Chapter 1. Preamble

Copyright 2014-2023 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at https://www.khronos.org/files/member_agreement.pdf. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos Intellectual Property Rights Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see https://www.khronos.org/adopters.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.
For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

Note
Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.2. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word optionally is an alternate form of optional, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.
In text addressing application developers, the additional key words **can** and **cannot** are to be interpreted as describing the capabilities of an application, as follows:

**can**
This word means that the application is able to perform the action described.

**cannot**
This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

---

**Note**

There is an important distinction between **cannot** and **must not**, as used in this Specification. **Cannot** means something the application literally is unable to express or accomplish through the API, while **must not** means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Valid Usage).

---

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

### 2.1.3. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as **Pipeline**, **Shader**, and **Host** to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The **Glossary** defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate, extend, or clarify the **Glossary** definitions. When a term defined in the **Glossary** is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

### 2.1.4. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in **Normative Terminology** to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host **must** have runtime support for 8, 16, 32 and 64-bit signed and unsigned twos-complement integers, all addressable at the granularity of their size in bytes.
- The host **must** have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating Point Computation section.
- The representation and endianness of these types on the host **must** match the representation and endianness of the same types on every physical device supported.

**Note**

Since a variety of data types and structures in Vulkan **may** be accessible by both host and physical device operations, the implementation **should** be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more **devices**, each of which exposes one or more **queues** which **may** process work asynchronously to one another. The set of queues supported by a device is partitioned into **families**. Each family supports one or more types of functionality and **may** contain multiple queues with similar characteristics. Queues within a single family are considered **compatible** with one another, and work produced for a family of queues **can** be executed on any queue within that family. This specification defines the following types of functionality that queues **may** support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

**Note**

A single device **may** report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are **not** directly compatible with one another.

Device memory is explicitly managed by the application. Each device **may** advertise one or more
heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an implementation include:

- **device-local** is memory that is physically connected to the device.
- **device-local, host visible** is device-local memory that is visible to the host.
- **host-local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using *queue submission commands* that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all *queue operations*. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with *semaphores* and *fences*.

Command buffer submissions to a single queue respect *submission order* and other implicit *ordering guarantees*, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. *sparse memory binding*) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with *semaphores* and *fences*.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with *explicit synchronization primitives*. 
There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with the various explicit synchronization primitives.

Note
Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes. State setting commands update the current state of the command buffer. Some commands that perform actions (e.g. draw/dispatch) do so based on the current state set cumulatively since the start of the command buffer. The work involved in performing action commands is often allowed to overlap or to be reordered, but doing so must not alter the state to be used by each action command. In general, action commands are those commands that alter framebuffer attachments, read/write buffer or image memory, or write to query pools.

Synchronization commands introduce explicit execution and memory dependencies between two sets of action commands, where the second set of commands depends on the first set of commands. These dependencies enforce both that the execution of certain pipeline stages in the later set occurs after the execution of certain stages in the source set, and that the effects of memory accesses performed by certain pipeline stages occur in order and are visible to each other. When not enforced by an explicit dependency or implicit ordering guarantees, action commands may overlap execution or execute out of order, and may not see the side effects of each other’s memory accesses.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. Dispatchable handle types are a pointer to an opaque type. This pointer may be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type must have a unique handle value during its lifetime.

Non-dispatchable handle types are a 64-bit integer type whose meaning is implementation-dependent. If the privateData feature is enabled for a VkDevice, each object of a non-dispatchable type created on that device must have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles may encode object information directly in the handle rather than acting as a reference to an underlying object, and thus may not have unique handle values. If handle values are not unique, then destroying one such handle must not cause identical handles of other types to become invalid, and must not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.
All objects created or allocated from a `VkDevice` (i.e. with a `VkDevice` as the first parameter) are private to that device, and must not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by `vkCreate*` and `vkAllocate*` commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by `vkDestroy*` and `vkFree*` commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects can occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory must be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application can alter or free this memory as soon as all the commands that acquired it have returned. If the command was deferred, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They must not be destroyed in the duration of any API command they are passed into:

- `VkShaderModule`
- `VkPipelineCache`

A `VkRenderPass` or `VkPipelineLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A `VkRenderPass` used in a command buffer follows the rules described below.

`VkDescriptorSetLayout` objects may be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets must not be updated with `vkUpdateDescriptorSets` after the descriptor set layout has been destroyed. Otherwise, a `VkDescriptorSetLayout` object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into.

The application must not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects must not be destroyed while any command buffers using the object are in the pending state:

- `VkEvent`
• VkQueryPool
• VkBuffer
• VkBufferView
• VkImage
• VkImageView
• VkPipeline
• VkSampler
• VkSamplerYcbcrConversion
• VkDescriptorPool
• VkFramebuffer
• VkRenderPass
• VkCommandBuffer
• VkCommandPool
• VkDeviceMemory
• VkDescriptorSet
• VkAccelerationStructureKHR
• VkVideoSessionKHR
• VkVideoSessionParametersKHR

Destroying these objects will move any command buffers that are in the recording or executable state, and are using those objects, to the invalid state.

The following Vulkan objects must not be destroyed while any queue is executing commands that use the object:

• VkFence
• VkSemaphore
• VkCommandBuffer
• VkCommandPool

In general, objects can be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a pipeline library in another pipeline, use of a bottom level acceleration structure in an instance referenced by a top level acceleration structure, use of an object in a command buffer, binding of a memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it can be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application must not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).
VkCommandPool objects are parents of VkCommandBuffer objects. VkDescriptorPool objects are parents of VkDescriptorSet objects. VkDevice objects are parents of many object types (all that take a VkDevice as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- **VkQueue** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the VkDevice object they are retrieved from is destroyed.

- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying VkCommandPool frees all VkCommandBuffer objects that were allocated from it, and destroying VkDescriptorPool frees all VkDescriptorSet objects that were allocated from it.

- **VkDevice** objects can be destroyed when all VkQueue objects retrieved from them are idle, and all objects created from them have been destroyed.

  - This includes the following objects:

    - VkFence
    - VkSemaphore
    - VkEvent
    - VkQueryPool
    - VkBuffer
    - VkBufferView
    - VkImage
    - VkImageView
    - VkShaderModule
    - VkPipelineCache
    - VkPipeline
    - VkPipelineLayout
    - VkSampler
    - VkSamplerYcbcrConversion
    - VkDescriptorSetLayout
    - VkDescriptorPool
    - VkFramebuffer
    - VkRenderPass
    - VkCommandPool
    - VkCommandBuffer
    - VkDeviceMemory
    - VkAccelerationStructureKHR
    - VkVideoSessionKHR
• **VkVideoSessionParametersKHR**

• **VkPhysicalDevice** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the **VkInstance** object they are retrieved from is destroyed.

• **VkInstance** objects can be destroyed once all **VkDevice** objects created from any of its **VkPhysicalDevice** objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a **VkDevice** is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle must be exported from the object in the source scope and imported into the destination scope.

**Note**

The scope of external handles and their associated resources may vary according to their type, but they can generally be shared across process and API boundaries.

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations must use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan must not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations should provide library symbols for commands in the highest version of this Specification they support, and for **Window System Integration** extensions relevant to the platform. They may also provide library symbols for commands defined by additional extensions.

**Note**

These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning
mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the *de facto* standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. `vkGetInstanceProcAddr` and `vkGetDeviceProcAddr` **should** be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

### 3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

`VkBool32` represents boolean `True` and `False` values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

`VK_TRUE` represents a boolean `True` (unsigned integer 1) value, and `VK_FALSE` a boolean `False` (unsigned integer 0) value.

All values returned from a Vulkan implementation in a `VkBool32` will be either `VK_TRUE` or `VK_FALSE`.

Applications **must** not pass any other values than `VK_TRUE` or `VK_FALSE` into a Vulkan implementation where a `VkBool32` is expected.

`VK_TRUE` is a constant representing a `VkBool32 True` value.

```c
#define VK_TRUE 1U
```

`VK_FALSE` is a constant representing a `VkBool32 False` value.

```c
#define VK_FALSE 0U
```

`VkDeviceSize` represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
```
typedef uint64_t VkDeviceSize;

VkDeviceAddress represents device buffer address values:

// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;

Commands that create Vulkan objects are of the form vkCreate* and take Vk*CreateInfo structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form vkDestroy*.

The last in-parameter to each command that creates or destroys a Vulkan object is pAllocator. The pAllocator parameter can be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form vkAllocate*, and take Vk*AllocateInfo structures. These Vulkan objects are freed with commands of the form vkFree*. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form vkCmd*. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The duration of a Vulkan command refers to the interval between calling the command and its return to the caller.

3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form vkGet* and vkEnumerate*.

Unless otherwise specified for an individual command, the results are invariant; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during
the host execution of the command. If two commands operate on the same object and at least one of
the commands declares the object to be externally synchronized, then the caller must guarantee
not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

Note
Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application must avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-const qualified memory at any point. Parameters referring to non-const qualified application-owned memory are not marked explicitly as externally synchronized in the Specification.

If an application is using deferred host operations in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.

Many object types are immutable, meaning the objects cannot change once they have been created. These types of objects never need external synchronization, except that they must not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command’s parameters (e.g. command pools and descriptor pools) may be affected by a command, and must also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

---

**Exteranly Synchronized Parameters**

- The `instance` parameter in `vkDestroyInstance`
- The `device` parameter in `vkDestroyDevice`
- The `queue` parameter in `vkQueueSubmit`
- The `fence` parameter in `vkQueueSubmit`
- The `queue` parameter in `vkQueueWaitIdle`
- The `memory` parameter in `vkFreeMemory`
- The `memory` parameter in `vkMapMemory`
- The `memory` parameter in `vkUnmapMemory`
• The `buffer` parameter in `vkBindBufferMemory`  
• The `image` parameter in `vkBindImageMemory`  
• The `queue` parameter in `vkQueueBindSparse`  
• The `fence` parameter in `vkQueueBindSparse`  
• The `fence` parameter in `vkDestroyFence`  
• The `semaphore` parameter in `vkDestroySemaphore`  
• The `event` parameter in `vkDestroyEvent`  
• The `event` parameter in `vkSetEvent`  
• The `event` parameter in `vkResetEvent`  
• The `queryPool` parameter in `vkDestroyQueryPool`  
• The `buffer` parameter in `vkDestroyBuffer`  
• The `bufferView` parameter in `vkDestroyBufferView`  
• The `image` parameter in `vkDestroyImage`  
• The `imageView` parameter in `vkDestroyImageView`  
• The `shaderModule` parameter in `vkDestroyShaderModule`  
• The `pipelineCache` parameter in `vkDestroyPipelineCache`  
• The `dstCache` parameter in `vkMergePipelineCaches`  
• The `pipeline` parameter in `vkDestroyPipeline`  
• The `pipelineLayout` parameter in `vkDestroyPipelineLayout`  
• The `sampler` parameter in `vkDestroySampler`  
• The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`  
• The `descriptorPool` parameter in `vkDestroyDescriptorPool`  
• The `descriptorPool` parameter in `vkResetDescriptorPool`  
• The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`  
• The `descriptorPool` parameter in `vkFreeDescriptorSets`  
• The `framebuffer` parameter in `vkDestroyFramebuffer`  
• The `renderPass` parameter in `vkDestroyRenderPass`  
• The `commandPool` parameter in `vkDestroyCommandPool`  
• The `commandPool` parameter in `vkResetCommandPool`  
• The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`  
• The `commandPool` parameter in `vkFreeCommandBuffers`  
• The `commandBuffer` parameter in `vkBeginCommandBuffer`  
• The `commandBuffer` parameter in `vkEndCommandBuffer`  
• The `commandBuffer` parameter in `vkResetCommandBuffer`  
• The `commandBuffer` parameter in `vkCmdBindPipeline`
- The `commandBuffer` parameter in `vkCmdSetViewport`
- The `commandBuffer` parameter in `vkCmdSetScissor`
- The `commandBuffer` parameter in `vkCmdSetLineWidth`
- The `commandBuffer` parameter in `vkCmdSetDepthBias`
- The `commandBuffer` parameter in `vkCmdSetBlendConstants`
- The `commandBuffer` parameter in `vkCmdSetDepthBounds`
- The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
- The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
- The `commandBuffer` parameter in `vkCmdSetStencilReference`
- The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
- The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
- The `commandBuffer` parameter in `vkCmdBindVertexBuffers`
- The `commandBuffer` parameter in `vkCmdDraw`
- The `commandBuffer` parameter in `vkCmdDrawIndexed`
- The `commandBuffer` parameter in `vkCmdDrawIndirect`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirect`
- The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier`
- The `commandBuffer` parameter in `vkCmdBeginQuery`
- The `commandBuffer` parameter in `vkCmdEndQuery`
• The `commandBuffer` parameter in `vkCmdResetQueryPool`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp`
• The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
• The `commandBuffer` parameter in `vkCmdPushConstants`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass`
• The `commandBuffer` parameter in `vkCmdNextSubpass`
• The `commandBuffer` parameter in `vkCmdEndRenderPass`
• The `commandBuffer` parameter in `vkCmdExecuteCommands`
• The `commandBuffer` parameter in `vkCmdSetDeviceMask`
• The `commandBuffer` parameter in `vkCmdDispatchBase`
• The `commandBuffer` parameter in `vkTrimCommandPool`
• The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
• The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
• The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
• The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
• The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
• The `commandBuffer` parameter in `vkCmdNextSubpass2`
• The `commandBuffer` parameter in `vkCmdEndRenderPass2`
• The `privateDataSlot` parameter in `vkDestroyPrivateDataSlot`
• The `commandBuffer` parameter in `vkCmdSetEvent2`
• The `commandBuffer` parameter in `vkCmdResetEvent2`
• The `commandBuffer` parameter in `vkCmdWaitEvents2`
• The `commandBuffer` parameter in `vkCmdPipelineBarrier2`
• The `commandBuffer` parameter in `vkCmdWriteTimestamp2`
• The `queue` parameter in `vkQueueSubmit2`
• The `fence` parameter in `vkQueueSubmit2`
• The `commandBuffer` parameter in `vkCmdCopyBuffer2`
• The `commandBuffer` parameter in `vkCmdCopyImage2`
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage2`
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2`
• The `commandBuffer` parameter in `vkCmdBlitImage2`
• The `commandBuffer` parameter in `vkCmdResolveImage2`
• The `commandBuffer` parameter in `vkCmdBeginRendering`
• The `commandBuffer` parameter in `vkCmdEndRendering`
• The `commandBuffer` parameter in `vkCmdSetCullMode`
• The `commandBuffer` parameter in `vkCmdSetFrontFace`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveTopology`
• The `commandBuffer` parameter in `vkCmdSetViewportWithCount`
• The `commandBuffer` parameter in `vkCmdSetScissorWithCount`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers2`
• The `commandBuffer` parameter in `vkCmdSetDepthTestEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthWriteEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthCompareOp`
• The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilTestEnable`
• The `commandBuffer` parameter in `vkCmdSetStencilOp`
• The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`
• The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`
• The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`
• The `surface` parameter in `vkDestroySurfaceKHR`
• The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `swapchain` parameter in `vkDestroySwapchainKHR`
• The `swapchain` parameter in `vkAcquireNextImageKHR`
• The `semaphore` parameter in `vkAcquireNextImageKHR`
• The `fence` parameter in `vkAcquireNextImageKHR`
• The `queue` parameter in `vkQueuePresentKHR`
• The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
• The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
• The `display` parameter in `vkCreateDisplayModeKHR`
• The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
• The `videoSession` parameter in `vkDestroyVideoSessionKHR`
• The `videoSession` parameter in `vkBindVideoSessionMemoryKHR`
• The `videoSessionParameters` parameter in `vkDestroyVideoSessionParametersKHR`
• The `commandBuffer` parameter in `vkCmdBeginVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdEndVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdControlVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdDecodeVideoKHR`
• The `commandBuffer` parameter in `vkCmdBeginRenderingKHR`
• The `commandBuffer` parameter in `vkCmdEndRenderingKHR`
- The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`
- The `commandBuffer` parameter in `vkCmdDispatchBaseKHR`
- The `commandPool` parameter in `vkTrimCommandPoolKHR`
- The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`
- The `commandBuffer` parameter in `vkCmdPushDescriptorSetWithTemplateKHR`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplateKHR`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2KHR`
- The `commandBuffer` parameter in `vkCmdNextSubpass2KHR`
- The `commandBuffer` parameter in `vkCmdEndRenderPass2KHR`
- The `swapchain` parameter in `vkGetSwapchainStatusKHR`
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversionKHR`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCountKHR`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCountKHR`
- The `commandBuffer` parameter in `vkCmdSetFragmentShadingRateKHR`
- The `swapchain` parameter in `vkWaitForPresentKHR`
- The `operation` parameter in `vkDestroyDeferredOperationKHR`
- The `commandBuffer` parameter in `vkCmdEncodeVideoKHR`
- The `commandBuffer` parameter in `vkCmdSetEvent2KHR`
- The `commandBuffer` parameter in `vkCmdResetEvent2KHR`
- The `commandBuffer` parameter in `vkCmdWaitEvents2KHR`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier2KHR`
- The `queue` parameter in `vkQueueSubmit2KHR`
- The `fence` parameter in `vkQueueSubmit2KHR`
- The `commandBuffer` parameter in `vkCmdWriteBufferMarker2AMD`
- The `commandBuffer` parameter in `vkCmdCopyBuffer2KHR`
- The `commandBuffer` parameter in `vkCmdCopyImage2KHR`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage2KHR`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2KHR`
- The `commandBuffer` parameter in `vkCmdBlitImage2KHR`
- The `commandBuffer` parameter in `vkCmdResolveImage2KHR`
- The `commandBuffer` parameter in `vkCmdTraceRaysIndirect2KHR`
- The `accelerationStructure` parameter in `vkDestroyAccelerationStructureKHR`
- The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresKHR`
- The `commandBuffer` parameter in `vkCmdBuildAccelerationStructuresIndirectKHR`
The commandBuffer parameter in vkCmdCopyAccelerationStructureKHR

The commandBuffer parameter in vkCmdCopyAccelerationStructureToMemoryKHR

The commandBuffer parameter in vkCmdCopyMemoryToAccelerationStructureKHR

The commandBuffer parameter in vkCmdWriteAccelerationStructuresPropertiesKHR

The commandBuffer parameter in vkCmdTraceRaysKHR

The commandBuffer parameter in vkCmdTraceRaysIndirectKHR

The commandBuffer parameter in vkCmdSetRayTracingPipelineStackSizeKHR

For VkPipelineCache objects created with flags containing VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, the above table is extended with the pipelineCache parameter to vkCreate*Pipelines being externally synchronized.

There are also a few instances where a command can take in a user allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

**Externally Synchronized Parameter Lists**

- Each element of the pFences parameter in vkResetFences
- Each element of the pDescriptorSets parameter in vkFreeDescriptorSets
- Each element of the pCommandBuffers parameter in vkFreeCommandBuffers
- Each element of the pWaitSemaphores member of the pPresentInfo parameter in vkQueuePresentKHR
- Each element of the pSwapchains member of the pPresentInfo parameter in vkQueuePresentKHR
- The surface member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR
- The oldSwapchain member of each element of the pCreateInfos parameter in vkCreateSharedSwapchainsKHR

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a commandBuffer parameter needs to be externally synchronized, it implies that the commandPool from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

**Implicit Externally Synchronized Parameters**

- All VkPhysicalDevice objects enumerated from instance in vkDestroyInstance
- All VkQueue objects created from device in vkDestroyDevice
- All VkQueue objects created from device in vkDeviceWaitIdle
• Any VkDescriptorSet objects allocated from descriptorPool in vkResetDescriptorPool
• The VkCommandPool that commandBuffer was allocated from in vkBeginCommandBuffer
• The VkCommandPool that commandBuffer was allocated from in vkEndCommandBuffer
• The VkCommandPool that commandBuffer was allocated from in vkResetCommandBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBindPipeline
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetViewport
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetScissor
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetLineWidth
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDepthBias
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetBlendConstants
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDepthBounds
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilCompareMask
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilWriteMask
• The VkCommandPool that commandBuffer was allocated from, in vkCmdSetStencilReference
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBindDescriptorSets
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBindIndexBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBindVertexBuffers
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDraw
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndexed
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndirect
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatch
• The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatchIndirect
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdBlitImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBufferToImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImageToBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdUpdateBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdFillBuffer
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearColorImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearDepthStencilImage
• The VkCommandPool that commandBuffer was allocated from, in vkCmdClearAttachments
- The VkCommandPool that commandBuffer was allocated from, in vkCmdResolveImage
- The VkCommandPool that commandBuffer was allocated from, in vkCmdSetEvent
- The VkCommandPool that commandBuffer was allocated from, in vkCmdResetEvent
- The VkCommandPool that commandBuffer was allocated from, in vkCmdWaitEvents
- The VkCommandPool that commandBuffer was allocated from, in vkCmdPipelineBarrier
- The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginQuery
- The VkCommandPool that commandBuffer was allocated from, in vkCmdEndQuery
- The VkCommandPool that commandBuffer was allocated from, in vkCmdResetQueryPool
- The VkCommandPool that commandBuffer was allocated from, in vkCmdWriteTimestamp
- The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyQueryPoolResults
- The VkCommandPool that commandBuffer was allocated from, in vkCmdPushConstants
- The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginRenderPass
- The VkCommandPool that commandBuffer was allocated from, in vkCmdNextSubpass
- The VkCommandPool that commandBuffer was allocated from, in vkCmdEndRenderPass
- The VkCommandPool that commandBuffer was allocated from, in vkCmdExecuteCommands
- The VkCommandPool that commandBuffer was allocated from, in vkCmdSetDeviceMask
- The VkCommandPool that commandBuffer was allocated from, in vkCmdDispatchBase
- The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndirectCount
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdDrawIndexedIndirectCount
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdBeginRenderPass2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdNextSubpass2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdEndRenderPass2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdSetEvent2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdResetEvent2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdWaitEvents2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdPipelineBarrier2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdWriteTimestamp2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBuffer2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImage2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyBufferToImage2
  - The VkCommandPool that commandBuffer was allocated from, in vkCmdCopyImageToBuffer2

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other Vulkan client applications in the system. In particular, any guarantees made by an operating system about whether memory from one process **can** be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application’s use of a particular feature or extension.

**Note**

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the `protectedMemory` feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in [Protected Memory Access Rules](#).

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan’s minimum supported values for these limits and features, or some subset of other known values.

Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

**Note**

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.
Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labelled “Valid Usage” following each command or structure they apply to.

### 3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications **should** not enable validation layers by default.

### 3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered **implicit**, and are described in a block labelled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

**Valid Usage for Object Handles**

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in the Specification.
- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, **must** also be valid.

The reserved values **VK_NULL_HANDLE** and **NULL** can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when explicitly called out in the Specification. Any command that creates an object successfully **must** not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

**Valid Usage for Pointers**

Any parameter that is a pointer **must** be a **valid pointer** only if it is explicitly called out by a Valid Usage statement.
A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

**Valid Usage for Strings**

Any parameter that is a pointer to `char` must be a finite sequence of values terminated by a null character, or if explicitly called out in the Specification, can be `NULL`.

**Valid Usage for Enumerated Types**

Any parameter of an enumerated type must be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with `_MAX_ENUM`.
  - This value exists only to ensure that C `enum` types are 32 bits in size and must not be used by applications.
- If the enumerant is used in a function that has a `VkInstance` as its first parameter and either:
  - it was added by a core version that is supported (as reported by `vkEnumerateInstanceVersion`) and the value of `VkApplicationInfo::apiVersion` is greater than or equal to the version that added it; or
  - it was added by an instance extension that was enabled for the instance.
- If the enumerant is used in a function that has a `VkPhysicalDevice` object as its first parameter and either:
  - it was added by a core version that is supported by that device (as reported by `VkPhysicalDeviceProperties::apiVersion`); or
  - it was added by an instance extension that was enabled for the instance; or
  - it was added by a device extension that is supported by that device.
- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
  - it was added by a core version that is supported for the device (as reported by `VkPhysicalDeviceProperties::apiVersion`); or
  - it was added by a device extension that was enabled for the device.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application must not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

**Note**

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.
Valid Usage for Flags

A collection of flags is represented by a bitmask using the type `VkFlags`:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but `VkFlags` is not used directly in the API. Instead, a `Vk*Flags` type which is an alias of `VkFlags`, and whose name matches the corresponding `Vk*FlagBits` that are valid for that type, is used.

Any `Vk*Flags` member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a `Vk*Flags` type if it would be a valid enumerant when used with the equivalent `Vk*FlagBits` type, where the bits type is obtained by taking the flag type and replacing the trailing `Flags` with `FlagBits`. For example, a flag value of type `VkColorComponentFlags` must contain only bit flags defined by `VkColorComponentFlagBits`.

Any `Vk*Flags` member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding `Vk*FlagBits` type. An application cannot rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

```c
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
```

A collection of 64-bit flags is represented by a bitmask using the type `VkFlags64`:
typedef uint64_t VkFlags64;

When the 31 bits available in VkFlags are insufficient, the VkFlags64 type can be passed to commands and structures to represent up to 64 options. VkFlags64 is not used directly in the API. Instead, a VkFlags2 type which is an alias of VkFlags64, and whose name matches the corresponding Vk*FlagBits2 that are valid for that type, is used.

Any Vk*Flags2 member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags2 type if it would be a valid enumerant when used with the equivalent Vk*FlagBits2 type, where the bits type is obtained by taking the flag type and replacing the trailing Flags2 with FlagBits2. For example, a flag value of type VkAccessFlags2KHR must contain only bit flags defined by VkAccessFlagBits2KHR.

Any Vk*Flags2 member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits2 type. An application cannot rely on the state of these unspecified bits.

Note
Both the Vk*FlagBits2 type, and the individual bits defined for that type, are defined as uint64_t integers in the C API. This is in contrast to the 32-bit types, where the Vk*FlagBits type is defined as a C enum and the individual bits as enumerants belonging to that enum. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit enum type in C99.

Valid Usage for Structure Types

Any parameter that is a structure containing a sType member must have a value of sType which is a valid VkStructureType value matching the type of the structure.

Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a void* pNext member must have a value of pNext that is either NULL, or is a pointer to a valid extending structure, containing sType and pNext members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by pNext pointers is referred to as a pNext chain.

Each structure included in the pNext chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a pNext chain, including any aliases. This general rule may be explicitly overridden for specific structures.
Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the sType and pNext members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The `VkBaseInStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
  VkStructureType sType;
  const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- sType is the structure type of the structure being iterated through.
- pNext is NULL or a pointer to the next structure in a structure chain.

`VkBaseInStructure` can be used to facilitate iterating through a read-only structure pointer chain.

The `VkBaseOutStructure` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
  VkStructureType sType;
  struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- sType is the structure type of the structure being iterated through.
- pNext is NULL or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

**Valid Usage for Nested Structures**

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

**Valid Usage for Extensions**

Instance-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.
Physical-device-level functionality or behavior added by an instance extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by a device extension to the API must not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Valid Usage for Newer Core Versions

Instance-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the instance as determined by `vkEnumerateInstanceVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Physical-device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the physical device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Device-level functionality or behavior added by a new core version of the API must not be used unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

### 3.8. VkResult Return Codes

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:

- Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.
- Run time error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via `VkResult` return values. The possible codes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkResult {  
    VK_SUCCESS = 0,  
    VK_NOT_READY = 1,  
    VK_TIMEOUT = 2,  
    VK_EVENT_SET = 3,  
    VK_EVENT_RESET = 4,  
    VK_INCOMPLETE = 5,  
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,  
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
};
```
VK_ERROR_INITIALIZATION_FAILED = -3,
VK_ERROR_DEVICE_LOST = -4,
VK_ERROR_MEMORY_MAP_FAILED = -5,
VK_ERROR_LAYER_NOT_PRESENT = -6,
VK_ERROR_EXTENSION_NOT_PRESENT = -7,
VK_ERROR_FEATURE_NOT_PRESENT = -8,
VK_ERROR_INCOMPATIBLE_DRIVER = -9,
VK_ERROR_TOO_MANY_OBJECTS = -10,
VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
VK_ERROR_FRAGMENTED_POOL = -12,
VK_ERROR_UNKNOWN = -13,
// Provided by VK_VERSION_1_1
VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
// Provided by VK_VERSION_1_1
VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
// Provided by VK_VERSION_1_2
VK_ERROR_FRAGMENTATION = -1000161000,
// Provided by VK_VERSION_1_2
VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
// Provided by VK_VERSION_1_3
VK_PIPELINE_COMPILE_REQUIRED = 1000297000,
// Provided by VK_KHR_surface
VK_ERROR_SURFACE_LOST_KHR = -1000000000,
// Provided by VK_KHR_surface
VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
// Provided by VK_KHR_swapchain
VK_SUBOPTIMAL_KHR = 1000001003,
// Provided by VK_KHR_swapchain
VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
// Provided by VK_KHR_display_swapchain
VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
// Provided by VK_KHR_video_queue
VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR = -1000023001,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR = -1000023002,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR = -1000023003,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR = -1000023004,
// Provided by VK_KHR_video_queue
VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR = -1000023005,
// Provided by VK_KHR_global_priority
VK_ERROR_NOT_PERMITTED_KHR = -1000174001,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_IDLE_KHR = 1000268000,
// Provided by VK_KHR_deferred_host_operations
VK_THREAD_DONE_KHR = 1000268001,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_DEFERRED_KHR = 1000268002,
// Provided by VK_KHR_deferred_host_operations
VK_OPERATION_NOT_DEFERRED_KHR = 1000268003,
#endif

// Provided by VK_KHR_video_encode_queue
// Provided by VK_KHR_maintenance1
// Provided by VK_KHR_external_memory
// Provided by VK_KHR_buffer_device_address
} VkResult;

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
- **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.
- **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.
- **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.
- **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.
- **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.
- **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

Error codes

- **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.
- **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.
- **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.
- **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device
- **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.
• **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.

• **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.

• **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.

• **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

• **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

• **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.

• **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool’s memory. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This **should** be returned in preference to **VK_ERROR_OUT_OF_POOL_MEMORY**, but only if the implementation is certain that the pool allocation failure was due to fragmentation.

• **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.

• **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.

• **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

• **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.

• **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** **should** be returned instead.

• **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.

• **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.

• **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.

• **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested `VkImageUsageFlags` are not supported.

• **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via `VkVideoProfileInfoKHR::videoCodecOperation` is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested `VkVideoProfileInfoKHR` chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested `VkVideoProfileInfoKHR` chain are not supported.

• **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not
supported.

- **VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR** The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

- **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with `sType` and `pNext` fields, those fields will be unmodified. Any structures chained from `pNext` will also have undefined contents, except that `sType` and `pNext` will be unmodified.

**VK_ERROR_OUT_OF_*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created can still be used by the application.

**Note**
As a general rule, Free, Release, and Reset commands do not return `VK_ERROR_OUT_OF_HOST_MEMORY`, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it may be returned from any command returning a `VkResult`.

**Note**
`VK_ERROR_UNKNOWN` is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If `VK_ERROR_UNKNOWN` is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (`vkCmd*`) runtime errors are reported by `vkEndCommandBuffer`.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the Precision and Operation of SPIR-V Instructions section.
In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the Precision and Operation of SPIR-V Instructions section.

Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values must be at least $2^{32}$.

\[ x \times 0 = 0 \times x = 0 \] for any non-infinite and non-NaN \( x \).

\[ 1 \times x = x \times 1 = x \]

\[ x + 0 = 0 + x = x \]

\[ 0^0 = 1. \]

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values \( \text{Inf} \) and \( -\text{Inf} \) encode values with magnitudes too large to be represented; the special value \( \text{NaN} \) encodes “Not A Number” values resulting from undefined arithmetic operations such as \( 0 / 0 \). Implementations may support \( \text{Inf} \) and \( \text{NaN} \) in their floating-point computations. Any computation which does not support either \( \text{Inf} \) or \( \text{NaN} \), for which that value is an input or output will yield an undefined value.

### 3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.
3.9.3. 16-Bit Floating-Point Numbers

16-bit floating point numbers are defined in the “16-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating point numbers are defined in the “Unsigned 11-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating point numbers are defined in the “Unsigned 10-bit floating point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, \( b \) denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, \( b \) is the bit width of that type. When the integer comes from an image containing color or depth component texels, \( b \) is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be \( b \)-bit binary two’s-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion from Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range \([0,1]\). The conversion from an unsigned normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is defined as
Signed normalized fixed-point integers represent numbers in the range [-1,1]. The conversion from a signed normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is performed using

\[
f = \frac{c}{2^b - 1}
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range [-1,1]. For example, if \( b = 8 \), then the integer value -127 corresponds to -1.0 and the value 127 corresponds to 1.0. This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (e.g., -128 in the example) is outside the representable range, and implementations must clamp it to 0.0. Where the value is subject to further processing by the implementation, e.g., during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion from Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \( f \) to the corresponding unsigned normalized fixed-point value \( c \) is defined by first clamping \( f \) to the range [0,1], then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where convertFloatToUint(r, b) returns one of the two unsigned binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations should round to nearest. If \( r \) is equal to an integer, then that integer value must be returned. In particular, if \( f \) is equal to 0.0 or 1.0, then \( c \) must be assigned 0 or \( 2^b - 1 \), respectively.

The conversion from a floating-point value \( f \) to the corresponding signed normalized fixed-point value \( c \) is performed by clamping \( f \) to the range [-1,1], then computing

\[
c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)
\]

where convertFloatToInt(r, b) returns one of the two signed two's-complement binary integer values with exactly \( b \) bits which are closest to the floating-point value \( r \). Implementations should round to nearest. If \( r \) is equal to an integer, then that integer value must be returned. In particular, if \( f \) is equal to -1.0, 0.0, or 1.0, then \( c \) must be assigned \(-2^{b-1} - 1\), 0, or \( 2^{b-1} - 1 \), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and
are described here. These types include offsets, extents, and rectangles.

3.11.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;
```

- x is the x offset.
- y is the y offset.

A three-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t x;
    int32_t y;
    int32_t z;
} VkOffset3D;
```

- x is the x offset.
- y is the y offset.
- z is the z offset.

3.11.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.

A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
    uint32_t width;
    uint32_t height;
} VkExtent2D;
```

- width is the width of the extent.
• `height` is the height of the extent.

A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkExtent3D;
```

• `width` is the width of the extent.
• `height` is the height of the extent.
• `depth` is the depth of the extent.

