $R = R_s \times S_r + R_d \times D_r$  
                          | $G = G_s \times S_g + G_d \times D_g$  
                          | $B = B_s \times S_b + B_d \times D_b$  
                          | $A = A_s \times S_a + A_d \times D_a$  |
| VK_BLEND_OP_SUBTRACT    | $R = R_s \times S_r - R_d \times D_r$  
                          | $G = G_s \times S_g - G_d \times D_g$  
                          | $B = B_s \times S_b - B_d \times D_b$  
                          | $A = A_s \times S_a - A_d \times D_a$  |
| VK_BLEND_OP_REVERSE_SUBTRACT | $R = R_d \times D_r - R_s \times S_r$  
                          | $G = G_d \times D_g - G_s \times S_g$  
                          | $B = B_d \times D_b - B_s \times S_b$  
                          | $A = A_d \times D_a - A_s \times S_a$  |
| VK_BLEND_OP_MIN         | $R = \min(R_s, R_d)$  
                          | $G = \min(G_s, G_d)$  
                          | $B = \min(B_s, B_d)$  
                          | $A = \min(A_s, A_d)$  |
| VK_BLEND_OP_MAX         | $R = \max(R_s, R_d)$  
                          | $G = \max(G_s, G_d)$  
                          | $B = \max(B_s, B_d)$  
                          | $A = \max(A_s, A_d)$  |

In this table, the following conventions are used:

- $R_s, G_s, B_s$ and $A_s$ represent the first source color $R$, $G$, $B$, and $A$ components, respectively.
- $R_d, G_d, B_d$ and $A_d$ represent the $R$, $G$, $B$, and $A$ components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- $S_r, S_g, S_b$ and $S_a$ represent the source blend factor $R$, $G$, $B$, and $A$ components, respectively.
- $D_r, D_g, D_b$ and $D_a$ represent the destination blend factor $R$, $G$, $B$, and $A$ components, respectively.

The blending operation produces a new set of values $R$, $G$, $B$, and $A$, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then $R$, $G$, $B$, and $A$ are assigned $R_s, G_s, B_s$, and $A_s$, respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to $[0,1]$ or $[-1,1]$ respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to $[0,1]$ or $[-1,1]$ respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the $R$, $G$, and $B$ destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each $R$, $G$, and $B$ component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final $R$, $G$, and $B$ values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specification.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting \( c_i \) values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is \( \text{VK_ATTACHMENT_UNUSED} \), no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the \( \text{VkSubpassDescription::colorAttachmentCount} \) or \( \text{VkSubpassDescription2::colorAttachmentCount} \) value.

## 27.2. Logical Operations

The application can enable a logical operation between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the \text{logicOpEnable} and \text{logicOp} members of \text{VkPipelineColorBlendStateCreateInfo}. The \text{logicOpEnable} state can also be controlled by \text{vkCmdSetLogicOpEnableEXT} if graphics pipeline is created with \text{VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT} set in \text{VkPipelineDynamicStateCreateInfo::pDynamicStates}. If \text{logicOpEnable} is \text{VK_TRUE}, then a logical operation selected by \text{logicOp} is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The \text{logicOp} is selected from the following operations:
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERSED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERSED = 12,
    VK_LOGIC_OP_OR_INVERSED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment’s \( R_{s0}, G_{s0}, B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment’s \( R, G, B \) or \( A \) component value:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_LOGIC_OP_CLEAR</td>
<td>0</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND</td>
<td>( s &amp; d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND_REVERSE</td>
<td>( s &amp; \neg d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_COPY</td>
<td>( s )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND_INVERTED</td>
<td>( \neg s &amp; d )</td>

<td>( \neg (s &amp; d) )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **logicOpEnable** specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

### Valid Usage

• VUID-vkCmdSetLogicOpEnableEXT-None-09423
  At least one of the following **must** be true:
  ◦ The `extendedDynamicState3LogicOpEnable` feature is enabled
  ◦ The `shaderObject` feature is enabled

• VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` **must** be `VK_FALSE`

### Valid Usage (Implicit)

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

• VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To **dynamically set** the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,  // Command buffer into which the command will be recorded.
    VkLogicOp logicOp);            // Logical operation to apply for blend state.
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using **shader objects**. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLogicOpEXT-None-09422**
  At least one of the following **must** be true:
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetLogicOpEXT-logicOp-parameter**
  `logicOp` **must** be a valid `VkLogicOp` value

- **VUID-vkCmdSetLogicOpEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetLogicOpEXT-videocoding**
  This command **must** only be called outside of a video coding scope
### Host Synchronization

- Host access to *commandBuffer* must be externally synchronized.
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 27.3. Color Write Mask

Bits which **can** be set in *VkPipelineColorBlendAttachmentState::colorWriteMask*, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- **VK_COLOR_COMPONENT_R_BIT** specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_G_BIT** specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_B_BIT** specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_A_BIT** specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

*VkColorComponentFlags* is a bitmask type for setting a mask of zero or more *VkColorComponentFlagBits*. 
Chapter 28. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-magFilter-09598
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` **must** be 1.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` **must** be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

If a `VkImageView` is sampled with depth comparison, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

For any `VkImageView` being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for
set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdDispatch-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdDispatch-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`

- **VUID-vkCmdDispatch-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by `descriptor validity` if they are statically used by a bound shader

- **VUID-vkCmdDispatch-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatch-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatch-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDispatch-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDispatch-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*`
instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDispatch-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

- VUID-vkCmdDispatch-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- VUID-vkCmdDispatch-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C_b conversion, that object must not use the ConstOffset and Offset operands.

- VUID-vkCmdDispatch-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- VUID-vkCmdDispatch-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.
• VUID-vkCmdDispatch-OpImageWrite-08795
If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

• VUID-vkCmdDispatch-OpImageWrite-08796
If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

• VUID-vkCmdDispatch-OpImageWrite-04469
If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

• VUID-vkCmdDispatch-None-07288
Any shader invocation executed by this command must terminate.

• VUID-vkCmdDispatch-None-09600
If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

• VUID-vkCmdDispatch-commandBuffer-02712
If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource.

• VUID-vkCmdDispatch-commandBuffer-02713
If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource.

• VUID-vkCmdDispatch-commandBuffer-04617
If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer.

• VUID-vkCmdDispatch-groupCountX-00386
groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

• VUID-vkCmdDispatch-groupCountY-00387
groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

• VUID-vkCmdDispatch-groupCountZ-00388
groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]
Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  
  \( \text{commandBuffer must be a valid } \text{VkCommandBuffer handle} \)

- VUID-vkCmdDispatch-commandBuffer-recording
  
  \( \text{commandBuffer must be in the recording state} \)

- VUID-vkCmdDispatch-commandBuffer-cmdpool
  
  The \text{VkCommandPool} that \text{commandBuffer} was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatch-videocoding
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to \text{commandBuffer} must be externally synchronized

- Host access to the \text{VkCommandPool} that \text{commandBuffer} was allocated from must be externally synchronized

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- \text{buffer} is the buffer containing dispatch parameters.
- \text{offset} is the byte offset into \text{buffer} where parameters begin.