### 3.11.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
    VkOffset2D offset;
    VkExtent2D extent;
} VkRect2D;
```

• `offset` is a `VkOffset2D` specifying the rectangle offset.
• `extent` is a `VkExtent2D` specifying the rectangle extent.

### 3.11.4. Structure Types

Each value corresponds to a particular structure with a `sType` member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the structure, stripping the leading `Vk`, prefixing each capital letter with `_`, converting the entire resulting string to upper case, and prefixing it with `VK_STRUCTURE_TYPE_`. For example, structures of type `VkImageCreateInfo` correspond to a `VkStructureType` value of `VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO`, and thus a structure of this type must have its `sType` member set to this value before it is passed to the API.

The values `VK_STRUCTURE_TYPE_LOADER_INSTANCE_CREATE_INFO` and `VK_STRUCTURE_TYPE_LOADER_DEVICE_CREATE_INFO` are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:
typedef enum VkStructureType {
    VK_STRUCTURE_TYPE_APPLICATION_INFO = 0,
    VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO = 1,
    VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO = 2,
    VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO = 3,
    VK_STRUCTURE_TYPE_SUBMIT_INFO = 4,
    VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO = 5,
    VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE = 6,

3.12. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.

Note

VK_STENCIL_FRONT_AND_BACK is an example of a typo alias. It was initially defined as part of VkStencilFaceFlagBits. Once the naming inconsistency was noticed, it was renamed to VK_STENCIL_FACE_FRONT_AND_BACK, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

Note

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

- `instance` is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.
- `pName` is the name of the command to obtain.

`vkGetInstanceProcAddr` itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for `vkGetInstanceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type PFN_vkVoidFunction, and must be cast to the type of the command being queried before use.

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>*¹</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid non-NULL instance</td>
<td>*¹</td>
<td>undefined</td>
</tr>
<tr>
<td>NULL</td>
<td>global command²</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>pName</td>
<td>return value</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>NULL</td>
<td>vkGetInstanceProcAddr</td>
<td>fp(^5)</td>
</tr>
<tr>
<td>instance</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core dispatchable command</td>
<td>fp(^3)</td>
</tr>
<tr>
<td>instance</td>
<td>enabled instance extension dispatchable command for instance</td>
<td>fp(^3)</td>
</tr>
<tr>
<td>instance</td>
<td>available device extension(^4) dispatchable command for instance</td>
<td>fp(^3)</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td>NULL</td>
</tr>
</tbody>
</table>

1

"\#\#\#" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: vkEnumerateInstanceVersion, vkEnumerateInstanceExtensionProperties, vkEnumerateInstanceLayerProperties, and vkCreateInstance. Dispatchable commands are all other commands which are not global.

3

The returned function pointer must only be called with a dispatchable object (the first parameter) that is instance or a child of instance, e.g. VkInstance, VkPhysicalDevice, VkDevice, VkQueue, or VkCommandBuffer.

4

An “available device extension” is a device extension supported by any physical device enumerated by instance.

5

Starting with Vulkan 1.2, vkGetInstanceProcAddr can resolve itself with a NULL instance pointer.

**Valid Usage (Implicit)**

- VUID-vkGetInstanceProcAddr-instance-parameter
  
  If instance is not NULL, instance must be a valid VkInstance handle

- VUID-vkGetInstanceProcAddr-pName-parameter
  
  pName must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by vkGetInstanceProcAddr may point to dispatch code that calls a different real implementation for different VkDevice objects or their child objects. The overhead of the internal dispatch for VkDevice
objects can be avoided by obtaining device-specific function pointers for any commands that use a device or device-child object as their dispatchable object. Such function pointers can be obtained with the command:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use. The function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

<table>
<thead>
<tr>
<th><code>device</code></th>
<th><code>pName</code></th>
<th><code>return value</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>NULL</code></td>
<td>*$^1$</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*$^1$</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td><code>NULL</code></td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>requested core version$^2$</td>
<td>fp$^4$</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>command$^3$</td>
<td></td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td>fp$^4$</td>
</tr>
<tr>
<td></td>
<td>device-level dispatchable</td>
<td></td>
</tr>
<tr>
<td></td>
<td>command$^3$</td>
<td></td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td></td>
<td><code>NULL</code></td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2

Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. Core commands beyond that version which are supported by the implementation may either return `NULL` or a function pointer, though the function pointer must not be called.

3

In this function, device-level excludes all physical-device-level commands.

4

The returned function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice`, `VkQueue`, or `VkCommandBuffer`. 
Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceProcAddr-pName-parameter
  - `pName` must be a null-terminated UTF-8 string

The definition of `PFN_vkVoidFunction` is:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.

### 4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when the physical-device version is greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling `vkGetPhysicalDeviceProperties`.

### 4.1.2. Extending Physical Device From Device Extensions

When the `VK_KHR_get_physical_device_properties2` extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by `vkEnumerateDeviceExtensionProperties` for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use `vkGetInstanceProcAddr`. This function pointer may point to dispatch code, which calls a different real implementation for different `VkPhysicalDevice` objects. Applications must not use a `VkPhysicalDevice` in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the `pNext` chain of physical-device-level commands.

### 4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a `VkInstance` object. Creating a `VkInstance` object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by `VkInstance` handles:
To query the version of instance-level functionality supported by the implementation, call:

```
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

```
Note
The intended behaviour of `vkEnumerateInstanceVersion` is that an implementation should not need to perform memory allocations and should unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, may return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.
```

Valid Usage (Implicit)

- `VUID-vkEnumerateInstanceVersion-pApiVersion-parameter`  
  `pApiVersion` must be a valid pointer to a `uint32_t` value

Return Codes

Success  
- `VK_SUCCESS`

Failure  
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.
vkCreateInstance verifies that the requested layers exist. If not, vkCreateInstance will return VK_ERROR_LAYER_NOT_PRESENT. Next vkCreateInstance verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, vkCreateInstance must return VK_ERROR_EXTENSION_NOT_PRESENT. After verifying and enabling the instance layers and extensions the VkInstance object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at vkCreateInstance time for the creation to succeed.

**Valid Usage**

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All required extensions for each extension in the VkInstanceCreateInfo::ppEnabledExtensionNames list must also be present in that list.

**Valid Usage (Implicit)**

- VUID-vkCreateInstance-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkInstanceCreateInfo structure.
- VUID-vkCreateInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.
- VUID-vkCreateInstance-pInstance-parameter
  pInstance must be a valid pointer to a VkInstance handle.

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_LAYER_NOT_PRESENT
- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INCOMPATIBLE_DRIVER

The VkInstanceCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkInstanceCreateInfo {
  VkStructureType          sType;
} VkInstanceCreateInfo;
```
```c
const void* pNext;
VkInstanceCreateFlags flags;
const VkApplicationInfo* pApplicationInfo;
uint32_t enabledLayerCount;
const char* const* ppEnabledLayerNames;
const char* const* ppEnabledExtensionNames;
}
VkInstanceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkInstanceCreateFlagBits` indicating the behavior of the instance.
- `pApplicationInfo` is `NULL` or a pointer to a `VkApplicationInfo` structure. If not `NULL`, this information helps implementations recognize behavior inherent to classes of applications. `VkApplicationInfo` is defined in detail below.
- `enabledLayerCount` is the number of global layers to enable.
- `ppEnabledLayerNames` is a pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.
- `enabledExtensionCount` is the number of global extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable.

### Valid Usage

- VUID-VkInstanceCreateInfo-flags-06559
  If `flags` has the `VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR` bit set, the list of enabled extensions in `ppEnabledExtensionNames` must contain `VK_KHR_portability Enumeration`

### Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO`

- VUID-VkInstanceCreateInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkInstanceCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkInstanceCreateFlagBits` values

- VUID-VkInstanceCreateInfo-pApplicationInfo-parameter
  If `pApplicationInfo` is not `NULL`, `pApplicationInfo` must be a valid pointer to a valid
**VkApplicationInfo** structure

- **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings

- **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings

```c
// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
    // Provided by VK_KHR_portability_enumeration
    VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;
```

- **`VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR`** specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;
```

`VkInstanceCreateFlags` is a bitmask type for setting a mask of zero or more `VkInstanceCreateFlagBits`.

The **VkApplicationInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType   sType;
    const void*       pNext;
    const char*       pApplicationName;
    uint32_t          applicationVersion;
    const char*       pEngineName;
    uint32_t          engineVersion;
    uint32_t          apiVersion;
} VkApplicationInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pApplicationName** is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.
- **applicationVersion** is an unsigned integer variable containing the developer-supplied version number of the application.
• `pEngineName` is `NULL` or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.

• `engineVersion` is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.

• `apiVersion` must be the highest version of Vulkan that the application is designed to use, encoded as described in `Version Numbers`. The patch version number specified in `apiVersion` is ignored when creating an instance object. The variant version of the instance must match that requested in `apiVersion`.

Vulkan 1.0 implementations were required to return `VK_ERROR_INCOMPATIBLE_DRIVER` if `apiVersion` was larger than 1.0. Implementations that support Vulkan 1.1 or later must not return `VK_ERROR_INCOMPATIBLE_DRIVER` for any value of `apiVersion`.

Note
Because Vulkan 1.0 implementations may fail with `VK_ERROR_INCOMPATIBLE_DRIVER`, applications should determine the version of Vulkan available before calling `vkCreateInstance`. If the `vkGetInstanceProcAddr` returns `NULL` for `vkEnumerateInstanceVersion`, it is a Vulkan 1.0 implementation. Otherwise, the application can call `vkEnumerateInstanceVersion` to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application can use different versions of Vulkan with an instance than it does with a device or physical device.

Note
The Khronos validation layers will treat `apiVersion` as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets `apiVersion` to 1.2, the application can use the following versions of Vulkan:

• Vulkan 1.0 can be used with the instance and with all physical devices.
• Vulkan 1.1 can be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
• Vulkan 1.2 can be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets `apiVersion` to 1.1, then the application must not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

Note
Providing a `NULL VkInstanceCreateInfo::pApplicationInfo` or providing an
apiVersion of 0 is equivalent to providing an apiVersion of VK_MAKE_API_VERSION(0,1,0,0).

Valid Usage

• VUID-VkApplicationInfo-apiVersion-04010
  If apiVersion is not 0, then it must be greater than or equal to VK_API_VERSION_1_0

Valid Usage (Implicit)

• VUID-VkApplicationInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_APPLICATION_INFO
• VUID-VkApplicationInfo-pNext-pNext
  pNext must be NULL
• VUID-VkApplicationInfo-pApplicationName-parameter
  If pApplicationName is not NULL, pApplicationName must be a null-terminated UTF-8 string
• VUID-VkApplicationInfo-pEngineName-parameter
  If pEngineName is not NULL, pEngineName must be a null-terminated UTF-8 string

To destroy an instance, call:

```c
#include <vk11.h>

// Provided by VK_VERSION_1_0
void vkDestroyInstance(
    VkInstance instance,
    const VkAllocationCallbacks* pAllocator);
```

• instance is the handle of the instance to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyInstance-instance-00629
  All child objects created using instance must have been destroyed prior to destroying instance
• VUID-vkDestroyInstance-instance-00630
  If VkAllocationCallbacks were provided when instance was created, a compatible set of callbacks must be provided here
• VUID-vkDestroyInstance-instance-00631
  If no VkAllocationCallbacks were provided when instance was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If `instance` is not `NULL`, `instance` must be a valid `VkInstance` handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

Host Synchronization

- Host access to `instance` must be externally synchronized
- Host access to all `VkPhysicalDevice` objects enumerated from `instance` must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of physical and logical devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by VkPhysicalDevice handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,       // Provided by VkInstance
    uint32_t* pPhysicalDeviceCount, // Provided by uint32_t
    VkPhysicalDevice* pPhysicalDevices); // Provided by VkPhysicalDevice
```

- **instance** is a handle to a Vulkan instance previously created with vkCreateInstance.
- **pPhysicalDeviceCount** is a pointer to an integer related to the number of physical devices available or queried, as described below.
- **pPhysicalDevices** is either NULL or a pointer to an array of VkPhysicalDevice handles.

If **pPhysicalDevices** is NULL, then the number of physical devices available is returned in **pPhysicalDeviceCount**. Otherwise, **pPhysicalDeviceCount** must point to a variable set by the user to the number of elements in the **pPhysicalDevices** array, and on return the variable is overwritten with the number of handles actually written to **pPhysicalDevices**. If **pPhysicalDeviceCount** is less than the number of physical devices available, at most **pPhysicalDeviceCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available physical devices were returned.

Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDevices-instance-parameter
  - **instance** must be a valid VkInstance handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
\textbf{Return Codes}

\textbf{Success}

\begin{itemize}
  \item VK\_SUCCESS
  \item VK\_INCOMPLETE
\end{itemize}

\textbf{Failure}

\begin{itemize}
  \item VK\_ERROR\_OUT\_OF\_HOST\_MEMORY
  \item VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY
  \item VK\_ERROR\_INITIALIZATION\_FAILED
\end{itemize}

To query general properties of physical devices once enumerated, call:

```
// Provided by VK\_VERSION\_1\_0
void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice physicalDevice, 
    VkPhysicalDeviceProperties* pProperties);
```

- \texttt{physicalDevice} is the handle to the physical device whose properties will be queried.
- \texttt{pProperties} is a pointer to a \texttt{VkPhysicalDeviceProperties} structure in which properties are returned.

\textbf{Valid Usage (Implicit)}

\begin{itemize}
  \item VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
      \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
  \item VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
      \texttt{pProperties} must be a valid pointer to a \texttt{VkPhysicalDeviceProperties} structure
\end{itemize}

The \texttt{VkPhysicalDeviceProperties} structure is defined as:

```
// Provided by VK\_VERSION\_1\_0
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
} VkPhysicalDeviceProperties;
```
uint32_t deviceID;
VkPhysicalDeviceType deviceType;
char deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
pipelineCacheUUID[VK_UUID_SIZE];
limits;
sparseProperties;
}
VkPhysicalDeviceProperties;

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the vendor (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a `VkPhysicalDeviceType` specifying the type of device.
- **deviceName** is an array of `VK_MAX_PHYSICAL_DEVICE_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of `VK_UUID_SIZE` uint8_t values representing a universally unique identifier for the device.
- **limits** is the `VkPhysicalDeviceLimits` structure specifying device-specific limits of the physical device. See Limits for details.
- **sparseProperties** is the `VkPhysicalDeviceSparseProperties` structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

**Note**
The value of **apiVersion** may be different than the version returned by `vkEnumerateInstanceVersion`; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The `pApiVersion` parameter returned by `vkEnumerateInstanceVersion` is the version associated with a `VkInstance` and its children, except for a `VkPhysicalDevice` and its children. `VkPhysicalDeviceProperties::apiVersion` is the version associated with a `VkPhysicalDevice` and its children.

**Note**
The encoding of **driverVersion** is implementation-defined. It may not use the same encoding as **apiVersion**. Applications should follow information from the vendor on how to extract the version information from **driverVersion**.

On implementations that claim support for the Roadmap 2022 profile, the major and minor version expressed by **apiVersion** must be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device characteristics that are not adequately exposed by other Vulkan queries.
Note

These may include performance profiles, hardware errata, or other characteristics.

The vendor identified by vendorID is the entity responsible for the most salient characteristics of the underlying implementation of the VkPhysicalDevice being queried.

Note

For example, in the case of a discrete GPU implementation, this should be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this should be the supplier of the silicon IP used to create the accelerator.

If the vendor has a PCI vendor ID, the low 16 bits of vendorID must contain that PCI vendor ID, and the remaining bits must be set to zero. Otherwise, the value returned must be a valid Khronos vendor ID, obtained as described in the Vulkan Documentation and Extensions: Procedures and Conventions document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the VkVendorId type.

The vendor is also responsible for the value returned in deviceID. If the implementation is driven primarily by a PCI device with a PCI device ID, the low 16 bits of deviceID must contain that PCI device ID, and the remaining bits must be set to zero. Otherwise, the choice of what values to return may be dictated by operating system or platform policies - but should uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

Note

The same device ID should be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration should use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which may be returned in VkPhysicalDeviceProperties::vendorID are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_VIV    = 0x10001,
    VK_VENDOR_ID_VSI    = 0x10002,
    VK_VENDOR_ID_KAZAN  = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA   = 0x10005,
    VK_VENDOR_ID_POCL   = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```
Note

Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding vk.xml API Registry, and of the corresponding vulkan_core.h header file must contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

VK_MAX_PHYSICAL_DEVICE_NAME_SIZE is the length in char values of an array containing a physical device name string, as returned in VkPhysicalDeviceProperties::deviceName.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE  256U
```

The physical device types which may be returned in VkPhysicalDeviceProperties::deviceType are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- **VK_PHYSICAL_DEVICE_TYPE_OTHER** - the device does not match any other available types.
- **VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU** - the device is typically one embedded in or tightly coupled with the host.
- **VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU** - the device is typically a separate processor connected to the host via an interlink.
- **VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU** - the device is typically a virtual node in a virtualization environment.
- **VK_PHYSICAL_DEVICE_TYPE_CPU** - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type may correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```
or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pProperties` is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in `pProperties` and its `pNext` chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter`  
  `pProperties` must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {  
    VkStructureType sType;  
    void* pNext;  
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `properties` is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The `pNext` chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProperties2-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2}

- VUID-VkPhysicalDeviceProperties2-pNext-pNext

- VUID-VkPhysicalDeviceProperties2-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

The \texttt{VkPhysicalDeviceVulkan11Properties} structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
} VkPhysicalDeviceVulkan11Properties;
```
VkBool32 subgroupQuadOperationsInAllStages;
VkPointClippingBehavior pointClippingBehavior;
uint32_t maxMultiviewViewCount;
uint32_t maxMultiviewInstanceIndex;
VkBool32 protectedNoFault;
uint32_t maxPerSetDescriptors;
VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the device.
- **driverUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of VK_LUID_SIZE uint8_t values representing a locally unique identifier for the device.
- **deviceNodeMask** is a uint32_t bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be VK_TRUE if deviceLUID contains a valid LUID and deviceNodeMask contains a valid node mask, and VK_FALSE if they do not.
- **subgroupSize** is the default number of invocations in each subgroup. subgroupSize is at least 1 if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. subgroupSize is a power-of-two.
- **subgroupSupportedStages** is a bitfield of VkShaderStageFlagBits describing the shader stages that group operations with subgroup scope are supported in. subgroupSupportedStages will have the VK_SHADER_STAGE_COMPUTE_BIT bit set if any of the physical device’s queues support VK_QUEUE_COMPUTE_BIT.
- **subgroupSupportedOperations** is a bitmask of VkSubgroupFeatureFlagBits specifying the sets of group operations with subgroup scope supported on this device. subgroupSupportedOperations will have the VK_SUBGROUP_FEATURE_BASIC_BIT bit set if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT.
- **subgroupQuadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.
- **pointClippingBehavior** is a VkPointClippingBehavior value specifying the point clipping behavior supported by the implementation.
- **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.
- **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.
- **protectedNoFault** specifies how an implementation behaves when an application attempts to
write to unprotected memory in a protected queue operation, read from protected memory in
an unprotected queue operation, or perform a query in a protected queue operation. If this limit
is VK_TRUE, such writes will be discarded or have undefined values written, reads and queries
will return undefined values. If this limit is VK_FALSE, applications must not perform these
operations. See Protected Memory Access Rules for more information.

- maxPerSetDescriptors is a maximum number of descriptors (summed over all descriptor types)
in a single descriptor set that is guaranteed to satisfy any implementation-dependent
constraints on the size of a descriptor set itself. Applications can query whether a descriptor set
that goes beyond this limit is supported using vkGetDescriptorSetLayoutSupport.

- maxMemoryAllocationSize is the maximum size of a memory allocation that can be created, even
if there is more space available in the heap.

If the VkPhysicalDeviceVulkan11Properties structure is included in the pNext chain of the
VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with
each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of VkPhysicalDeviceVulkan11Properties have the same values as the corresponding
members of VkPhysicalDeviceIDProperties, VkPhysicalDeviceSubgroupProperties,
VkPhysicalDevicePointClippingProperties, VkPhysicalDeviceMultiviewProperties,
VkPhysicalDeviceProtectedMemoryProperties, and VkPhysicalDeviceMaintenance3Properties.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Properties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_PROPERTIES

The VkPhysicalDeviceVulkan12Properties structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Properties {
    VkStructureType sType;
    void* pNext;
    VkDriverId driverID;
    char char;
    char char;
    VkConformanceVersion conformanceVersion;
    VkShaderFloatControlsIndependence denormBehaviorIndependence;
    VkShaderFloatControlsIndependence roundingModeIndependence;
    VkBool32 shaderSignedZeroInfNanPreserveFloat16;
    VkBool32 shaderSignedZeroInfNanPreserveFloat32;
    VkBool32 shaderSignedZeroInfNanPreserveFloat64;
    VkBool32 shaderDenormPreserveFloat16;
    VkBool32 shaderDenormPreserveFloat32;
    VkBool32 shaderDenormPreserveFloat64;
    VkBool32 shaderDenormFlushToZeroFloat16;
```

VkBool32 shaderDenormFlushToZeroFloat32;

VkResolveModeFlags supportedDepthResolveModes;
VkResolveModeFlags supportedStencilResolveModes;
VkBool32 independentResolveNone;
VkBool32 independentResolve;
VkBool32 filterMinmaxSingleComponentFormats;
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **driverID** is a unique identifier for the driver of the physical device.

• **driverName** is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.

• **driverInfo** is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.

• **conformanceVersion** is the version of the Vulkan conformance test this driver is conformant against (see `VkConformanceVersion`).

• **denormBehaviorIndependence** is a `VkShaderFloatControlsIndependence` value indicating whether, and how, denorm behavior can be set independently for different bit widths.

• **roundingModeIndependence** is a `VkShaderFloatControlsIndependence` value indicating whether, and how, rounding modes can be set independently for different bit widths.

• **shaderSignedZeroInfNanPreserveFloat16** is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 16-bit floating-point types.

• **shaderSignedZeroInfNanPreserveFloat32** is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 32-bit floating-point types.

• **shaderSignedZeroInfNanPreserveFloat64** is a boolean value indicating whether sign of a zero, Nans and ±∞ can be preserved in 64-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 64-bit floating-point types.

• **shaderDenormPreserveFloat16** is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 16-bit floating-point types.

• **shaderDenormPreserveFloat32** is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 32-bit floating-point types.

• **shaderDenormPreserveFloat64** is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 64-bit floating-point types.

• **shaderDenormFlushToZeroFloat16** is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 16-bit floating-point types.

• **shaderDenormFlushToZeroFloat32** is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 32-bit floating-point types.
execution mode can be used for 32-bit floating-point types.

- shaderDenormFlushToZeroFloat64 is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the DenormFlushToZero execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTEFloat16 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTEFloat32 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTEFloat64 is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTE execution mode can be used for 64-bit floating-point types.

- shaderRoundingModeRTZFloat16 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 16-bit floating-point types.

- shaderRoundingModeRTZFloat32 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 32-bit floating-point types.

- shaderRoundingModeRTZFloat64 is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the RoundingModeRTZ execution mode can be used for 64-bit floating-point types.

- maxUpdateAfterBindDescriptorsInAllPools is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

- shaderUniformBufferArrayNonUniformIndexingNative is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is VK_FALSE, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

- shaderSampledImageArrayNonUniformIndexingNative is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is VK_FALSE, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

- shaderStorageBufferArrayNonUniformIndexingNative is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is VK_FALSE, then a
single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

- **shaderStorageImageArrayNonUniformIndexingNative** is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is VK_FALSE, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

- **shaderInputAttachmentArrayNonUniformIndexingNative** is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is VK_FALSE, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

- **robustBufferAccessUpdateAfterBind** is a boolean value indicating whether robustBufferAccess can be enabled on a device simultaneously with descriptorBindingUniformBufferUpdateAfterBind, descriptorBindingStorageBufferUpdateAfterBind, descriptorBindingUniformTexelBufferUpdateAfterBind, and/or descriptorBindingStorageTexelBufferUpdateAfterBind. If this is VK_FALSE, then either robustBufferAccess must be disabled or all of these update-after-bind features must be disabled.

- **quadDivergentImplicitLod** is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See **Derivative Image Operations**.

- **maxPerStageDescriptorUpdateAfterBindSamplers** is similar to maxPerStageDescriptorSamplers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindUniformBuffers** is similar to maxPerStageDescriptorUniformBuffers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageBuffers** is similar to maxPerStageDescriptorStorageBuffers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindSampledImages** is similar to maxPerStageDescriptorSampledImages but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageImages** is similar to maxPerStageDescriptorStorageImages but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageDescriptorUpdateAfterBindInputAttachments** is similar to maxPerStageDescriptorInputAttachments but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxPerStageUpdateAfterBindResources** is similar to maxPerStageResources but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindSamplers** is similar to maxDescriptorSetSamplers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.
• \texttt{maxDescriptorSetUpdateAfterBindUniformBuffers} is similar to \texttt{maxDescriptorSetUniformBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

• \texttt{maxDescriptorSetUpdateAfterBindUniformBuffersDynamic} is similar to \texttt{maxDescriptorSetUniformBuffersDynamic} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT}, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT}.

• \texttt{maxDescriptorSetUpdateAfterBindStorageBuffers} is similar to \texttt{maxDescriptorSetStorageBuffers} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

• \texttt{maxDescriptorSetUpdateAfterBindStorageBuffersDynamic} is similar to \texttt{maxDescriptorSetStorageBuffersDynamic} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT}, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT}.

• \texttt{maxDescriptorSetUpdateAfterBindSampledImages} is similar to \texttt{maxDescriptorSetSampledImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

• \texttt{maxDescriptorSetUpdateAfterBindStorageImages} is similar to \texttt{maxDescriptorSetStorageImages} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

• \texttt{maxDescriptorSetUpdateAfterBindInputAttachments} is similar to \texttt{maxDescriptorSetInputAttachments} but counts descriptors from descriptor sets created with or without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set.

• \texttt{supportedDepthResolveModes} is a bitmask of \texttt{VkResolveModeFlagBits} indicating the set of supported depth resolve modes. \texttt{VK_RESOLVE_MODE_SAMPLE_ZERO_BIT} must be included in the set but implementations may support additional modes.

• \texttt{supportedStencilResolveModes} is a bitmask of \texttt{VkResolveModeFlagBits} indicating the set of supported stencil resolve modes. \texttt{VK_RESOLVE_MODE_SAMPLE_ZERO_BIT} must be included in the set but implementations may support additional modes. \texttt{VK_RESOLVE_MODE_AVERAGE_BIT} must not be included in the set.

• \texttt{independentResolveNone} is \texttt{VK_TRUE} if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is \texttt{VK_RESOLVE_MODE_NONE}. Otherwise the implementation only supports setting both modes to the same value.

• \texttt{independentResolve} is \texttt{VK_TRUE} if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to \texttt{VK_RESOLVE_MODE_NONE}. An implementation that supports \texttt{independentResolve} must also support \texttt{independentResolveNone}.
• **filterMinmaxSingleComponentFormats** is a boolean value indicating whether a minimum set of required formats support min/max filtering.

• **filterMinmaxImageComponentMapping** is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

• **maxTimelineSemaphoreValueDifference** indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

• **framebufferIntegerColorSampleCounts** is a bitmask of **VkSampleCountFlagBits** indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the **VkPhysicalDeviceVulkan12Properties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of **VkPhysicalDeviceVulkan12Properties** must have the same values as the corresponding members of **VkPhysicalDeviceDriverProperties**, **VkPhysicalDeviceFloatControlsProperties**, **VkPhysicalDeviceDescriptorIndexingProperties**, **VkPhysicalDeviceDepthStencilResolveProperties**, **VkPhysicalDeviceSamplerFilterMinmaxProperties**, and **VkPhysicalDeviceTimelineSemaphoreProperties**.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVulkan12Properties-sType-sType**

  The **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES**

The **VkPhysicalDeviceVulkan13Properties** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceVulkan13Properties {
    VkStructureType sType;
    void* pNext;
    uint32_t minSubgroupSize;
    uint32_t maxSubgroupSize;
    uint32_t maxComputeWorkgroupSubgroups;
    VkShaderStageFlags requiredSubgroupSizeStages;
    uint32_t maxInlineUniformBlockSize;
    uint32_t maxPerStageDescriptorInlineUniformBlocks;
    uint32_t maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks;
    uint32_t maxDescriptorSetInlineUniformBlocks;
    uint32_t maxDescriptorSetUpdateAfterBindInlineUniformBlocks;
    uint32_t maxInlineUniformTotalSize;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
} VkPhysicalDeviceVulkan13Properties;
```
VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;

VkBool32 integerDotProduct16BitUnsignedAccelerated;
VkBool32 integerDotProduct16BitSignedAccelerated;
VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
VkBool32 integerDotProduct32BitUnsignedAccelerated;
VkBool32 integerDotProduct32BitSignedAccelerated;
VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
VkBool32 integerDotProduct64BitUnsignedAccelerated;
VkBool32 integerDotProduct64BitSignedAccelerated;
VkBool32 integerDotProduct64BitMixedSignednessAccelerated;

VkDeviceSize storageTexelBufferOffsetAlignmentBytes;
VkBool32 storageTexelBufferOffsetSingleTexelAlignment;
VkDeviceSize uniformTexelBufferOffsetAlignmentBytes;
VkBool32 uniformTexelBufferOffsetSingleTexelAlignment;
VkDeviceSize maxBufferSize;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• minSubgroupSize is the minimum subgroup size supported by this device. minSubgroupSize is at least one if any of the physical device's queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. minSubgroupSize is a power-of-two. minSubgroupSize is less than or equal to maxSubgroupSize. minSubgroupSize is less than or equal to subgroupSize.

• maxSubgroupSize is the maximum subgroup size supported by this device. maxSubgroupSize is at least one if any of the physical device's queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. maxSubgroupSize is a power-of-two. maxSubgroupSize is greater than or equal to minSubgroupSize. maxSubgroupSize is greater than or equal to subgroupSize.

• maxComputeWorkgroupSubgroups is the maximum number of subgroups supported by the implementation within a workgroup.

• requiredSubgroupSizeStages is a bitfield of what shader stages support having a required subgroup size specified.

• maxInlineUniformBlockSize is the maximum size in bytes of an inline uniform block binding.

• maxPerStageDescriptorInlineUniformBlock is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

• maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks is similar to maxPerStageDescriptorInlineUniformBlock but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

• maxDescriptorSetInlineUniformBlocks is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit. Only descriptor bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit.

• maxDescriptorSetUpdateAfterBindInlineUniformBlocks is similar to maxDescriptorSetInlineUniformBlocks but counts descriptor bindings from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

• maxInlineUniformTotalSize is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK count against this limit.

• integerDotProduct8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

• integerDotProduct8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support
for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct32BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE`
if the support for 8-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.
operations using the OpSUdotAccSatKHR SPIR-V instruction is accelerated as defined below.

- `storageTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.
- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.
- `maxBufferSize` is the maximum size `VkBuffer` that can be created.

If the `VkPhysicalDeviceVulkan13Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of `VkPhysicalDeviceVulkan13Properties` must have the same values as the corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceVulkan13Properties-sType-sType` sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType    sType;
    void*              pNext;
    uint8_t            deviceUUID[VK_UUID_SIZE];
    uint8_t            driverUUID[VK_UUID_SIZE];
    uint8_t            deviceLUID[VK_LUID_SIZE];
    uint32_t           deviceNodeMask;
    VkBool32           deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities,
// VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **deviceUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the device.

• **driverUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the driver build in use by the device.

• **deviceLUID** is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.

• **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.

• **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**deviceUUID** must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the **driverUUID** value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

**deviceUUID** and/or **driverUUID** must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

• **External memory handle types compatibility**

• **External semaphore handle types compatibility**

• **External fence handle types compatibility**

If **deviceLUIDValid** is `VK_FALSE`, the values of **deviceLUID** and **deviceNodeMask** are undefined. If **deviceLUIDValid** is `VK_TRUE` and Vulkan is running on the Windows operating system, the contents of **deviceLUID** can be cast to an `LUID` object and **must** be equal to the locally unique identifier of a `IDXGIAdapter1` object that corresponds to **physicalDevice**. If **deviceLUIDValid** is `VK_TRUE`, **deviceNodeMask** must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and **physicalDevice** corresponds to an individual device in a linked device adapter, **deviceNodeMask** identifies the Direct3D 12 node corresponding to **physicalDevice**. Otherwise, **deviceNodeMask** must be 1.

---

**Note**

Although they have identical descriptions, ** VkPhysicalDeviceIDProperties ::deviceUUID** may differ from ** VkPhysicalDeviceProperties2::pipelineCacheUUID**. The former is intended to identify and correlate devices across API and driver
boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations **should** return `deviceUUID` values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos’ conformance testing is unable to guarantee that `deviceUUID` values are actually unique, so implementors **should** make their own best efforts to ensure this. In particular, hard-coded `deviceUUID` values, especially all-0 bits, **should** never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a `deviceUUID` which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by `vkGetPhysicalDeviceProperties`
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.

**Note**
While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceIDProperties-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`.

`VK_UUID_SIZE` is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```
#define VK_UUID_SIZE 16U
```
**VK_LUID_SIZE** is the length in **uint8_t** values of an array containing a locally unique device identifier, as returned in **VkPhysicalDeviceIDProperties::deviceLUID**.

```c
#define VK_LUID_SIZE                      8U
```

or the equivalent

```c
#define VK_LUID_SIZE_KHR                  VK_LUID_SIZE
```

The **VkPhysicalDeviceDriverProperties** structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType sType;
    void* pNext;
    VkDriverId driverID;
    char driverName[VK_MAX_DRIVER_NAME_SIZE];
    char driverInfo[VK_MAX_DRIVER_INFO_SIZE];
    VkConformanceVersion conformanceVersion;
} VkPhysicalDeviceDriverProperties;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **driverID** is a unique identifier for the driver of the physical device.
- **driverName** is an array of **VK_MAX_DRIVER_NAME_SIZE** **char** containing a null-terminated UTF-8 string which is the name of the driver.
- **driverInfo** is an array of **VK_MAX_DRIVER_INFO_SIZE** **char** containing a null-terminated UTF-8 string with additional information about the driver.
- **conformanceVersion** is the version of the Vulkan conformance test this driver is conformant against (see **VkConformanceVersion**).

If the **VkPhysicalDeviceDriverProperties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

**driverID** **must** be immutable for a given driver across instances, processes, driver versions, and
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDriverProperties-sType-sType

  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DRIVER_PROPERTIES

Khronos driver IDs which may be returned in VkPhysicalDeviceDriverProperties::driverID are:

```c
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
    VK_DRIVER_ID_MESA_LLVMPIPE = 13,
    VK_DRIVER_ID_MOLTENVK = 14,
    VK_DRIVER_ID_COREAVI_PROPRIETARY = 15,
    VK_DRIVER_ID_JUICE_PROPRIETARY = 16,
    VK_DRIVER_ID_VERISILICON_PROPRIETARY = 17,
    VK_DRIVER_ID_MESA_TURNIP = 18,
    VK_DRIVER_ID_MESA_V3DV = 19,
    VK_DRIVER_ID_MESA_PANVK = 20,
    VK_DRIVER_ID_SAMSUNG_PROPRIETARY = 21,
    VK_DRIVER_ID_MESA_VENUS = 22,
    VK_DRIVER_ID_MESA_DOZEN = 23,
    VK_DRIVER_ID_MESA_NVK = 24,
    VK_DRIVER_ID_IMAGINATION_OPEN_SOURCE_MESA = 25,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_AMD_PROPRIETARY_KHR = VK_DRIVER_ID_AMD_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_AMD_OPEN_SOURCE_KHR = VK_DRIVER_ID_AMD_OPEN_SOURCE,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_MESA_RADV_KHR = VK_DRIVER_ID_MESA_RADV,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_NVIDIA_PROPRIETARY_KHR = VK_DRIVER_ID_NVIDIA_PROPRIETARY,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS_KHR = VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS,
    // Provided by VK_KHR_driver_properties
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA_KHR = VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA,
```
or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;
```

**Note**

Khronos driver IDs may be allocated by vendors at any time. There may be multiple driver IDs for the same vendor, representing different drivers (for e.g. different platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry, and of the corresponding `vulkan_core.h` header file **must** contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There **may be** unregistered driver IDs returned.

**VK_MAX_DRIVER_NAME_SIZE** is the length in `char` values of an array containing a driver name string, as returned in `VkPhysicalDeviceDriverProperties::driverName`.

```c
#define VK_MAX_DRIVER_NAME_SIZE 256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_NAME_SIZE_KHR VK_MAX_DRIVER_NAME_SIZE
```

**VK_MAX_DRIVER_INFO_SIZE** is the length in `char` values of an array containing a driver information string, as returned in `VkPhysicalDeviceDriverProperties::driverInfo`.

```c
#define VK_MAX_DRIVER_INFO_SIZE 256U
```
or the equivalent

```c
#define VK_MAX_DRIVER_INFO_SIZE_KHR VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the `VkConformanceVersion` structure:

```c
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t major;
    uint8_t minor;
    uint8_t subminor;
    uint8_t patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- `major` is the major version number of the conformance test suite.
- `minor` is the minor version number of the conformance test suite.
- `subminor` is the subminor version number of the conformance test suite.
- `patch` is the patch version number of the conformance test suite.

The `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProduct16BitUnsignedAccelerated;
    VkBool32 integerDotProduct16BitSignedAccelerated;
    VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct32BitUnsignedAccelerated;
    VkBool32 integerDotProduct32BitSignedAccelerated;
    VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct64BitUnsignedAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
```
or the equivalent

```c
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductProperties
VkPhysicalDeviceShaderIntegerDotProductPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **integerDotProduct8BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.
- **integerDotProduct8BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.
- **integerDotProduct8BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.
- **integerDotProduct4x8BitPackedUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the
support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned dot product operations using the OpUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed dot product operations using the OpSDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProduct64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness dot product operations using the OpSUDotKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating8BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating8BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.
be VK_TRUE if the support for 8-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated is a boolean that will be VK_TRUE if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

• integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

If the VkPhysicalDeviceShaderIntegerDotProductProperties structure is included in the pNext chain of
the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

**Note**
A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

---

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES`

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
  VkPhysicalDevice physicalDevice,
  uint32_t* pQueueFamilyPropertyCount,
  VkQueueFamilyProperties* pQueueFamilyProperties);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described below.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties` structures.

If `pQueueFamilyProperties` is `NULL`, then the number of queue families available is returned in `pQueueFamilyPropertyCount`. Implementations must support at least one queue family. Otherwise, `pQueueFamilyPropertyCount` must point to a variable set by the user to the number of elements in the `pQueueFamilyProperties` array, and on return the variable is overwritten with the number of structures actually written to `pQueueFamilyProperties`. If `pQueueFamilyPropertyCount` is less than the number of queue families available, at most `pQueueFamilyPropertyCount` structures will be written.

---

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter`
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter`
**pQueueFamilyPropertyCount** must be a valid pointer to a `uint32_t` value.

- VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter
  If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not NULL, `pQueueFamilyProperties` must be a valid pointer to an array of `pQueueFamilyPropertyCount` `VkQueueFamilyProperties` structures.