\text{vkCmdDispatchIndirect} behaves similarly to \text{vkCmdDispatch} except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a
Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-magFilter-09598**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatchIndirect-mipmapMode-09599**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- **VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09635**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `layerCount` and `levelCount` must be 1

- **VUID-vkCmdDispatchIndirect-unnormalizedCoordinates-09636**
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`

- **VUID-vkCmdDispatchIndirect-None-06479**
  If a `VkImageView` is sampled with `depth comparison`, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatchIndirect-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDispatchIndirect-None-07888**
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDispatchIndirect-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchIndirect-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchIndirect-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchIndirect-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDispatchIndirect-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command
If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchIndirect-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by **bound shaders must** not be a protected resource

- **VUID-vkCmdDispatchIndirect-None-06550**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y′C aCk conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDispatchIndirect-ConstOffset-06551**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y′C aCk conversion`, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDispatchIndirect-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatchIndirect-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's format and the `Sampled Type` operand of the `OpTypeImage` **must** match

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components

- **VUID-vkCmdDispatchIndirect-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- **VUID-vkCmdDispatchIndirect-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDispatchIndirect-None-09600**
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written

- **VUID-vkCmdDispatchIndirect-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object
• VUID-vkCmdDispatchIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDispatchIndirect-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDispatchIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatchIndirect-offset-00407
  The sum of offset and the size of VkDispatchIndirectCommand must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatchIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDispatchIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchIndirect-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDispatchIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkDispatchIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`.

### Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  
  `x` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- VUID-VkDispatchIndirectCommand-y-00418
  
  `y` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- VUID-VkDispatchIndirectCommand-z-00419
  
  `z` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

To record a dispatch using non-zero base values for the components of `WorkgroupId`, call:
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);

or the equivalent command

void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);

• commandBuffer is the command buffer into which the command will be recorded.
• baseGroupX is the start value for the X component of WorkgroupId.
• baseGroupY is the start value for the Y component of WorkgroupId.
• baseGroupZ is the start value for the Z component of WorkgroupId.
• groupCountX is the number of local workgroups to dispatch in the X dimension.
• groupCountY is the number of local workgroups to dispatch in the Y dimension.
• groupCountZ is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of groupCountX × groupCountY × groupCountZ local workgroups is assembled, with WorkgroupId values ranging from [baseGroup*, baseGroup* + groupCount*) in each component. vkCmdDispatch is equivalent to vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ).

Valid Usage

• VUID-vkCmdDispatchBase-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT
• VUID-vkCmdDispatchBase-magFilter-09598
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- VUID-vkCmdDispatchBase-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09635
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1.

- VUID-vkCmdDispatchBase-unnormalizedCoordinates-09636
  If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

- VUID-vkCmdDispatchBase-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- VUID-vkCmdDispatchBase-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDispatchBase-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

1683
For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler *must* not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler *must* not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects *must* be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage *must* not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it *must* not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage *must* not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it *must* not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` *must* not be a protected resource.

If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables sampler Y′C′ₐCₐ conversion, that object *must* only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.
If a bound shader accesses a VkSampler or VkImageView object that enables sampler \(Y'CyC\) conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

Any shader invocation executed by this command must terminate.

If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource.

If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer.

Any shader invocation executed by this command must terminate.
**Valid Usage (Implicit)**

- VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle

- VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer **must** be in the recording state

- VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support compute operations

- VUID-vkCmdDispatchBase-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdDispatchBase-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer **must** be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Chapter 29. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

29.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:

  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See Sparse Memory Aliasing for more information.

### 29.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource **must** be bound to one or more `VkDeviceMemory` objects before use.

### 29.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment.alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 29.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 29.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the **mip tail**) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications **can** use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application **can** unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application **can** also use this functionality to access subregions of the image in a “megatexture” fashion. The application **can** create a large image and only populate the region of the image that is currently being used in the scene.

### 29.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered **safe** and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

**Implementor’s Note**

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

**29.4.2. Mip Tail Regions**

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image’s `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` may affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

![Figure 17. Sparse Image](image)

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.
When \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} is present all array layers will share a single mip tail region.

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure18.png}
\caption{Sparse Image with Single Mip Tail}
\end{figure}

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{figure19.png}
\caption{Sparse Image with Aligned Mip Size}
\end{figure}

\textit{Note}
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \(N\) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

```

```

Figure 20. Sparse Image with Aligned Mip Size and Single Mip Tail

**Note**
The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

### 29.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for BC5) thus the dimensions of the standard sparse image block
shapes apply in terms of compressed texel blocks.

**Note**

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

29.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 29.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 21. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The
per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by \( \text{VkMemoryRequirements::alignment} \).

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata must be bound prior to device use of the sparse image.

### 29.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

\( \text{VkDevice} \) objects that have the \texttt{sparseResidencyAliased} feature enabled are able to use the \texttt{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} and \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a data consistent fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care must be taken when performing a write operation to aliased physical memory. Memory dependencies must be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing must abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory must be created with the \texttt{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} / \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} flag.
- All resources that access aliased physical memory must interpret the memory in the same way. This implies the following:
  - Buffers and images cannot alias the same physical memory in a data consistent fashion. The physical memory ranges must be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions cannot access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory must have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory cannot be accessed in a data consistent fashion.
Note
Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

29.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address
The basic sparseBinding feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages must be bound to physical memory before the device accesses the resource.

The sparseResidency features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault may support residencyNonResidentStrict.

Not faulting on access to unbound pages is not enough to support residencyNonResidentStrict. An implementation must also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this may not always be possible.

Any implementation that does not fault, but does not guarantee correct read values must not support residencyNonResidentStrict.

Any implementation that cannot access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory may be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process must not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations may allocate more often (per instance, per device, or per resource).

Binding Memory
The byte size reported in VkMemoryRequirements::size must be greater than or equal to the amount of physical memory required to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

*Note*

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

*Binding Metadata Memory*

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
29.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

29.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in VkPhysicalDeviceFeatures. These features must be supported and enabled on the VkDevice object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

Sparse Physical Device Features

- **sparseBinding**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT and VK_IMAGE_CREATE_SPARSE_BINDING_BIT flags, respectively.
- **sparseResidencyBuffer**: Support for creating VkBuffer objects with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyImage3D**: Support for creating 3D VkImage objects with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency2Samples**: Support for creating 2D VkImage objects with 2 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency4Samples**: Support for creating 2D VkImage objects with 4 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency8Samples**: Support for creating 2D VkImage objects with 8 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidency16Samples**: Support for creating 2D VkImage objects with 16 samples and VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.
- **sparseResidencyAliased**: Support for creating VkBuffer and VkImage objects with the VK_BUFFER_CREATE_SPARSE_ALIASED_BIT and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT flags, respectively.

29.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

• **residencyStandard2DBlockShape** is **VK_TRUE** if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

• **residencyStandard2DMultisampleBlockShape** is **VK_TRUE** if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

• **residencyStandard3DBlockShape** is **VK_TRUE** if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.

• **residencyAlignedMipSize** is **VK_TRUE** if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block **may** be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

• **residencyNonResidentStrict** specifies whether the physical device **can** consistently access non-resident regions of a resource. If this property is **VK_TRUE**, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
29.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, 
\texttt{vkGetPhysicalDeviceSparseImageFormatProperties} can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

**Sparse Image Format Properties API**

The \texttt{VkSparseImageFormatProperties} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- \texttt{aspectMask} is a bitmask \texttt{VkImageAspectFlagBits} specifying which aspects of the image the properties apply to.
- \texttt{imageGranularity} is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- \texttt{flags} is a bitmask of \texttt{VkSparseImageFormatFlagBits} specifying additional information about the sparse resource.

Bits which may be set in \texttt{VkSparseImageFormatProperties::flags}, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- \texttt{VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT} specifies that the image uses a single mip tail region for all array layers.
- \texttt{VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT} specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- \texttt{VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT} specifies that the image uses non-standard sparse image block dimensions, and the \texttt{imageGranularity} values do not match the standard sparse image block dimensions for the given format.
typedef VkFlags VkSparseImageFormatFlags;

VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element describes properties for one set of image aspects that are bound simultaneously for a VkImage created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);

• physicalDevice is the physical device from which to query the sparse image format properties.
• format is the image format.
• type is the dimensionality of the image.
• samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
• usage is a bitmask describing the intended usage of the image.
• tiling is the tiling arrangement of the texel blocks in memory.
• pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
• pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be set to zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`.

Valid Usage

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094**
  - `samples` must be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command.

Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter**
  - `format` must be a valid `VkFormat` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter**
  - `type` must be a valid `VkImageType` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter**
  - `samples` must be a valid `VkSampleCountFlagBits` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter**
  - `usage` must be a valid combination of `VkImageUsageFlagBits` values

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask**
  - `usage` must not be 0

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter**
  - `tiling` must be a valid `VkImageTiling` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element describes properties for one set of image aspects that are bound simultaneously for a `VkImage` created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
void vkGetPhysicalDeviceSparseImageFormatProperties2(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);

or the equivalent command

void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);

- physicalDevice is the physical device from which to query the sparse image format properties.
- pFormatInfo is a pointer to a VkPhysicalDeviceSparseImageFormatInfo2 structure containing input parameters to the command.
- pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties2 structures.

vkGetPhysicalDeviceSparseImageFormatProperties2 behaves identically to vkGetPhysicalDeviceSparseImageFormatProperties, with the ability to return extended information by adding extending structures to the pNext chain of its pProperties parameter.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter pFormatInfo must be a valid pointer to a valid VkPhysicalDeviceSparseImageFormatInfo2 structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties2 structures

The VkPhysicalDeviceSparseImageFormatInfo2 structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

typedef VkPhysicalDeviceSparseImageFormatInfo2KHR

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **format** is the image format.
• **type** is the dimensionality of the image.
• **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
• **usage** is a bitmask describing the intended usage of the image.
• **tiling** is the tiling arrangement of the texel blocks in memory.

**Valid Usage**

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
  `samples must` be a valid `VkSampleCountFlagBits` value that is set in
  `VkImageFormatProperties::sampleCounts` returned by
  `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to
  those in this command

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext
  `pNext must` be NULL

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter
  `format must` be a valid `VkFormat` value

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter

1708
type must be a valid VkImageType value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-required bitmask
  usage must not be 0

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
  tiling must be a valid VkImageTiling value

The VkSparseImageFormatProperties2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {  
  VkStructureType sType;  
  void* pNext;  
  VkSparseImageFormatProperties properties;  
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- properties is a VkSparseImageFormatProperties structure which is populated with the same values as in vkGetPhysicalDeviceSparseImageFormatProperties.

29.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the VkPhysicalDeviceFeatures structure described previously in the Physical Device Features section) when calling vkCreateDevice. When the appropriate device features are enabled, the VK_BUFFER_CREATE_SPARSE_* and VK_IMAGE_CREATE_SPARSE_* flags can be used. See vkCreateBuffer and
vkCreateImage for details of the resource creation APIs.

Note
Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

29.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the binding granularity in bytes and the required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the binding granularity in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• `formatProperties` is a `VkSparseImageFormatProperties` structure specifying properties of the image format.

• `imageMipTailFirstLod` is the first mip level at which image subresources are included in the mip tail region.

• `imageMipTailSize` is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• `imageMipTailOffset` is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).

• `imageMipTailStride` is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device, 
    VkImage image, 
    uint32_t* pSparseMemoryRequirementCount, 
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

• `device` is the logical device that owns the image.

• `image` is the `VkImage` object to get the memory requirements for.

• `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the application to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

**Note**

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. 
This may occur when the implementation requires unused padding in the address range describing the resource.

**Valid Usage (Implicit)**

- **VUID-vkGetImageSparseMemoryRequirements-device-parameter**
  
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetImageSparseMemoryRequirements-image-parameter**
  
  - `image` must be a valid `VkImage` handle

- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter**
  
  - `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter**
  
  - If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not NULL, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements` structures

- **VUID-vkGetImageSparseMemoryRequirements-image-parent**
  
  - `image` must have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
    VkDevice device,     
    const VkImageSparseMemoryRequirementsInfo2* pInfo,   
    uint32_t* pSparseMemoryRequirementCount,    
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,     
    const VkImageSparseMemoryRequirementsInfo2* pInfo,   
    uint32_t* pSparseMemoryRequirementCount,    
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device that owns the image.

- **pInfo** is a pointer to a `VkImageSparseMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.

- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

### Valid Usage (Implicit)

- **VUID-vkGetImageSparseMemoryRequirements2-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter**
  - `pInfo` must be a valid pointer to a valid `VkImageSparseMemoryRequirementsInfo2` structure

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter**
  - `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter**
  - If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

**Valid Usage (Implicit)**

• VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
device must be a valid `VkDevice` handle

• VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
pInfo must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a `uint32_t` value

• VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

The `VkImageSparseMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `image` is the image to query.