The `VkQueueFamilyProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- `queueFlags` is a bitmask of `VkQueueFlagBits` indicating capabilities of the queues in this queue family.
- `queueCount` is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.
- `timestampValidBits` is the unsigned integer count of meaningful bits in the timestamps written via `vkCmdWriteTimestamp2` or `vkCmdWriteTimestamp`. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.
- `minImageTransferGranularity` is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in `minImageTransferGranularity` has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of `minImageTransferGranularity` are:

- `(0,0,0)` specifies that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The `x`, `y`, and `z` members of a `VkOffset3D` parameter must always be zero.
  - The `width`, `height`, and `depth` members of a `VkExtent3D` parameter must always match the width, height, and depth of the image subresource corresponding to the parameter, respectively.
- `(A_x, A_y, A_z)` where `A_x`, `A_y`, and `A_z` are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  - `x`, `y`, and `z` of a `VkOffset3D` parameter must be integer multiples of `A_x`, `A_y`, and `A_z`, respectively.
  - `width` of a `VkExtent3D` parameter must be an integer multiple of `A_x`, or else `x + width` must...
equal the width of the image subresource corresponding to the parameter.

- **height** of a `VkExtent3D` parameter **must** be an integer multiple of \( A_y \), or else \( y + \text{height} \) **must** equal the height of the image subresource corresponding to the parameter.

- **depth** of a `VkExtent3D` parameter **must** be an integer multiple of \( A_z \), or else \( z + \text{depth} \) **must** equal the depth of the image subresource corresponding to the parameter.

- If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity **must** be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations **must** report \((1,1,1)\) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only **required** to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families **may** be \((0,0,0)\).

The **Device Memory** section describes memory properties queried from the physical device.

For physical device feature queries see the **Features** chapter.

Bits which **may** be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,

    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,

    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODER_BIT_KHR = 0x00000020,

    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODER_BIT_KHR = 0x00000040,

} VkQueueFlagBits;
```

- **VK_QUEUE_GRAPHICS_BIT** specifies that queues in this queue family support graphics operations.
- **VK_QUEUE_COMPUTE_BIT** specifies that queues in this queue family support compute operations.
- **VK_QUEUE_TRANSFER_BIT** specifies that queues in this queue family support transfer operations.
- **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see **Sparse Resources**). If any of the sparse resource features are enabled, then at least one queue family **must** support this bit.
- **VK_QUEUE_VIDEO_DECODER_BIT_KHR** specifies that queues in this queue family support **video decode** operations.
• **VK_QUEUEVIDEO_ENCODE_BIT_KHR** specifies that queues in this queue family support video encode operations.

• **VK_QUEUE_PROTECTED_BIT** specifies that queues in this queue family support the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

**Note**

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is optional.

For further details see Queues.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

**VkQueueFlags** is a bitmask type for setting a mask of zero or more **VkQueueFlagBits**.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

• **physicalDevice** is the handle to the physical device whose properties will be queried.
- `pQueueFamilyPropertyCount` is a pointer to an integer related to the number of queue families available or queried, as described in `vkGetPhysicalDeviceQueueFamilyProperties`.
- `pQueueFamilyProperties` is either `NULL` or a pointer to an array of `VkQueueFamilyProperties2` structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to `vkGetPhysicalDeviceQueueFamilyProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter  
  `pQueueFamilyPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter  
  If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` must be a valid pointer to an array of `VkQueueFamilyProperties2` structures

The `VkQueueFamilyProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VK_VERSION_1_1
VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyProperties` is a `VkQueueFamilyProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceQueueFamilyProperties`.

### Valid Usage (Implicit)

- VUID-VkQueueFamilyProperties2-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2`

- **VUID-VkQueueFamilyProperties2-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyGlobalPriorityPropertiesKHR`, `VkQueueFamilyQueryResultStatusPropertiesKHR`, or `VkQueueFamilyVideoPropertiesKHR`.

- **VUID-VkQueueFamilyProperties2-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

The definition of `VkQueueFamilyGlobalPriorityPropertiesKHR` is:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it must be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_EXT` `VkQueueGlobalPriorityEXT` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of `priorities` must not contain any duplicate values.

The valid elements of `priorities` must be a continuous sequence of `VkQueueGlobalPriorityKHR` enums in the ascending order.

**Note**
For example, returning `priorityCount` as 3 with supported `priorities` as `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR`, `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` and `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is not allowed.

**Valid Usage (Implicit)**

- **VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR`
Each element of `priorities` must be a valid `VkQueueGlobalPriorityKHR` value.

`VK_MAX_GLOBAL_PRIORITY_SIZE_KHR` is the length of an array of `VkQueueGlobalPriorityKHR` enumerants representing supported queue priorities, as returned in `VkQueueFamilyGlobalPriorityPropertiesKHR::priorities`.

```
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR   16U
```

The `VkQueueFamilyVideoPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoCodecOperations` is a bitmask of `VkVideoCodecOperationFlagBitsKHR` that indicates the set of video codec operations supported by the queue family.

If this structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with the set of video codec operations supported by the specified queue family.

Valid Usage (Implicit)

- `VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR`

The `VkQueueFamilyQueryResultStatusPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `queryResultStatusSupport` reports `VK_TRUE` if query type `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and use of `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` are supported.

If this structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with information about whether result status queries are supported by the specified queue family.

**Valid Usage (Implicit)**

- `VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR`

To enumerate the performance query counters available on a queue family of a physical device, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    uint32_t* pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `queueFamilyIndex` is the index into the queue family of the physical device we want to get properties for.
- `pCounterCount` is a pointer to an integer related to the number of counters available or queried, as described below.
- `pCounters` is either `NULL` or a pointer to an array of `VkPerformanceCounterKHR` structures.
- `pCounterDescriptions` is either `NULL` or a pointer to an array of `VkPerformanceCounterDescriptionKHR` structures.

If `pCounters` is `NULL` and `pCounterDescriptions` is `NULL`, then the number of counters available is returned in `pCounterCount`. Otherwise, `pCounterCount` must point to a variable set by the user to the number of elements in the `pCounters`, `pCounterDescriptions`, or both arrays and on return the variable is overwritten with the number of structures actually written out. If `pCounterCount` is less than the number of counters available, at most `pCounterCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available counters were returned.

**Valid Usage (Implicit)**

- `VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-physicalDevice-parameter`
 physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterCount-parameter
  pCounterCount must be a valid pointer to a uint32_t value

• VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounters-parameter
  If the value referenced by pCounterCount is not \( \emptyset \), and pCounters is not NULL, pCounters must be a valid pointer to an array of pCounterCount VkPerformanceCounterKHR structures

• VUID-vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR-pCounterDescriptions-parameter
  If the value referenced by pCounterCount is not \( \emptyset \), and pCounterDescriptions is not NULL, pCounterDescriptions must be a valid pointer to an array of pCounterCount VkPerformanceCounterDescriptionKHR structures

Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED

The VkPerformanceCounterKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **unit** is a VkPerformanceCounterUnitKHR specifying the unit that the counter data will record.
• **scope** is a VkPerformanceCounterScopeKHR specifying the scope that the counter belongs to.
• **storage** is a VkPerformanceCounterStorageKHR specifying the storage type that the counter's
data uses.

- **uuid** is an array of size **VK_UUID_SIZE**, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

### Valid Usage (Implicit)

- VUID-VkPerformanceCounterKHR-sType-sType
  
  *must* be **VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR**

- VUID-VkPerformanceCounterKHR-pNext-pNext
  
  *must* be **NULL**

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in **VkPerformanceCounterKHR::unit** are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;
```

- **VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR** - the performance counter unit is a generic data point.
- **VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR** - the performance counter unit is a percentage (%).
- **VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR** - the performance counter unit is a value of nanoseconds (ns).
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR** - the performance counter unit is a value of bytes.
- **VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR** - the performance counter unit is a value of bytes/s.
- **VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR** - the performance counter unit is a temperature reported in Kelvin.
- **VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR** - the performance counter unit is a value of watts (W).
- **VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR** - the performance counter unit is a value of volts (V).
Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which **may** be returned in `VkPerformanceCounterKHR::scope` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;
```

- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR** - the performance counter scope is a single complete command buffer.
- **VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR** - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter **must** begin and end outside a render pass instance.
- **VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR** - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which **may** be returned in `VkPerformanceCounterKHR::storage` are:

```
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;
```

- **VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR** - the performance counter storage is a 32-bit signed

...
• **VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR** - the performance counter storage is a 64-bit signed integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR** - the performance counter storage is a 32-bit unsigned integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR** - the performance counter storage is a 64-bit unsigned integer.

• **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR** - the performance counter storage is a 32-bit floating-point.

• **VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR** - the performance counter storage is a 64-bit floating-point.

The *VkPerformanceCounterDescriptionKHR* structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

• *sType* is a *VkStructureType* value identifying this structure.

• *pNext* is NULL or a pointer to a structure extending this structure.

• *flags* is a bitmask of *VkPerformanceCounterDescriptionFlagBitsKHR* indicating the usage behavior for the counter.

• *name* is an array of size *VK_MAX_DESCRIPTION_SIZE*, containing a null-terminated UTF-8 string specifying the name of the counter.

• *category* is an array of size *VK_MAX_DESCRIPTION_SIZE*, containing a null-terminated UTF-8 string specifying the category of the counter.

• *description* is an array of size *VK_MAX_DESCRIPTION_SIZE*, containing a null-terminated UTF-8 string specifying the description of the counter.

**Valid Usage (Implicit)**

• VUID-VkPerformanceCounterDescriptionKHR-sType-sType
  
  *sType* must be *VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR*

• VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext

  *pNext* must be NULL
Bits which can be set in `VkPerformanceCounterDescriptionKHR::flags`, specifying usage behavior of a performance counter, are:

```c
// Provided by VK_KHR_performance_query
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
        VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
        VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;
```

- `VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR` specifies that recording the counter may have a noticeable performance impact.
- `VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR` specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;
```

`VkPerformanceCounterDescriptionFlagsKHR` is a bitmask type for setting a mask of zero or more `VkPerformanceCounterDescriptionFlagBitsKHR`.

## 5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device can then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the Physical Device Enumeration section above.

A single logical device can be created from multiple physical devices, if those physical devices belong to the same device group. A device group is a set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices. Device groups are enumerated by calling `vkEnumeratePhysicalDeviceGroups`, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through `VkDeviceGroupDeviceCreateInfo`. For two physical devices to be in the
same device group, they **must** support identical extensions, features, and properties.

**Note**

Physical devices in the same device group **must** be so similar because there are no rules for how different features/properties would interact. They **must** return the same values for nearly every invariant `vkGetPhysicalDevice*` feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,  
    uint32_t* pPhysicalDeviceGroupCount, 
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,  
    uint32_t* pPhysicalDeviceGroupCount, 
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either `NULL` or a pointer to an array of `VkPhysicalDeviceGroupProperties` structures.

If `pPhysicalDeviceGroupProperties` is `NULL`, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` **must** point to a variable set by the user to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available device groups were returned.

Every physical device **must** be in exactly one device group.
Valid Usage (Implicit)

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
  pPhysicalDeviceGroupCount must be a valid pointer to a uint32_t value

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
  If the value referenced by pPhysicalDeviceGroupCount is not 0, and
  pPhysicalDeviceGroupProperties is not NULL, pPhysicalDeviceGroupProperties must be a
  valid pointer to an array of pPhysicalDeviceGroupCount VkPhysicalDeviceGroupProperties
  structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkPhysicalDeviceGroupProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of physical devices in the group.
• **physicalDevices** is an array of **VK_MAX_DEVICE_GROUP_SIZE** `VkPhysicalDevice` handles representing all physical devices in the group. The first `physicalDeviceCount` elements of the array will be valid.

• **subsetAllocation** specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is **VK_FALSE**, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be **VK_FALSE**.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceGroupProperties-sType-sType**
  
  *`sType` must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES**

- **VUID-VkPhysicalDeviceGroupProperties-pNext-pNext**
  
  *`pNext` must be **NULL**

---

**VK_MAX_DEVICE_GROUP_SIZE** is the length of an array containing `VkPhysicalDevice` handle values representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties::physicalDevices`.

```c
#define VK_MAX_DEVICE_GROUP_SIZE          32U
```

or the equivalent

```c
#define VK_MAX_DEVICE_GROUP_SIZE_KHR      VK_MAX_DEVICE_GROUP_SIZE
```

### 5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(  
  VkPhysicalDevice physicalDevice,  
  const VkDeviceCreateInfo* pCreateInfo,  
  const VkAllocationCallbacks* pAllocator,  
  VkDevice* pDevice);  
```

• **physicalDevice** **must** be one of the device handles returned from a call to
vkEnumeratePhysicalDevices (see Physical Device Enumeration).

- **pCreateInfo** is a pointer to a VkDeviceCreateInfo structure containing information about how to create the device.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDevice** is a pointer to a handle in which the created VkDevice is returned.

vkCreateDevice verifies that extensions and features requested in the ppEnabledExtensionNames and pEnabledFeatures members of pCreateInfo, respectively, are supported by the implementation. If any requested extension is not supported, vkCreateDevice must return VK_ERROR_EXTENSION_NOT_PRESENT. If any requested feature is not supported, vkCreateDevice must return VK_ERROR_FEATURE_NOT_PRESENT. Support for extensions can be checked before creating a device by querying vkEnumerateDeviceExtensionProperties. Support for features can similarly be checked by querying vkGetPhysicalDeviceFeatures.

After verifying and enabling the extensions the VkDevice object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to other errors). If that occurs, vkCreateDevice will return VK_ERROR_TOO_MANY_OBJECTS.

### Valid Usage

- VUID-vkCreateDevice-ppEnabledExtensionNames-01387
  All required device extensions for each extension in the VkDeviceCreateInfo::ppEnabledExtensionNames list must also be present in that list

### Valid Usage (Implicit)

- VUID-vkCreateDevice-physicalDevice-parameter
  `physicalDevice` must be a valid VkPhysicalDevice handle

- VUID-vkCreateDevice-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid VkDeviceCreateInfo structure

- VUID-vkCreateDevice-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateDevice-pDevice-parameter
  `pDevice` must be a valid pointer to a VkDevice handle

### Return Codes

**Success**

- VK_SUCCESS
The `VkDeviceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceCreateFlags flags;
    uint32_t queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    uint32_t enabledLayerCount;
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queueCreateInfoCount` is the unsigned integer size of the `pQueueCreateInfos` array. Refer to the Queue Creation section below for further details.
- `pQueueCreateInfos` is a pointer to an array of `VkDeviceQueueCreateInfo` structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- `enabledLayerCount` is deprecated and ignored.
- `ppEnabledLayerNames` is deprecated and ignored. See Device Layer Deprecation.
- `enabledExtensionCount` is the number of device extensions to enable.
- `ppEnabledExtensionNames` is a pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.
- `pEnabledFeatures` is `NULL` or a pointer to a `VkPhysicalDeviceFeatures` structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further detailed information.
Valid Usage

• VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
  The `queueFamilyIndex` member of each element of `pQueueCreateInfos` must be unique
  within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex`
  if one describes protected-capable queues and one describes queues that are not
  protected-capable

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of
  their `queueCount` members must be less than or equal to the `queueCount` member of the
  `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties`
  in the `pQueueFamilyProperties[queueFamilyIndex]`

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of
  such elements must have the same global priority level, which can be specified explicitly
  by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext`
  chain, or by the implicit default value

• VUID-VkDeviceCreateInfo-pNext-00373
  If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures`
  must be `NULL`

• VUID-VkDeviceCreateInfo-pNext-02829
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it must
  not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`,
  `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`,
  or `VkPhysicalDeviceShaderDrawParametersFeatures` structure

• VUID-VkDeviceCreateInfo-pNext-02830
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it must
  not include a `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceShaderAtomicInt64Features`,
  `VkPhysicalDeviceShaderFloat16Int8Features`, `VkPhysicalDeviceDescriptorIndexingFeatures`,
  `VkPhysicalDeviceScalarBlockLayoutFeatures`, `VkPhysicalDeviceImagelessFramebufferFeatures`,
  `VkPhysicalDeviceUniformBufferStandardLayoutFeatures`, `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures`,
  `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures`, `VkPhysicalDeviceHostQueryResetFeatures`,
  `VkPhysicalDeviceTimelineSemaphoreFeatures`, or `VkPhysicalDeviceVulkanMemoryModelFeatures` structure
If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` must be `VK_TRUE`.

If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` must be `VK_TRUE`.

If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it must not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, `VkPhysicalDeviceShaderIntegerDotProductFeatures`, `VkPhysicalDeviceShaderTerminateInvocationFeatures`, `VkPhysicalDeviceSubgroupSizeControlFeatures`, `VkPhysicalDeviceSynchronization2Features`, `VkPhysicalDeviceTextureCompressionASTCHDRFeatures`, or `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure.

If the `VK_KHR_portability_subset` extension is included in `pProperties` of `vkEnumerateDeviceExtensionProperties`, `ppEnabledExtensionNames` must include "VK_KHR_portability_subset".

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`.
- `pNext` must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupDeviceCreateInfo`, `VkDevicePrivateDataCreateInfo`, `VkDevice16BitStorageFeatures`, `VkDevice8BitStorageFeatures`, `VkDeviceAccelerationStructureFeaturesKHR`, `VkDeviceBufferDeviceAddressFeatures`, `VkDeviceCooperativeMatrixFeaturesKHR`, `VkDeviceDescriptorIndexingFeatures`, `VkDeviceDynamicRenderingFeatures`, or `VkDeviceFeatures2`. 
The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkDevicePrivateDataCreateInfo`.

- `flags` must be 0
- `pQueueCreateInfos` must be a valid pointer to an array of `queueCreateInfoCount` valid `VkDeviceQueueCreateInfo` structures

- or

- `ppEnabledLayerNames` parameter

- `VkDeviceCreateInfo`-pEnabledLayerNames-parameter

- `VkPhysicalDeviceVulkan13Features` or `VkPhysicalDeviceVulkanMemoryModelFeatures`
If `enabledLayerCount` is not 0, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter
  If `enabledExtensionCount` is not 0, `ppEnabledExtensionNames` must be a valid pointer to an array of `enabledExtensionCount` null-terminated UTF-8 strings

- VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter
  If `pEnabledFeatures` is not NULL, `pEnabledFeatures` must be a valid pointer to a valid `VkPhysicalDeviceFeatures` structure

- VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength
  `queueCreateInfoCount` must be greater than 0

// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;

**VkDeviceCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device can be created that connects to one or more physical devices by adding a `VkDeviceGroupDeviceCreateInfo` structure to the `pNext` chain of `VkDeviceCreateInfo`. The `VkDeviceGroupDeviceCreateInfo` structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
  VkStructureType sType;
  const void* pNext;
  uint32_t physicalDeviceCount;
  const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;

or the equivalent

// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `physicalDeviceCount` is the number of elements in the `pPhysicalDevices` array.
- `pPhysicalDevices` is a pointer to an array of physical device handles belonging to the same device group.

The elements of the `pPhysicalDevices` array are an ordered list of the physical devices that the logical device represents. These must be a subset of a single device group, and need not be in the same order as they were enumerated. The order of the physical devices in the `pPhysicalDevices` array determines the device index of each physical device, with element i being assigned a device
Certain commands and structures refer to one or more physical devices by using device indices or *device masks* formed using device indices.

A logical device created without using *VkDeviceGroupDeviceCreateInfo*, or with `physicalDeviceCount` equal to zero, is equivalent to a `physicalDeviceCount` of one and `pPhysicalDevices` pointing to the `physicalDevice` parameter to `vkCreateDevice`. In particular, the device index of that physical device is zero.

### Valid Usage

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375**
  Each element of `pPhysicalDevices` must be unique

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376**
  All elements of `pPhysicalDevices` must be in the same device group as enumerated by `vkEnumeratePhysicalDeviceGroups`

- **VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377**
  If `physicalDeviceCount` is not 0, the `physicalDevice` parameter of `vkCreateDevice` must be an element of `pPhysicalDevices`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupDeviceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO`

- **VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter**
  If `physicalDeviceCount` is not 0, `pPhysicalDevices` must be a valid pointer to an array of `physicalDeviceCount` valid `VkPhysicalDevice` handles

To reserve private data storage slots, add a `VkDevicePrivateDataCreateInfo` structure to the `pNext` chain of the `VkDeviceCreateInfo` structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

```c
// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **privateDataSlotRequestCount** is the amount of slots to reserve.
5.2.2. Device Use

The following is a high-level list of VkDevice uses along with references on where to find more information:

• Creation of queues. See the Queues section below for further details.

• Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.

• Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.

• Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.

• Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

**Note**

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.
Note

Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the user that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid. Those objects must still be destroyed before their parents or the device can be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using vkMapMemory is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution may fail, and certain commands that return a VkResult may return VK_ERROR_DEVICE_LOST. These commands can be identified by the inclusion of VK_ERROR_DEVICE_LOST in the Return Codes section for each command. Commands that do not allow runtime errors must still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely vkDeviceWaitIdle, vkQueueWaitIdle, vkWaitForFences or vkAcquireNextImageKHR with a maximum timeout, and vkGetQueryPoolResults with the VK_QUERY_RESULT_WAIT_BIT bit set in flags) must return in finite time even in the case of a lost device, and return either VK_SUCCESS or VK_ERROR_DEVICE_LOST. For any command that may return VK_ERROR_DEVICE_LOST, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device, a return value of VK_ERROR_DEVICE_LOST is equivalent to VK_SUCCESS.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to VkDeviceMemory objects associated with the same underlying memory resources as external memory objects on the lost device becomes VK_IMAGE_LAYOUT_UNDEFINED.

The state of VkSemaphore objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of VkSemaphore objects on other logical devices that permanently share a semaphore payload with a VkSemaphore object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations must ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.
5.2.4. Device Destruction

To destroy a device, call:

```c
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

**Note**
The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.

**Valid Usage**

- VUID-vkDestroyDevice-device-00378
  All child objects created on **device** **must** have been destroyed prior to destroying **device**

- VUID-vkDestroyDevice-device-00379
  If `VkAllocationCallbacks` were provided when **device** was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyDevice-device-00380
  If no `VkAllocationCallbacks` were provided when **device** was created, **pAllocator** **must** be **NULL**

**Valid Usage (Implicit)**

- VUID-vkDestroyDevice-device-parameter
  If **device** is not **NULL**, **device** **must** be a valid `VkDevice` handle

- VUID-vkDestroyDevice-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
5.3. Queues

5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the `vkGetPhysicalDeviceQueueFamilyProperties` command is used to retrieve details about the queue families and queues supported by a device.

Each index in the `pQueueFamilyProperties` array returned by `vkGetPhysicalDeviceQueueFamilyProperties` describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the `queueFamilyIndex` that is passed to the `vkCreateDevice` command via the `VkDeviceQueueCreateInfo` structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

Note

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of `VkDeviceQueueCreateInfo` structures that are passed to `vkCreateDevice` in `pQueueCreateInfos`.

Queues are represented by `VkQueue` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The `VkDeviceQueueCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
```

---

Host Synchronization

- Host access to **device must** be externally synchronized
- Host access to all `VkQueue` objects created from **device must** be externally synchronized
VkStructureType sType;
const void* pNext;
VkDeviceQueueCreateFlags flags;
uint32_t queueFamilyIndex;
uint32_t queueCount;
const float* pQueuePriorities;
}

VkDeviceQueueCreateInfo

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask indicating behavior of the queues.

• **queueFamilyIndex** is an unsigned integer indicating the index of the queue family in which to create the queues on this device. This index corresponds to the index of an element of the pQueueFamilyProperties array that was returned by *vkGetPhysicalDeviceQueueFamilyProperties*.

• **queueCount** is an unsigned integer specifying the number of queues to create in the queue family indicated by queueFamilyIndex, and with the behavior specified by flags.

• **pQueuePriorities** is a pointer to an array of queueCount normalized floating point values, specifying priorities of work that will be submitted to each created queue. See Queue Priority for more information.

**Valid Usage**

• VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381

  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by *vkGetPhysicalDeviceQueueFamilyProperties*

• VUID-VkDeviceQueueCreateInfo-queueCount-00382

  queueCount must be less than or equal to the queueCount member of the VkQueueFamilyProperties structure, as returned by *vkGetPhysicalDeviceQueueFamilyProperties* in the pQueueFamilyProperties[queueFamilyIndex]

• VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383

  Each element of pQueuePriorities must be between 0.0 and 1.0 inclusive

• VUID-VkDeviceQueueCreateInfo-flags-02861

  If the protectedMemory feature is not enabled, the VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT bit of flags must not be set

• VUID-VkDeviceQueueCreateInfo-flags-06449

  If flags includes VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, queueFamilyIndex must be the index of a queue family that includes the VK_QUEUE_PROTECTED_BIT capability

**Valid Usage (Implicit)**

• VUID-VkDeviceQueueCreateInfo-sType-sType

  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO
• VUID-VkDeviceQueueCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDeviceQueueGlobalPriorityCreateInfoKHR

• VUID-VkDeviceQueueCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkDeviceQueueCreateInfo-flags-parameter
  flags must be a valid combination of VkDeviceQueueCreateFlagBits values

• VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter
  pQueuePriorities must be a valid pointer to an array of queueCount float values

• VUID-VkDeviceQueueCreateInfo-queueCount-arraylength
  queueCount must be greater than 0

Bits which can be set in VkDeviceQueueCreateInfo::flags, specifying usage behavior of a queue, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
  // Provided by VK_VERSION_1_1
  VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

• VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT specifies that the device queue is a protected-capable queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

VkDeviceQueueCreateFlags is a bitmask type for setting a mask of zero or more VkDeviceQueueCreateFlagBits.

Queues can be created with a system-wide priority by adding a VkDeviceQueueGlobalPriorityCreateInfoKHR structure to the pNext chain of VkDeviceQueueCreateInfo.

The VkDeviceQueueGlobalPriorityCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `globalPriority` is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityEXT`.

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`.

### Valid Usage (Implicit)

- `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR`
- `VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter globalPriority must be a valid VkQueueGlobalPriorityKHR value`

Possible values of `VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority`, specifying a system-wide priority level are:

```cpp
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR` is below the system default. Useful for non-interactive tasks.
- `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` is the system default priority.
- `VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR` is above the system default.
- `VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR` is the highest priority. Useful for critical tasks.

Queues with higher system priority **may** be allotted more processing time than queues with lower priority. An implementation **may** allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.
The global priority level of a queue takes precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_KHR is returned.

The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

If the globalPriorityQuery feature is enabled and the requested global priority is not reported via VkQueueFamilyGlobalPriorityPropertiesKHR, the driver implementation must fail the queue creation. In this scenario, VK_ERROR_INITIALIZATION_FAILED is returned.

To retrieve a handle to a VkQueue object, call:

```c
// Provided by VK_VERSION_1_0
void vkGetDeviceQueue(VkDevice device,
                      uint32_t queueFamilyIndex,
                      uint32_t queueIndex,
                      VkQueue* pQueue);
```

- device is the logical device that owns the queue.
- queueFamilyIndex is the index of the queue family to which the queue belongs.
- queueIndex is the index within this queue family of the queue to retrieve.
- pQueue is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

vkGetDeviceQueue must only be used to get queues that were created with the flags parameter of VkDeviceQueueCreateInfo set to zero. To get queues that were created with a non-zero flags parameter use vkGetDeviceQueue2.

Valid Usage

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384 queueFamilyIndex must be one of the queue family indices specified when device was created, via the VkDeviceQueueCreateInfo structure
- VUID-vkGetDeviceQueue-queueIndex-00385 queueIndex must be less than the value of VkDeviceQueueCreateInfo::queueCount for the queue family indicated by queueFamilyIndex when device was created
- VUID-vkGetDeviceQueue-flags-01841 VkDeviceQueueCreateInfo::flags must have been set to zero when device was created
To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:

```c
// Provided by VK_VERSION_1_1
def void vkGetDeviceQueue2(
    VkDevice device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `pQueueInfo` is a pointer to a `VkDeviceQueueInfo2` structure, describing parameters of the device queue to be retrieved.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

The `VkDeviceQueueInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueIndex;
} VkDeviceQueueInfo2;
```

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure. The **pNext** chain of **VkDeviceQueueInfo2** can be used to provide additional device queue parameters to **vkGetDeviceQueue2**.

• **flags** is a **VkDeviceQueueCreateFlags** value indicating the flags used to create the device queue.

• **queueFamilyIndex** is the index of the queue family to which the queue belongs.

• **queueIndex** is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.

The queue returned by **vkGetDeviceQueue2** must have the same **flags** value from this structure as that used at device creation time in a **VkDeviceQueueCreateInfo** structure.

**Note**

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and **queueIndex** is relative to the start of the list of queues specified by both **queueFamilyIndex** and **flags**. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat **queueIndex** as relative to the start of the first list of queues with the given **queueFamilyIndex**. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of **queueIndex** is equal to the sum of **VkDeviceQueueCreateInfo::queueCount** minus one, for all **VkDeviceQueueCreateInfo** structures that share a common **queueFamilyIndex**.

Such implementations will return **NULL** for either the protected or unprotected queues when calling **vkGetDeviceQueue2** with **queueIndex** in the range zero to **VkDeviceQueueCreateInfo::queueCount** minus one. In cases where these implementations returned **NULL**, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behaviour will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying **VkPhysicalDeviceDriverProperties::conformanceVersion**.

**Valid Usage**

• VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
  
  **queueFamilyIndex** must be one of the queue family indices specified when **device** was created, via the **VkDeviceQueueCreateInfo** structure

• VUID-VkDeviceQueueInfo2-flags-06225
  
  **flags** must be equal to **VkDeviceQueueCreateInfo::flags** for a **VkDeviceQueueCreateInfo** structure for the queue family indicated by **queueFamilyIndex** when **device** was created

• VUID-VkDeviceQueueInfo2-queueIndex-01843
queueIndex must be less than VkDeviceQueueCreateInfo::queueCount for the corresponding queue family and flags indicated by queueFamilyIndex and flags when device was created.

Valid Usage (Implicit)

- VUID-VkDeviceQueueInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2
- VUID-VkDeviceQueueInfo2-pNext-pNext
  pNext must be NULL
- VUID-VkDeviceQueueInfo2-flags-parameter
  flags must be a valid combination of VkDeviceQueueCreateFlagBits values

5.3.3. Queue Family Index

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via vkGetDeviceQueue, the queue family index is used to select which queue family to retrieve the VkQueue handle from as described in the previous section.

When creating a VkCommandPool object (see Command Pools), a queue family index is specified in the VkCommandPoolCreateInfo structure. Command buffers from this pool can only be submitted on queues corresponding to this queue family.

When creating VkImage (see Images) and VkBuffer (see Buffers) resources, a set of queue families is included in the VkImageCreateInfo and VkBufferCreateInfo structures to specify the queue families that can access the resource.

When inserting a VkBufferMemoryBarrier or VkImageMemoryBarrier (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

5.3.4. Queue Priority

Each queue is assigned a priority, as set in the VkDeviceQueueCreateInfo structures when creating the device. The priority of each queue is a normalized floating point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same VkDevice until the higher-priority queue has no further commands to execute. The relationship of
queue priorities **must** not cause queues on one VkDevice to starve queues on another VkDevice.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

### 5.3.5. Queue Submission

Work is submitted to a queue via *queue submission* commands such as `vkQueueSubmit2` or `vkQueueSubmit`. Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an **optional** fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   - If present, these describe a *semaphore wait operation*.
2. Zero or more work items to execute.
   - If present, these describe a *queue operation* matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   - If present, these describe a *semaphore signal operation*.

If a fence is present in a queue submission, it describes a *fence signal operation*.

All work described by a queue submission command **must** be submitted to the queue before the command returns.

#### Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the Sparse Resource chapter. Sparse memory binding is a queue operation. A queue whose flags include the `VK_QUEUE_SPARSE_BINDING_BIT` **must** be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update **must** be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the Synchronization and Cache Control chapter for how this synchronization is accomplished.

### 5.3.6. Queue Destruction

Queues are created along with a logical device during `vkCreateDevice`. All queues associated with a logical device are destroyed when `vkDestroyDevice` is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the recording state, or freed.
Recording

\texttt{vkBeginCommandBuffer} changes the state of a command buffer from the initial state to the \textit{recording state}. Once a command buffer is in the recording state, \texttt{vkCmd*} commands \textbf{can} be used to record to the command buffer.

Executable

\texttt{vkEndCommandBuffer} ends the recording of a command buffer, and moves it from the recording state to the \textit{executable state}. Executable command buffers \textbf{can} be submitted, reset, or recorded to another command buffer.

Pending

Queue submission of a command buffer changes the state of a command buffer from the executable state to the \textit{pending state}. Whilst in the pending state, applications \textbf{must} not attempt to modify the command buffer in any way - as the device \textbf{may} be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the \textit{executable state}, or if it was recorded with \texttt{VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT}, it moves to the \textit{invalid state}. A synchronization command \textbf{should} be used to detect when this occurs.

Invalid

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the \textit{invalid state}. Command buffers in the invalid state \textbf{can} only be reset or freed.

\textbf{Figure 1. Lifecycle of a command buffer}

Any given command that operates on a command buffer has its own requirements on what state a command buffer \textbf{must} be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the \textit{initial state}. Resetting occurs as a result of \texttt{vkResetCommandBuffer} or \texttt{vkResetCommandPool}, or as part of \texttt{vkBeginCommandBuffer} (which additionally puts the command buffer in the \textit{recording state}).

Secondary command buffers \textbf{can} be recorded to a primary command buffer via
vkCmdExecuteCommands. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the *pending state*. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the *executable state* or the *invalid state*, as specified above).

If a secondary moves to the *invalid state* or the *initial state*, then all primary buffers it is recorded in move to the *invalid state*. A primary moving to any other state does not affect the state of a secondary recorded in it.

*Note*

Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

### 6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool **must** not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by `VkCommandPool` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)
```

To create a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    const VkDevice device,  // Logical device that creates the command pool.
    const VkCommandPoolCreateInfo* pCreateInfo,  // Pointer to a VkCommandPoolCreateInfo structure specifying the state of the command pool object.
    const VkAllocationCallbacks* pAllocator,  // Controls host memory allocation as described in the Memory Allocation chapter.
    VkCommandPool* pCommandPool  // Pointer to a VkCommandPool handle in which the created pool is returned.
);
```

- `device` is the logical device that creates the command pool.
- `pCreateInfo` is a pointer to a `VkCommandPoolCreateInfo` structure specifying the state of the command pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pCommandPool` is a pointer to a `VkCommandPool` handle in which the created pool is returned.
Valid Usage

• VUID-vkCreateCommandPool-queueFamilyIndex-01937
  pCreateInfo->queueFamilyIndex must be the index of a queue family available in the logical device device

Valid Usage (Implicit)

• VUID-vkCreateCommandPool-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateCommandPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkCommandPoolCreateInfo structure

• VUID-vkCreateCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateCommandPool-pCommandPool-parameter
  pCommandPool must be a valid pointer to a VkCommandPool handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPoolCreateFlags flags;
    uint32_t queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkCommandPoolCreateFlagBits indicating usage behavior for the pool and command buffers allocated from it.
• `queueFamilyIndex` designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool must be submitted on queues from the same queue family.

### Valid Usage

- **VUID-VkCommandPoolCreateInfo-flags-02860**
  If the protectedMemory feature is not enabled, the `VK_COMMAND_POOL_CREATE_PROTECTED_BIT` bit of `flags` must not be set.

### Valid Usage (Implicit)

- **VUID-VkCommandPoolCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO`

- **VUID-VkCommandPoolCreateInfo-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkCommandPoolCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkCommandPoolCreateFlagBits` values

Bits which can be set in `VkCommandPoolCreateInfo::flags`, specifying usage behavior for a command pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
    // Provided by VK_VERSION_1_1
    VK_COMMAND_POOL_CREATE_PROTECTED_BIT = 0x00000004,
} VkCommandPoolCreateFlagBits;
```

- **VK_COMMAND_POOL_CREATE_TRANSIENT_BIT** specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.

- **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT** allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling `vkResetCommandBuffer`, or via the implicit reset when calling `vkBeginCommandBuffer`. If this flag is not set on a pool, then `vkResetCommandBuffer` must not be called for any command buffer allocated from that pool.

- **VK_COMMAND_POOL_CREATE_PROTECTED_BIT** specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```
VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:

```c
// Provided by VK_VERSION_1_1
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance1
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

**Note**

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool may be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool may involve allocating memory in bulk from the system and sub-allocating from that memory. In such an
implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

Trimming may be an expensive operation, and should not be called frequently.Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- VUID-vkTrimCommandPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkTrimCommandPool-commandPool-parameter
  commandPool must be a valid VkCommandPool handle

- VUID-vkTrimCommandPool-flags-zerobitmask
  flags must be 0

- VUID-vkTrimCommandPool-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;

or the equivalent

// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
  VkDevice device,
  VkCommandPool commandPool,
  VkFlags flags);
• device is the logical device that owns the command pool.
• commandPool is the command pool to reset.
• flags is a bitmask of VkCommandPoolResetFlagBits controlling the reset operation.

Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another VkCommandPool that is in the recording or executable state and has a secondary command buffer allocated from commandPool recorded into it, becomes invalid.

**Valid Usage**

• VUID-vkResetCommandPool-commandPool-00040
  All VkCommandBuffer objects allocated from commandPool must not be in the pending state

**Valid Usage (Implicit)**

• VUID-vkResetCommandPool-device-parameter
device must be a valid VkDevice handle

• VUID-vkResetCommandPool-commandPool-parameter
  commandPool must be a valid VkCommandPool handle

• VUID-vkResetCommandPool-flags-parameter
  flags must be a valid combination of VkCommandPoolResetFlagBits values

• VUID-vkResetCommandPool-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device

**Host Synchronization**

• Host access to commandPool must be externally synchronized

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_DEVICE_MEMORY
Bits which can be set in `vkResetCommandPool::flags`, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```

- `VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT` specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

`VkCommandPoolResetFlags` is a bitmask type for setting a mask of zero or more `VkCommandPoolResetFlagBits`.

To destroy a command pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are freed.

Any primary command buffer allocated from another `VkCommandPool` that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

---

## Valid Usage

- **VUID-vkDestroyCommandPool-commandPool-00041**
  All `VkCommandBuffer` objects allocated from `commandPool` must not be in the pending state.

- **VUID-vkDestroyCommandPool-commandPool-00042**
  If `VkAllocationCallbacks` were provided when `commandPool` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyCommandPool-commandPool-00043**
  If no `VkAllocationCallbacks` were provided when `commandPool` was created, `pAllocator` must be NULL.
Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyCommandPool-commandPool-parameter
  If commandPool is not VK_NULL_HANDLE, commandPool must be a valid VkCommandPool handle

- VUID-vkDestroyCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyCommandPool-commandPool-parent
  If commandPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(
    VkDevice device,
    const VkCommandBufferAllocateInfo* pAllocateInfo,
    VkCommandBuffer* pCommandBuffers);
```

- device is the logical device that owns the command pool.
- pAllocateInfo is a pointer to a VkCommandBufferAllocateInfo structure describing parameters of the allocation.
- pCommandBuffers is a pointer to an array of VkCommandBuffer handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the commandBufferCount member of pAllocateInfo. Each allocated command buffer begins in the initial state.

vkAllocateCommandBuffers can be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation must free all successfully allocated command buffer objects from this command, set all entries of the pCommandBuffers array to NULL and return the error.

**Note**
Filling \texttt{pCommandBuffers} with \texttt{NULL} values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the \textit{initial state}.

\textbf{Valid Usage (Implicit)}

- VUID-vkAllocateCommandBuffers-device-parameter\texttt{device must} be a valid \texttt{VkDevice} handle
- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter\texttt{pAllocateInfo must} be a valid pointer to a valid \texttt{VkCommandBufferAllocateInfo} structure
- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter\texttt{pCommandBuffers must} be a valid pointer to an array of \texttt{pAllocateInfo->commandBufferCount} \texttt{VkCommandBuffer} handles
- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength\texttt{pAllocateInfo->commandBufferCount must} be greater than \texttt{0}

\textbf{Host Synchronization}

- Host access to \texttt{pAllocateInfo->commandPool must} be externally synchronized

\textbf{Return Codes}

\textbf{Success}
- \texttt{VK_SUCCESS}

\textbf{Failure}
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OFDEVICE_MEMORY}

The \texttt{VkCommandBufferAllocateInfo} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandPool commandPool;
    VkCommandBufferLevel level;
    uint32_t commandBufferCount;
} VkCommandBufferAllocateInfo;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `commandPool` is the command pool from which the command buffers are allocated.

• `level` is a `VkCommandBufferLevel` value specifying the command buffer level.

• `commandBufferCount` is the number of command buffers to allocate from the pool.

---

**Valid Usage (Implicit)**

- VUID-VkCommandBufferAllocateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO`

- VUID-VkCommandBufferAllocateInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
  
  `commandPool` must be a valid `VkCommandPool` handle

- VUID-VkCommandBufferAllocateInfo-level-parameter
  
  `level` must be a valid `VkCommandBufferLevel` value

---

Possible values of `VkCommandBufferAllocateInfo::level`, specifying the command buffer level, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- `VK_COMMAND_BUFFER_LEVEL_PRIMARY` specifies a primary command buffer.

- `VK_COMMAND_BUFFER_LEVEL_SECONDARY` specifies a secondary command buffer.

To reset a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,  
    VkCommandBufferResetFlags flags);
```

- `commandBuffer` is the command buffer to reset. The command buffer can be in any state other than `pending`, and is moved into the `initial state`.

- `flags` is a bitmask of `VkCommandBufferResetFlagBits` controlling the reset operation.

Any primary command buffer that is in the `recording or executable state` and has `commandBuffer` recorded into it, becomes `invalid`. 
Valid Usage

- **VUID-vkResetCommandBuffer-commandBuffer-00045**
  *commandBuffer must not be in the pending state*

- **VUID-vkResetCommandBuffer-commandBuffer-00046**
  *commandBuffer must have been allocated from a pool that was created with the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT`*

Valid Usage (Implicit)

- **VUID-vkResetCommandBuffer-commandBuffer-parameter**
  *commandBuffer must be a valid `VkCommandBuffer` handle*

- **VUID-vkResetCommandBuffer-flags-parameter**
  *flags must be a valid combination of `VkCommandBufferResetFlagBits` values*

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Bits which can be set in `vkResetCommandBuffer::flags`, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- **VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT** specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. `commandBuffer` is moved to the initial state.
typedef VkFlags VkCommandBufferResetFlags;

VkCommandBufferResetFlags is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits.

To free command buffers, call:

```c
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool from which the command buffers were allocated.
- **commandBufferCount** is the length of the **pCommandBuffers** array.
- **pCommandBuffers** is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of **pCommandBuffers** recorded into it, becomes **invalid**.

### Valid Usage

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of **pCommandBuffers** must not be in the pending state
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  **pCommandBuffers** must be a valid pointer to an array of **commandBufferCount** VkCommandBuffer handles, each element of which must either be a valid handle or **NULL**

### Valid Usage (Implicit)

- VUID-vkFreeCommandBuffers-device-parameter
  **device** must be a valid **VkDevice** handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
  **commandPool** must be a valid **VkCommandPool** handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  **commandBufferCount** must be greater than **0**
- VUID-vkFreeCommandBuffers-commandPool-parent
  **commandPool** must have been created, allocated, or retrieved from **device**
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
Each element of `pCommandBuffers` that is a valid handle must have been created, allocated, or retrieved from `commandPool`.

## Host Synchronization

- Host access to `commandPool` must be externally synchronized
- Host access to each member of `pCommandBuffers` must be externally synchronized

### 6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

## Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049
  `commandBuffer` must not be in the recording or pending state
- VUID-vkBeginCommandBuffer-commandBuffer-00050
  If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` must be in the initial state
- VUID-vkBeginCommandBuffer-commandBuffer-00051
  If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` must be a valid `VkCommandBufferInheritanceInfo` structure
- VUID-vkBeginCommandBuffer-commandBuffer-00052
  If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is VK_FALSE, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` must not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkBeginCommandBuffer-commandBuffer-02840
  If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` must not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags
Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkBeginCommandBuffer-pBeginInfo-parameter
  pBeginInfo must be a valid pointer to a valid VkCommandBufferBeginInfo structure

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandBufferBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkCommandBufferUsageFlagBits specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a VkCommandBufferInheritanceInfo structure, used if commandBuffer is a secondary command buffer. If this is a primary command buffer, then this value is ignored.
Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-00055
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT, the framebuffer member of pInheritanceInfo must be either VK_NULL_HANDLE, or a valid VkFramebuffer that is compatible with the renderPass member of pInheritanceInfo.

- VUID-VkCommandBufferBeginInfo-flags-06000
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, renderPass must be a valid VkRenderPass.

- VUID-VkCommandBufferBeginInfo-flags-06001
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is not VK_NULL_HANDLE, the subpass member of pInheritanceInfo must be a valid subpass index within the renderPass member of pInheritanceInfo.

- VUID-VkCommandBufferBeginInfo-flags-06002
  If flags contains VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT and the renderPass member of pInheritanceInfo is VK_NULL_HANDLE, the pNext chain of pInheritanceInfo must include a VkCommandBufferInheritanceRenderingInfo structure.

Valid Usage (Implicit)

- VUID-VkCommandBufferBeginInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO.

- VUID-VkCommandBufferBeginInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkDeviceGroupCommandBufferBeginInfo.

- VUID-VkCommandBufferBeginInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkCommandBufferBeginInfo-flags-parameter
  flags must be a valid combination of VkCommandBufferUsageFlagBits values.

Bits which can be set in VkCommandBufferBeginInfo::flags, specifying usage behavior for a command buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
  VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
  VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
  VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT specifies that each recording of the command
buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.

- **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

- **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer can be resubmitted to a queue while it is in the *pending state*, and recorded into multiple primary command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

**VkCommandBufferUsageFlags** is a bitmask type for setting a mask of zero or more **VkCommandBufferUsageFlagBits**.

If the command buffer is a secondary command buffer, then the **VkCommandBufferInheritanceInfo** structure defines any state that will be inherited from the primary command buffer:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkFramebuffer framebuffer;
    VkBool32 occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **renderPass** is a **VkRenderPass** object defining which render passes the **VkCommandBuffer** will be compatible with and **can** be executed within.

- **subpass** is the index of the subpass within the render pass instance that the **VkCommandBuffer** will be executed within.

- **framebuffer** **can** refer to the **VkFramebuffer** object that the **VkCommandBuffer** will be rendering to if it is executed within a render pass instance. It **can** be **VK_NULL_HANDLE** if the framebuffer is not known.

**Note**

Specifying the exact framebuffer that the secondary command buffer will be executed with **may** result in better performance at command buffer execution time.
• **occlusionQueryEnable** specifies whether the command buffer can be executed while an occlusion query is active in the primary command buffer. If this is **VK_TRUE**, then this command buffer can be executed whether the primary command buffer has an occlusion query active or not. If this is **VK_FALSE**, then the primary command buffer must not have an occlusion query active.

• **queryFlags** specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the **VK_QUERY_CONTROL_PRECISE_BIT** bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the **VK_QUERY_CONTROL_PRECISE_BIT** bit.

• **pipelineStatistics** is a bitmask of **VkQueryPipelineStatisticFlagBits** specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query must not be from a query pool that counts that statistic.

If the **VkCommandBuffer** will not be executed within a render pass instance, or if the render pass instance was begun with **vkCmdBeginRendering**, **renderPass**, **subpass**, and **framebuffer** are ignored.

### Valid Usage

- **VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056**
  - If the **inheritedQueries** feature is not enabled, **occlusionQueryEnable** must be **VK_FALSE**

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-00057**
  - If the **inheritedQueries** feature is enabled, **queryFlags** must be a valid combination of **VkQueryControlFlagBits** values

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-02788**
  - If the **inheritedQueries** feature is not enabled, **queryFlags** must be **0**

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789**
  - If the **pipelineStatisticsQuery** feature is enabled, **pipelineStatistics** must be a valid combination of **VkQueryPipelineStatisticFlagBits** values

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058**
  - If the **pipelineStatisticsQuery** feature is not enabled, **pipelineStatistics** must be **0**

### Valid Usage (Implicit)

- **VUID-VkCommandBufferInheritanceInfo-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO**

- **VUID-VkCommandBufferInheritanceInfo-pNext-pNext**
  - Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkAttachmentSampleCountInfoAMD**, **VkCommandBufferInheritanceRenderingInfo**, or **VkMultiviewPerViewAttributesInfoNVX**
• VUID-VkCommandBufferInheritanceInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkCommandBufferInheritanceInfo-commonparent
  Both of framebuffer, and renderPass that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Note
On some implementations, not using the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT flag set, then vkBeginCommandBuffer implicitly resets the command buffer, behaving as if vkResetCommandBuffer had been called with VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT not set. After the implicit reset, commandBuffer is moved to the recording state.

The VkCommandBufferInheritanceRenderingInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo VkCommandBufferInheritanceRenderingInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure
• flags is a bitmask of VkRenderingFlagBits used by the render pass instance.
• viewMask is the view mask used for rendering.
• colorAttachmentCount is the number of color attachments specified in the render pass instance.
• pColorAttachmentFormats is a pointer to an array of VkFormat values defining the format of color
attachments.

- **depthAttachmentFormat** is a `VkFormat` value defining the format of the depth attachment.
- **stencilAttachmentFormat** is a `VkFormat` value defining the format of the stencil attachment.
- **rasterizationSamples** is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is 0 and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

### Valid Usage

- VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004
  If `colorAttachmentCount` is not 0, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005
  If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` must be a valid `VkSampleCountFlagBits` value.

- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06006
  If any element of `pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.

- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a stencil aspect.

- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200
If \texttt{depthAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED} and \texttt{stencilAttachmentFormat} is not \texttt{VK_FORMAT_UNDEFINED}, \texttt{depthAttachmentFormat} \textbf{must} equal \texttt{stencilAttachmentFormat}

- VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008
  If the \texttt{multiview} feature is not enabled, \texttt{viewMask} \textbf{must} be \texttt{0}

- VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009
  The index of the most significant bit in \texttt{viewMask} \textbf{must} be less than \texttt{maxMultiviewViewCount}

\section*{Valid Usage (Implicit)}

- VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO}

- VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter
  \texttt{flags} \textbf{must} be a valid combination of \texttt{VkRenderingFlagBits} values

- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-parameter
  If \texttt{colorAttachmentCount} is not \texttt{0}, \texttt{pColorAttachmentFormats} \textbf{must} be a valid pointer to an array of \texttt{colorAttachmentCount} valid \texttt{VkFormat} values

- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-parameter
  \texttt{depthAttachmentFormat} \textbf{must} be a valid \texttt{VkFormat} value

- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-parameter
  \texttt{stencilAttachmentFormat} \textbf{must} be a valid \texttt{VkFormat} value

- VUID-VkCommandBufferInheritanceRenderingInfo-rasterizationSamples-parameter
  If \texttt{rasterizationSamples} is not \texttt{0}, \texttt{rasterizationSamples} \textbf{must} be a valid \texttt{VkSampleCountFlagBits} value

Once recording starts, an application records a sequence of commands (\texttt{vkCmd*}) to set state in the command buffer, draw, dispatch, and other commands.

To complete recording of a command buffer, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer( VkCommandBuffer commandBuffer );
\end{verbatim}

- \texttt{commandBuffer} is the command buffer to complete recording.

The command buffer \textbf{must} have been in the \texttt{recording state}, and, if successful, is moved to the \texttt{executable state}.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by \texttt{vkEndCommandBuffer}, and the command buffer will be moved to the \texttt{invalid state}.

In case the application recorded one or more \texttt{video encode operations} into the command buffer, implementations \textbf{may} return the \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR} error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used
video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**
Applications **should** not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

### Valid Usage

- **VUID-vkEndCommandBuffer-commandBuffer-00059**
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkEndCommandBuffer-commandBuffer-00060**
  If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance

- **VUID-vkEndCommandBuffer-commandBuffer-00061**
  All queries made **active** during the recording of `commandBuffer` **must** have been made inactive

- **VUID-vkEndCommandBuffer-None-06991**
  There **must** be no video session object bound

### Valid Usage (Implicit)

- **VUID-vkEndCommandBuffer-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
When a command buffer is in the executable state, it can be submitted to a queue for execution.

### 6.5. Command Buffer Submission

**Note**
Submission can be a high overhead operation, and applications should attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:

```cpp
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

or the equivalent command

```cpp
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

- **queue** is the queue that the command buffers will be submitted to.
- **submitCount** is the number of elements in the **pSubmits** array.
- **pSubmits** is a pointer to an array of **VkSubmitInfo2** structures, each specifying a command buffer submission batch.
- **fence** is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If **fence** is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit2` is a queue submission command, with each batch defined by an element of **pSubmits**.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore section of the synchronization chapter.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending...
state, back to the executable state. If a command buffer was recorded with the 
VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves back to the invalid state.

If vkQueueSubmit2 fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit2 fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.

Valid Usage

- VUID-vkQueueSubmit2-fence-04894
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueSubmit2-fence-04895
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-vkQueueSubmit2-synchronization2-03866
  The synchronization2 feature must be enabled

- VUID-vkQueueSubmit2-commandBuffer-03867
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits referenced an VkEvent, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state

- VUID-vkQueueSubmit2-semaphore-03868
  The semaphore member of any binary semaphore element of the pSignalSemaphoreInfos member of any element of pSubmits must be unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueSubmit2-stageMask-03869
  The stageMask member of any element of the pSignalSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to

- VUID-vkQueueSubmit2-stageMask-03870
  The stageMask member of any element of the pWaitSemaphoreInfos member of any element of pSubmits must only include pipeline stages that are supported by the queue family which queue belongs to

- VUID-vkQueueSubmit2-semaphore-03871
  When a semaphore wait operation for a binary semaphore is executed, as defined by the semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits, there must be no other queues waiting on the same semaphore

- VUID-vkQueueSubmit2-semaphore-03873
  Any semaphore member of any element of the pWaitSemaphoreInfos member of any element of pSubmits that was created with a VkSemaphoreTypeKHR of VK_SEMAPHORE_TYPE_BINARY_KHR must reference a semaphore signal operation that has been
submitted for execution and any semaphore signal operations on which it depends (if any) **must** have also been submitted for execution

- **VUID-vkQueueSubmit2-commandBuffer-03874**
  The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits **must** be in the pending or executable state

- **VUID-vkQueueSubmit2-commandBuffer-03875**
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it **must** not be in the pending state

- **VUID-vkQueueSubmit2-commandBuffer-03876**
  Any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits **must** be in the pending or executable state

- **VUID-vkQueueSubmit2-commandBuffer-03877**
  If any secondary command buffers recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it **must** not be in the pending state

- **VUID-vkQueueSubmit2-commandBuffer-03878**
  The commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits **must** have been allocated from a VkCommandPool that was created for the same queue family queue belongs to

- **VUID-vkQueueSubmit2-commandBuffer-03879**
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits includes a Queue Family Transfer Acquire Operation, there **must** exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation

- **VUID-vkQueueSubmit2-commandBuffer-03880**
  If a command recorded into the commandBuffer member of any element of the pCommandBufferInfos member of any element of pSubmits was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock **must** have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers

- **VUID-vkQueueSubmit2-queue-06447**
  If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, the flags member of any element of pSubmits **must** not include VK_SUBMIT_PROTECTED_BIT_KHR

---

**Valid Usage (Implicit)**

- **VUID-vkQueueSubmit2-queue-parameter**
  queue **must** be a valid VkQueue handle
• VUID-vkQueueSubmit2-pSubmits-parameter
  If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures

• VUID-vkQueueSubmit2-fence-parameter
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle

• VUID-vkQueueSubmit2-commonparent
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

- Host access to `queue` must be externally synchronized
- Host access to `fence` must be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

## Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

The `VkSubmitInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkSubmitFlags flags;
    uint32_t waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```
VkSubmitInfo2

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitInfo2 VkSubmitInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubmitFlagBits`.
- `waitSemaphoreInfoCount` is the number of elements in `pWaitSemaphoreInfos`.
- `pWaitSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` structures defining semaphore wait operations.
- `commandBufferInfoCount` is the number of elements in `pCommandBufferInfos` and the number of command buffers to execute in the batch.
- `pCommandBufferInfos` is a pointer to an array of `VkCommandBufferSubmitInfo` structures describing command buffers to execute in the batch.
- `signalSemaphoreInfoCount` is the number of elements in `pSignalSemaphoreInfos`.
- `pSignalSemaphoreInfos` is a pointer to an array of `VkSemaphoreSubmitInfo` describing semaphore signal operations.

### Valid Usage

- **VUID-VkSubmitInfo2-semaphore-03881**
  If the same semaphore is used as the `semaphore` member of both an element of `pSignalSemaphoreInfos` and `pWaitSemaphoreInfos`, and that semaphore is a timeline semaphore, the `value` member of the `pSignalSemaphoreInfos` element **must** be greater than the `value` member of the `pWaitSemaphoreInfos` element

- **VUID-VkSubmitInfo2-semaphore-03882**
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed

- **VUID-VkSubmitInfo2-semaphore-03883**
  If the `semaphore` member of any element of `pSignalSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- **VUID-VkSubmitInfo2-semaphore-03884**
  If the `semaphore` member of any element of `pWaitSemaphoreInfos` is a timeline semaphore, the `value` member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`
• VUID-VkSubmitInfo2-flags-03886
If flags includes VK_SUBMIT_PROTECTED_BIT, all elements of pCommandBuffers must be protected command buffers

• VUID-VkSubmitInfo2-flags-03887
If flags does not include VK_SUBMIT_PROTECTED_BIT, each element of pCommandBuffers must not be a protected command buffer

• VUID-VkSubmitInfo2KHR-commandBuffer-06192
If any commandBuffer member of an element of pCommandBufferInfos contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBufferInfos

• VUID-VkSubmitInfo2KHR-commandBuffer-06010
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos

• VUID-VkSubmitInfo2KHR-commandBuffer-06011
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it

• VUID-VkSubmitInfo2KHR-commandBuffer-06012
If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

Valid Usage (Implicit)

• VUID-VkSubmitInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO_2

• VUID-VkSubmitInfo2-pNext-pNext
Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPerformanceQuerySubmitInfoKHR or VkWin32KeyedMutexAcquireReleaseInfoKHR

• VUID-VkSubmitInfo2-sType-unique
The sType value of each struct in the pNext chain must be unique

• VUID-VkSubmitInfo2-flags-parameter
flags must be a valid combination of VkSubmitFlagBits values

• VUID-VkSubmitInfo2-pWaitSemaphoreInfos-parameter
If waitSemaphoreInfoCount is not 0, pWaitSemaphoreInfos must be a valid pointer to an array of waitSemaphoreInfoCount valid VkSemaphoreSubmitInfo structures

• VUID-VkSubmitInfo2-pCommandBufferInfos-parameter
If commandBufferInfoCount is not 0, pCommandBufferInfos must be a valid pointer to an array of commandBufferInfoCount valid VkCommandBufferSubmitInfo structures

• VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter
If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` must be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures.

Bits which can be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- `VK_SUBMIT_PROTECTED_BIT` specifies that this batch is a protected submission.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBits`.

The `VkSemaphoreSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType                      sType;
    const void*                          pNext;
    VkSemaphore                          semaphore;
    uint64_t                              value;
    VkPipelineStageFlags2                stageMask;
    uint32_t                              deviceIndex;
} VkSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
```
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is a `VkSemaphore` affected by this operation.
- `value` is either the value used to signal `semaphore` or the value waited on by `semaphore`, if `semaphore` is a timeline semaphore. Otherwise it is ignored.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphorewait operation as described in the `semaphore wait operation` and `semaphore signal operation` sections of the synchronization chapter.
- `deviceIndex` is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

### Valid Usage

- **VUID-VkSemaphoreSubmitInfo-stageMask-03929**
  If the `geometryShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-03930**
  If the `tessellationShader` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-07317**
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkSemaphoreSubmitInfo-stageMask-07947**
  If the `rayTracingPipeline` feature is not enabled, `stageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkSemaphoreSubmitInfo-device-03888**
  If the `device` that `semaphore` was created on is not a device group, `deviceIndex` **must** be `0`

- **VUID-VkSemaphoreSubmitInfo-device-03889**
  If the `device` that `semaphore` was created on is a device group, `deviceIndex` **must** be a valid device index

### Valid Usage (Implicit)

- **VUID-VkSemaphoreSubmitInfo-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO`

- **VUID-VkSemaphoreSubmitInfo-pNext-pNext**
  `pNext` **must** be `NULL` or a pointer to a structure extending this structure.
The `VkCommandBufferSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `commandBuffer` is a `VkCommandBuffer` to be submitted for execution.
- `deviceMask` is a bitmask indicating which devices in a device group execute the command buffer. A `deviceMask` of 0 is equivalent to setting all bits corresponding to valid devices in the group to 1.

### Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
  `commandBuffer` must not have been allocated with `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
  If `deviceMask` is not 0, it must be a valid device mask

### Valid Usage (Implicit)

- VUID-VkCommandBufferSubmitInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO`

- VUID-VkCommandBufferSubmitInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue queue,                // Provided by VK_VERSION_1_0
    uint32_t submitCount,         // Provided by VK_VERSION_1_0
    const VkSubmitInfo* pSubmits, // Provided by VK_VERSION_1_0
    VkFence fence);              // Provided by VK_VERSION_1_0
```

- queue is the queue that the command buffers will be submitted to.
- submitCount is the number of elements in the pSubmits array.
- pSubmits is a pointer to an array of VkSubmitInfo structures, each specifying a command buffer submission batch.
- fence is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueSubmit is a queue submission command, with each batch defined by an element of pSubmits. Batches begin execution in the order they appear in pSubmits, but may complete out of order.

Fence and semaphore operations submitted with vkQueueSubmit have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of pWaitDstStageMask with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in pSubmits is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves to the invalid state.

If vkQueueSubmit fails, it may return VK_ERROR_OUT_OF_HOST_MEMORY or VK_ERROR_OUT_OF_DEVICE_MEMORY. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by pSubmits is unaffected by the call or its failure. If vkQueueSubmit fails in such a way that the implementation is unable to make that guarantee, the implementation must return VK_ERROR_DEVICE_LOST. See Lost Device.
### Valid Usage

- **VUID-vkQueueSubmit-fence-00063**
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- **VUID-vkQueueSubmit-fence-00064**
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueSubmit-pCommandBuffers-00065**
  Any calls to `vkCmdSetEvent`, `vkCmdResetEvent` or `vkCmdWaitEvents` that have been recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, must not reference any VkEvent that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the pending state

- **VUID-vkQueueSubmit-pWaitDstStageMask-00066**
  Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` must be a pipeline stage supported by one of the capabilities of queue, as specified in the table of supported pipeline stages

- **VUID-vkQueueSubmit-pSignalSemaphores-00067**
  Each binary semaphore element of the `pSignalSemaphores` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit-pWaitSemaphores-00068**
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on queue, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit-pWaitSemaphores-03238**
  All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

- **VUID-vkQueueSubmit-pCommandBuffers-00070**
  Each element of the `pCommandBuffers` member of each element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit-pCommandBuffers-00071**
  If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- **VUID-vkQueueSubmit-pCommandBuffers-00072**
  Any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit-pCommandBuffers-00073**
  If any secondary command buffers recorded into any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the
VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

- **VUID-vkQueueSubmit-pCommandBuffers-00074**
  Each element of the pCommandBuffers member of each element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to.

- **VUID-vkQueueSubmit-pSubmits-02207**
  If any element of pSubmits->pCommandBuffers includes a Queue Family Transfer Acquire Operation, there must exist a previously submitted Queue Family Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation.

- **VUID-vkQueueSubmit-pCommandBuffers-03220**
  If a command recorded into any element of pCommandBuffers was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers.

- **VUID-vkQueueSubmit-pSubmits-02808**
  Any resource created with VK_SHARING_MODE_EXCLUSIVE that is read by an operation specified by pSubmits must not be owned by any queue family other than the one which queue belongs to, at the time it is executed.

- **VUID-vkQueueSubmit-pSubmits-04626**
  Any resource created with VK_SHARING_MODE_CONCURRENT that is accessed by an operation specified by pSubmits must have included the queue family of queue at resource creation time.

- **VUID-vkQueueSubmit-queue-06448**
  If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, there must be no element of pSubmits that includes an VkProtectedSubmitInfo structure in its pNext chain with protectedSubmit equal to VK_TRUE.

---

**Valid Usage (Implicit)**

- **VUID-vkQueueSubmit-queue-parameter**
  queue must be a valid VkQueue handle.

- **VUID-vkQueueSubmit-pSubmits-parameter**
  If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo structures.

- **VUID-vkQueueSubmit-fence-parameter**
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle.

- **VUID-vkQueueSubmit-commonparent**
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

Command Properties

<table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
    const VkSubmitInfo* pNext;
} VkSubmitInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the command buffers for the batch.
- **pWaitSemaphores** is a pointer to an array of VkSemaphore handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
• **pWaitDstStageMask** is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.

• **commandBufferCount** is the number of command buffers to execute in the batch.

• **pCommandBuffers** is a pointer to an array of **VkCommandBuffer** handles to execute in the batch.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the commands specified in **pCommandBuffers** have completed execution.

• **pSignalSemaphores** is a pointer to an array of **VkSemaphore** handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a **semaphore signal operation**.

The order that command buffers appear in **pCommandBuffers** is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers **may** overlap or otherwise execute out of order.

---

**Valid Usage**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04090**
  If the **geometryShader** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04091**
  If the **tessellationShader** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** or **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**

- **VUID-VkSubmitInfo-pWaitDstStageMask-07319**
  If the **attachmentFragmentShadingRate** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkSubmitInfo-pWaitDstStageMask-03937**
  If the **synchronization2** feature is not enabled, **pWaitDstStageMask** must not be 0

- **VUID-VkSubmitInfo-pWaitDstStageMask-07950**
  If the **rayTracingPipeline** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR**

- **VUID-VkSubmitInfo-pCommandBuffers-00075**
  Each element of **pCommandBuffers** must not have been allocated with **VK_COMMAND_BUFFER_LEVEL_SECONDARY**

- **VUID-VkSubmitInfo-pWaitDstStageMask-00078**
  Each element of **pWaitDstStageMask** must not include **VK_PIPELINE_STAGE_HOST_BIT**

- **VUID-VkSubmitInfo-pWaitSemaphores-03239**
  If any element of **pWaitSemaphores** or **pSignalSemaphores** was created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE**, then the **pNext** chain must include a **VkTimelineSemaphoreSubmitInfo** structure

- **VUID-VkSubmitInfo-pNext-03240**
  If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure
and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`

- **VUID-VkSubmitInfo-pNext-03241**  
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`

- **VUID-VkSubmitInfo-pSignalSemaphores-03242**  
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

- **VUID-VkSubmitInfo-pWaitSemaphores-03243**  
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- **VUID-VkSubmitInfo-pSignalSemaphores-03244**  
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`

- **VUID-VkSubmitInfo-pNext-04120**  
  If the `pNext` chain of this structure does not include a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be an unprotected command buffer.

- **VUID-VkSubmitInfo-pNext-04148**  
  If the `pNext` chain of this structure includes a `VkProtectedSubmitInfo` structure with `protectedSubmit` set to `VK_TRUE`, then each element of the `pCommandBuffers` array must be a protected command buffer.

- **VUID-VkSubmitInfo-pCommandBuffers-06193**  
  If `pCommandBuffers` contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within `pCommandBuffers`.

- **VUID-VkSubmitInfo-pCommandBuffers-06014**  
  If `pCommandBuffers` contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within `pCommandBuffers`.

- **VUID-VkSubmitInfo-pCommandBuffers-06015**  
  If `pCommandBuffers` contains any suspended render pass instances, there must be no action.
or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-pCommandBuffers-06016
  If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it

Valid Usage (Implicit)

- VUID-VkSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO

- VUID-VkSubmitInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkD3D12FenceSubmitInfoKHR, VkDeviceGroupSubmitInfo, VkPerformanceQuerySubmitInfoKHR, VkProtectedSubmitInfo, VkTimelineSemaphoreSubmitInfo, or VkWin32KeyedMutexAcquireReleaseInfoKHR

- VUID-VkSubmitInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubmitInfo-pWaitSemaphores-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
  If waitSemaphoreCount is not 0, pWaitDstStageMask must be a valid pointer to an array of waitSemaphoreCount valid combinations of VkPipelineStageFlagBits values

- VUID-VkSubmitInfo-pCommandBuffers-parameter
  If commandBufferCount is not 0, pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles

- VUID-VkSubmitInfo-pSignalSemaphores-parameter
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

- VUID-VkSubmitInfo-commonparent
  Each of the elements of pCommandBuffers, the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkSubmitInfo structure when using vkQueueSubmit or the VkBindSparseInfo structure when using vkQueueBindSparse. The VkTimelineSemaphoreSubmitInfo structure is defined as:

```plaintext
// Provided by VK_VERSION_1_2
```
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValueCount;
    const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• waitSemaphoreValueCount is the number of semaphore wait values specified in pWaitSemaphoreValues.
• pWaitSemaphoreValues is a pointer to an array of waitSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
• signalSemaphoreValueCount is the number of semaphore signal values specified in pSignalSemaphoreValues.
• pSignalSemaphoreValues is a pointer to an array signalSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively was not created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.

Valid Usage (Implicit)

• VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO

• VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  If waitSemaphoreValueCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValueCount uint64_t values

• VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If signalSemaphoreValueCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValueCount uint64_t values

To specify the values to use when waiting for and signaling semaphores whose current payload
refers to a Direct3D 12 fence, add a `VkD3D12FenceSubmitInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure. The `VkD3D12FenceSubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreValuesCount` is the number of semaphore wait values specified in `pWaitSemaphoreValues`.
- `pWaitSemaphoreValues` is a pointer to an array of `waitSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pWaitSemaphores` to wait for.
- `signalSemaphoreValuesCount` is the number of semaphore signal values specified in `pSignalSemaphoreValues`.
- `pSignalSemaphoreValues` is a pointer to an array of `signalSemaphoreValuesCount` values for the corresponding semaphores in `VkSubmitInfo::pSignalSemaphores` to set when signaled.

If the semaphore in `VkSubmitInfo::pWaitSemaphores` or `VkSubmitInfo::pSignalSemaphores` corresponding to an entry in `pWaitSemaphoreValues` or `pSignalSemaphoreValues` respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the `pWaitSemaphoreValues` or `pSignalSemaphoreValues` entry.

**Note**

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, and use the `VkTimelineSemaphoreSubmitInfo` structure instead of the `VkD3D12FenceSubmitInfoKHR` structure to specify the values to use when waiting for and signaling such semaphores.

**Valid Usage**

- `VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079` `waitSemaphoreValuesCount` must be the same value as `VkSubmitInfo::waitSemaphoreCount`,
where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

- **VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080**
  
  `signalSemaphoreValuesCount` must be the same value as `VkSubmitInfo::signalSemaphoreCount`, where this structure is in the `pNext` chain of a `VkSubmitInfo` structure

### Valid Usage (Implicit)

- **VUID-VkD3D12FenceSubmitInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR`

- **VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter**
  
  If `waitSemaphoreValuesCount` is not 0, and `pWaitSemaphoreValues` is not NULL, `pWaitSemaphoreValues` must be a valid pointer to an array of `waitSemaphoreValuesCount uint64_t` values

- **VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter**
  
  If `signalSemaphoreValuesCount` is not 0, and `pSignalSemaphoreValues` is not NULL, `pSignalSemaphoreValues` must be a valid pointer to an array of `signalSemaphoreValuesCount uint64_t` values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the `D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX` flag.

To acquire keyed mutexes before submitted work and/or release them after, add a `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure to the `pNext` chain of the `VkSubmitInfo` structure.

The `VkWin32KeyedMutexAcquireReleaseInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_keyed_mutex
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint32_t* pAcquireTimeouts;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• acquireCount is the number of entries in the pAcquireSyncs, pAcquireKeys, and pAcquireTimeouts arrays.

• pAcquireSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pAcquireKeys is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in pAcquireSyncs.

• pAcquireTimeouts is a pointer to an array of timeout values, in millisecond units, for each acquire specified in pAcquireKeys.

• releaseCount is the number of entries in the pReleaseSyncs and pReleaseKeys arrays.

• pReleaseSyncs is a pointer to an array of VkDeviceMemory objects which were imported from Direct3D 11 resources.

• pReleaseKeys is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in pReleaseSyncs.