**Valid Usage (Implicit)**

• VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
sType must be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`

• VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext
pNext must be `NULL`
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
  - `pNext` must be `NULL`

### 29.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include VK_QUEUE_SPARSE_BINDING_BIT support in queue families that also include graphics and compute support, other implementations **may** only expose a VK_QUEUE_SPARSE_BINDING_BIT-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the VK_IMAGE_ASPECT_METADATA_BIT the application **must** use the VK_SPARSE_MEMORY_BIND_METADATA_BIT in the VkSparseMemoryBind::flags field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the VK_SPARSE_MEMORY_BIND_METADATA_BIT flag.

Binding the mip tail for any aspect **must** only be performed using VkSparseImageOpaqueMemoryBindInfo. If formatProperties.flags contains VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT, then it **can** be bound with a single VkSparseMemoryBind structure, with resourceOffset = imageMipTailOffset and size = imageMipTailSize.

If formatProperties.flags does not contain VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT then the offset for the mip tail in each array layer is given as:

```plaintext
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with layerCount VkSparseMemoryBind structures, each using size = imageMipTailSize and resourceOffset = arrayMipTailOffset as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The VkSparseMemoryBind structure is defined as:
// Provided by VK_VERSION_1_0

typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;

- `resourceOffset` is the offset into the resource.
- `size` is the size of the memory region to be bound.
- `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
- `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
- `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range `[resourceOffset, resourceOffset + size]` has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

\[
\text{metadataRegion} = (\text{base}, \text{base} + \text{imageMipTailSize})
\]

\[
\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n
\]

and `imageMipTailOffset`, `imageMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image.

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the range `[0, VkMemoryRequirements::size)`.

**Valid Usage**

- **VUID-VkSparseMemoryBind-memory-01096**
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` must match the memory requirements of the resource, as described in section Resource Memory Association.

- **VUID-VkSparseMemoryBind-resourceOffset-09491**
  If the resource being bound is a `VkBuffer`, `resourceOffset`, `memoryOffset` and `size` must be an integer multiple of the alignment of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with the buffer resource.
If the resource being bound is a `VkImage`, `resourceOffset` and `memoryOffset` must be an integer multiple of the alignment of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the image resource.

If `memory` is not `VK_NULL_HANDLE`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

`size` must be greater than 0.

`resourceOffset` must be less than the size of the resource.

`size` must be less than or equal to the size of the resource minus `resourceOffset`.

`memoryOffset` must be less than the size of `memory`.

`size` must be less than or equal to the size of `memory` minus `memoryOffset`.

If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

Valid Usage (Implicit)

- `VK_SPARSE_MEMORY_BIND_METADATA_BIT` = 0x00000001

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```c
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```
- `VK_SPARSE_MEMORY_BIND_METADATA_BIT` specifies that the memory being bound is only for the metadata aspect.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

`VkSparseMemoryBindFlags` is a bitmask type for setting a mask of zero or more `VkSparseMemoryBindFlagBits`.

Memory is bound to `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;
```

- `buffer` is the `VkBuffer` object to be bound.
- `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
- `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

**Valid Usage (Implicit)**

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter  
  `buffer` must be a valid `VkBuffer` handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter  
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength  
  `bindCount` must be greater than `0`

Memory is bound to opaque regions of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- `image` is the `VkImage` object to be bound.
• `bindCount` is the number of `VkSparseMemoryBind` structures in the `pBinds` array.
• `pBinds` is a pointer to an array of `VkSparseMemoryBind` structures.

## Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined **must** be within the mip tail region of the metadata aspect of `image`

## Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  `image` **must** be a valid `VkImage` handle
- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  `pBinds` **must** be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures
- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  `bindCount` **must** be greater than 0

### Note
This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it **can** also be used to bind memory for the entire binding range of partially resident images.

In case `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range `[0, VkMemoryRequirements::size)`. This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified **must** be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not **required** to be a simple device address offset within the resource. However, it is defined to be within `[imageMipTailOffset, imageMipTailOffset + imageMipTailSize)` for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Memory **can** be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;

- **image** is the VkImage object to be bound
- **bindCount** is the number of VkSparseImageMemoryBind structures in pBinds array
- **pBinds** is a pointer to an array of VkSparseImageMemoryBind structures

### Valid Usage

- **VUID-VkSparseImageMemoryBindInfo-subresource-01722**
The subresource.mipLevel member of each element of pBinds must be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkSparseImageMemoryBindInfo-subresource-01723**
The subresource.arrayLayer member of each element of pBinds must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- **VUID-VkSparseImageMemoryBindInfo-subresource-01106**
The subresource.aspectMask member of each element of pBinds must be valid for the format specified in VkImageCreateInfo when image was created

- **VUID-VkSparseImageMemoryBindInfo-image-02901**
image must have been created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT set

### Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBindInfo-image-parameter**
image must be a valid VkImage handle

- **VUID-VkSparseImageMemoryBindInfo-pBinds-parameter**
pBinds must be a valid pointer to an array of bindCount valid VkSparseImageMemoryBind structures

- **VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength**
bindCount must be greater than 0

The VkSparseImageMemoryBind structure is defined as:
typedef struct VkSparseImageMemoryBind {
  VkImageSubresource subresource;
  VkOffset3D offset;
  VkExtent3D extent;
  VkDeviceMemory memory;
  VkDeviceSize memoryOffset;
  VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;

• subresource is the image aspect and region of interest in the image.

• offset are the coordinates of the first texel within the image subresource to bind.

• extent is the size in texels of the region within the image subresource to bind. The extent must be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it can instead be such that any coordinate of offset + extent equals the corresponding dimensions of the image subresource.

• memory is the VkDeviceMemory object that the sparse image blocks of the image are bound to. If memory is VK_NULL_HANDLE, the sparse image blocks are unbound.

• memoryOffset is an offset into VkDeviceMemory object. If memory is VK_NULL_HANDLE, this value is ignored.

• flags are sparse memory binding flags.