Valid Usage

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
  Each member of pAcquireSyncs and pReleaseSyncs must be a device memory object imported by setting VkImportMemoryWin32HandleInfoKHR::handleType to VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT

Valid Usage (Implicit)

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-parameter
  If acquireCount is not 0, pAcquireSyncs must be a valid pointer to an array of acquireCount valid VkDeviceMemory handles

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireKeys-parameter
  If acquireCount is not 0, pAcquireKeys must be a valid pointer to an array of acquireCount uint64_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireTimeouts-parameter
  If acquireCount is not 0, pAcquireTimeouts must be a valid pointer to an array of acquireCount uint32_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseSyncs-parameter
  If releaseCount is not 0, pReleaseSyncs must be a valid pointer to an array of releaseCount valid VkDeviceMemory handles

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pReleaseKeys-parameter
  If releaseCount is not 0, pReleaseKeys must be a valid pointer to an array of releaseCount
uint64_t values

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-commonparent
  Both of the elements of pAcquireSyncs, and the elements of pReleaseSyncs that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the pNext chain of VkSubmitInfo includes a VkProtectedSubmitInfo structure, then the structure indicates whether the batch is protected. The VkProtectedSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkBool32 protectedSubmit;
} VkProtectedSubmitInfo;
```

• protectedSubmit specifies whether the batch is protected. If protectedSubmit is VK_TRUE, the batch is protected. If protectedSubmit is VK_FALSE, the batch is unprotected. If the VkSubmitInfo::pNext chain does not include this structure, the batch is unprotected.

Valid Usage (Implicit)

• VUID-VkProtectedSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO

If the pNext chain of VkSubmitInfo includes a VkDeviceGroupSubmitInfo structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The VkDeviceGroupSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;
```

or the equivalent
typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of elements in the `pWaitSemaphoreDeviceIndices` array.
- `pWaitSemaphoreDeviceIndices` is a pointer to an array of `waitSemaphoreCount` device indices indicating which physical device executes the semaphore wait operation in the corresponding element of `VkSubmitInfo::pWaitSemaphores`.
- `commandBufferCount` is the number of elements in the `pCommandBufferDeviceMasks` array.
- `pCommandBufferDeviceMasks` is a pointer to an array of `commandBufferCount` device masks indicating which physical devices execute the command buffer in the corresponding element of `VkSubmitInfo::pCommandBuffers`. A physical device executes the command buffer if the corresponding bit is set in the mask.
- `signalSemaphoreCount` is the number of elements in the `pSignalSemaphoreDeviceIndices` array.
- `pSignalSemaphoreDeviceIndices` is a pointer to an array of `signalSemaphoreCount` device indices indicating which physical device executes the semaphore signal operation in the corresponding element of `VkSubmitInfo::pSignalSemaphores`.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

### Valid Usage

- **VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082**
  - `waitSemaphoreCount` must equal `VkSubmitInfo::waitSemaphoreCount`

- **VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083**
  - `commandBufferCount` must equal `VkSubmitInfo::commandBufferCount`

- **VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084**
  - `signalSemaphoreCount` must equal `VkSubmitInfo::signalSemaphoreCount`

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085**
  - All elements of `pWaitSemaphoreDeviceIndices` and `pSignalSemaphoreDeviceIndices` must be valid device indices

- **VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086**
  - All elements of `pCommandBufferDeviceMasks` must be valid device masks

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSubmitInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO`

- **VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter**
If `waitSemaphoreCount` is not 0, `pWaitSemaphoreDeviceIndices` must be a valid pointer to an array of `waitSemaphoreCount` `uint32_t` values.

- VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
  If `commandBufferCount` is not 0, `pCommandBufferDeviceMasks` must be a valid pointer to an array of `commandBufferCount` `uint32_t` values.

- VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
  If `signalSemaphoreCount` is not 0, `pSignalSemaphoreDeviceIndices` must be a valid pointer to an array of `signalSemaphoreCount` `uint32_t` values.

If the `pNext` chain of `VkSubmitInfo` includes a `VkPerformanceQuerySubmitInfoKHR` structure, then the structure indicates which counter pass is active for the batch in that submit.

The `VkPerformanceQuerySubmitInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `counterPassIndex` specifies which counter pass index is active.

If the `VkSubmitInfo::pNext` chain does not include this structure, the batch defaults to use counter pass index 0.

**Valid Usage**

- VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
  `counterPassIndex` must be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Valid Usage (Implicit)**

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

### 6.6. Queue Forward Progress

When using binary semaphores, the application must ensure that command buffer submissions
will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there **must** be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications can submit work via `vkQueueSubmit` defining a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application **must** ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application **must** ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host **must** be signaled before the command buffer waits on those events.

```
Note
The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.
```

### 6.7. Secondary Command Buffer Execution

A secondary command buffer **must** not be directly submitted to a queue. Instead, secondary command buffers are recorded to execute as part of a primary command buffer with the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer, commandBufferCount, pCommandBuffers);
```

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the
VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes invalid.

### Valid Usage

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00088**  
  Each element of `pCommandBuffers` **must** have been allocated with a level of VK_COMMAND_BUFFER_LEVEL_SECONDARY

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00089**  
  Each element of `pCommandBuffers` **must** be in the pending or executable state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00091**  
  If any element of `pCommandBuffers` was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT flag, it **must** not be in the pending state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00092**  
  If any element of `pCommandBuffers` was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT flag, it **must** not have already been recorded to `commandBuffer`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00093**  
  If any element of `pCommandBuffers` was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT flag, it **must** not appear more than once in `pCommandBuffers`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00094**  
  Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00096**  
  If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` **must** have been recorded with the VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00099**  
  If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to VK_NULL_HANDLE, that `VkFramebuffer` **must** match the `VkFramebuffer` used in the current render pass instance

- **VUID-vkCmdExecuteCommands-contents-06018**  
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, its `contents` parameter **must** have been set to VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06019**  
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` **must** have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be compatible with the current render pass.

If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` must not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

If the `inheritedQueries` feature is not enabled, `commandBuffer` must not have any queries active.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::queryFlags` having all bits set that are set for the query.

If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses.

Each element of `pCommandBuffers` must not begin any query types that are active in `commandBuffer`.

`commandBuffer` must not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` active.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be a protected command buffer.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be an unprotected command buffer.

If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` must not read from the memory backing that image subresource in any other way.

If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded
command in commandBuffer in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of pCommandBuffers must not write to that image subresource as an attachment

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06535**
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in a given element of pCommandBuffers will write to an image subresource as an attachment, commands recorded in elements of pCommandBuffers at a higher index must not read from the memory backing that image subresource in any other way

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06536**
  If vkCmdExecuteCommands is being called within a render pass instance and any recorded command in a given element of pCommandBuffers will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of pCommandBuffers at a higher index must not write to that image subresource as an attachment

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06021**
  If pCommandBuffers contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and any render pass instance that resumes it

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06022**
  If pCommandBuffers contains any suspended render pass instances, there must be no render pass instances between that render pass instance and any render pass instance that resumes it

- **VUID-vkCmdExecuteCommands-flags-06024**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, its VkRenderingInfo::flags parameter must have included VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT

- **VUID-vkCmdExecuteCommands-pBeginInfo-06025**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the render passes specified in the pBeginInfo->pInheritanceInfo->renderPass members of the vkBeginCommandBuffer commands used to begin recording each element of pCommandBuffers must be VK_NULL_HANDLE

- **VUID-vkCmdExecuteCommands-flags-06026**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the flags member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::flags parameter to vkCmdBeginRendering, excluding VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT

- **VUID-vkCmdExecuteCommands-colorAttachmentCount-06027**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the colorAttachmentCount member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::colorAttachmentCount parameter to vkCmdBeginRendering
• **VUID-vkCmdExecuteCommands-imageView-06028**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view.

• **VUID-vkCmdExecuteCommands-imageView-07606**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`.

• **VUID-vkCmdExecuteCommands-pDepthAttachment-06029**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view.

• **VUID-vkCmdExecuteCommands-pStencilAttachment-06030**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be equal to the format used to create that image view.

• **VUID-vkCmdExecuteCommands-pDepthAttachment-06774**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pDepthAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `depthAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`.

• **VUID-vkCmdExecuteCommands-pStencilAttachment-06775**

If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering` and the `VkRenderingInfo::pStencilAttachment->imageView` parameter to `vkCmdBeginRendering` was `VK_NULL_HANDLE`, the value of the `stencilAttachmentFormat` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritenceInfo` used to begin recording each element of `pCommandBuffers` **must** be `VK_FORMAT_UNDEFINED`. 
If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `viewMask` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::viewMask` parameter to `vkCmdBeginRendering`

**Valid Usage (Implicit)**

- VUID-vkCmdExecuteCommands-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
  `pCommandBuffers` must be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles

- VUID-vkCmdExecuteCommands-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdExecuteCommands-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdExecuteCommands-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

- VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
  `commandBufferCount` must be greater than 0

- VUID-vkCmdExecuteCommands-commonparent
  Both of `commandBuffer`, and the elements of `pCommandBuffers` must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### 6.8. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the `pCommandBufferDeviceMasks` member of `VkDeviceGroupSubmitInfo`. Commands only execute on a physical device if the device index is set in both device masks.

If the `pNext` chain of `VkCommandBufferBeginInfo` includes a `VkDeviceGroupCommandBufferBeginInfo` structure, then that structure includes an initial device mask for the command buffer.

The `VkDeviceGroupCommandBufferBeginInfo` structure is defined as:

```c
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```c
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
deviceMask is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.

If this structure is not present, the initial value of a command buffer's device mask is set to include all physical devices in the logical device when the command buffer begins recording.

Valid Usage

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
deviceMask must be a valid device mask value

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
deviceMask must not be zero

Valid Usage (Implicit)

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO

To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer, 
    uint32_t deviceMask);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer, 
    uint32_t deviceMask);
```

- commandBuffer is command buffer whose current device mask is modified.
- deviceMask is the new value of the current device mask.

deviceMask is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the deviceMask member of the VkDeviceGroupRenderPassBeginInfo structure passed to the command beginning the corresponding render pass instance.
Valid Usage

- VUID-vkCmdSetDeviceMask-deviceMask-00108
deviceMask must be a valid device mask value

- VUID-vkCmdSetDeviceMask-deviceMask-00109
deviceMask must not be zero

- VUID-vkCmdSetDeviceMask-deviceMask-00110
deviceMask must not include any set bits that were not in the VkDeviceGroupCommandBufferBeginInfo::deviceMask value when the command buffer began recording

- VUID-vkCmdSetDeviceMask-deviceMask-00111
If vkCmdSetDeviceMask is called inside a render pass instance, deviceMask must not include any set bits that were not in the VkDeviceGroupRenderPassBeginInfo::deviceMask value when the render pass instance began recording

Valid Usage (Implicit)

- VUID-vkCmdSetDeviceMask-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDeviceMask-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

Fences
Fences can be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

Semaphores
Semaphores can be used to control resource access across multiple queues.

Events
Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host. Events can be used to control resource access within a single queue.

Pipeline Barriers
Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers can be used to control resource access within a single queue.

Render Passes
Render passes provide a useful synchronization framework for most rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass. Render pass objects can be used to control resource access within a single queue.

7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a
dependency. Other scoping options are possible, depending on the particular command.

An execution dependency is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let \( \text{Ops}_1 \) and \( \text{Ops}_2 \) be separate sets of operations.
- Let \( \text{Sync} \) be a synchronization command.
- Let \( \text{Scope}_{\text{1st}} \) and \( \text{Scope}_{\text{2nd}} \) be the synchronization scopes of \( \text{Sync} \).
- Let \( \text{ScopedOps}_1 \) be the intersection of sets \( \text{Ops}_1 \) and \( \text{Scope}_{\text{1st}} \).
- Let \( \text{ScopedOps}_2 \) be the intersection of sets \( \text{Ops}_2 \) and \( \text{Scope}_{\text{2nd}} \).
- Submitting \( \text{Ops}_1 \), \( \text{Sync} \) and \( \text{Ops}_2 \) for execution, in that order, will result in execution dependency \( \text{ExeDep} \) between \( \text{ScopedOps}_1 \) and \( \text{ScopedOps}_2 \).
- Execution dependency \( \text{ExeDep} \) guarantees that \( \text{ScopedOps}_1 \) happen-before \( \text{ScopedOps}_2 \).

An execution dependency chain is a sequence of execution dependencies that form a happens-before relation between the first dependency's \( \text{ScopedOps}_1 \) and the final dependency's \( \text{ScopedOps}_2 \). For each consecutive pair of execution dependencies, a chain exists if the intersection of \( \text{Scope}_{\text{2nd}} \) in the first dependency and \( \text{Scope}_{\text{1st}} \) in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let \( \text{Sync} \) be a set of synchronization commands that generate an execution dependency chain.
- Let \( \text{Scope}_{\text{1st}} \) be the first synchronization scope of the first command in \( \text{Sync} \).
- Let \( \text{Scope}_{\text{2nd}} \) be the second synchronization scope of the last command in \( \text{Sync} \).

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. Availability operations cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. Memory domain operations cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). Visibility operations cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the Availability and Visibility section of the Memory Model chapter. Which API operations perform each of these operations is defined in Availability, Visibility, and Domain Operations.

A memory dependency is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
The availability operation happens-before the visibility operation.

The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the access scopes of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in $\text{ScopedOps}_1$ is made available. Any type of access that is in a memory dependency’s second access scope and occurs in $\text{ScopedOps}_2$ has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

- Let $\text{MemOps}_1$ be the set of memory accesses performed by $\text{ScopedOps}_1$.
- Let $\text{MemOps}_2$ be the set of memory accesses performed by $\text{ScopedOps}_2$.
- Let $\text{AccessScope}_{\text{1st}}$ be the first access scope of the first command in the $\text{Sync}$ chain.
- Let $\text{AccessScope}_{\text{2nd}}$ be the second access scope of the last command in the $\text{Sync}$ chain.
- Let $\text{ScopedMemOps}_{\text{1st}}$ be the intersection of sets $\text{MemOps}_1$ and $\text{AccessScope}_{\text{1st}}$.
- Let $\text{ScopedMemOps}_{\text{2nd}}$ be the intersection of sets $\text{MemOps}_2$ and $\text{AccessScope}_{\text{2nd}}$.
- Submitting $\text{Ops}_1$, $\text{Sync}$, and $\text{Ops}_2$ for execution, in that order, will result in a memory dependency $\text{MemDep}$ between $\text{ScopedOps}_1$ and $\text{ScopedOps}_2$.
- Memory dependency $\text{MemDep}$ guarantees that:
  - Memory writes in $\text{ScopedMemOps}_{\text{1st}}$ are made available.
  - Available memory writes, including those from $\text{ScopedMemOps}_{\text{1st}}$, are made visible to $\text{ScopedMemOps}_{\text{2nd}}$.

Note

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

7.1.1. Image Layout Transitions

Image subresources can be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions may perform read and write...
accesses on all memory bound to the image subresource range, so applications must ensure that all memory writes have been made available before a layout transition is executed. Available memory is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be VK_IMAGE_LAYOUT_UNDEFINED, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is VK_IMAGE_LAYOUT_UNDEFINED, the contents of that range may be discarded.

**Note**

Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT and VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT capabilities as returned by vkGetDeviceGroupPeerMemoryFeatures.

**Note**

Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

### 7.1.2. Pipeline Stages

The work performed by an action or synchronization command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded. Drawing commands, dispatching commands, copy commands, clear commands, and synchronization commands all execute in
different sets of pipeline stages. Synchronization commands do not execute in a defined pipeline stage.

Note

Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT_KHR = 0x00000008ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT_KHR = 0x00000010ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020ULL;
```
VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT_KHR = 0x00000020ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT_KHR = 0x00000040ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT = 0x00000080ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT_KHR = 0x00000080ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlagBits2 VkPipelineStageFlagBits2KHR;

• **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.

• **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect command parameters are consumed.

• **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** specifies the stage of the pipeline where index buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** specifies the stage of the pipeline where vertex buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** specifies the vertex shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation
shader stage.

- `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT` specifies the geometry shader stage.
- `VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT` is equivalent to specifying all supported pre-rasterization shader stages:
  - `VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT`
  - `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT`
  - `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`
  - `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`
- `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT` specifies the fragment shader stage.
- `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT` specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.
- `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and `vkCmdClearAttachments`.
- `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` specifies the compute shader stage.
- `VK_PIPELINE_STAGE_2_HOST_BIT` specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- `VK_PIPELINE_STAGE_2_COPY_BIT` specifies the execution of all copy commands, including `vkCmdCopyQueryPoolResults`.
- `VK_PIPELINE_STAGE_2_BLIT_BIT` specifies the execution of `vkCmdBlitImage`.
- `VK_PIPELINE_STAGE_2_RESOLVE_BIT` specifies the execution of `vkCmdResovelImage`.
- `VK_PIPELINE_STAGE_2_CLEAR_BIT` specifies the execution of clear commands, with the exception of `vkCmdClearAttachments`.
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` is equivalent to specifying all of:
  - `VK_PIPELINE_STAGE_2_COPY_BIT`
  - `VK_PIPELINE_STAGE_2_BLIT_BIT`
  - `VK_PIPELINE_STAGE_2_RESOLVE_BIT`
  - `VK_PIPELINE_STAGE_2_CLEAR_BIT`
  - `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`
- `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR` specifies the execution of the ray tracing shader stages.
- `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` specifies the execution of
acceleration structure commands or acceleration structure copy commands.

- **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of acceleration structure copy commands.

- **VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT**
  - **VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV**

- **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

- **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.

- **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** specifies the execution of video decode operations.

- **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** specifies the execution of video encode operations.

- **VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the second synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the first scope.

- **VK_PIPELINE_STAGE_2_BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the first synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2_NONE** in the second scope.

**Note**
The TOP and BOTTOM pipeline stages are deprecated, and applications should prefer **VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT** and **VK_PIPELINE_STAGE_2_NONE**.

**Note**
The VkPipelineStageFlags2 bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how VkPipelineStageFlagBits is defined. The first 31 values are common to both, and are interchangeable.

VkPipelineStageFlags2 is a bitmask type for setting a mask of zero or more VkPipelineStageFlagBits2.
flags:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which can be set in a `VkPipelineStageFlags` mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_STAGE_NONE = 0,
    // Provided by VK_KHR_acceleration_structure
    VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR = 0x02000000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00400000,
    // Provided by VK_KHR_synchronization2
    VK_PIPELINE_STAGE_NONE_KHR = VK_PIPELINE_STAGE_NONE,
} VkPipelineStageFlagBits;
```

These values all have the same meaning as the equivalently named values for `VkPipelineStageFlags2`.

- `VK_PIPELINE_STAGE_NONE` specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where `VkDrawIndirect*` / `VkDispatchIndirect*` / `VkTraceRaysIndirect*` data structures are consumed.

- **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.

- **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.

- **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

- **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

- **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

- **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

- **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

- **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and `vkCmdClearAttachments`.

- **VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT** specifies the execution of a compute shader.

- **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  - All copy commands, including `vkCmdCopyQueryPoolResults`
  - `vkCmdBlitImage2` and `vkCmdBlitImage`  
  - `vkCmdResolveImage2` and `vkCmdResolveImage`  
  - All clear commands, with the exception of `vkCmdClearAttachments`

- **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

- **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of `vkCmdBuildAccelerationStructuresKHR`, `vkCmdBuildAccelerationStructuresIndirectKHR`, `vkCmdCopyAccelerationStructureKHR`, `vkCmdCopyAccelerationStructureToMemoryKHR`, `vkCmdCopyMemoryToAccelerationStructureKHR`, and `vkCmdWriteAccelerationStructuresPropertiesKHR`.

- **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of `vkCmdCopyAccelerationStructureKHR`, `vkCmdCopyAccelerationStructureToMemoryKHR`, and `vkCmdWriteAccelerationStructuresPropertiesKHR`.

- **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader
stages, via `vkCmdTraceRaysKHR`, or `vkCmdTraceRaysIndirectKHR`

- **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - `VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT`
  - `VK_PIPELINE_STAGE_VERTEX_INPUT_BIT`
  - `VK_PIPELINE_STAGE_VERTEX_SHADER_BIT`
  - `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`
  - `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`
  - `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`
  - `VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT`
  - `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT`
  - `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT`
  - `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
  - `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VK_PIPELINE_STAGE_ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

- **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.

- **VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT** is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

- **VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT** is equivalent to `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` with `VkAccessFlags` set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;
```

`VkPipelineStageFlags` is a bitmask type for setting a mask of zero or more `VkPipelineStageFlagBits`.

If a synchronization command includes a source stage mask, its first **synchronization scope** only includes execution of the pipeline stages specified in that mask and any **logically earlier** stages. Its first **access scope** only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second **synchronization scope** only includes execution of the pipeline stages specified in that mask and any **logically later** stages. Its second **access scope** only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.
Note

Note that access scopes do not interact with the logically earlier or later stages for either scope - only the stages the app specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see Physical Device Enumeration and Queues.

Table 3. Supported pipeline stage flags

<table>
<thead>
<tr>
<th>Pipeline stage flag</th>
<th>Required queue capability flag</th>

</tbody>
</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage must not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in Scope₁st for that command.

Similarly, initiation of a logically earlier pipeline stage must not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in Scope₂nd for that command.

**Note**

Implementations may not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it may substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it may substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it may instead signal the event after color attachment output has completed.
If an implementation makes such a substitution, it must not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

Graphics pipelines are executable on queues supporting VK_QUEUE_GRAPHICS_BIT. Stages executed by graphics pipelines can only be specified in commands recorded for queues supporting VK_QUEUE_GRAPHICS_BIT.

The graphics pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT
- VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT
- VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT
- VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT
- VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT
- VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT
- VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

For the transfer pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_2_HOST_BIT

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

- VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR
For the ray tracing pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
- VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

For the video decode pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

For the video encode pipeline, the following stages occur in this order:

- VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

### 7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The *access type* is a function of the *descriptor type* used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the *access scopes* of a memory dependency. If a synchronization command includes a *source access mask*, its first *access scope* only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a *destination access mask*, its second *access scope* only includes accesses via the access types specified in that mask.

Bits which can be set in the *srcAccessMask* and *dstAccessMask* members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```c

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;

- **VK_ACCESS_2_NONE** specifies no accesses.
- **VK_ACCESS_2_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all **READ** access flags that are valid where it is used.
- **VK_ACCESS_2_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all **WRITE** access flags that are valid where it is used.
- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** pipeline stage.
- **VK_ACCESS_2_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by **vkCmdBindIndexBuffer**. Such access occurs in the **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** pipeline stage.
- **VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by **vkCmdBindVertexBuffers**. Such access occurs in the **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** pipeline stage.
- **VK_ACCESS_2_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** pipeline stage.
- **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a shader binding table in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_UNIFORM_READ_BIT**
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
  - **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**
  - **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR**
- **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.
- **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations or certain render pass load operations. Such access occurs in the **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.
- **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color attachment during a render pass or via certain render pass load, store, and multisample resolve operations. Such
access occurs in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

• VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations. Such access occurs in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages.

• VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages.

• VK_ACCESS_2_TRANSFER_READ_BIT specifies read access to an image or buffer in a copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

• VK_ACCESS_2_TRANSFER_WRITE_BIT specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, or VK_PIPELINE_STAGE_2_RESOLVE_BIT pipeline stages.

• VK_ACCESS_2_HOST_READ_BIT specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

• VK_ACCESS_2_HOST_WRITE_BIT specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VK_PIPELINE_STAGE_2_HOST_BIT pipeline stage.

• VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR pipeline stage or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

• VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

• VK_ACCESS_2_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

• VK_ACCESS_2_VIDEO DECODE_READ_BIT_KHR specifies read access to an image or buffer resource in a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO DECODE_BIT_KHR pipeline stage.

• VK_ACCESS_2_VIDEO DECODE_WRITE_BIT_KHR specifies write access to an image or buffer resource in a video decode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO DECODE_BIT_KHR pipeline stage.

• VK_ACCESS_2_VIDEO ENCODE_READ_BIT_KHR specifies read access to an image or buffer resource in a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO ENCODE_BIT_KHR pipeline stage.

• VK_ACCESS_2_VIDEO ENCODE_WRITE_BIT_KHR specifies write access to an image or buffer resource in a video encode operation. Such access occurs in the VK_PIPELINE_STAGE_2_VIDEO ENCODE_BIT_KHR pipeline stage.
a video encode operation. Such access occurs in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` pipeline stage.

**Note**
In situations where an application wishes to select all access types for a given set of pipeline stages, `VK_ACCESS_2_MEMORY_READ_BIT` or `VK_ACCESS_2_MEMORY_WRITE_BIT` can be used. This is particularly useful when specifying stages that only have a single access type.

**Note**
The `VkAccessFlags2` bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how `VkAccessFlagBits` is defined. The first 31 values are common to both, and are interchangeable.

`VkAccessFlags2` is a bitmask type for setting a mask of zero or more `VkAccessFlagBits`:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which can be set in the `srcAccessMask` and `dstAccessMask` members of `VkSubpassDependency`, `VkSubpassDependency2`, `VkMemoryBarrier`, `VkBufferMemoryBarrier`, and `VkImageMemoryBarrier`, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000
};
```
VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
VK_ACCESS_NONE = 0,
    // Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_acceleration_structure
VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
    // Provided by VK_KHR_fragment_shading_rate
VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR = 0x00800000,
    // Provided by VK_KHR_synchronization2
VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
}
VkAccessFlagBits;

These values all have the same meaning as the equivalently named values for VkAccessFlags2.

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT pipeline stage.
- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by vkCmdBindIndexBuffer. Such access occurs in the VK_PIPELINE_STAGE_VERTEX_INPUT_BIT pipeline stage.
- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by vkCmdBindVertexBuffers. Such access occurs in the VK_PIPELINE_STAGE_VERTEX_INPUT_BIT pipeline stage.
- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.
- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage.
- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a uniform buffer, uniform texel buffer, sampled image, storage buffer, physical storage buffer, shader binding table, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_SHADER_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending, logic operations or certain render pass load operations. Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.
- **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain render pass load and store operations.
Such access occurs in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations. Such access occurs in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` or `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stages.

- **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.

- **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT` pipeline stage.

- **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the `VK_PIPELINE_STAGE_HOST_BIT` pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR` pipeline stage or `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage.

- **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` pipeline stage.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application must not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

<table>

// Provided by VK_VERSION_1_0
typedef VkFlags VkAccessFlags;
VkAccessFlags is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property, then vkFlushMappedMemoryRanges must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, vkInvalidateMappedMemoryRanges must be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

Note
Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes can be made available by using an explicit memory barrier.

7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:

- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.

If the first synchronization scope includes operations on pixels/fragments with N samples and the second synchronization scope includes operations on pixels/fragments with M samples, where N
does not equal M, then a framebuffer region containing all samples at a given (x, y, layer) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, it is a pixel granularity dependency. If N equals M, then a framebuffer region containing a single (x, y, layer, sample) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, it is a sample granularity dependency.

**Note**

Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

**Note**

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline’s `rasterizationSamples`, then a fragment **can** access any sample in the input attachment’s pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

**Note**

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

### 7.1.5. View-Local Dependencies

In a render pass instance that has **multiview** enabled, dependencies **can** be either view-local or view-global.

A view-local dependency only includes operations from a single source view from the source
subpass in the first synchronization scope, and only includes operations from a single destination view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

Submission order is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which VkSubmitInfo structures are specified in the pSubmits parameter of vkQueueSubmit, or in which VkSubmitInfo2 structures are specified in the pSubmits parameter of vkQueueSubmit2, from lowest index to highest.

3. The order in which command buffers are specified in the pCommandBuffers member of VkSubmitInfo or VkSubmitInfo2 from lowest index to highest.

4. The order in which commands were recorded to a command buffer on the host, from first to last:
   - For commands recorded outside a render pass, this includes all other commands recorded outside a render pass, including vkCmdBeginRenderPass and vkCmdEndRenderPass commands; it does not directly include commands inside a render pass.
   - For commands recorded inside a render pass, this includes all other commands recorded inside the same subpass, including the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the same render pass instance; it does not include commands recorded to other subpasses. State commands do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. Action commands consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of pipeline stages within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which vkQueueSubmit and vkQueueSubmit2 commands are executed on the host, for a single queue, from first to last.

2. The order in which VkSubmitInfo structures are specified in the pSubmits parameter of vkQueueSubmit, or in which VkSubmitInfo2 structures are specified in the pSubmits parameter of vkQueueSubmit2, from lowest index to highest.

3. The fence signal operation defined by the fence parameter of a vkQueueSubmit or vkQueueSubmit2 or vkQueueBindSparse command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single VkSubmitInfo or VkSubmitInfo2 or VkBindSparseInfo structure are unordered with respect to other semaphore signal operations defined within the same structure.

The vkSignalSemaphore command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a vkSignalSemaphore command happens-after the vkSignalSemaphore command is invoked and happens-before the command returns.
Note

When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphore` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the `vkSignalSemaphore` with the lower semaphore value returns before `vkSignalSemaphore` is called with the higher value.

7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the execution of a queue submission command. Fences can be unsignaled on the host with `vkResetFences`. Fences can be waited on by the host with the `vkWaitForFences` command, and the current state can be queried with `vkGetFenceStatus`.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence’s payload. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by `VkFence` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFence)
```
To create a fence, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFence(
    VkDevice device,
    const VkFenceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- **device** is the logical device that creates the fence.
- **pCreateInfo** is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pFence** is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateFence-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid `VkFenceCreateInfo` structure

- VUID-vkCreateFence-pAllocator-parameter  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateFence-pFence-parameter  
  `pFence` must be a valid pointer to a `VkFence` handle

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
}
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkFenceCreateFlagBits` specifying the initial state and behavior of the fence.

**Valid Usage (Implicit)**

- `VUID-VkFenceCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`  
- `VUID-VkFenceCreateInfo-pNext-pNext`  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceWin32HandleInfoKHR`  
- `VUID-VkFenceCreateInfo-sType-unique`  
  The `sType` value of each struct in the `pNext` chain must be unique  
- `VUID-VkFenceCreateInfo-flags-parameter`  
  `flags` must be a valid combination of `VkFenceCreateFlagBits` values

```c
// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
  VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;
```

• `VK_FENCE_CREATE_SIGNALED_BIT` specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;
```

`VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload can be exported to external handles, add a `VkExportFenceCreateInfo` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

### Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`

### Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`
- VUID-VkExportFenceCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a fence, add a `VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security
attributes of the handle.

- **dwAccess** is a DWORD specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If **VkExportFenceCreateInfo** is not included in the same **pNext** chain, this structure is ignored.

If **VkExportFenceCreateInfo** is included in the **pNext** chain of **VkFenceCreateInfo** with a Windows **handleType**, but either **VkExportFenceWin32HandleInfoKHR** is not included in the **pNext** chain, or it is included but **pAttributes** is set to **NULL**, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights". Further, if the structure is not present, the access rights will be

$\text{DXGI\_SHARED\_RESOURCE\_READ} \mid \text{DXGI\_SHARED\_RESOURCE\_WRITE}$

for handles of the following types:

**VK\_EXTERNAL\_FENCE\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT**

1

---

**Valid Usage**

- **VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447**
  If **VkExportFenceCreateInfo**: **handleTypes** does not include **VK\_EXTERNAL\_FENCE\_HANDLE\_TYPE\_OPAQUE\_WIN32\_BIT**, a **VkExportFenceWin32HandleInfoKHR** structure must not be included in the **pNext** chain of **VkFenceCreateInfo**

---

**Valid Usage (Implicit)**

- **VUID-VkExportFenceWin32HandleInfoKHR-sType-sType**
  **sType** must be **VK\_STRUCTURE\_TYPE\_EXPORT\_FENCE\_WIN32\_HANDLE\_INFO\_KHR**

- **VUID-VkExportFenceWin32HandleInfoKHR-pAttributes-parameter**
  If **pAttributes** is not **NULL**, **pAttributes** must be a valid pointer to a valid **SECURITY\_ATTRIBUTES** value

To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK\_KHR\_external\_fence\_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
);```

230
HANDLE* pHandle);

- device is the logical device that created the fence being exported.
- pGetWin32HandleInfo is a pointer to a VkFenceGetWin32HandleInfoKHR structure containing parameters of the export operation.
- pHandle will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by vkGetFenceWin32HandleKHR are owned by the application. To avoid leaking resources, the application must release ownership of them using the CloseHandle system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

### Valid Usage (Implicit)

- VUID-vkGetFenceWin32HandleKHR-device-parameter device must be a valid VkDevice handle
- VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter pGetWin32HandleInfo must be a valid pointer to a valid VkFenceGetWin32HandleInfoKHR structure
- VUID-vkGetFenceWin32HandleKHR-pHandle-parameter pHandle must be a valid pointer to a HANDLE value

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkFenceGetWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
pNext is `NULL` or a pointer to a structure extending this structure.

`fence` is the fence from which state will be exported.

`handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

### Valid Usage

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448**
  `handleType must` have been included in `VkExportFenceCreateInfo::handleTypes` when the `fence`'s current payload was created

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449**
  If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` must be called no more than once for each valid unique combination of `fence` and `handleType`

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-01450**
  `fence must` not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451**
  If `handleType` refers to a handle type with copy payload transference semantics, `fence must` be signaled, or have an associated `fence signal operation` pending execution

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452**
  `handleType must` be defined as an NT handle or a global share handle

### Valid Usage (Implicit)

- **VUID-VkFenceGetWin32HandleInfoKHR-sType-sType**
  `sType must` be `VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR`

- **VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext**
  `pNext must` be `NULL`

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter**
  `fence must` be a valid `VkFence` handle

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter**
  `handleType must` be a valid `VkExternalFenceHandleTypeFlagBits` value

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR();
```
VkDevice
c
const VkFenceGetFdInfoKHR*
pGetFdInfo,
int*
pFd);

• device is the logical device that created the fence being exported.
• pGetFdInfo is a pointer to a VkFenceGetFdInfoKHR structure containing parameters of the export operation.
• pFd will return the file descriptor representing the fence payload.

Each call to vkGetFenceFdKHR must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

Note
Ownership can be released in many ways. For example, the application can call close() on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If pGetFdInfo->handleType is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT and the fence is signaled at the time vkGetFenceFdKHR is called, pFd may return the value -1 instead of a valid file descriptor.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an execve system call is made.

Exporting a file descriptor from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

Valid Usage (Implicit)
• VUID-vkGetFenceFdKHR-device-parameter
device must be a valid VkDevice handle
• VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
pGetFdInfo must be a valid pointer to a valid VkFenceGetFdInfoKHR structure
• VUID-vkGetFenceFdKHR-pFd-parameter
pFd must be a valid pointer to an int value

Return Codes
Success
• VK_SUCCESS
Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY
The `VkFenceGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

### Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
  `handleType must` have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created

- VUID-VkFenceGetFdInfoKHR-handleType-01454
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution

- VUID-VkFenceGetFdInfoKHR-fence-01455
  `fence` must not currently have its payload replaced by an imported payload as described below in `Importing Fence Payloads` unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- VUID-VkFenceGetFdInfoKHR-handleType-01456
  `handleType must` be defined as a POSIX file descriptor handle

### Valid Usage (Implicit)

- VUID-VkFenceGetFdInfoKHR-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`

- VUID-VkFenceGetFdInfoKHR-pNext-pNext
  `pNext must` be `NULL`

- VUID-VkFenceGetFdInfoKHR-fence-parameter
  `fence must` be a valid `VkFence` handle
To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice device,
    VkFence fence,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the fence.
- **fence** is the handle of the fence to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyFence-fence-01120
  All queue submission commands that refer to **fence** must have completed execution.

- VUID-vkDestroyFence-fence-01121
  If **VkAllocationCallbacks** were provided when **fence** was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyFence-fence-01122
  If no **VkAllocationCallbacks** were provided when **fence** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
  **device** must be a valid **VkDevice** handle.

- VUID-vkDestroyFence-fence-parameter
  If **fence** is not **VK_NULL_HANDLE**, **fence** must be a valid **VkFence** handle.

- VUID-vkDestroyFence-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- VUID-vkDestroyFence-fence-parent
  If **fence** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **fence** must be externally synchronized.
To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,       // device is the logical device that owns the fence.
    VkFence fence          // fence is the handle of the fence to query.
);
```

Upon success, `vkGetFenceStatus` returns the status of the fence object, with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by <code>fence</code> is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by <code>fence</code> is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

If the device has been lost (see Lost Device), `vkGetFenceStatus` may return any of the above status codes. If the device has been lost and `vkGetFenceStatus` is called repeatedly, it will eventually return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`.

---

**Valid Usage (Implicit)**

- VUID-vkGetFenceStatus-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetFenceStatus-fence-parameter
  - `fence` must be a valid `VkFence` handle
- VUID-vkGetFenceStatus-fence-parent
  - `fence` must have been created, allocated, or retrieved from `device`

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_NOT_READY`

---

236
To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to reset.
- `pFences` is a pointer to an array of fence handles to reset.

If any member of `pFences` currently has its payload imported with temporary permanence, that fence’s prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When `vkResetFences` is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.

If any member of `pFences` is already in the unsignaled state when `vkResetFences` is executed, then `vkResetFences` has no effect on that fence.

### Valid Usage

- VUID-vkResetFences-pFences-01123
  Each element of `pFences` must not be currently associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkResetFences-pFences-parameter
  `pFences` must be a valid pointer to an array of `fenceCount` valid `VkFence` handles
- VUID-vkResetFences-fenceCount-arraylength
  `fenceCount` must be greater than 0
- VUID-vkResetFences-pFences-parent
  Each element of `pFences` must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to each member of `pfences` must be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

When a fence is submitted to a queue as part of a `queue submission` command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a `fence signal operation` which sets the fence to the signaled state.

The first **synchronization scope** includes every batch submitted in the same `queue submission` command. Fence signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` additionally include in the first synchronization scope all commands that occur earlier in submission order. Fence signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second **synchronization scope** only includes the fence signal operation.

The first **access scope** includes all memory access performed by the device.

The second **access scope** is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkwaitforFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences,
    VkBool32 waitAll,
    uint64_t timeout);
```

- `device` is the logical device that owns the fences.
- `fenceCount` is the number of fences to wait on.
- `pFences` is a pointer to an array of `fenceCount` fence handles.
- `waitAll` is the condition that **must** be satisfied to successfully unblock the wait. If `waitAll` is `VK_TRUE`, then the condition is that all fences in `pFences` are signaled. Otherwise, the condition is that at least one fence in `pFences` is signaled.
• **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. **VK_TIMEOUT** will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, `vkWaitForFences` returns **VK_SUCCESS**. Otherwise, `vkWaitForFences` returns **VK_TIMEOUT** after the **timeout** has expired.

If device loss occurs (see **Lost Device**) before the **timeout** has expired, `vkWaitForFences` **must** return in finite time with either **VK_SUCCESS** or **VK_ERROR_DEVICE_LOST**.

---

**Note**

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the client can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

---

### Valid Usage (Implicit)

- VUID-vkWaitForFences-device-parameter
  
  **device** **must** be a valid `VkDevice` handle

- VUID-vkWaitForFences-pFences-parameter
  
  **pFences** **must** be a valid pointer to an array of **fenceCount** valid `VkFence` handles

- VUID-vkWaitForFences-fenceCount-arraylength
  
  **fenceCount** **must** be greater than 0

- VUID-vkWaitForFences-pFences-parent
  
  Each element of **pFences** **must** have been created, allocated, or retrieved from **device**

---

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_TIMEOUT**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
An execution dependency is defined by waiting for a fence to become signaled, either via `vkWaitForFences` or by polling on `vkGetFenceStatus`.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of `vkWaitForFences` or `vkGetFenceStatus` indicating that the fence has become signaled.

**Note**

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

### 7.3.1. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.

**Note**

Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See `vkResetFences` for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation’s permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle’s type. The import method used is referred to as the handle type’s transference. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any
other fence or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence's payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence's prior permanent payload will be restored.

**Note**
The tables *Handle Types Supported by VkImportFenceWin32HandleInfoKHR* and *Handle Types Supported by VkImportFenceFdInfoKHR* define the permanence and transference of each handle type.

**External synchronization** allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of *VkFence* parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.
- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.
- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.
- In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return *VK_ERROR_INITIALIZATION_FAILED*.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation **must** not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,
- Timeouts on future wait commands on fences sharing the payload **must** be effective.

**Note**
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or
maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its `VkExportFenceCreateInfo::handleTypes` value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, `VkExternalFenceProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a fence based on the specific handle type used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

**Note**
Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types can be exported from a fence in this state. Therefore, applications must not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation must fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportFenceWin32HandleKHR-fence-04448
fence must not be associated with any queue command that has not yet completed execution on that queue

## Valid Usage (Implicit)

- VUID-vkImportFenceWin32HandleKHR-device-parameter
  - device must be a valid VkDevice handle
- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  - pImportFenceWin32HandleInfo must be a valid pointer to a valid VkImportFenceWin32HandleInfoKHR structure

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportFenceWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fence** is the fence into which the state will be imported.
- **flags** is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- **handleType** is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle.
- **handle** is NULL or the external handle to import.
- **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.
The handle types supported by `handleType` are:

**Table 6. Handle Types Supported by `VkImportFenceWin32HandleInfoKHR`**

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457**
  
  `handleType` must be a value included in the `Handle Types Supported by VkImportFenceWin32HandleInfoKHR` table.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459**
  
  If `handleType` is not `VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `name` must be NULL.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460**
  
  If `handle` is NULL, `name` must name a valid synchronization primitive of the type specified by `handleType`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461**
  
  If `name` is NULL, `handle` must be a valid handle of the type specified by `handleType`.

- **VUID-VkImportFenceWin32HandleInfoKHR-handleType-01462**
  
  If `handle` is not NULL, `name` must be NULL.

- **VUID-VkImportFenceWin32HandleInfoKHR-handle-01539**
  
  If `handle` is not NULL, it must obey any requirements listed for `handleType` in **external fence handle types compatibility**.

- **VUID-VkImportFenceWin32HandleInfoKHR-name-01540**
  
  If `name` is not NULL, it must obey any requirements listed for `handleType` in **external fence handle types compatibility**.

**Valid Usage (Implicit)**

- **VUID-VkImportFenceWin32HandleInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR`.

- **VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext**
  
  `pNext` must be NULL.

- **VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter**
  
  `fence` must be a valid `VkFence` handle.

- **VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter**
  
  `flags` must be a valid combination of `VkFenceImportFlagBits` values.
Host Synchronization

- Host access to fence must be externally synchronized

To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,        // device is the logical device that created the fence.
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);        // pImportFenceFdInfo is a pointer to a VkImportFenceFdInfoKHR structure specifying the fence and import parameters.
```

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportFenceFdKHR-fence-01463 fence must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportFenceFdKHR-device-parameter device must be a valid VkDevice handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter pImportFenceFdInfo must be a valid pointer to a valid VkImportFenceFdInfoKHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
The `VkImportFenceFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence into which the payload will be imported.
- `flags` is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportFenceFdInfoKHR-handleType-01464
  `handleType` must be a value included in the Handle Types Supported by `VkImportFenceFdInfoKHR` table.
- VUID-VkImportFenceFdInfoKHR-fd-01541
  `fd` must obey any requirements listed for `handleType` in external fence handle types compatibility.
- VUID-VkImportFenceFdInfoKHR-handleType-07306
  If `handleType` refers to a handle type with copy payload transference semantics, `flags` must contain `VK_FENCE_IMPORT_TEMPORARY_BIT`.

If `handleType` is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value -1 for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor
had been provided.

Note
This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT from a VkFence which is signaled.

Valid Usage (Implicit)

• VUID-VkImportFenceFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR

• VUID-VkImportFenceFdInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkImportFenceFdInfoKHR-fence-parameter
  fence must be a valid VkFence handle

• VUID-VkImportFenceFdInfoKHR-flags-parameter
  flags must be a valid combination of VkFenceImportFlagBits values

• VUID-VkImportFenceFdInfoKHR-handleType-parameter
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value

Host Synchronization

• Host access to fence must be externally synchronized

Bits which can be set in

• VkImportFenceWin32HandleInfoKHR::flags
• VkImportFenceFdInfoKHR::flags

specifying additional parameters of a fence import operation are:

```
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
  VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
  // Provided by VK_KHR_external_fence
  VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent
• **VK_FENCE_IMPORT_TEMPORARY_BIT** specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of handleType.

---

## 7.4. Semaphores

Semaphores are a synchronization primitive that can be used to insert a dependency between queue operations or between a queue operation and the host. Binary semaphores have two states - signaled and unsignaled. Timeline semaphores have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the vkSignalSemaphore command and waited on from the host with the vkWaitSemaphores command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's payload. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by VkSemaphore handles:

---

To create a semaphore, call:

---
VkSemaphore(vkDevice device, const VkSemaphoreCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSemaphore* pSemaphore);

- **device** is the logical device that creates the semaphore.
- **pCreateInfo** is a pointer to a VkSemaphoreCreateInfo structure containing information about how the semaphore is to be created.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter device must be a valid VkDevice handle
- VUID-vkCreateSemaphore-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkSemaphoreCreateInfo structure
- VUID-vkCreateSemaphore-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSemaphore-pSemaphore-parameter pSemaphore must be a valid pointer to a VkSemaphore handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSemaphoreCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.

---

**Valid Usage (Implicit)**

- VUID-VkSemaphoreCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO

- VUID-VkSemaphoreCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either
  NULL or a pointer to a valid instance of VkExportSemaphoreCreateInfo,
  VkExportSemaphoreWin32HandleInfoKHR, or VkSemaphoreTypeCreateInfo

- VUID-VkSemaphoreCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSemaphoreCreateInfo-flags-zerobitmask
  flags must be 0

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

VkSemaphoreCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkSemaphoreTypeCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreType semaphoreType;
    uint64_t initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphoreType** is a VkSemaphoreType value specifying the type of the semaphore.
- **initialValue** is the initial payload value if semaphoreType is VK_SEMAPHORE_TYPE_TIMELINE.

To create a semaphore of a specific type, add a VkSemaphoreTypeCreateInfo structure to the
VkSemaphoreCreateInfo::pNext chain.

If no VkSemaphoreTypeCreateInfo structure is included in the pNext chain of VkSemaphoreCreateInfo, then the created semaphore will have a default VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY.

Valid Usage

- VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252
  If the timelineSemaphore feature is not enabled, semaphoreType must not equal VK_SEMAPHORE_TYPE_TIMELINE

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279
  If semaphoreType is VK_SEMAPHORE_TYPE_BINARY, initialValue must be zero

Valid Usage (Implicit)

- VUID-VkSemaphoreTypeCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO

- VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter
  semaphoreType must be a valid VkSemaphoreType value

Possible values of VkSemaphoreTypeCreateInfo::semaphoreType, specifying the type of a semaphore, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_BINARY_KHR = VK_SEMAPHORE_TYPE_BINARY,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_TYPE_TIMELINE_KHR = VK_SEMAPHORE_TYPE_TIMELINE,
} VkSemaphoreType;
```
or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- VK_SEMAPHORE_TYPE_BINARY specifies a binary semaphore type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

- VK_SEMAPHORE_TYPE_TIMELINE specifies a timeline semaphore type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the
To create a semaphore whose payload can be exported to external handles, add a `VkExportSemaphoreCreateInfo` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.

**Valid Usage**
- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalSemaphoreProperties`

**Valid Usage (Implicit)**
- VUID-VkExportSemaphoreCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`
- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef VkExportSemaphoreWin32HandleInfoKHR
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.
```c
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportSemaphoreWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- **dwAccess** is a `DWORD` specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `HANDLE_TYPE`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**

The access rights **must** be:

**GENERIC_ALL**

1

### Valid Usage

- **VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125**

  If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT, VkExportSemaphoreWin32HandleInfoKHR must not be included in the pNext chain of VkSemaphoreCreateInfo

Valid Usage (Implicit)

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR
- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter If pAttributes is not NULL, pAttributes must be a valid pointer to a valid SECURITY_ATTRIBUTES value

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a VkSemaphoreGetWin32HandleInfoKHR structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore Payloads.

Valid Usage (Implicit)

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter `pGetWin32HandleInfo` must be a valid pointer to a valid VkSemaphoreGetWin32HandleInfoKHR structure
- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter `pHandle` must be a valid pointer to a HANDLE value
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkSemaphoreGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

Valid Usage

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126
  `handleType must` have been included in `VkExportSemaphoreCreateInfo::handleTypes` when the semaphore's current payload was created.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128
  `semaphore must` not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` for `handleType`.

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129
  If `handleType` refers to a handle type with copy payload transference semantics, as defined
below in Importing Semaphore Payloads, there **must** be no queue waiting on semaphore

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
  If **handleType** refers to a handle type with copy payload transference semantics, semaphore **must** be signaled, or have an associated semaphore signal operation pending execution

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
  **handleType** **must** be defined as an NT handle or a global share handle

**Valid Usage (Implicit)**

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
  **sType** **must** be \texttt{VK\_STRUCTURE\_TYPE\_SEMAPHORE\_GET\_WIN32\_HANDLE\_INFO\_KHR}

- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
  **pNext** **must** be \texttt{NULL}

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
  **semaphore** **must** be a valid \texttt{VkSemaphore} handle

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
  **handleType** **must** be a valid \texttt{VkExternalSemaphoreHandleTypeFlagBits} value

To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- **device** is the logical device that created the semaphore being exported.
- **pGetFdInfo** is a pointer to a \texttt{VkSemaphoreGetFdInfoKHR} structure containing parameters of the export operation.
- **pFd** will return the file descriptor representing the semaphore payload.

Each call to \texttt{vkGetSemaphoreFdKHR} **must** create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application **must** release ownership of the file descriptor when it is no longer needed.

**Note**

Ownership can be released in many ways. For example, the application can call \texttt{close()} on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation **must** set the file descriptor to be closed automatically when an \texttt{execve} system call is made.
Exporting a file descriptor from a semaphore may have side effects depending on the transference of the specified handle type, as described in Importing Semaphore State.

### Valid Usage (Implicit)

- **VUID-vkGetSemaphoreFdKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter**
  - `pGetFdInfo` must be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure
- **VUID-vkGetSemaphoreFdKHR-pFd-parameter**
  - `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.
Valid Usage

• VUID-VkSemaphoreGetFdInfoKHR-handleType-01132
  handleType must have been included in VkExportSemaphoreCreateInfo::handleTypes when semaphore’s current payload was created

• VUID-VkSemaphoreGetFdInfoKHR-semaphore-01133
  semaphore must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload’s handle type was included in VkExternalSemaphoreProperties::exportFromImportedHandleTypes for handleType

• VUID-VkSemaphoreGetFdInfoKHR-handleType-01134
  If handleType refers to a handle type with copy payload transference semantics, as defined below in Importing Semaphore Payloads, there must be no queue waiting on semaphore

• VUID-VkSemaphoreGetFdInfoKHR-handleType-01135
  If handleType refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution

• VUID-VkSemaphoreGetFdInfoKHR-handleType-01136
  handleType must be defined as a POSIX file descriptor handle

• VUID-VkSemaphoreGetFdInfoKHR-handleType-03253
  If handleType refers to a handle type with copy payload transference semantics, semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

• VUID-VkSemaphoreGetFdInfoKHR-handleType-03254
  If handleType refers to a handle type with copy payload transference semantics, semaphore must have an associated semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution

Valid Usage (Implicit)

• VUID-VkSemaphoreGetFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR

• VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

• VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter
  handleType must be a valid VkExternalSemaphoreHandleTypeFlagBits value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
```
VkDevice device, VkSemaphore semaphore, const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the semaphore.
- **semaphore** is the handle of the semaphore to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroySemaphore-semaphore-01137**
  All submitted batches that refer to **semaphore** must have completed execution.

- **VUID-vkDestroySemaphore-semaphore-01138**
  If VkAllocationCallbacks were provided when **semaphore** was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroySemaphore-semaphore-01139**
  If no VkAllocationCallbacks were provided when **semaphore** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- **VUID-vkDestroySemaphore-device-parameter**
  **device** must be a valid VkDevice handle.

- **VUID-vkDestroySemaphore-semaphore-parameter**
  If **semaphore** is not VK_NULL_HANDLE, **semaphore** must be a valid VkSemaphore handle.

- **VUID-vkDestroySemaphore-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid VkAllocationCallbacks structure.

- **VUID-vkDestroySemaphore-semaphore-parent**
  If **semaphore** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **semaphore** must be externally synchronized.

#### 7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines semaphore signal operations which set the semaphores to the signaled state.
In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the semaphore is considered signaled with respect to the counter value set to be signaled as specified in `VkTimelineSemaphoreSubmitInfo` or `VkSemaphoreSignalInfo`.

The first **synchronization scope** includes every command submitted in the same batch. In the case of `vkQueueSubmit2`, the first synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in **signal operation order**.

The second **synchronization scope** includes only the semaphore signal operation.

The first **access scope** includes all memory access performed by the device.

The second **access scope** is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a **queue submission**, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines **semaphore wait operations**.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in `VkTimelineSemaphoreSubmitInfo`.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second **synchronization scope** includes every command submitted in the same batch. In the case of `vkQueueSubmit`, the second synchronization scope is limited to operations on the pipeline stages determined by the **destination stage mask** specified by the corresponding element of `pWaitDstStageMask`. In the case of `vkQueueSubmit2`, the second synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Also, in the case of either `vkQueueSubmit2` or `vkQueueSubmit`, the second synchronization scope additionally includes all commands that occur later in **submission order**.

The first **access scope** is empty.

The second **access scope** includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.
Note

Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications must ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and signals should thus occur in discrete 1:1 pairs.

Note

A common scenario for using pWaitDstStageMask with values other than VK_PIPELINE_STAGE_ALL_COMMANDS_BIT is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or pre-rasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a VkImageMemoryBarrier could use:

- srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
- srcAccessMask = 0
- dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT
- dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.
- oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR
- newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

Alternatively, oldLayout can be VK_IMAGE_LAYOUT_UNDEFINED, if the image’s contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT stage, and there is a dependency from that same stage to itself with the layout transition performed in between.
7.4.3. Semaphore State Requirements For Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation depends must also be completed or pending execution.
- There must be no other queue waiting on the same binary semaphore when the operation executes.

7.4.4. Host Operations on Semaphores

In addition to semaphore signal operations and semaphore wait operations submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the `vkGetSemaphoreCounterValue` command.
- Wait for a set of semaphores to reach particular counter values using the `vkWaitSemaphores` command.
- Signal the semaphore with a particular counter value from the host using the `vkSignalSemaphore` command.

To query the current counter value of a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(
   VkDevice device,
   VkSemaphore semaphore,
   uint64_t* pValue);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(
    VkDevice device,
    VkSemaphore semaphore,
    uint64_t* pValue);
```

- `device` is the logical device that owns the semaphore.
- `semaphore` is the handle of the semaphore to query.
- `pValue` is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.
Note
If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

Valid Usage

- VUID-vkGetSemaphoreCounterValue-semaphore-03255
  semaphore must have been created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE

Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
  pValue must be a valid pointer to a uint64_t value

- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  semaphore must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_DEVICE_LOST

To wait for a set of semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE to reach particular counter values on the host, call:

// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
  VkDevice device,
  const VkSemaphoreWaitInfo* pWaitInfo,
  uint64_t timeout);

or the equivalent command
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);

• device is the logical device that owns the semaphores.

• pWaitInfo is a pointer to a VkSemaphoreWaitInfo structure containing information about the wait condition.

• timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

If the condition is satisfied when vkWaitSemaphores is called, then vkWaitSemaphores returns immediately. If the condition is not satisfied at the time vkWaitSemaphores is called, then vkWaitSemaphores will block and wait until the condition is satisfied or the timeout has expired, whichever is sooner.

If timeout is zero, then vkWaitSemaphores does not wait, but simply returns information about the current state of the semaphores. VK_TIMEOUT will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the timeout has expired, vkWaitSemaphores returns VK_SUCCESS. Otherwise, vkWaitSemaphores returns VK_TIMEOUT after the timeout has expired.

If device loss occurs (see Lost Device) before the timeout has expired, vkWaitSemaphores must return in finite time with either VK_SUCCESS or VK_ERROR_DEVICE_LOST.

Valid Usage (Implicit)

• VUID-vkWaitSemaphores-device-parameter
device must be a valid VkDevice handle

• VUID-vkWaitSemaphores-pWaitInfo-parameter
pWaitInfo must be a valid pointer to a valid VkSemaphoreWaitInfo structure

Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
The `VkSemaphoreWaitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreWaitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t* pValues;
} VkSemaphoreWaitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitInfo VkSemaphoreWaitInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSemaphoreWaitFlagBits` specifying additional parameters for the semaphore wait operation.
- **semaphoreCount** is the number of semaphores to wait on.
- **pSemaphores** is a pointer to an array of `semaphoreCount` semaphore handles to wait on.
- **pValues** is a pointer to an array of `semaphoreCount` timeline semaphore values.

### Valid Usage

- **VUID-VkSemaphoreWaitInfo-pSemaphores-03256**
  All of the elements of `pSemaphores` must reference a semaphore that was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`.

### Valid Usage (Implicit)

- **VUID-VkSemaphoreWaitInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO`

- **VUID-VkSemaphoreWaitInfo-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkSemaphoreWaitInfo-flags-parameter**
  `flags` must be a valid combination of `VkSemaphoreWaitFlagBits` values
- **VUID-VkSemaphoreWaitInfo-pSemaphores-parameter**
  
  `pSemaphores` must be a valid pointer to an array of `semaphoreCount` valid `VkSemaphore` handles

- **VUID-VkSemaphoreWaitInfo-pValues-parameter**
  
  `pValues` must be a valid pointer to an array of `semaphoreCount uint64_t` values

- **VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength**
  
  `semaphoreCount` must be greater than 0

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- **VK_SEMAPHORE_WAIT_ANY_BIT** specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:
VkResult vkSignalSemaphore(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);

or the equivalent command

VkResult vkSignalSemaphoreKHR(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a semaphore signal operation which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

**Valid Usage (Implicit)**

- VUID-vkSignalSemaphore-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkSignalSemaphore-pSignalInfo-parameter `pSignalInfo` must be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

**Return Codes**

- **Success**
  - `VK_SUCCESS`

- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreSignalInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
```
VkSemaphoreSignalInfo

```c
VkSemaphoreSignalInfo
{
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
}
```

or the equivalent

```c
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the handle of the semaphore to signal.
- `value` is the value to signal.

### Valid Usage

- **VUID-VkSemaphoreSignalInfo-semaphore-03257**
  
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- **VUID-VkSemaphoreSignalInfo-value-03258**
  
  `value` must have a value greater than the current value of the semaphore

- **VUID-VkSemaphoreSignalInfo-value-03259**
  
  `value` must be less than the value of any pending semaphore signal operations

- **VUID-VkSemaphoreSignalInfo-value-03260**
  
  `value` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`

### Valid Usage (Implicit)

- **VUID-VkSemaphoreSignalInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`

- **VUID-VkSemaphoreSignalInfo-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkSemaphoreSignalInfo-semaphore-parameter**
  
  `semaphore` must be a valid `VkSemaphore` handle
7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to vkDestroySemaphore are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's permanence. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's transference. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set must behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports must not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

Note
The permanence and transference of handle types can be found in:

- Handle Types Supported by VkImportSemaphoreWin32HandleInfoKHR
- Handle Types Supported by VkImportSemaphoreFdInfoKHR

External synchronization allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of VkSemaphore parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the wait operation state requirements would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the wait operation state requirements are violated for the
shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects must be limited to one or more of the following:

- Returning VK_ERROR_INITIALIZATION_FAILED from the command which resulted in the violation.
- Losing the logical device on which the violation occurred immediately or at a future time, resulting in a VK_ERROR_DEVICE_LOST error from subsequent commands, including the one causing the violation.
- Continuing execution of the violating command or operation as if the semaphore wait completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore must be destroyed or have its payload replaced by an import operation to again have a well-defined state.

Note
These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its VkExportSemaphoreCreateInfo::handleTypes value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, VkExternalSemaphoreProperties::exportFromImportedHandleTypes restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to vkAcquireNextImageKHR is equivalent to temporarily importing a semaphore payload to that semaphore.

Note
Because the exportable handle types of an imported semaphore correspond to its current imported payload, and vkAcquireNextImageKHR behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must not attempt to export external handles from semaphores using a temporarily imported payload from vkAcquireNextImageKHR.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the valid semaphore state for wait operations rules. If the external handle provided does not meet these requirements, the implementation must fail the semaphore payload import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE.
In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation may fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

**Note**

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications *should* prefer importing such handle types into semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`.

To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a `VkImportSemaphoreWin32HandleInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application *must* release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications *can* import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage (Implicit)**

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter `pImportSemaphoreWin32HandleInfo` must be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure

**Return Codes**

**Success**

- `VK_SUCCESS`
The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportSemaphoreWin32HandleInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `handle`.
- **handle** is **NULL** or the external handle to import.
- **name** is **NULL** or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td><code>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</code></td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- `VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140`
**Valid Usage (Implicit)**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
  
  *sType* **must** be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
  
  *pNext* **must** be NULL.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
  
  *semaphore* **must** be a valid `VkSemaphore` handle.

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
  
  *flags* **must** be a valid combination of `VkSemaphoreImportFlagBits` values.
Host Synchronization

- Host access to semaphore must be externally synchronized

To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
  semaphore must not be associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
  device must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
  `pImportSemaphoreFdInfo` must be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkImportSemaphoreFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore into which the payload will be imported.
- `flags` is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.
- `fd` is the external handle to import.

The handle types supported by `handleType` are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
  `handleType` must be a value included in the [Handle Types Supported by VkImportSemaphoreFdInfoKHR](#) table

- VUID-VkImportSemaphoreFdInfoKHR-fd-01544
  `fd` must obey any requirements listed for `handleType` in [external semaphore handle types compatibility](#)

- VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
  If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field must match that of the semaphore from which `fd` was exported
If `handleType` refers to a handle type with copy payload transference semantics, `flags` must contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field must match that of the semaphore from which `fd` was exported.

If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported must not be `VK_SEMAPHORE_TYPE_TIMELINE`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

**Note**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`.
- `pNext` must be `NULL`.
- `semaphore` must be a valid `VkSemaphore` handle.
- `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values.
- `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

### Host Synchronization

- Host access to `semaphore` must be externally synchronized.
Bits which can be set in

- VkImportSemaphoreWin32HandleInfoKHR::flags
- VkImportSemaphoreFdInfoKHR::flags

specifying additional parameters of a semaphore import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkSemaphoreImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlagBits VkSemaphoreImportFlagBitsKHR;
```

These bits have the following meanings:

- **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT** specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of `handleType`.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkSemaphoreImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore
typedef VkSemaphoreImportFlags VkSemaphoreImportFlagsKHR;
```

`VkSemaphoreImportFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

### 7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.
Events are represented by *VkEvent* handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkEvent)
```

To create an event, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice device,
    const VkEventCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkEvent* pEvent);
```

- *device* is the logical device that creates the event.
- *pCreateInfo* is a pointer to a *VkEventCreateInfo* structure containing information about how the event is to be created.
- *pAllocator* controls host memory allocation as described in the Memory Allocation chapter.
- *pEvent* is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

**Valid Usage**

- VUID-vkCreateEvent-events-04468
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::events` is `VK_FALSE`, then the implementation does not support events, and `vkCreateEvent` must not be used

**Valid Usage (Implicit)**

- VUID-vkCreateEvent-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkCreateEvent-pCreateInfo-parameter
  *pCreateInfo* must be a valid pointer to a valid *VkEventCreateInfo* structure

- VUID-vkCreateEvent-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateEvent-pEvent-parameter
  *pEvent* must be a valid pointer to a *VkEvent* handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkEventCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkEventCreateFlagBits` defining additional creation parameters.

Valid Usage (Implicit)

• VUID-VkEventCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EVENT_CREATE_INFO`

• VUID-VkEventCreateInfo-pNext-pNext
  `pNext` must be `NULL`

• VUID-VkEventCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkEventCreateFlagBits` values

```c
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

• `VK_EVENT_CREATE_DEVICE_ONLY_BIT` specifies that host event commands will not be used with this event.
typedef VkFlags VkEventCreateFlags;

VkEventCreateFlags is a bitmask type for setting a mask of VkEventCreateFlagBits.

To destroy an event, call:

```c
vkDestroyEvent(
    VkDevice device,  // Provided by VK_VERSION_1_0
    VkEvent event,   // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the event.
- `event` is the handle of the event to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyEvent-event-01145
  All submitted commands that refer to `event` must have completed execution
- VUID-vkDestroyEvent-event-01146
  If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyEvent-event-01147
  If no `VkAllocationCallbacks` were provided when `event` was created, `pAllocator` must be NULL

## Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkDestroyEvent-event-parameter
  If `event` is not `VK_NULL_HANDLE`, `event` must be a valid `VkEvent` handle
- VUID-vkDestroyEvent-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyEvent-event-parent
  If `event` is a valid handle, it must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to event must be externally synchronized

To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the pending state, then the value returned by this command may immediately be out of date.

The state of an event can be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

Valid Usage

- VUID-vkGetEventStatus-event-03940
  event must not have been created with VK_EVENT_CREATE_DEVICE_ONLY_BIT

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetEventStatus-event-parameter
event must be a valid VkEvent handle
- VUID-vkGetEventStatus-event-parent
event must have been created, allocated, or retrieved from device
Return Codes

Success
• VK_EVENT_SET
• VK_EVENT_RESET

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice device,
    VkEvent event);
```

• `device` is the logical device that owns the event.
• `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an event signal operation which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

**Note**
If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the queue forward progress section.

Valid Usage

• VUID-vkSetEvent-event-03941
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

Valid Usage (Implicit)

• VUID-vkSetEvent-device-parameter
  `device` must be a valid `VkDevice` handle
• VUID-vkSetEvent-event-parameter
  `event` must be a valid `VkEvent` handle
Host Synchronization

- Host access to event must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- device is the logical device that owns the event.
- event is the event to reset.

When vkResetEvent is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.

If event is already in the unsignaled state when vkResetEvent is executed, then vkResetEvent has no effect, and no event unsignal operation occurs.

Valid Usage

- VUID-vkResetEvent-event-03821
  There must be an execution dependency between vkResetEvent and the execution of any vkCmdWaitEvents that includes event in its pEvents parameter

- VUID-vkResetEvent-event-03822
  There must be an execution dependency between vkResetEvent and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter

- VUID-vkResetEvent-event-03823
  event must not have been created with VK_EVENT_CREATE_DEVICE_ONLY_BIT
Valid Usage (Implicit)

- VUID-vkResetEvent-device-parameter
device must be a valid VkDevice handle
- VUID-vkResetEvent-event-parameter
event must be a valid VkEvent handle
- VUID-vkResetEvent-event-parent
event must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to event must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

- commandBuffer is the command buffer into which the command is recorded.
- event is the event that will be signaled.
• **pDependencyInfo** is a pointer to a **VkDependencyInfo** structure defining the first scopes of this operation.

When **vkCmdSetEvent2** is submitted to a queue, it defines the first half of memory dependencies defined by **pDependencyInfo**, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first **synchronization scope** and **access scope** are defined by the union of all the memory dependencies defined by **pDependencyInfo**, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by **pDependencyInfo** are also included in the first scopes.

The second **synchronization scope** includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by **pDependencyInfo**.

The second **access scope** includes only queue family ownership transfers and image layout transitions.

Future **vkCmdWaitEvents2** commands rely on all values of each element in **pDependencyInfo** matching exactly with those used to signal the corresponding event. **vkCmdWaitEvents** **must** not be used to wait on the result of a signal operation defined by **vkCmdSetEvent2**.

**Note**
The extra information provided by **vkCmdSetEvent2** compared to **vkCmdSetEvent** allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With **vkCmdSetEvent**, the full dependency information is not known until **vkCmdWaitEvents** is recorded, forcing implementations to insert the required operations at that point and not before.

If **event** is already in the signaled state when **vkCmdSetEvent2** is executed on the device, then **vkCmdSetEvent2** has no effect, no event signal operation occurs, and no dependency is generated.

### Valid Usage

- **VUID-vkCmdSetEvent2-synchronization2-03824**
  The **synchronization2** feature **must** be enabled

- **VUID-vkCmdSetEvent2-dependencyFlags-03825**
  The **dependencyFlags** member of **pDependencyInfo** **must** be 0

- **VUID-vkCmdSetEvent2-commandBuffer-03826**
  The current device mask of **commandBuffer** **must** include exactly one physical device

- **VUID-vkCmdSetEvent2-srcStageMask-03827**
  The **srcStageMask** member of any element of the **pMemoryBarriers**, **pBufferMemoryBarriers**, or **pImageMemoryBarriers** members of **pDependencyInfo** **must** only include pipeline stages valid for the queue family that was used to create the command pool that **commandBuffer** was allocated from

- **VUID-vkCmdSetEvent2-dstStageMask-03828**
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

### Valid Usage (Implicit)

- **VUID-vkCmdSetEvent2-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetEvent2-event-parameter**
  - `event` must be a valid `VkEvent` handle

- **VUID-vkCmdSetEvent2-pDependencyInfo-parameter**
  - `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure

- **VUID-vkCmdSetEvent2-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetEvent2-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- **VUID-vkCmdSetEvent2-renderpass**
  - This command must only be called outside of a render pass instance

- **VUID-vkCmdSetEvent2-commonparent**
  - Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics Compute Decode Encode</td>
<td>Synchronization</td>
</tr>
</tbody>
</table>

The `VkDependencyInfo` structure is defined as:
```c
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent

```c
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.

This structure defines a set of memory dependencies, as well as queue family transfer operations and image layout transitions.

Each member of `pMemoryBarriers`, `pBufferMemoryBarriers`, and `pImageMemoryBarriers` defines a separate memory dependency.

**Valid Usage (Implicit)**

- VUID-VkDependencyInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEPENDENCY_INFO`
- VUID-VkDependencyInfo-pNext-pNext
pNext must be NULL

- **VUID-VkDependencyInfo-dependencyFlags-parameter**
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

- **VUID-VkDependencyInfo-pMemoryBarriers-parameter**
  If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier2 structures

- **VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter**
  If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier2 structures

- **VUID-VkDependencyInfo-pImageMemoryBarriers-parameter**
  If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier2 structures

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.
- **stageMask** specifies the source stage mask used to determine the first synchronization scope.

vkCmdSetEvent behaves identically to vkCmdSetEvent2, except that it does not define an access scope, and must only be used with vkCmdWaitEvents, not vkCmdWaitEvents2.

### Valid Usage

- **VUID-vkCmdSetEvent-stageMask-04090**
  If the geometryShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- **VUID-vkCmdSetEvent-stageMask-04091**
  If the tessellationShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-vkCmdSetEvent-stageMask-07319**
  If the attachmentFragmentShadingRate feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- **VUID-vkCmdSetEvent-stageMask-03937**
  If the synchronization2 feature is not enabled, stageMask must not be 0

- **VUID-vkCmdSetEvent-stageMask-07950**
If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-vkCmdSetEvent-stageMask-06457**
  Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- **VUID-vkCmdSetEvent-stageMask-01149**
  `stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`

- **VUID-vkCmdSetEvent-commandBuffer-01152**
  `commandBuffer`'s current device mask must include exactly one physical device

### Valid Usage (Implicit)

- **VUID-vkCmdSetEvent-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetEvent-event-parameter**
  `event` must be a valid `VkEvent` handle

- **VUID-vkCmdSetEvent-stageMask-parameter**
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdSetEvent-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetEvent-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- **VUID-vkCmdSetEvent-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdSetEvent-commonparent**
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags2 stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by `stageMask` or stages that are logically earlier than `stageMask`.

The second synchronization scope includes only the event unsignal operation.

If `event` is already in the unsignaled state when `vkCmdResetEvent2` is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.
Valid Usage

- **VUID-vkCmdResetEvent2-stageMask-03929**
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdResetEvent2-stageMask-03930**
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdResetEvent2-stageMask-07317**
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdResetEvent2-stageMask-07947**
  If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdResetEvent2-stageMask-03829**
  The `synchronization2` feature must be enabled.

- **VUID-vkCmdResetEvent2-stageMask-03830**
  `stageMask` must not include `VK_PIPELINE_STAGE_2_HOST_BIT`.

- **VUID-vkCmdResetEvent2-event-03831**
  There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter.

- **VUID-vkCmdResetEvent2-event-03832**
  There must be an execution dependency between `vkCmdResetEvent2` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter.

- **VUID-vkCmdResetEvent2-commandBuffer-03833**
  `commandBuffer`’s current device mask must include exactly one physical device.

Valid Usage (Implicit)

- **VUID-vkCmdResetEvent2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdResetEvent2-event-parameter**
  `event` must be a valid `VkEvent` handle.

- **VUID-vkCmdResetEvent2-stageMask-parameter**
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.

- **VUID-vkCmdResetEvent2-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdResetEvent2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.
This command must only be called outside of a render pass instance.

Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To set the state of an event to unsignaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkEvent event,                 // Provided by VK_VERSION_1_0
    VkPipelineStageFlags stageMask // Provided by VK_VERSION_1_0
);
```

- commandBuffer is the command buffer into which the command is recorded.
- event is the event that will be unsignaled.
- stageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask used to determine when the event is unsignaled.

vkCmdResetEvent behaves identically to vkCmdResetEvent2.

Valid Usage

- VUID-vkCmdResetEvent-stageMask-04090
  If the geometryShader feature is not enabled, stageMask must not containVK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
- VUID-vkCmdResetEvent-stageMask-04091
If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-vkCmdResetEvent-stageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_RATE_ATTACHMENT_BIT_KHR`.

- VUID-vkCmdResetEvent-stageMask-03937
  If the `synchronization2` feature is not enabled, `stageMask` must not be `0`.

- VUID-vkCmdResetEvent-stageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- VUID-vkCmdResetEvent-stageMask-06458
  Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- VUID-vkCmdResetEvent-stageMask-01153
  `stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`.

- VUID-vkCmdResetEvent-event-03834
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter.

- VUID-vkCmdResetEvent-event-03835
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents2` that includes `event` in its `pEvents` parameter.

- VUID-vkCmdResetEvent-commandBuffer-01157
  `commandBuffer`’s current device mask must include exactly one physical device.

### Valid Usage (Implicit)

- VUID-vkCmdResetEvent-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdResetEvent-event-parameter
  `event` must be a valid `VkEvent` handle.

- VUID-vkCmdResetEvent-stageMask-parameter
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- VUID-vkCmdResetEvent-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdResetEvent-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.