Valid Usage

• VUID-VkSparseImageMemoryBind-memory-01104
  If the sparseResidencyAliased feature is not enabled, and if any other resources are bound to ranges of memory, the range of memory being bound must not overlap with those bound ranges

• VUID-VkSparseImageMemoryBind-memory-01105
  memory and memoryOffset must match the memory requirements of the calling command’s image, as described in section Resource Memory Association

• VUID-VkSparseImageMemoryBind-offset-01107
  offset.x must be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of the image

• VUID-VkSparseImageMemoryBind-extent-09388
  extent.width must be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01108
  extent.width must either be a multiple of the sparse image block width of the image, or else (extent.width + offset.x) must equal the width of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01109
  offset.y must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of the image
• VUID-VkSparseImageMemoryBind-extent-09389

extent.height must be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01110

extent.height must either be a multiple of the sparse image block height of the image, or else (extent.height + offset.y) must equal the height of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01111

offset.z must be a multiple of the sparse image block depth (VkSparseImageFormatProperties::imageGranularity.depth) of the image

• VUID-VkSparseImageMemoryBind-extent-09390

extent.depth must be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01112

extent.depth must either be a multiple of the sparse image block depth of the image, or else (extent.depth + offset.z) must equal the depth of the image subresource

• VUID-VkSparseImageMemoryBind-memory-02732

If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when the image was created

• VUID-VkSparseImageMemoryBind-memory-02733

If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

Valid Usage (Implicit)

• VUID-VkSparseImageMemoryBind-subresource-parameter

subresource must be a valid VkImageSubresource structure

• VUID-VkSparseImageMemoryBind-memory-parameter

If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

• VUID-VkSparseImageMemoryBind-flags-parameter

flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,
    uint32_t bindInfoCount,
    const VkBindSparseInfo* pBindInfo,
    VkFence fence);
```

• queue is the queue that the sparse binding operations will be submitted to.

• bindInfoCount is the number of elements in the pBindInfo array.
• `pBindInfo` is a pointer to an array of `VkBindSparseInfo` structures, each specifying a sparse binding submission batch.

• `fence` is an optional handle to a fence to be signaled. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueBindSparse` is a queue submission command, with each batch defined by an element of `pBindInfo` as a `VkBindSparseInfo` structure. Batches begin execution in the order they appear in `pBindInfo`, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application must guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to `vkQueueBindSparse` causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

---

### Valid Usage

- **VUID-vkQueueBindSparse-fence-01113**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsignaled

- **VUID-vkQueueBindSparse-fence-01114**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueBindSparse-pSignalSemaphores-01115**
  Each element of the `pSignalSemaphores` member of each element of `pBindInfo` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueBindSparse-pWaitSemaphores-01116**
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pBindInfo` executes on `queue`, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueBindSparse-pWaitSemaphores-03245**
  All elements of the `pWaitSemaphores` member of all elements of `pBindInfo` referring to a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

---

### Valid Usage (Implicit)

- **VUID-vkQueueBindSparse-queue-parameter**
  `queue` must be a valid `VkQueue` handle
• VUID-vkQueueBindSparse-pBindInfo-parameter
  If `bindInfoCount` is not 0, `pBindInfo` must be a valid pointer to an array of `bindInfoCount` valid `VkBindSparseInfo` structures

• VUID-vkQueueBindSparse-fence-parameter
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

• VUID-vkQueueBindSparse-queuetype
  The `queue` must support sparse binding operations

• VUID-vkQueueBindSparse-commonparent
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

• Host access to `queue` must be externally synchronized

• Host access to `fence` must be externally synchronized

---

**Return Codes**

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

• `VK_ERROR_DEVICE_LOST`

---

The `VkBindSparseInfo` structure is defined as:
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
} VkBindSparseInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.
- **pBufferBinds** is a pointer to an array of `VkSparseBufferMemoryBindInfo` structures.
- **imageOpaqueBindCount** is the number of opaque sparse image bindings to perform.
- **pImageOpaqueBinds** is a pointer to an array of `VkSparseImageOpaqueMemoryBindInfo` structures, indicating opaque sparse image bindings to perform.
- **imageBindCount** is the number of sparse image bindings to perform.
- **pImageBinds** is a pointer to an array of `VkSparseImageMemoryBindInfo` structures, indicating sparse image bindings to perform.
- **signalSemaphoreCount** is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
- **pSignalSemaphores** is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

**Valid Usage**

- **VUID-VkBindSparseInfo-pWaitSemaphores-03246**
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain **must** include a `VkTimelineSemaphoreSubmitInfo` structure.
If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_BIND_SPARSE_INFO`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupBindSparseInfo`, `VkFrameBoundaryEXT`, or `VkTimelineSemaphoreSubmitInfo`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles.
To specify the values to use when waiting for and signaling semaphores created with a 
VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo 
structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that 
structure includes device indices specifying which instance of the resources and memory are 
bound.

The VkDeviceGroupBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- resourceDeviceIndex is a device index indicating which instance of the resource is bound.
- memoryDeviceIndex is a device index indicating which instance of the memory the resource
instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

### Valid Usage

- **VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118**
  
  `resourceDeviceIndex` and `memoryDeviceIndex` **must** both be valid device indices

- **VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119**
  
  Each memory allocation bound in this batch **must** have allocated an instance for `memoryDeviceIndex`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupBindSparseInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO`
Chapter 30. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

30.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- `#define` the appropriate preprocessor symbol prior to including the `vulkan.h` header file, or
- include `vulkan_core.h` and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with `vkCreateInstance` before using them.

30.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by `VkSurfaceKHR` handles:

```cpp
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The `VK_KHR_surface` extension declares the `VkSurfaceKHR` object, and provides a function for destroying `VkSurfaceKHR` objects. Separate platform-specific extensions each provide a function for creating a `VkSurfaceKHR` object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.

**Note**
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap `VkSurfaceKHR` objects.

### 30.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

#### Note

In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain’s `imageExtent` does not match the surface’s `currentExtent`, the presentable images will be scaled to the surface’s dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer’s preferred size).

#### Valid Usage (Implicit)

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  **instance** must be a valid `VkInstance` handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

Valid Usage (Implicit)

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
To remove an unnecessary compile time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter `instance` must be a valid `VkInstance` handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkWaylandSurfaceCreateInfoKHR` structure
If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

## Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

## Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304 `display` must point to a valid Wayland `wl_display`

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305 `surface` must point to a valid Wayland `wl_surface`

## Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR`

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zero bitmask
  
  **flags** must be **0**

On Wayland, `currentExtent` is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's `imageExtent` to will be the size of the window, after the first image is presented. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum supported surface size. Any calls to `vkGetPhysicalDeviceSurfacePresentModesKHR` on a surface created with `vkCreateWaylandSurfaceKHR` are **required** to return `VK_PRESENT_MODE_MAILBOX_KHR` as one of the valid present modes.