- VUID-vkCmdResetEvent-renderpass
  This command must only be called outside of a render pass instance.
Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

or the equivalent command:

```c
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` `VkEvent` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second synchronization scope.
When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` must not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in submission order than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in submission order with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first synchronization scope defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in submission order than `vkCmdWaitEvents2`.

Note

`vkCmdWaitEvents2` is used with `vkCmdSetEvent2` to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

Note

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between `vkCmdSetEvent2` and `vkCmdResetEvent2`, `vkCmdResetEvent`, or `vkCmdSetEvent`. Another execution dependency (e.g. a pipeline barrier or semaphore with `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`) is needed to prevent such a race condition.

Valid Usage

- VUID-vkCmdWaitEvents2-synchronization2-03836
  The synchronization2 feature must be enabled

- VUID-vkCmdWaitEvents2-pEvents-03837
  Members of pEvents must not have been signaled by vkCmdSetEvent

- VUID-vkCmdWaitEvents2-pEvents-03838
  For any element `i` of pEvents, if that event is signaled by vkCmdSetEvent2, that command's dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- VUID-vkCmdWaitEvents2-pEvents-03839
  For any element `i` of pEvents, if that event is signaled by vkSetEvent, barriers in the ith
element of \texttt{pDependencyInfos} \textbf{must} include only host operations in their first synchronization scope.

- VUID-vkCmdWaitEvents2-pEvents-03840
  For any element \(i\) of \(pEvents\), if barriers in the \(i\)th element of \(pDependencyInfos\) include only host operations, the \(i\)th element of \(pEvents\) \textbf{must} be signaled before \texttt{vkCmdWaitEvents2} is executed.

- VUID-vkCmdWaitEvents2-pEvents-03841
  For any element \(i\) of \(pEvents\), if barriers in the \(i\)th element of \(pDependencyInfos\) do not include host operations, the \(i\)th element of \(pEvents\) \textbf{must} be signaled by a corresponding \texttt{vkCmdSetEvent2} that occurred earlier in submission order.

- VUID-vkCmdWaitEvents2-srcStageMask-03842
  The \texttt{srcStageMask} member of any element of the \(pMemoryBarriers\), \(pBufferMemoryBarriers\), or \(pImageMemoryBarriers\) members of \(pDependencyInfos\) \textbf{must} either include only pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from, or include only \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}.

- VUID-vkCmdWaitEvents2-dstStageMask-03843
  The \texttt{dstStageMask} member of any element of the \(pMemoryBarriers\), \(pBufferMemoryBarriers\), or \(pImageMemoryBarriers\) members of \(pDependencyInfos\) \textbf{must} only include pipeline stages valid for the queue family that was used to create the command pool that \texttt{commandBuffer} was allocated from.

- VUID-vkCmdWaitEvents2-dependencyFlags-03844
  If \texttt{vkCmdWaitEvents2} is being called inside a render pass instance, the \texttt{srcStageMask} member of any element of the \(pMemoryBarriers\), \(pBufferMemoryBarriers\), or \(pImageMemoryBarriers\) members of \(pDependencyInfos\) \textbf{must} not include \texttt{VK_PIPELINE_STAGE_2_HOST_BIT}.

- VUID-vkCmdWaitEvents2-commandBuffer-03846
  \texttt{commandBuffer}’s current device mask \textbf{must} include exactly one physical device.

**Valid Usage (Implicit)**

- VUID-vkCmdWaitEvents2-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

- VUID-vkCmdWaitEvents2-pEvents-parameter
  \(pEvents\) \textbf{must} be a valid pointer to an array of \texttt{eventCount} valid \texttt{VkEvent} handles.

- VUID-vkCmdWaitEvents2-pDependencyInfos-parameter
  \(pDependencyInfos\) \textbf{must} be a valid pointer to an array of \texttt{eventCount} valid \texttt{VkDependencyInfo} structures.

- VUID-vkCmdWaitEvents2-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state.

- VUID-vkCmdWaitEvents2-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics, compute, decode, or encode operations.

- VUID-vkCmdWaitEvents2-eventCount-arraylength

296
**eventCount** must be greater than 0

- VUID-vkCmdWaitEvents2-commonparent
  Both of **commandBuffer**, and the elements of **pEvents** must have been created, allocated, or retrieved from the same **VkDevice**

---

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

---

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **eventCount** is the length of the **pEvents** array.
- **pEvents** is a pointer to an array of event object handles to wait on.
- **srcStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the source stage mask.
- **dstStageMask** is a bitmask of **VkPipelineStageFlagBits** specifying the destination stage mask.
memoryBarrierCount is the length of the pMemoryBarriers array.

pMemoryBarriers is a pointer to an array of VkMemoryBarrier structures.

bufferMemoryBarrierCount is the length of the pBufferMemoryBarriers array.

pBufferMemoryBarriers is a pointer to an array of VkBufferMemoryBarrier structures.

imageMemoryBarrierCount is the length of the pImageMemoryBarriers array.

pImageMemoryBarriers is a pointer to an array of VkImageMemoryBarrier structures.

vkCmdWaitEvents is largely similar to vkCmdWaitEvents2, but can only wait on signal operations defined by vkCmdSetEvent. As vkCmdSetEvent does not define any access scopes, vkCmdWaitEvents defines the first access scope for each event signal operation in addition to its own access scopes.

Note
Since vkCmdSetEvent does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with vkCmdSetEvent2 and vkCmdWaitEvents2.

When vkCmdWaitEvents is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. vkCmdWaitEvents must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of pEvents, and the operations that happened-before the event signal operations. Event signal operations performed by vkCmdSetEvent that occur earlier in submission order are included in the first synchronization scope, if the logically latest pipeline stage in their stageMask parameter is logically earlier than or equal to the logically latest pipeline stage in srcStageMask. Event signal operations performed by vkSetEvent are only included in the first synchronization scope if VK_PIPELINE_STAGE_HOST_BIT is included in srcStageMask.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by dstStageMask.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by srcStageMask. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.
Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
  If the `geometryShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdWaitEvents-srcStageMask-04091
  If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdWaitEvents-srcStageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdWaitEvents-srcStageMask-03937
  If the `synchronization2` feature is not enabled, `srcStageMask` must not be 0

- VUID-vkCmdWaitEvents-srcStageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdWaitEvents-dstStageMask-04090
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- VUID-vkCmdWaitEvents-dstStageMask-04091
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdWaitEvents-dstStageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdWaitEvents-dstStageMask-03937
  If the `synchronization2` feature is not enabled, `dstStageMask` must not be 0

- VUID-vkCmdWaitEvents-dstStageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdWaitEvents-srcAccessMask-02815
  The `srcAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-dstAccessMask-02816
  The `dstAccessMask` member of each element of `pMemoryBarriers` must only include access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02817
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and

**VUID-vkCmdWaitEvents-pBufferMemoryBarriers-02818**
For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

**VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819**
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

**VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820**
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `srcAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

**VUID-vkCmdWaitEvents-srcStageMask-06459**
Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

**VUID-vkCmdWaitEvents-dstStageMask-06460**
Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

**VUID-vkCmdWaitEvents-srcStageMask-01158**
`sccStageMask` must be the bitwise OR of the `stageMask` parameter used in previous calls to `vkCmdSetEvent` with any of the elements of `pEvents` and `VK_PIPELINE_STAGE_HOST_BIT` if any of the elements of `pEvents` was set using `vkSetEvent`.

**VUID-vkCmdWaitEvents-srcStageMask-07308**
If `vkCmdWaitEvents` is being called inside a render pass instance, `srcStageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`.

**VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803**
The `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any element of
**pBufferMemoryBarriers or pImageMemoryBarriers must** be equal

- VUID-vkCmdWaitEvents-commandBuffer-01167
  commandBuffer’s current device mask **must** include exactly one physical device
- VUID-vkCmdWaitEvents-pEvents-03847
  Elements of **pEvents** **must** not have been signaled by `vkCmdSetEvent2`

### Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter
  **commandBuffer** **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWaitEvents-pEvents-parameter
  **pEvents** **must** be a valid pointer to an array of `eventCount` valid `VkEvent` handles
- VUID-vkCmdWaitEvents-srcStageMask-parameter
  **srcStageMask** **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-dstStageMask-parameter
  **dstStageMask** **must** be a valid combination of `VkPipelineStageFlagBits` values
- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
  If `memoryBarrierCount` is not 0, **pMemoryBarriers** **must** be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
  If `bufferMemoryBarrierCount` is not 0, **pBufferMemoryBarriers** **must** be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures
- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
  If `imageMemoryBarrierCount` is not 0, **pImageMemoryBarriers** **must** be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures
- VUID-vkCmdWaitEvents-commandBuffer-recording
  **commandBuffer** **must** be in the `recording` state
- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
  The `VkCommandPool` that **commandBuffer** was allocated from **must** support graphics, compute, decode, or encode operations
- VUID-vkCmdWaitEvents-eventCount-arraylength
  `eventCount` **must** be greater than 0
- VUID-vkCmdWaitEvents-commonparent
  Both of **commandBuffer**, and the elements of **pEvents** **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the `VkCommandPool` that **commandBuffer** was allocated from **must** be externally
### Command Properties

#### 7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in submission order.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to operations within the same subpass.
**Valid Usage**

- **VUID-vkCmdPipelineBarrier2-None-07889**
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the render pass **must** have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has **synchronization scopes** and **access scopes** that are all supersets of the scopes defined in this command.

- **VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178**
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, it **must** not include any buffer memory barriers.

- **VUID-vkCmdPipelineBarrier2-image-04073**
  If `vkCmdPipelineBarrier2` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command **must** be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment.

- **VUID-vkCmdPipelineBarrier2-oldLayout-01181**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command **must** be equal.

- **VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command **must** be equal.

- **VUID-vkCmdPipelineBarrier2-None-07890**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, destination stage masks of all memory barriers **must** only include `framebuffer-space stages`.

- **VUID-vkCmdPipelineBarrier2-dependencyFlags-07891**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and the source stage masks of any memory barriers include `framebuffer-space stages`, then `dependencyFlags` **must** include `VK_DEPENDENCY_BY_REGION_BIT`.

- **VUID-vkCmdPipelineBarrier2-None-07892**
  If `vkCmdPipelineBarrier2` is called within a render pass instance, and there is more than one view in the current subpass, dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-vkCmdPipelineBarrier2-None-07893**
  If `vkCmdPipelineBarrier2` is called inside a render pass instance, the dependency flags **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`
• VUID-vkCmdPipelineBarrier2-None-06191
  If `vkCmdPipelineBarrier2` is called within a render pass instance, the render pass must not have been started with `vkCmdBeginRendering`.

• VUID-vkCmdPipelineBarrier2-synchronization2-03848
  The `synchronization2` feature must be enabled.

• VUID-vkCmdPipelineBarrier2-srcStageMask-03849
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

• VUID-vkCmdPipelineBarrier2-dstStageMask-03850
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

Valid Usage (Implicit)

• VUID-vkCmdPipelineBarrier2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

• VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
  `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure.

• VUID-vkCmdPipelineBarrier2-commandBuffer-recording
  `commandBuffer` must be in the recording state.

• VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations.

Host Synchronization

• Host access to `commandBuffer` must be externally synchronized.

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stages.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stages.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the ` pBufferMemoryBarriers` array.
- ` pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the ` pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdPipelineBarrier` operates almost identically to `vkCmdPipelineBarrier2`, except that the scopes and barriers are defined as direct parameters rather than being defined by an `VkDependencyInfo`.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.
If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. Within that, the first access scope only includes the first access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. Within that, the second access scope only includes the second access scopes defined by elements of the `pMemoryBarriers`, `pBufferMemoryBarriers` and `pImageMemoryBarriers` arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.

### Valid Usage

- **VUID-vkCmdPipelineBarrier-srcStageMask-04090**
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdPipelineBarrier-srcStageMask-04091**
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdPipelineBarrier-srcStageMask-07319**
  If the attachmentFragmentShadingRate feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdPipelineBarrier-srcStageMask-03937**
  If the synchronization2 feature is not enabled, `srcStageMask` must not be 0

- **VUID-vkCmdPipelineBarrier-srcStageMask-07950**
  If the rayTracingPipeline feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
If the geometryShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

If the tessellationShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

If the attachmentFragmentShadingRate feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If the synchronization2 feature is not enabled, dstStageMask must not be 0

If the rayTracingPipeline feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

The srcAccessMask member of each element of pMemoryBarriers must only include access
flags that are supported by one or more of the pipeline stages in srcStageMask, as specified
in the table of supported access types

The dstAccessMask member of each element of pMemoryBarriers must only include access
flags that are supported by one or more of the pipeline stages in dstStageMask, as specified
in the table of supported access types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family
index that was used to create the command pool that commandBuffer was allocated from,
then its srcAccessMask member must only contain access flags that are supported by one
or more of the pipeline stages in srcStageMask, as specified in the table of supported access
types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and
dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family
index that was used to create the command pool that commandBuffer was allocated from,
then its dstAccessMask member must only contain access flags that are supported by one
or more of the pipeline stages in dstStageMask, as specified in the table of supported access
types

For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and
dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family
index that was used to create the command pool that commandBuffer was allocated from,
then its srcAccessMask member must only contain access flags that are supported by one
or more of the pipeline stages in srcStageMask, as specified in the table of supported access
types
For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family index that was used to create the command pool that `commandBuffer` was allocated from, then its `dstAccessMask` member must only contain access flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include `VK_DEPENDENCY_BY_REGION_BIT` if this command does not, does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT` if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, it must not include any buffer memory barriers.

If `vkCmdPipelineBarrier` is called within a render pass instance using a `VkRenderPass` object, the `image` member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color or depth/stencil attachment.

If `vkCmdPipelineBarrier` is called within a render pass instance, the `oldLayout` and `newLayout` members of any image memory barrier included in this command must be equal.

If `vkCmdPipelineBarrier` is called within a render pass instance, the `srcQueueFamilyIndex` and `dstQueueFamilyIndex` members of any memory barrier included in this command must be equal.

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages.

If `vkCmdPipelineBarrier` is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers must only include graphics pipeline stages.

If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.
If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

If `vkCmdPipelineBarrier` is called within a render pass instance, the render pass must not have been started with `vkCmdBeginRendering`.

Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.
- `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.
- `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values.
- If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `VkMemoryBarrier` structures.
- If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `VkBufferMemoryBarrier` structures.
- If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `VkImageMemoryBarrier` structures.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Bits which can be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
} VkDependencyFlagBits;
```

- **VK_DEPENDENCY_BY_REGION_BIT** specifies that dependencies will be framebuffer-local.
- **VK_DEPENDENCY_VIEW_LOCAL_BIT** specifies that dependencies will be view-local.
- **VK_DEPENDENCY_DEVICE_GROUP_BIT** specifies that dependencies are non-device-local.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`. 
7.7. Memory Barriers

Memory barriers are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts, and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2KHR VkMemoryBarrier2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by `srcStageMask` and `srcAccessMask`.

The second synchronization scope and access scope described by this structure include only
operations and memory accesses specified by dstStageMask and dstAccessMask.

**Valid Usage**

- **VUID-VkMemoryBarrier2-srcStageMask-03929**
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- **VUID-VkMemoryBarrier2-srcStageMask-03930**
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSERATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSERATION_EVALUATION_SHADER_BIT

- **VUID-VkMemoryBarrier2-srcStageMask-07317**
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- **VUID-VkMemoryBarrier2-srcStageMask-07947**
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- **VUID-VkMemoryBarrier2-srcAccessMask-03900**
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkMemoryBarrier2-srcAccessMask-03901**
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkMemoryBarrier2-srcAccessMask-03902**
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkMemoryBarrier2-srcAccessMask-03903**
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkMemoryBarrier2-srcAccessMask-03904**
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03905**
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages
• VUID-VkMemoryBarrier2-srcAccessMask-03906
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of
  the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-srcAccessMask-03907
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must
  include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or
  one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-srcAccessMask-03908
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`,
  `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or one of the
  `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-srcAccessMask-03909
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or
  one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-srcAccessMask-03910
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must
  include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`,
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-srcAccessMask-03911
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must
  include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`,
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-srcAccessMask-03912
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask`
  must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`,
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-srcAccessMask-03913
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask`
  must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`,
  `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-srcAccessMask-03914
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include
  `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`,
  `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`,
  or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-srcAccessMask-03915
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include
VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- **VUID-VkMemoryBarrier2-srcAccessMask-03916**
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03917**
  If `srcAccessMask` includes `VK_ACCESS_2_HOST_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-03927**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

- **VUID-VkMemoryBarrier2-srcAccessMask-03928**
  If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkMemoryBarrier2-srcAccessMask-06256**
  If the rayQuery feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-07272**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04858**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04859**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04860**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- **VUID-VkMemoryBarrier2-srcAccessMask-04861**
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`
• VUID-VkMemoryBarrier2-dstStageMask-03929
  If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

• VUID-VkMemoryBarrier2-dstStageMask-03930
  If the `tessellationShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

• VUID-VkMemoryBarrier2-dstStageMask-07317
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

• VUID-VkMemoryBarrier2-dstStageMask-07947
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

• VUID-VkMemoryBarrier2-dstAccessMask-03900
  If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-dstAccessMask-03901
  If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-dstAccessMask-03902
  If `dstAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-dstAccessMask-03903
  If `dstAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

• VUID-VkMemoryBarrier2-dstAccessMask-03904
  If `dstAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-dstAccessMask-03905
  If `dstAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

• VUID-VkMemoryBarrier2-dstAccessMask-03906
  If `dstAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `dstStageMask` **must** include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages
VK_MEMORY_BARRIER2

If dstAccessMask includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If dstAccessMask includes VK_ACCESS_2_SHADER_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If dstAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages.

If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If dstAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.

If dstAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT.
VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-dstAccessMask-03916
  If dstAccessMask includes VK_ACCESS_2_HOST_READ_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkMemoryBarrier2-dstAccessMask-03917
  If dstAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, dstStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkMemoryBarrier2-dstAccessMask-03927
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask
  must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT
  stages

• VUID-VkMemoryBarrier2-dstAccessMask-03928
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, dstStageMask
  must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkMemoryBarrier2-dstAccessMask-06256
  If the rayQuery feature is not enabled and dstAccessMask includes
  VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages except
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-07272
  If dstAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, dstStageMask
  must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04858
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, dstStageMask must
  include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04859
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, dstStageMask must
  include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04860
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR, dstStageMask must
  include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

• VUID-VkMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, dstStageMask must
  include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

Valid Usage (Implicit)

• VUID-VkMemoryBarrier2-sType-sType
**sType** must be **VK_STRUCTURE_TYPE_MEMORY_BARRIER**

- VUID-VkMemoryBarrier2-srcStageMask-parameter
  
  **srcStageMask** must be a valid combination of **VkPipelineStageFlagBits** values

- VUID-VkMemoryBarrier2-srcAccessMask-parameter
  
  **srcAccessMask** must be a valid combination of **VkAccessFlagBits** values

- VUID-VkMemoryBarrier2-dstStageMask-parameter
  
  **dstStageMask** must be a valid combination of **VkPipelineStageFlagBits** values

- VUID-VkMemoryBarrier2-dstAccessMask-parameter
  
  **dstAccessMask** must be a valid combination of **VkAccessFlagBits** values

The **VkMemoryBarrier** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of **VkAccessFlagBits** specifying a source access mask.
- **dstAccessMask** is a bitmask of **VkAccessFlagBits** specifying a destination access mask.

The first **access scope** is limited to access types in the **source access mask** specified by **srcAccessMask**.

The second **access scope** is limited to access types in the **destination access mask** specified by **dstAccessMask**.

**Valid Usage (Implicit)**

- VUID-VkMemoryBarrier-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_MEMORY_BARRIER**

- VUID-VkMemoryBarrier-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  
  **srcAccessMask** must be a valid combination of **VkAccessFlagBits** values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  
  **dstAccessMask** must be a valid combination of **VkAccessFlagBits** values
7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is scoped to access via the specified buffer range. Buffer memory barriers can also be used to define a queue family ownership transfer for the specified buffer range.

The `VkBufferMemoryBarrier2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the first access scope.
- `dstStageMask` is a `VkPipelineStageFlags2` mask of pipeline stages to be included in the second synchronization scope.
- `dstAccessMask` is a `VkAccessFlags2` mask of access flags to be included in the second access scope.
- `srcQueueFamilyIndex` is the source queue family for a queue family ownership transfer.
- `dstQueueFamilyIndex` is the destination queue family for a queue family ownership transfer.
- `buffer` is a handle to the buffer whose backing memory is affected by the barrier.
- `offset` is an offset in bytes into the backing memory for `buffer`; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).
- `size` is a size in bytes of the affected area of backing memory for `buffer`, or `VK_WHOLE_SIZE` to use...
the range from offset to the end of the buffer.

This structure defines a memory dependency limited to a range of a buffer, and can define a queue family transfer operation for that range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by srcStageMask and srcAccessMask.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by dstStageMask and dstAccessMask.

Both access scopes are limited to only memory accesses to buffer in the range defined by offset and size.

If buffer was created with VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified buffer range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified buffer range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

### Valid Usage

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03929**
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- **VUID-VkBufferMemoryBarrier2-srcStageMask-03930**
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- **VUID-VkBufferMemoryBarrier2-srcStageMask-07317**
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- **VUID-VkBufferMemoryBarrier2-srcStageMask-07947**
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- **VUID-VkBufferMemoryBarrier2-srcAccessMask-03900**
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT,
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03906
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03907
  If srcAccessMask includes VK_ACCESS_2_SHADER_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or one of the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03908
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03909
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, srcStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03911
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03912
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03913
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03915
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03916
  If srcAccessMask includes VK_ACCESS_2_HOST_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03917
  If srcAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03927
  If srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must include
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-srcAccessMask-03928
  If srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, srcStageMask
must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-srcAccessMask-06256
  If the rayQuery feature is not enabled and srcAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the VK_PIPELINE_STAGE_2_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07272
  If srcAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04858
  If srcAccessMask includes VK_ACCESS_2_VIDEO_DECODER_READ_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04859
  If srcAccessMask includes VK_ACCESS_2_VIDEO_DECODER_WRITE_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04860
  If srcAccessMask includes VK_ACCESS_2_VIDEO_ENCODER_READ_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04861
  If srcAccessMask includes VK_ACCESS_2_VIDEO_ENCODER_WRITE_BIT_KHR, srcStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstStageMask-03929
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkBufferMemoryBarrier2-dstStageMask-03930
  If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkBufferMemoryBarrier2-dstStageMask-07317
  If the attachmentFragmentShadingRate feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstStageMask-07947
  If the rayTracingPipeline feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03900
  If dstAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03901
If dstAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, dstStageMask must include
VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03902
  If dstAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, dstStageMask must
  include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT,

  must include VK_PIPELINE_STAGE_2 ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2 ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2 ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*/SHADER_BIT
  stages

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03928
  If dstAccessMask includes VK_ACCESS_2 ACCELERATION_STRUCTURE_WRITE_BIT_KHR, dstStageMask
  must include VK_PIPELINE_STAGE_2 ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2 ACCELERATION_STRUCTURE_BUILD_BIT_KHR
  or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT
If the rayQuery feature is not enabled and dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR.

If dstAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR.

If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR.

If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR.

offset must be less than the size of buffer.

If size is not equal to VK_WHOLE_SIZE, size must be greater than 0.

If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to than the size of buffer minus offset.

If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family.

If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`.

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

Valid Usage (Implicit)

- `VUID-VkBufferMemoryBarrier2-sType-sType`
sType must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2`
- `VUID-VkBufferMemoryBarrier2-pNext-pNext`
pNext must be `NULL`
- `VUID-VkBufferMemoryBarrier2-srcStageMask-parameter`
srcStageMask must be a valid combination of `VkPipelineStageFlagBits2` values
- `VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter`
srcAccessMask must be a valid combination of `VkAccessFlagBits2` values
- `VUID-VkBufferMemoryBarrier2-dstStageMask-parameter`
dstStageMask must be a valid combination of `VkPipelineStageFlagBits2` values
- `VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter`
dstAccessMask must be a valid combination of `VkAccessFlagBits2` values
- `VUID-VkBufferMemoryBarrier2-buffer-parameter`
buffer must be a valid `VkBuffer` handle

The `VkBufferMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.

• **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.

• **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.

• **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.

• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.

• **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see `vkBindBufferMemory`).

• **size** is a size in bytes of the affected area of backing memory for **buffer**, or `VK_WHOLE_SIZE` to use the range from **offset** to the end of the buffer.

The first **access scope** is limited to access to memory through the specified buffer range, via access types in the source access mask specified by **srcAccessMask**. If **srcAccessMask** includes `VK_ACCESS_HOST_WRITE_BIT`, a memory domain operation is performed where available memory in the host domain is also made available to the device domain.

The second **access scope** is limited to access to memory through the specified buffer range, via access types in the destination access mask specified by **dstAccessMask**. If **dstAccessMask** includes `VK_ACCESS_HOST_WRITE_BIT` or `VK_ACCESS_HOST_READ_BIT`, a memory domain operation is performed where available memory in the device domain is also made available to the host domain.

*Note* When `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, and **srcQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified buffer range, and the second access scope includes no access, as if **dstAccessMask** was `0`.

If **dstQueueFamilyIndex** is not equal to **srcQueueFamilyIndex**, and **dstQueueFamilyIndex** is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified buffer range, and the first access scope includes no access, as if **srcAccessMask** was `0`.

### Valid Usage

- **VUID-VkBufferMemoryBarrier-offset-01187**
  
  **offset must** be less than the size of **buffer**

- **VUID-VkBufferMemoryBarrier-size-01188**
  
  If **size** is not equal to `VK_WHOLE_SIZE`, **size must** be greater than `0`

- **VUID-VkBufferMemoryBarrier-size-01189**
  
  If **size** is not equal to `VK_WHOLE_SIZE`, **size must** be less than or equal to than the size of **buffer** minus **offset**
• VUID-VkBufferMemoryBarrier-buffer-01931
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-VkBufferMemoryBarrier-buffer-09095
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family.

• VUID-VkBufferMemoryBarrier-buffer-09096
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family.

• VUID-VkBufferMemoryBarrier-srcQueueFamilyIndex-04087
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkBufferMemoryBarrier-None-09097
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkBufferMemoryBarrier-None-09098
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkBufferMemoryBarrier-None-09049
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED.

• VUID-VkBufferMemoryBarrier-None-09050
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL.

• VUID-VkBufferMemoryBarrier-None-09051
  If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL.

Valid Usage (Implicit)

• VUID-VkBufferMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER.

• VUID-VkBufferMemoryBarrier-pNext-pNext
  pNext must be NULL.

• VUID-VkBufferMemoryBarrier-buffer-parameter
  buffer must be a valid VkBuffer handle.
VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer following a given offset should be used. It can be specified for VkBufferMemoryBarrier::size and other structures.

```
#define VK_WHOLE_SIZE (~0ULL)
```

### 7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The VkImageMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.
- `srcAccessMask` is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- `dstStageMask` is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- dstAccessMask is a VkAccessFlags2 mask of access flags to be included in the second access scope.
- oldLayout is the old layout in an image layout transition.
- newLayout is the new layout in an image layout transition.
- srcQueueFamilyIndex is the source queue family for a queue family ownership transfer.
- dstQueueFamilyIndex is the destination queue family for a queue family ownership transfer.
- image is a handle to the image affected by this barrier.
- subresourceRange describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by srcStageMask and srcAccessMask.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by dstStageMask and dstAccessMask.

Both access scopes are limited to only memory accesses to image in the subresource range defined by subresourceRange.

If image was created with VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, this memory barrier defines a queue family transfer operation. When executed on a queue in the family identified by srcQueueFamilyIndex, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization and access scopes do not synchronize operations on that queue. When executed on a queue in the family identified by dstQueueFamilyIndex, this barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization and access scopes do not synchronize operations on that queue.

A queue family transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when dstQueueFamilyIndex is one of those values, and a queue family acquire operation is defined when srcQueueFamilyIndex is one of those values.

If oldLayout is not equal to newLayout, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family transfer operation, the layout transition is only executed once between the queues.

**Note**

When the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including...
Valid Usage

• VUID-VkImageMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

• VUID-VkImageMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or
  VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

• VUID-VkImageMemoryBarrier2-srcStageMask-07317
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcStageMask-07947
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkImageMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkImageMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkImageMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
The VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03906**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03907**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03908**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03909**
  If `srcAccessMask` includes `VK_ACCESS_2_SHADER_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03910**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03911**
  If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT` or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03912**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03913**
  If `srcAccessMask` includes `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03914**
  If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_COPY_BIT`, `VK_PIPELINE_STAGE_2_BLIT_BIT`, `VK_PIPELINE_STAGE_2_RESOLVE_BIT`, `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- **VUID-VkImageMemoryBarrier2-srcAccessMask-03915**
If `srcAccessMask` includes `VK_ACCESS_2_TRANSFER_WRITE_BIT`, `srcStageMask` must include:
- `VK_PIPELINE_STAGE_2_COPY_BIT`
- `VK_PIPELINE_STAGE_2_BLIT_BIT`
- `VK_PIPELINE_STAGE_2_CLEAR_BIT`
- `VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT`

  VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

- VUID-VkImageMemoryBarrier2-dstAccessMask-04860
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR, dstStageMask must include 
  VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

- VUID-VkImageMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, dstStageMask must include 
  VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

- VUID-VkImageMemoryBarrier2-oldLayout-01208
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01209
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01210
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01211
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01212
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01213
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

- VUID-VkImageMemoryBarrier2-newLayout-01197
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` must be `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier2-oldLayout-01198
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- VUID-VkImageMemoryBarrier2-oldLayout-01658
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` then `image` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkImageMemoryBarrier2-oldLayout-01659
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04065
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

• VUID-VkImageMemoryBarrier2-oldLayout-02088
If the synchronization feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

• VUID-VkImageMemoryBarrier2-newLayout-02086
If the synchronization feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL` then image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

• VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL`, image must have been created with at least one of `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_SAMPLED_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

• VUID-VkImageMemoryBarrier2-oldLayout-02088
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`, then image must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR` set

- **VUID-VkImageMemoryBarrier2-image-09117**
  If image was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `srcQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, or a valid queue family

- **VUID-VkImageMemoryBarrier2-image-09118**
  If image was created with a sharing mode of `VK_SHARING_MODE_EXCLUSIVE`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` are not equal, `dstQueueFamilyIndex` must be `VK_QUEUE_FAMILY_EXTERNAL`, or a valid queue family

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-04070**
  If `srcQueueFamilyIndex` is not equal to `dstQueueFamilyIndex`, at least one of `srcQueueFamilyIndex` or `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- **VUID-VkImageMemoryBarrier2-None-09119**
  If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- **VUID-VkImageMemoryBarrier2-None-09120**
  If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07120**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07121**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07122**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07123**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07124**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`

- **VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125**
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then `image` must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`.

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-07125
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then `image` must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`.

- VUID-VkImageMemoryBarrier2-subresourceRange-01486
  `subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkImageMemoryBarrier2-subresourceRange-01724
  If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkImageMemoryBarrier2-subresourceRange-01488
  `subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkImageMemoryBarrier2-subresourceRange-01725
  If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- VUID-VkImageMemoryBarrier2-image-01932
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-VkImageMemoryBarrier2-image-01671
  If `image` has a single-plane color format or is not disjoint, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkImageMemoryBarrier2-image-01672
  If `image` has a multi-planar format and the image is disjoint, then the `aspectMask` member of `subresourceRange` must include at least one multi-planar aspect mask or `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkImageMemoryBarrier2-image-03319
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- VUID-VkImageMemoryBarrier2-image-03320
  If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.
If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal.

If `srcStageMask` includes `VK_PIPELINE_STAGE_2_HOST_BIT`, and `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `oldLayout` must be one of `VK_IMAGE_LAYOUT_PREINITIALIZED`, `VK_IMAGE_LAYOUT_UNDEFINED`, or `VK_IMAGE_LAYOUT_GENERAL`.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2`.
- `pNext` must be `NULL`.
- `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.
- `srcAccessMask` must be a valid combination of `VkAccessFlagBits2` values.
- `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits2` values.
- `dstAccessMask` must be a valid combination of `VkAccessFlagBits2` values.
- `oldLayout` must be a valid `VkImageLayout` value.
- `newLayout` must be a valid `VkImageLayout` value.
- `image` must be a valid `VkImage` handle.
- `subresourceRange` must be a valid `VkImageSubresourceRange` structure.

The `VkImageMemoryBarrier` structure is defined as:
```c
typedef struct VkImageMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
- **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

The first access scope is limited to access to memory through the specified image subresource range, via access types in the source access mask specified by srcAccessMask. If srcAccessMask includes VK_ACCESS_HOST_WRITE_BIT, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.

The second access scope is limited to access to memory through the specified image subresource range, via access types in the destination access mask specified by dstAccessMask. If dstAccessMask includes VK_ACCESS_HOST_WRITE_BIT or VK_ACCESS_HOST_READ_BIT, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, and srcQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified image subresource range, and the second access scope includes no access, as if dstAccessMask was 0.

If dstQueueFamilyIndex is not equal to srcQueueFamilyIndex, and dstQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified image subresource range, and the first access scope includes no access, as if srcAccessMask was 0.
If the synchronization feature is not enabled or oldLayout is not equal to newLayout, oldLayout and newLayout define an image layout transition for the specified image subresource range.

**Note**
If the synchronization feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

### Valid Usage

- **VUID-VkImageMemoryBarrier-oldLayout-01208**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01209**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01210**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01211**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01212**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- **VUID-VkImageMemoryBarrier-oldLayout-01213**
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources affected by the barrier.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, newLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set.

If the synchronization2 feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.
• VUID-VkImageMemoryBarrier-synchronization2-07794
  If the synchronization2 feature is not enabled, newLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer
  or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR, image must have been created with
  VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer
  or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
  VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, image must have been created with at least one of
  VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or
  VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier-oldLayout-02088
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer
  or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
  VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then image must have
  been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set

• VUID-VkImageMemoryBarrier-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and
  srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be
  VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family

• VUID-VkImageMemoryBarrier-image-09118
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and
  srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be
  VK_QUEUE_FAMILY_EXTERNAL, or a valid queue family

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of
  srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of
  VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal
  to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of
  VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal
  to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer
  or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
  VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image must have been created with
  VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07121
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07124
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`.

• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07125
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`.

• VUID-VkImageMemoryBarrier-subresourceRange-01486
`subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created.

• VUID-VkImageMemoryBarrier-subresourceRange-01724
If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when image was created.

• VUID-VkImageMemoryBarrier-subresourceRange-01488
`subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when image was created.

• VUID-VkImageMemoryBarrier-subresourceRange-01725
If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when image was created.

• VUID-VkImageMemoryBarrier-image-01932
If image is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• VUID-VkImageMemoryBarrier-image-01671
If image has a single-plane color format or is not disjoint, then the `aspectMask` member of
**Valid Usage (Implicit)**

- **VUID-VkImageMemoryBarrier-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER

- **VUID-VkImageMemoryBarrier-pNext-pNext**
  
  pNext must be NULL

- **VUID-VkImageMemoryBarrier-oldLayout-parameter**
oldLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-newLayout-parameter
  newLayout must be a valid VkImageLayout value

- VUID-VkImageMemoryBarrier-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageMemoryBarrier-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure

7.7.4. Queue Family Ownership Transfer

Resources created with a VkSharingMode of VK_SHARING_MODE_EXCLUSIVE must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index VK_QUEUE_FAMILY_IGNORED indicates that a queue family parameter or member is ignored.

```
#define VK_QUEUE_FAMILY_IGNORED    (-0U)
```

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the VkSharingMode specified when creating them.

The special queue family index VK_QUEUE_FAMILY_EXTERNAL represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's VkDevice, as indicated by VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.

```
#define VK_QUEUE_FAMILY_EXTERNAL    (~1U)
```

or the equivalent

```
#define VK_QUEUE_FAMILY_EXTERNAL_KHR VK_QUEUE_FAMILY_EXTERNAL
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

Note

If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.
A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application must ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A release operation is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The srcQueueFamilyIndex parameter of the barrier must be set to the source queue family index, and the dstQueueFamilyIndex parameter to the destination queue family index. dstAccessMask is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation, and happens-before operations specified in the second synchronization scope of the calling command.

An acquire operation is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation must match exactly that of a previous release operation. The srcQueueFamilyIndex parameter of the barrier must be set to the source queue family index, and the dstQueueFamilyIndex parameter to the destination queue family index. srcAccessMask is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-after operations in the first synchronization scope of the calling command, and happens-before the visibility operation.

Note

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks should be set to 0.

If the transfer is via an image memory barrier, and an image layout transition is desired, then the values of oldLayout and newLayout in the release operation's memory barrier must be equal to values of oldLayout and newLayout in the acquire operation's memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.

If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to VK_QUEUE_FAMILY_IGNORED.
Queue family ownership transfers **may** perform read and write accesses on all memory bound to the image subresource or buffer range, so applications **must** ensure that all memory writes have been made **available** before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a **VK_SHARING_MODE_EXCLUSIVE** resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

**Note**

Because **events** **cannot** be used directly for inter-queue synchronization, and because **vkCmdSetEvent** does not have the queue family index or memory barrier parameters needed by a **release operation**, the release and acquire operations of a queue family ownership transfer **can** only be performed using **vkCmdPipelineBarrier**.

### 7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- **queue** is the queue on which to wait.

**vkQueueWaitIdle** is equivalent to having submitted a valid fence to every previously executed **queue submission command** that accepts a fence, then waiting for all of those fences to signal using **vkWaitForFences** with an infinite timeout and **waitAll** set to **VK_TRUE**.