Some Vulkan functions may send protocol over the specified `wl_display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to a `wl_surface`. Applications must therefore ensure that both the `wl_display` and the `wl_surface` remain valid for the lifetime of any `VkSwapchainKHR` objects created from a particular `wl_display` and `wl_surface`. Also, calling `vkQueuePresentKHR` will result in Vulkan sending `wl_surface.commit` requests to the underlying `wl_surface` of each The `wl_surface.attach`, `wl_surface.damage`, and `wl_surface.commit` requests must be issued by the implementation during the call to `vkQueuePresentKHR` and **must** not be issued by the implementation outside of `vkQueuePresentKHR`. This ensures that any Wayland requests sent by the client after the call to `vkQueuePresentKHR` returns will be received by the compositor after the `wl_surface.commit`. Regardless of the mode of swapchain creation, a new `wl_event_queue` must be created for each successful `vkCreateWaylandSurfaceKHR` call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling `vkQueuePresentKHR`.

```c
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

`VkWaylandSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.3. Win32 Platform

To create a `VkSurfaceKHR` object for a Win32 window, call:
// Provided by VK_KHR_win32_surface

VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  instance must be a valid `VkInstance` handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid `VkWin32SurfaceCreateInfoKHR` structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Some Vulkan functions may call the [SendMessage] system API when interacting with a `VkSurfaceKHR` through a `VkSwapchainKHR`. In a multithreaded environment, calling `SendMessage` from a thread that is not the thread associated with `pCreateInfo::hwnd` will block until the application has processed the window message. Thus, applications should either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so may result in deadlocks.

The functions subject to this requirement are:
• vkCreateSwapchainKHR
• vkDestroySwapchainKHR
• vkAcquireNextImageKHR and vkAcquireNextImage2KHR
• vkQueuePresentKHR
• vkAcquireFullScreenExclusiveModeEXT
• vkReleaseFullScreenExclusiveModeEXT
• vkSetHdrMetadataEXT

The VkWin32SurfaceCreateInfoKHR structure is defined as:

```c
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **hinstance** is the Win32 HINSTANCE for the window to associate the surface with.
- **hwnd** is the Win32 HWND for the window to associate the surface with.

### Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  **hinstance must** be a valid Win32 HINSTANCE
- VUID-VkWin32SurfaceCreateInfoKHR hwnd-01308
  **hwnd must** be a valid Win32 HWND

### Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  **sType must** be VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR
- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  **pNext must** be NULL
- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  **flags must** be 0
With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of a Win32 surface must have both width and height greater than 0, or both of them 0.

**Note**

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance, const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateXcbSurfaceKHR-pSurface-parameter `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

## Return Codes

### Success
- `VK_SUCCESS`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `connection` is a pointer to an `xcb_connection_t` to the X server.
• `window` is the `xcb_window_t` for the X11 window to associate the surface with.

## Valid Usage

• VUID-VkXcbSurfaceCreateInfoKHR-connection-01310 `connection` must point to a valid X11 `xcb_connection_t`

• VUID-VkXcbSurfaceCreateInfoKHR-window-01311 `window` must be a valid X11 `xcb_window_t`

## Valid Usage (Implicit)

• VUID-VkXcbSurfaceCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`
With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of an Xcb surface **must** have both `width` and `height` greater than 0, or both of them 0.

### Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

Some Vulkan functions **may** send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications **must** therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains **must**

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so **may** result in deadlock.

```c
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```
• **instance** is the instance to associate the surface with.

• **pCreateInfo** is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

---

### Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter
  
  **instance** must be a valid `VkInstance` handle

- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid `VkXlibSurfaceCreateInfoKHR` structure

- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
  
  **pSurface** must be a valid pointer to a `VkSurfaceKHR` handle

---

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

---

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **flags** is reserved for future use.
• `dpy` is a pointer to an Xlib Display connection to the X server.
• `window` is an Xlib Window to associate the surface with.

### Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  `dpy` must point to a valid Xlib Display
- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  `window` must be a valid Xlib Window

### Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  `flags` must be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xlib surface must have both `width` and `height` greater than 0, or both of them 0.

### Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call `XInitThreads()` before calling any other Xlib functions.
VkXlibSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.6. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
define void vkDestroySurfaceKHR(
    VkInstance instance,
    VkSurfaceKHR surface,
    const VkAllocationCallbacks* pAllocator);
```

- instance is the instance used to create the surface.
- surface is the surface to destroy.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

**Valid Usage**

- **VUID-vkDestroySurfaceKHR-surface-01266**
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface

- **VUID-vkDestroySurfaceKHR-surface-01267**
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroySurfaceKHR-surface-01268**
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance

Host Synchronization

- Host access to surface must be externally synchronized

30.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

30.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
  VkPhysicalDevice physicalDevice,
  uint32_t* pPropertyCount,
  VkDisplayPropertiesKHR* pProperties);
```

- physicalDevice is a physical device.
• pPropertyCount is a pointer to an integer related to the number of display devices available or queried, as described below.

• pProperties is either NULL or a pointer to an array of VkDisplayPropertiesKHR structures.

If pProperties is NULL, then the number of display devices available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the application to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display devices for physicalDevice, at most pPropertyCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPropertiesKHR structures

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```
• **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

• **displayName** is **NULL** or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If **NULL**, no suitable name is available. If not **NULL**, the string pointed to **must** remain accessible and unmodified as long as **display** is valid.

• **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

• **physicalResolution** describes the physical, native, or preferred resolution of the display.

  **Note**

  For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

• **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** describing which transforms are supported by this display.

• **planeReorderPossible** tells whether the planes on this display **can** have their z order changed. If this is **VK_TRUE**, the application **can** re-arrange the planes on this display in any order relative to each other.

• **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

  **Note**

  Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

• **physicalDevice** is a physical device.

• **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.

• **pProperties** is either **NULL** or a pointer to an array of **VkDisplayProperties2KHR** structures.

```
vkGetPhysicalDeviceDisplayProperties2KHR
```

behaves similarly to

```
vkGetPhysicalDeviceDisplayPropertiesKHR
```

with the ability to return extended information via chained output structures.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a `VkDisplayPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`

- VUID-VkDisplayProperties2KHR-pNext-pNext
  `pNext` must be `NULL`
Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application-specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is NULL, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkDisplayPlanePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice,       
    uint32_t* pPropertyCount,              
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures
## Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

### Valid Usage (Implicit)

- `VUID-VkDisplayPlaneProperties2KHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`

- `VUID-VkDisplayPlaneProperties2KHR-pNext-pNext`  
  `pNext` must be `NULL`

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,  
    uint32_t planeIndex,  
    uint32_t* pDisplayCount,  
    VkDisplayKHR* pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and must be in the range `[0, physical device plane count - 1]`.  

1750
• **pDisplayCount** is a pointer to an integer related to the number of displays available or queried, as described below.

• **pDisplays** is either **NULL** or a pointer to an array of *VkDisplayKHR* handles.

If **pDisplays** is **NULL**, then the number of displays usable with the specified **planeIndex** for **physicalDevice** is returned in **pDisplayCount**. Otherwise, **pDisplayCount** must point to a variable set by the application to the number of elements in the **pDisplays** array, and on return the variable is overwritten with the number of handles actually written to **pDisplays**. If the value of **pDisplayCount** is less than the number of usable display-plane pairs for **physicalDevice**, at most **pDisplayCount** handles will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available pairs were returned.

### Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  
  **planeIndex** must be less than the number of display planes supported by the device as determined by calling *vkGetPhysicalDeviceDisplayPlanePropertiesKHR*

### Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  
  **physicalDevice** must be a valid *VkPhysicalDevice* handle

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  
  **pDisplayCount** must be a valid pointer to a *uint32_t* value

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  
  If the value referenced by **pDisplayCount** is not 0, and **pDisplays** is not **NULL**, **pDisplays** must be a valid pointer to an array of **pDisplayCount** *VkDisplayKHR* handles

### Return Codes

**Success**

- **VK_SUCCESS**

- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**

- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by *VkDisplayModeKHR* handles:
Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
int VkGetDisplayModePropertiesKHR(  
    VkPhysicalDevice physicalDevice,  
    VkDisplayKHR display,  
    uint32_t* pPropertyCount,  
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter  
  `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter  
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter  
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent  
  `display` must have been created, allocated, or retrieved from `physicalDevice`
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModePropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

• `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
• `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

\n
```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,           // physicalDevice
    VkDisplayKHR display,                      // display
    uint32_t* pPropertyCount,                 // pPropertyCount
    VkDisplayModeProperties2KHR* pProperties  // pProperties
);
```

• `physicalDevice` is the physical device associated with `display`.
• `display` is the display to query.
• `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
• `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.
vkGetDisplayModeProperties2KHR behaves similarly to vkGetDisplayModePropertiesKHR, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- **VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetDisplayModeProperties2KHR-display-parameter**
  - `display` must be a valid `VkDisplayKHR` handle

- **VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures

- **VUID-vkGetDisplayModeProperties2KHR-display-parent**
  - `display` must have been created, allocated, or retrieved from `physicalDevice`

Return Codes

Success

- **VK_SUCCESS**
- **VK_INCOMPLETE**

Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkDisplayModeProperties2KHR` structure is defined as:

```c
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displayModeProperties** is a `VkDisplayModePropertiesKHR` structure.
Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  \texttt{sType must be VK\_STRUCTURE\_TYPE\_DISPLAY\_MODE\_PROPERTIES\_2\_KHR}

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  \texttt{pNext must be NULL}

The \texttt{VkDisplayModeParametersKHR} structure is defined as:

```c
// Provided by VK\_KHR\_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D visibleRegion;
    uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

- \texttt{visibleRegion} is the 2D extents of the visible region.
- \texttt{refreshRate} is a \texttt{uint32\_t} that is the number of times the display is refreshed each second multiplied by 1000.

\medskip

\textbf{Note}

For example, a 60Hz display mode would report a \texttt{refreshRate} of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The \texttt{width} member of \texttt{visibleRegion} must be greater than 0

- VUID-VkDisplayModeParametersKHR-height-01991
  The \texttt{height} member of \texttt{visibleRegion} must be greater than 0

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  \texttt{refreshRate} must be greater than 0

Additional modes may also be created by calling:

```c
// Provided by VK\_KHR\_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,  // physicalDevice
    VkDisplayKHR display,              // display
    const VkDisplayModeCreateInfoKHR* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator,  // pAllocator
    VkDisplayModeKHR* pMode);        // pMode
```

- \texttt{physicalDevice} is the physical device associated with \texttt{display}. 
• **display** is the display to create an additional mode for.

• **pCreateInfo** is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.

• **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).

• **pMode** is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

---

### Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkCreateDisplayModeKHR-display-parameter
  
  `display` **must** be a valid `VkDisplayKHR` handle

- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
  
  `pCreateInfo` **must** be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure

- VUID-vkCreateDisplayModeKHR-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDisplayModeKHR-pMode-parameter
  
  `pMode` **must** be a valid pointer to a `VkDisplayModeKHR` handle

- VUID-vkCreateDisplayModeKHR-display-parent
  
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

---

### Host Synchronization

- Host access to `display` **must** be externally synchronized

---

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkDisplayModeCreateInfoKHR` structure is defined as:
```c
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and must be zero.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return `VK_ERROR_INITIALIZATION_FAILED`.

### Valid Usage (Implicit)

- `VUID-VkDisplayModeCreateInfoKHR-sType-sType` sType must be `VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR`
- `VUID-VkDisplayModeCreateInfoKHR-pNext-pNext` pNext must be `NULL`
- `VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask` flags must be `0`
- `VUID-VkDisplayModeCreateInfoKHR-parameters-parameter` parameters must be a valid `VkDisplayModeParametersKHR` structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with the display specified by `mode`
- `mode` is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- `planeIndex` is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
• **pCapabilities** is a pointer to a *VkDisplayPlaneCapabilitiesKHR* structure in which the capabilities are returned.

## Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter  
  *physicalDevice** must** be a valid *VkPhysicalDevice* handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter  
  *mode** must** be a valid *VkDisplayModeKHR* handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter  
  *pCapabilities** must** be a valid pointer to a *VkDisplayPlaneCapabilitiesKHR* structure
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent  
  *mode** must** have been created, allocated, or retrieved from *physicalDevice*

## Host Synchronization

- Host access to *mode** must** be externally synchronized

## Return Codes

**Success**

- *VK_SUCCESS*

**Failure**

- *VK_ERROR_OUT_OF_HOST_MEMORY*
- *VK_ERROR_OUT_OF_DEVICE_MEMORY*

The *VkDisplayPlaneCapabilitiesKHR* structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

• **supportedAlpha** is a bitmask of *VkDisplayPlaneAlphaFlagBitsKHR* describing the supported alpha
blending modes.

- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.

- **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of **maxSrcPosition** must each be greater than or equal to the x and y components of **minSrcPosition**, respectively.

- **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.

- **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.

- **minDstPosition**, **maxDstPosition**, **minDstExtent**, and **maxDstExtent** all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, **minDstPosition** and **maxDstPosition** may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning **minSrcPosition**, **maxSrcPosition**, **minSrcExtent**, and **maxSrcExtent** values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning **minDstPosition**, **maxDstPosition**, **minDstExtent**, and **maxDstExtent** values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for **minSrcPosition**, **maxSrcPosition**, **minSrcExtent**, and **maxSrcExtent**, and (display mode width, display mode height) for **minSrcExtent**, **maxSrcExtent**, **minDstExtent**, and **maxDstExtent**.

The value **supportedAlpha** must contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in VkDisplayPlaneCapabilitiesKHR are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.
- `pDisplayPlaneInfo` is a pointer to a `VkDisplayPlaneInfo2KHR` structure describing the plane and mode.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter `pDisplayPlaneInfo` must be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure
- VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilities2KHR` structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• mode is the display mode the application intends to program when using the specified plane.

Note
This parameter also implicitly specifies a display.

• planeIndex is the plane which the application intends to use with the display.

The members of VkDisplayPlaneInfo2KHR correspond to the arguments to vkGetDisplayPlaneCapabilitiesKHR, with sType and pNext added for extensibility.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneInfo2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR

• VUID-VkDisplayPlaneInfo2KHR-pNext-pNext
  pNext must be NULL

• VUID-VkDisplayPlaneInfo2KHR-mode-parameter
  mode must be a valid VkDisplayModeKHR handle

Host Synchronization

• Host access to mode must be externally synchronized

The VkDisplayPlaneCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType               sType;
    void*                         pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• capabilities is a VkDisplayPlaneCapabilitiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
30.3.2. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a VkSurfaceKHR object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance, 
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a VkDisplaySurfaceCreateInfoKHR structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface is returned.

Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter  
  `instance` must be a valid VkInstance handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid VkDisplaySurfaceCreateInfoKHR structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter  
  `pSurface` must be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and must be zero.
- `displayMode` is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- `planeIndex` is the plane on which this surface appears.
- `planeStackIndex` is the z-order of the plane.
- `transform` is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
- `globalAlpha` is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
- `alphaMode` is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.
- `imageExtent` is the size of the presentable images to use with the surface.

**Note**

Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

**Valid Usage**

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252

`planeIndex` must be less than the number of display planes supported by the device as
determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR

- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
  If the planeReorderPossible member of the VkDisplayPropertiesKHR structure returned by
  vkGetPhysicalDeviceDisplayPropertiesKHR for the display corresponding to displayMode is
  VK_TRUE then planeStackIndex must be less than the number of display planes supported
  by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR;
  otherwise planeStackIndex must equal the currentStackIndex member of
  VkDisplayPlanePropertiesKHR returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR
  for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If alphaMode is VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR then globalAlpha must be between 0
  and 1, inclusive

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  alphaMode must be one of the bits present in the supportedAlpha member of
  VkDisplayPlaneCapabilitiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  transform must be one of the bits present in the supportedTransforms member of
  VkDisplayPropertiesKHR for the display corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of imageExtent must be less than or equal to
  VkPhysicalDeviceLimits::maxImageDimension2D

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR

- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zero bitmask
  flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
  displayMode must be a valid VkDisplayModeKHR handle

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
  transform must be a valid VkSurfaceTransformFlagBitsKHR value

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
  alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for
future use.

Bits which can be set in `VkDisplaySurfaceCreateInfoKHR::alphaMode`, specifying the type of alpha blending to use on a display, are:

```c
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- `VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR` specifies that the source image will be treated as opaque.
- `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR` specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR` is equivalent to `VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR`, except the source alpha values are assumed to be premultiplied into the source image's other color components.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

`VkDisplayPlaneAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkDisplayPlaneAlphaFlagBitsKHR`.

### 30.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);

• physicalDevice is the physical device.
• queueFamilyIndex is the queue family.
• surface is the surface.
• pSupported is a pointer to a VkBool32, which is set to VK_TRUE to indicate support, and VK_FALSE otherwise.

Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  pSupported must be a valid pointer to a VkBool32 value

• VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR
30.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

30.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

Valid Usage
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306 `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter `display` must be a valid pointer to a `wl_display` value

30.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:
```cpp
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

30.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```cpp
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an xcb_connection_t to the X server.
- `visual_id` is an X11 visual (xcb_visualid_t).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter connection must be a valid pointer to an xcb_connection_t value

30.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.
- `visualID` is an X11 visual (`VisualID`).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter dpy must be a valid pointer to a Display value
30.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

**Note**

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

### 30.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523 `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211 `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter `surface` must be a valid `VkSurfaceKHR` handle
• **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter**
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure

• **VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent**
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

## Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to minImageCount. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of currentExtent, unless currentExtent has the special value described above.
• `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `minImageExtent`. The `width` and `height` of the extent will each be greater than or equal to the corresponding `width` and `height` of `currentExtent`, unless `currentExtent` has the special value described above.

• `maxImageArrayLayers` is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

• `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

• `currentTransform` is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.

• `supportedCompositeAlpha` is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

• `supportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set. Implementations may support additional usages.

**Note**
Supported usage flags of a presentable image when using `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` presentation mode are provided by `VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags`.

**Note**
Formulas such as `min(N, maxImageCount)` are not correct, since `maxImageCount` may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

• `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`. 

1772
• pSurfaceInfo is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.

• pSurfaceCapabilities is a pointer to a VkSurfaceCapabilities2KHR structure in which the capabilities are returned.

vkGetPhysicalDeviceSurfaceCapabilities2KHR behaves similarly to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
  pSurfaceInfo->surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
  pSurfaceInfo->surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671
  If a VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is included in the pNext chain of pSurfaceCapabilities, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the pNext chain of pSurfaceInfo

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **surface** is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

### Valid Usage

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672**
  If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullscreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the `pNext` chain.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919**
  If `surface` is not `VK_NULL_HANDLE`, `surface` **must** be a valid `VkSurfaceKHR` handle.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT` or `VkSurfaceFullScreenExclusiveWin32InfoEXT`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique.
If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application's preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fullScreenExclusive` is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

**Valid Usage (Implicit)**

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`
- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter
  - `fullScreenExclusive` must be a valid `VkFullScreenExclusiveEXT` value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT` indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.
- `VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT` indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- `VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT` indicates the implementation should avoid using full-
screen mechanisms which rely on disruptive transitions.

- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```c
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **hmonitor** is the Win32 `HMONITOR` handle identifying the display to create the surface with.

**Note**

If **hmonitor** is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

**Note**

It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

**Valid Usage**

- **VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673**

  **hmonitor** must be a valid `HMONITOR`

**Valid Usage (Implicit)**

- **VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType**

  **sType** must be `VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_WIN32_INFO_EXT`

The `VkSurfaceCapabilities2KHR` structure is defined as:
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **surfaceCapabilities** is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

### Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2KHR-sType-sType**
  *sType* must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- **VUID-VkSurfaceCapabilities2KHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, or `VkSurfaceProtectedCapabilitiesKHR`

- **VUID-VkSurfaceCapabilities2KHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **supportsProtected** specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.
Valid Usage (Implicit)

- **VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The **VkSharedPresentSurfaceCapabilitiesKHR** structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkImageUsageFlags    sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **sharedPresentSupportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways
  the application can use the shared presentable image from a swapchain created with
  `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or
  `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device.
  `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set but implementations may
  support additional usages.

Valid Usage (Implicit)

- **VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The **VkSurfaceCapabilitiesFullScreenExclusiveEXT** structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType      sType;
    void*                pNext;
    VkBool32             fullscreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **fullscreenExclusiveControlSupported** is a boolean describing whether the surface is able to
  make use of exclusive full-screen access.

This structure can be included in the `pNext` chain of **VkSurfaceCapabilities2KHR** to determine
support for exclusive full-screen access. If `fullscreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications **must** not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullscreenExclusiveSupported` is `VK_FALSE`.

### Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`

Bits which **may** be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
• **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.

• **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```c
// Provided by VK_KHR_display