**Valid Usage (Implicit)**

- **VUID-vkQueueWaitIdle-queue-parameter**
  
  **queue** **must** be a valid **VkQueue** handle

**Host Synchronization**

- Host access to **queue** **must** be externally synchronized
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice device);
```

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

Valid Usage (Implicit)

- VUID-vkDeviceWaitIdle-device-parameter
  - `device` must be a valid `VkDevice` handle

Host Synchronization

- Host access to all `VkQueue` objects created from `device` must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope includes execution of vkQueueSubmit on the host and anything that happened-before it, as defined by the host memory model.

Note

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call _mm_sfence().

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.

The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.

7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the VkDeviceGroupSubmitInfo and VkDeviceGroupBindSparseInfo structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).
Chapter 8. Render Pass

Draw commands **must** be recorded within a *render pass instance*. Each render pass instance defines a set of image resources, referred to as *attachments*, used during rendering.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pRenderingInfo** is a pointer to a *VkRenderingInfo* structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record *draw commands*.

If **pRenderingInfo->flags** includes **VK_RENDERING_RESUMING_BIT** then this render pass is resumed from a render pass instance that has been suspended earlier in *submission order*.

### Valid Usage

- **VUID-vkCmdBeginRendering-dynamicRendering-06446** The dynamicRendering feature **must** be enabled
- **VUID-vkCmdBeginRendering-commandBuffer-06068** If **commandBuffer** is a secondary command buffer, **pRenderingInfo->flags** **must not include** **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT**

### Valid Usage (Implicit)

- **VUID-vkCmdBeginRendering-commandBuffer-parameter** **commandBuffer** **must** be a valid *VkCommandBuffer* handle
- **VUID-vkCmdBeginRendering-pRenderingInfo-parameter** **pRenderingInfo** **must** be a valid pointer to a valid *VkRenderingInfo* structure
- **VUID-vkCmdBeginRendering-commandBuffer-recording**
The **commandBuffer** must be in the **recording state**

- VUID-vkCmdBeginRendering-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- VUID-vkCmdBeginRendering-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRendering-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **VkRenderingInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    VkRect2D renderArea;
    uint32_t layerCount;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingInfo VkRenderingInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkRenderingFlagBits`.

• **renderArea** is the render area that is affected by the render pass instance.

• **layerCount** is the number of layers rendered to in each attachment when `viewMask` is `0`.

• **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not `0`.

• **colorAttachmentCount** is the number of elements in `pColorAttachments`.

• **pColorAttachments** is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo` structures describing any color attachments used.

• **pDepthAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth attachment.

• **pStencilAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not `0`, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not `0`, then `renderArea` is ignored, and the render area is defined per-device by that structure.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`.

<table>
<thead>
<tr>
<th>Valid Usage</th>
</tr>
</thead>
</table>
| VUID-VkRenderingInfo-viewMask-06069  
If `viewMask` is `0`, `layerCount` must not be `0` |
| VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857  
If none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount` |
| VUID-VkRenderingInfo-None-08994  
If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is `0`, `renderArea.extent.width` must be greater than `0` |
| VUID-VkRenderingInfo-None-08995  
If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is `0`, `renderArea.extent.height` must be greater than `0` |
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.width` and `renderArea.offset.x` must be less than or equal to `maxFramebufferWidth`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.height` and `renderArea.offset.y` must be less than or equal to `maxFramebufferHeight`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.x + renderArea.extent.width`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.y + renderArea.extent.height`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`.

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL` and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure must be the same.

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL`, and the `resolveMode` member of
each is not VK_RESOLVE_MODE_NONE, the resolveImageView member of each structure must be the same

• VUID-VkRenderingInfo-colorAttachmentCount-06087
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, that imageView must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pDepthAttachment-06547
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with a format that includes a depth component

• VUID-VkRenderingInfo-pDepthAttachment-06088
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->imageView must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-pStencilAttachment-06548
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a format that includes a stencil aspect

• VUID-VkRenderingInfo-pStencilAttachment-06089
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->imageView must have been created with a stencil usage including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkRenderingInfo-colorAttachmentCount-06090
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingInfo-colorAttachmentCount-06091
If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkRenderingInfo-pDepthAttachment-06092
If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkRenderingInfo-pDepthAttachment-06093
If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL.Handle, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkRenderingInfo-pStencilAttachment-06094
If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL
If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL.

If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL.

If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL.

If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, if the resolveMode member of that element of pDepthAttachment is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.
pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- VUID-VkRenderingInfo-pStencilAttachment-07734
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.

- VUID-VkRenderingInfo-pStencilAttachment-07735
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.

- VUID-VkRenderingInfo-pDepthAttachment-06102
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes.

- VUID-VkRenderingInfo-pStencilAttachment-06103
  If pStencilAttachment is not NULL and pStencilAttachment->imageView is not VK_NULL_HANDLE, pStencilAttachment->resolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes.

- VUID-VkRenderingInfo-pDepthAttachment-06104
  If pDepthAttachment or pStencilAttachment are both not NULL, pDepthAttachment->imageView and pStencilAttachment->imageView are both not VK_NULL_HANDLE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, the resolveMode of both structures must be the same value.

- VUID-VkRenderingInfo-pDepthAttachment-06105
  If pDepthAttachment or pStencilAttachment are both not NULL, pDepthAttachment->imageView and pStencilAttachment->imageView are both not VK_NULL_HANDLE, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and the resolveMode of neither structure is VK_RESOLVE_MODE_NONE, the resolveMode of both structures must be the same value.

- VUID-VkRenderingInfo-colorAttachmentCount-06106
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

- VUID-VkRenderingInfo-pNext-06119
  If the pNext chain does not contain VkDeviceGroupRenderPassBeginInfo or its deviceRenderAreaCount member is equal to 0 and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext chain is not VK_NULL_HANDLE, imageView must have a width greater than or equal to renderAreaX + renderAreaWidth, shadingRateAttachmentTexelSize.width.

- VUID-VkRenderingInfo-pNext-06120
  If the pNext chain contains a VkDeviceGroupRenderPassBeginInfo structure, its deviceRenderAreaCount member is not 0, and the imageView member of a VkRenderingFragmentShadingRateAttachmentInfoKHR structure included in the pNext...
chain is not \texttt{VK_NULL_HANDLE}, \textit{imageView} \textbf{must} have a width greater than or equal to \(\frac{\text{renderArea} \times \text{shadingRateAttachmentTexelSize.width}}{\text{shadingRateAttachmentTexelSize.width}}\) for each element of \texttt{pDeviceRenderAreas}

- \textbf{VUID-VkRenderingInfo-pNext-06121}
  
  If the \texttt{pNext} chain does not contain \texttt{VkDeviceGroupRenderPassBeginInfo} or its \texttt{deviceRenderAreaCount} member is equal to 0 and the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, \textit{imageView} \textbf{must} have a height greater than or equal to \(\frac{\text{renderArea} \times \text{shadingRateAttachmentTexelSize.height}}{\text{shadingRateAttachmentTexelSize.height}}\)

- \textbf{VUID-VkRenderingInfo-pNext-06122}
  
  If the \texttt{pNext} chain contains a \texttt{VkDeviceGroupRenderPassBeginInfo} structure, its \texttt{deviceRenderAreaCount} member is not 0, and the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, \textit{imageView} \textbf{must} have a height greater than or equal to \(\frac{\text{renderArea} \times \text{shadingRateAttachmentTexelSize.height}}{\text{shadingRateAttachmentTexelSize.height}}\) for each element of \texttt{pDeviceRenderAreas}

- \textbf{VUID-VkRenderingInfo-layerCount-07817}
  
  \textit{layerCount} \textbf{must} be less than or equal to \texttt{maxFramebufferLayers}

- \textbf{VUID-VkRenderingInfo-imageView-06123}
  
  If the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, and \texttt{viewMask} is 0, \textit{imageView} \textbf{must} have a \textit{layerCount} that is either equal to 1 or greater than or equal to \textit{layerCount}

- \textbf{VUID-VkRenderingInfo-imageView-06124}
  
  If the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, and \texttt{viewMask} is not 0, \textit{imageView} \textbf{must} have a \textit{layerCount} that either equal to 1 or greater than or equal to the index of the most significant bit in \texttt{viewMask}

- \textbf{VUID-VkRenderingInfo-imageView-06125}
  
  If the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \texttt{pNext} chain is not \texttt{VK_NULL_HANDLE}, it \textbf{must} not be equal to the \textit{imageView} or \texttt{resolveImageView} member of \texttt{pDepthAttachment}, \texttt{pStencilAttachment}, or any element of \texttt{pColorAttachments}

- \textbf{VUID-VkRenderingInfo-multiview-06127}
  
  If the \texttt{multiview} feature is not enabled, \texttt{viewMask} \textbf{must} be 0

- \textbf{VUID-VkRenderingInfo-viewMask-06128}
  
  The index of the most significant bit in \texttt{viewMask} \textbf{must} be less than \texttt{maxMultiviewViewCount}

- \textbf{VUID-VkRenderingInfo-None-09044}
  
  Valid attachments specified by this structure \textbf{must} not be bound to memory locations that are bound to any other valid attachments specified by this structure

\textbf{Valid Usage (Implicit)}

- \textbf{VUID-VkRenderingInfo-sType-sType}
  
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_RENDERING_INFO}
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderingFragmentDensityMapAttachmentInfoEXT`, or `VkRenderingFragmentShadingRateAttachmentInfoKHR`.

The `sType` value of each struct in the `pNext` chain must be unique.

Flags must be a valid combination of `VkRenderingFlagBits` values.

If `colorAttachmentCount` is not 0, `pColorAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkRenderingAttachmentInfo` structures.

If `pDepthAttachment` is not `NULL`, `pDepthAttachment` must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure.

If `pStencilAttachment` is not `NULL`, `pStencilAttachment` must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure.

Bits which can be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {  
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,  
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,  
    VK_RENDERING_RESUMING_BIT = 0x00000004,  
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR = VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,  
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,  
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,  
} VkRenderingFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlagBits VkRenderingFlagBitsKHR;
```

- `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` specifies that draw calls for the render pass instance will be recorded in secondary command buffers.
- `VK_RENDERING_RESUMING_BIT` specifies that the render pass instance is resuming an earlier suspended render pass instance.
• **VK_RENDERING_SUSPENDING_BIT** specifies that the render pass instance will be suspended.

The contents of `pRenderingInfo` must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the `VK_RENDERING_RESUMING_BIT`, `VK_RENDERING_SUSPENDING_BIT`, and `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT` flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkRenderingFlags;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingFlags VkRenderingFlagsKHR;
```

*VkRenderingFlags* is a bitmask type for setting a mask of zero or more *VkRenderingFlagBits*.

The *VkRenderingAttachmentInfo* structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView resolveImageView;
    VkImageLayout resolveImageLayout;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearValue clearValue;
} VkRenderingAttachmentInfo;
```

or the equivalent

```
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;
```

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **imageView** is the image view that will be used for rendering.
• **imageLayout** is the layout that **imageView** will be in during rendering.
• **resolveMode** is a `VkResolveModeFlagBits` value defining how multisampled data written to `imageView` will be resolved.

• **resolveImageView** is an image view used to write resolved multisample data at the end of rendering.

• **resolveImageLayout** is the layout that `resolveImageView` will be in during rendering.

• **loadOp** is a `VkAttachmentLoadOp` value defining the load operation for the attachment.

• **storeOp** is a `VkAttachmentStoreOp` value defining the store operation for the attachment.

• **clearValue** is a `VkClearValue` structure defining values used to clear `imageView` when `loadOp` is `VK_ATTACHMENT_LOAD_OP_CLEAR`.

Values in `imageView` are loaded and stored according to the values of `loadOp` and `storeOp`, within the render area for each device specified in `VkRenderingInfo`. If `imageView` is `VK_NULL_HANDLE`, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or multisample resolve operations will be performed.

If `resolveMode` is `VK_RESOLVE_MODE_NONE`, then `resolveImageView` is ignored. If `resolveMode` is not `VK_RESOLVE_MODE_NONE`, and `resolveImageView` is not `VK_NULL_HANDLE`, a render pass multisample resolve operation is defined for the attachment subresource.

> **Note**
>
The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

### Valid Usage

- **VUID-VkRenderingAttachmentInfo-imageView-06129**
  If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06130**
  If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` **must** be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06132**
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` **must** not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkRenderingAttachmentInfo-imageView-06860**
If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must not be `VK_NULL_HANDLE`.

- VUID-VkRenderingAttachmentInfo-imageView-06864
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkRenderingAttachmentInfo-imageView-06865
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` must have the same `VkFormat`.

- VUID-VkRenderingAttachmentInfo-imageView-06135
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- VUID-VkRenderingAttachmentInfo-imageView-06136
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- VUID-VkRenderingAttachmentInfo-imageView-06137
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- VUID-VkRenderingAttachmentInfo-imageView-06142
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06143
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06144
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06145
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

- VUID-VkRenderingAttachmentInfo-imageView-06146
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`.

365
Valid Usage (Implicit)

- **VUID-VkRenderingAttachmentInfo-sType-sType**
  
  sType **must** be `VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO`.

- **VUID-VkRenderingAttachmentInfo-pNext-pNext**
  
  pNext **must** be `NULL`.

- **VUID-VkRenderingAttachmentInfo-imageView-parameter**
  
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` **must** be a valid `VkImageView` handle.

- **VUID-VkRenderingAttachmentInfo-imageLayout-parameter**
  
  `imageLayout` **must** be a valid `VkImageLayout` value.

- **VUID-VkRenderingAttachmentInfo-resolveMode-parameter**
  
  If `resolveMode` is not 0, `resolveMode` **must** be a valid `VkResolveModeFlagBits` value.

- **VUID-VkRenderingAttachmentInfo-resolveImageView-parameter**
  
  If `resolveImageView` is not `VK_NULL_HANDLE`, `resolveImageView` **must** be a valid `VkImageView` handle.

- **VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter**
  
  `resolveImageLayout` **must** be a valid `VkImageLayout` value.

- **VUID-VkRenderingAttachmentInfo-loadOp-parameter**
  
  `loadOp` **must** be a valid `VkAttachmentLoadOp` value.

- **VUID-VkRenderingAttachmentInfo-storeOp-parameter**
  
  `storeOp` **must** be a valid `VkAttachmentStoreOp` value.

- **VUID-VkRenderingAttachmentInfo-clearValue-parameter**
  
  `clearValue` **must** be a valid `VkClearValue` union.

- **VUID-VkRenderingAttachmentInfo-commonparent**
  
  Both of `imageView`, and `resolveImageView` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

The `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **imageView** is the image view that will be used as a fragment shading rate attachment.
• `imageLayout` is the layout that `imageView` will be in during rendering.
• `shadingRateAttachmentTexelSize` specifies the number of pixels corresponding to each texel in `imageView`.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment shading rate attachment. If `imageView` is `VK_NULL_HANDLE`, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

**Valid Usage**

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
  If `imageView` is not `VK_NULL_HANDLE`, layout must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
  If `imageView` is not `VK_NULL_HANDLE`, it must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be a power of two value.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be a power of two value.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.
Valid Usage (Implicit)

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(VkCommandBuffer commandBuffer);
```

- commandBuffer is the command buffer in which to record the command.

If the value of pRenderingInfo->flags used to begin this render pass instance included
VK_RENDERING_SUSPENDING_BIT, then this render pass is suspended and will be resumed later in
submission order.

Valid Usage

- VUID-vkCmdEndRendering-None-06161
  The current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdEndRendering-commandBuffer-06162
  The current render pass instance must have been begun in commandBuffer

- VUID-vkCmdEndRendering-None-06999
  If vkCmdBeginQuery* was called within the render pass, the corresponding vkCmdEndQuery*
  must have been called subsequently within the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRendering-commandBuffer-recording

368
commandBuffer must be in the recording state

- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

</tr>
</tbody>
</table>

Note

For more complex rendering graphs, it is possible to pre-define a static render pass object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to vkCmdBeginRendering, but use of subpass dependencies can confer important performance benefits on some devices.

### 8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by VkRenderPass handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkRenderPass)
```

An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.
A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.

Note

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.

Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the vkCmdBeginRenderPass and vkCmdEndRenderPass commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.
A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in VkFramebuffer objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

VK_ATTACHMENT_UNUSED is a constant indicating that a render pass attachment is not used.

```
#define VK_ATTACHMENT_UNUSED (~0U)
```

## 8.2. Render Pass Creation

To create a render pass, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device, 
    const VkRenderPassCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkRenderPass* pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a VkRenderPassCreateInfo structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a VkRenderPass handle in which the resulting render pass object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateRenderPass-device-parameter
  - device must be a valid VkDevice handle
- VUID-vkCreateRenderPass-pCreateInfo-parameter
  - pCreateInfo must be a valid pointer to a valid VkRenderPassCreateInfo structure
- VUID-vkCreateRenderPass-pAllocator-parameter
  - If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateRenderPass-pRenderPass-parameter
**pRenderPass** must be a valid pointer to a **VkRenderPass** handle

## Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkRenderPassCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **attachmentCount** is the number of attachments used by this render pass.
- **pAttachments** is a pointer to an array of **attachmentCount** **VkAttachmentDescription** structures describing the attachments used by the render pass.
- **subpassCount** is the number of subpasses to create.
- **pSubpasses** is a pointer to an array of **subpassCount** **VkSubpassDescription** structures describing each subpass.
- **dependencyCount** is the number of memory dependencies between pairs of subpasses.
- **pDependencies** is a pointer to an array of **dependencyCount** **VkSubpassDependency** structures describing dependencies between pairs of subpasses.

### Note
Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a
write, a subpass dependency needs to be included between them.

**Valid Usage**

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it **must** be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01566**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment **must** not specify a layout equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member **must** be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01927**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member **must** be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by its `subpass` member.

- **VUID-VkRenderPassCreateInfo-pNext-01963**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, for any element of the `pInputAttachments` member of any element of `pSubpasses` where the `attachment` member is not `VK_ATTACHMENT_UNUSED`, the `aspectMask` member of the corresponding element of `VkRenderPassInputAttachmentAspectCreateInfo` **must** only include aspects that are present in images of the format specified by the element of `pAttachments` at `attachment`.

- **VUID-VkRenderPassCreateInfo-pNext-01928**
If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and its `subpassCount` member is not zero, that member **must** be equal to the value of `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01929**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, if its `dependencyCount` member is not zero, it **must** be equal to `dependencyCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01930**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for each non-zero element of `pViewOffsets`, the `srcSubpass` and `dstSubpass` members of `pDependencies` at the same index **must** not be equal.

- **VUID-VkRenderPassCreateInfo-pNext-02512**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, for any element of `pDependencies` with a `dependencyFlags` member that does not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`, the corresponding element of the `pViewOffsets` member of that `VkRenderPassMultiviewCreateInfo` instance **must** be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02513**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, elements of its `pViewMasks` member **must** either all be 0, or all not be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02514**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, the `dependencyFlags` member of each element of `pDependencies` **must** not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

- **VUID-VkRenderPassCreateInfo-pNext-02515**
  If the `pNext` chain includes a `VkRenderPassMultiviewCreateInfo` structure, and each element of its `pViewMasks` member is 0, its `correlationMaskCount` member **must** be 0.

- **VUID-VkRenderPassCreateInfo-pDependencies-00837**
  For any element of `pDependencies`, if the `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `srcStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the source subpass.

- **VUID-VkRenderPassCreateInfo-pDependencies-00838**
  For any element of `pDependencies`, if the `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, all stage flags included in the `dstStageMask` member of that dependency **must** be a pipeline stage supported by the `pipeline` identified by the `pipelineBindPoint` member of the destination subpass.

- **VUID-VkRenderPassCreateInfo-pDependencies-06866**
  For any element of `pDependencies`, if its `srcSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pDependencies-06867**
  For any element of `pDependencies`, if its `dstSubpass` is not `VK_SUBPASS_EXTERNAL`, it **must** be less than `subpassCount`. 
Valid Usage (Implicit)

- **VUID-VkRenderPassCreateInfo-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO**

- **VUID-VkRenderPassCreateInfo-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either NULL or a pointer to a valid instance of **VkRenderPassInputAttachmentAspectCreateInfo** or **VkRenderPassMultiviewCreateInfo**

- **VUID-VkRenderPassCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkRenderPassCreateInfo-flags-zerobitmask**
  
  *flags* must be 0

- **VUID-VkRenderPassCreateInfo-pAttachments-parameter**
  
  If *attachmentCount* is not 0, *pAttachments* must be a valid pointer to an array of *attachmentCount* valid **VkAttachmentDescription** structures

- **VUID-VkRenderPassCreateInfo-pSubpasses-parameter**
  
  *pSubpasses* must be a valid pointer to an array of *subpassCount* valid **VkSubpassDescription** structures

- **VUID-VkRenderPassCreateInfo-pDependencies-parameter**
  
  If *dependencyCount* is not 0, *pDependencies* must be a valid pointer to an array of *dependencyCount* valid **VkSubpassDependency** structures

- **VUID-VkRenderPassCreateInfo-subpassCount-arraylength**
  
  *subpassCount* must be greater than 0

Bits which **can** be set in **VkRenderPassCreateInfo::flags**, describing additional properties of the render pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
} VkRenderPassCreateFlagBits;
```

**Note**

All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkRenderPassCreateFlags;
```

**VkRenderPassCreateFlags** is a bitmask type for setting a mask of zero or more **VkRenderPassCreateFlagBits**.

If the **VkRenderPassCreateInfo::pNext** chain includes a **VkRenderPassMultiviewCreateInfo** structure,
then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The `VkRenderPassMultiviewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
    const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subpassCount` is zero or the number of subpasses in the render pass.
- `pViewMasks` is a pointer to an array of `subpassCount` view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If `subpassCount` is zero, each view mask is treated as zero.
- `dependencyCount` is zero or the number of dependencies in the render pass.
- `pViewOffsets` is a pointer to an array of `dependencyCount` view offsets, one for each dependency. If `dependencyCount` is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- `correlationMaskCount` is zero or the number of correlation masks.
- `pCorrelationMasks` is a pointer to an array of `correlationMaskCount` view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, *multiview* functionality is considered to be enabled. Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the `ViewIndex` shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.
If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with geometry shaders or tessellation shaders.

When multiview is enabled, the `VK_DEPENDENCY_VIEW_LOCAL_BIT` bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + pViewOffsets[dependency] in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of pCorrelationMasks are a set of masks of views indicating that views in the same mask may exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks must not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time `vkCmdBeginRenderPass` or `vkCmdNextSubpass` is called the graphics pipeline must be bound, any relevant descriptor sets or vertex/index buffers must be bound, and any relevant dynamic state or push constants must be set before they are used.

Valid Usage

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index must not be set in more than one element of pCorrelationMasks

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
  If the multiview feature is not enabled, each element of pViewMasks must be 0

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
  The index of the most significant bit in each element of pViewMasks must be less than maxMultiviewViewCount

Valid Usage (Implicit)

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_MULTIVIEW_CREATE_INFO

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-parameter
  If subpassCount is not 0, pViewMasks must be a valid pointer to an array of subpassCount uint32_t values

- VUID-VkRenderPassMultiviewCreateInfo-pViewOffsets-parameter
  If dependencyCount is not 0, pViewOffsets must be a valid pointer to an array of dependencyCount int32_t values
The **VkAttachmentDescription** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription;
```

- **flags** is a bitmask of **VkAttachmentDescriptionFlagBits** specifying additional properties of the attachment.
- **format** is a **VkFormat** value specifying the format of the image view that will be used for the attachment.
- **samples** is a **VkSampleCountFlagBits** value specifying the number of samples of the image.
- **loadOp** is a **VkAttachmentLoadOp** value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- **storeOp** is a **VkAttachmentStoreOp** value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- **stencilLoadOp** is a **VkAttachmentLoadOp** value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- **stencilStoreOp** is a **VkAttachmentStoreOp** value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
- **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

If the attachment uses a color format, then **loadOp** and **storeOp** are used, and **stencilLoadOp** and **stencilStoreOp** are ignored. If the format has depth and/or stencil components, **loadOp** and **storeOp** apply only to the depth data, while **stencilLoadOp** and **stencilStoreOp** define how the stencil data is handled. **loadOp** and **stencilLoadOp** define the load operations for the attachment. **storeOp** and **stencilStoreOp** define the store operations for the attachment. If an attachment is not used by any subpass, **loadOp**, **storeOp**, **stencilStoreOp**, and **stencilLoadOp** will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by **initialLayout** and **finalLayout** will be performed.
**finalLayout** will still be executed.

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments **must** each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

**Note**

Render passes **must** include subpass dependencies (either directly or via a subpass dependency chain) between any two subpasses that operate on the same attachment or aliasing attachments and those subpass dependencies **must** include execution and memory dependencies separating uses of the aliases, if at least one of those subpasses writes to one of the aliases. These dependencies **must not** include the `VK_DEPENDENCY_BY_REGION_BIT` if the aliases are views of distinct image subresources which overlap in memory.

Multiple attachments that alias the same memory **must not** be used in a single subpass. A given attachment index **must not** be used multiple times in a single subpass, with one exception: two subpass attachments **can** use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view **can be used simultaneously as an input and color or depth/stencil attachment, but must not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.**

If a set of attachments alias each other, then all except the first to be used in the render pass **must** use an **initialLayout** of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias **must** not be used in any later subpasses. However, an application **can** assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

**Note**

Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there **should** be no additional cost of introducing additional aliases, and using these additional aliases **may** allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.  

379
Valid Usage

- **VUID-VkAttachmentDescription-format-06698**
  
  **format** must not be VK_FORMAT_UNDEFINED

- **VUID-VkAttachmentDescription-format-06699**
  
  If **format** includes a color or depth component and **loadOp** is VK_ATTACHMENT_LOAD_OP_LOAD, then **initialLayout** must not be VK_IMAGE_LAYOUT_UNDEFINED

- **VUID-VkAttachmentDescription-finalLayout-00843**
  
  **finalLayout** must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- **VUID-VkAttachmentDescription-format-03280**
  
  If **format** is a color format, **initialLayout** must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03281**
  
  If **format** is a depth/stencil format, **initialLayout** must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescription-format-03282**
  
  If **format** is a color format, **finalLayout** must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03283**
  
  If **format** is a depth/stencil format, **finalLayout** must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescription-format-06487**
  
  If **format** is a color format, **initialLayout** must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescription-format-06488**
  
  If **format** is a color format, **finalLayout** must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284**
  
  If the separateDepthStencilLayouts feature is not enabled, **initialLayout** must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285**
  
  If the separateDepthStencilLayouts feature is not enabled, **finalLayout** must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03286**
  
  If **format** is a color format, **initialLayout** must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03287**
  If format is a color format, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-06906**
  If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-06907**
  If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03290**
  If format is a depth/stencil format which includes only the depth component, initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03291**
  If format is a depth/stencil format which includes only the depth component, finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-synchronization2-06908**
  If the synchronization2 feature is not enabled, initialLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- **VUID-VkAttachmentDescription-synchronization2-06909**
  If the synchronization2 feature is not enabled, finalLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- **VUID-VkAttachmentDescription-samples-08745**
  samples must be a bit value that is set in imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

- **VUID-VkAttachmentDescription-format-06700**
  If format includes a stencil component and stencilLoadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

- **VUID-VkAttachmentDescription-format-03292**
  If format is a depth/stencil format which includes only the stencil component, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- **VUID-VkAttachmentDescription-format-03293**
  If format is a depth/stencil format which includes only the stencil component, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
• VUID-VkAttachmentDescription-format-06242
If format is a depth/stencil format which includes both depth and stencil components, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06243
If format is a depth/stencil format which includes both depth and stencil components, finalLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

Valid Usage (Implicit)

• VUID-VkAttachmentDescription-flags-parameter
flags must be a valid combination of VkAttachmentDescriptionFlagBits values

• VUID-VkAttachmentDescription-format-parameter
format must be a valid VkFormat value

• VUID-VkAttachmentDescription-samples-parameter
samples must be a valid VkSampleCountFlagBits value

• VUID-VkAttachmentDescription-loadOp-parameter
loadOp must be a valid VkAttachmentLoadOp value

• VUID-VkAttachmentDescription-storeOp-parameter
storeOp must be a valid VkAttachmentStoreOp value

• VUID-VkAttachmentDescription-stencilLoadOp-parameter
stencilLoadOp must be a valid VkAttachmentLoadOp value

• VUID-VkAttachmentDescription-stencilStoreOp-parameter
stencilStoreOp must be a valid VkAttachmentStoreOp value

• VUID-VkAttachmentDescription-initialLayout-parameter
initialLayout must be a valid VkImageLayout value

• VUID-VkAttachmentDescription-finalLayout-parameter
finalLayout must be a valid VkImageLayout value

Bits which can be set in VkAttachmentDescription::flags, describing additional properties of the attachment, are:

// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;

• VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT specifies that the attachment aliases the same device memory as other attachments.
`typedef VkFlags VkAttachmentDescriptionFlags;`

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s) can be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

**Valid Usage (Implicit)**

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter `pAspectReferences` must be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures
The **VkInputAttachmentAspectReference** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- **subpass** is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- **inputAttachmentIndex** is an index into the `pInputAttachments` of the specified subpass.
- **aspectMask** is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```

### Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
  aspectMask must not include `VK_IMAGE_ASPECT_METADATA_BIT`

### Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  aspectMask must be a valid combination of `VkImageAspectFlagBits` values
- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
  aspectMask must not be 0

The **VkSubpassDescription** structure is defined as:
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    const uint32_t* pPreserveAttachments;
    uint32_t preserveAttachmentCount;
} VkSubpassDescription;

- **flags** is a bitmask of **VkSubpassDescriptionFlagBits** specifying usage of the subpass.
- **pipelineBindPoint** is a **VkPipelineBindPoint** value specifying the pipeline type supported for this subpass.
- **inputAttachmentCount** is the number of input attachments.
- **pInputAttachments** is a pointer to an array of **VkAttachmentReference** structures defining the input attachments for this subpass and their layouts.
- **colorAttachmentCount** is the number of color attachments.
- **pColorAttachments** is a pointer to an array of **colorAttachmentCount** **VkAttachmentReference** structures defining the color attachments for this subpass and their layouts.
- **pResolveAttachments** is **NULL** or a pointer to an array of **colorAttachmentCount** **VkAttachmentReference** structures defining the resolve attachments for this subpass and their layouts.
- **pDepthStencilAttachment** is a pointer to a **VkAttachmentReference** structure specifying the depth/stencil attachment for this subpass and its layout.
- **preserveAttachmentCount** is the number of preserved attachments.
- **pPreserveAttachments** is a pointer to an array of **preserveAttachmentCount** render pass attachment indices identifying attachments that are not used by this subpass, but whose contents **must** be preserved throughout the subpass.

Each element of the **pInputAttachments** array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a **InputAttachmentIndex** value of X, then it uses the attachment provided in **pInputAttachments[X]**. Input attachments **must** also be bound to the pipeline in a descriptor set. If the **attachment** member of any element of **pInputAttachments** is **VK_ATTACHMENT_UNUSED**, the application **must** not read from the corresponding input attachment index. Fragment shaders **can** use subpass input variables to access the contents of an input attachment at the fragment’s (x, y, layer) framebuffer coordinates.

Each element of the **pColorAttachments** array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a **Location** value of X, then it uses the attachment provided in **pColorAttachments[X]**. If the **attachment** member of any element of **pColorAttachments** corresponds to an attachment index that is not in use by the subpass, the application **must** not write to it.
If \( p_{\text{ResolveAttachments}} \) is not NULL, each of its elements corresponds to a color attachment (the element in \( p_{\text{ColorAttachments}} \) at the same index), and a multisample resolve operation is defined for each attachment unless the resolve attachment index is VK_ATTACHMENT_UNUSED.

Similarly, if \( \text{VkSubpassDescriptionDepthStencilResolve}::p_{\text{DepthStencilResolveAttachment}} \) is not NULL and does not have the value VK_ATTACHMENT_UNUSED, it corresponds to the depth/stencil attachment in \( p_{\text{DepthStencilAttachment}} \), and multisample resolve operation for depth and stencil are defined by \( \text{VkSubpassDescriptionDepthStencilResolve}::\text{depthResolveMode} \) and \( \text{VkSubpassDescriptionDepthStencilResolve}::\text{stencilResolveMode} \), respectively. If \( \text{VkSubpassDescriptionDepthStencilResolve}::\text{depthResolveMode} \) is VK_RESOLVE_MODE_NONE or the \( p_{\text{DepthStencilResolveAttachment}} \) does not have a depth aspect, no resolve operation is performed for the depth attachment. If \( \text{VkSubpassDescriptionDepthStencilResolve}::\text{stencilResolveMode} \) is VK_RESOLVE_MODE_NONE or the \( p_{\text{DepthStencilResolveAttachment}} \) does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If \( p_{\text{DepthStencilAttachment}} \) is NULL, or if its attachment index is VK_ATTACHMENT_UNUSED, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass \( S \) if all of the following conditions are true:

- The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.
- There is a subpass \( S_1 \) that uses or preserves the attachment, and a subpass dependency from \( S_1 \) to \( S \).
- The attachment is not used or preserved in subpass \( S \).

Once the contents of an attachment become undefined in subpass \( S \), they remain undefined for subpasses in subpass dependency chains starting with subpass \( S \) until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass \( S_1 \) if those subpasses use or preserve the attachment.

### Valid Usage

- **VUID-VkSubpassDescription-attachment-06912**
  If the **attachment** member of an element of \( p_{\text{InputAttachments}} \) is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL.

- **VUID-VkSubpassDescription-attachment-06913**
  If the **attachment** member of an element of \( p_{\text{ColorAttachments}} \) is not VK_ATTACHMENT_UNUSED, its **layout** member **must** not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL.

- **VUID-VkSubpassDescription-attachment-06914**
  If the **attachment** member of an element of \( p_{\text{ResolveAttachments}} \) is not
VK_ATTACHMENT_UNUSED, its layout member must not be
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription-attachment-06917
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or
  VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkSubpassDescription-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be
  VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkSubpassDescription-pipelineBindPoint-00844
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS
• VUID-VkSubpassDescription-colorAttachmentCount-00845
colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

• VUID-VkSubpassDescription-loadOp-00846
If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

• VUID-VkSubpassDescription-pResolveAttachments-00847
If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescription-pResolveAttachments-00848
If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescription-pResolveAttachments-00849
If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescription-pResolveAttachments-00850
If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have the same VkFormat as its corresponding color attachment

• VUID-VkSubpassDescription-pColorAttachments-06868
If neither the VK_AMD_mixed_attachment_samples extension nor the VK_NV_framebuffer_mixed_samples extension is enabled, all attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

• VUID-VkSubpassDescription-pInputAttachments-02647
All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pColorAttachments-02648
All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pResolveAttachments-02649
All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pDepthStencilAttachment-02650
If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription-pDepthStencilAttachment-01418
If neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, and if `pDepthStencilAttachment` is not `VK_ATTACHMENT_UNUSED` and any attachments in `pColorAttachments` are not `VK_ATTACHMENT_UNUSED`, they must have the same sample count

- **VUID-VkSubpassDescription-attachment-00853**
  Each element of `pPreserveAttachments` must not be `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescription-pPreserveAttachments-00854**
  Each element of `pPreserveAttachments` must not also be an element of any other member of the subpass description

- **VUID-VkSubpassDescription-layout-02519**
  If any attachment is used by more than one `VkAttachmentReference` member, then each use must use the same layout

- **VUID-VkSubpassDescription-pDepthStencilAttachment-04438**
  `pDepthStencilAttachment` and `pColorAttachments` must not contain references to the same attachment

---

### Valid Usage (Implicit)

- **VUID-VkSubpassDescription-flags-zero bitmask**
  `flags` must be 0

- **VUID-VkSubpassDescription-pipelineBindPoint-parameter**
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- **VUID-VkSubpassDescription-pInputAttachments-parameter**
  If `inputAttachmentCount` is not 0, `pInputAttachments` must be a valid pointer to an array of `inputAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pColorAttachments-parameter**
  If `colorAttachmentCount` is not 0, `pColorAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pResolveAttachments-parameter**
  If `colorAttachmentCount` is not 0, and `pResolveAttachments` is not NULL, `pResolveAttachments` must be a valid pointer to an array of `colorAttachmentCount` valid `VkAttachmentReference` structures

- **VUID-VkSubpassDescription-pDepthStencilAttachment-parameter**
  If `pDepthStencilAttachment` is not NULL, `pDepthStencilAttachment` must be a valid pointer to a valid `VkAttachmentReference` structure

- **VUID-VkSubpassDescription-pPreserveAttachments-parameter**
  If `preserveAttachmentCount` is not 0, `pPreserveAttachments` must be a valid pointer to an array of `preserveAttachmentCount` uint32_t values

---

Bits which can be set in `VkSubpassDescription::flags`, specifying usage of the subpass, are:

```cpp
// Provided by VK_VERSION_1_0
```
typedef enum VkSubpassDescriptionFlagBits {
    } VkSubpassDescriptionFlagBits;

Note
All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;

VkSubpassDescriptionFlags is a bitmask type for setting a mask of zero or more VkSubpassDescriptionFlagBits.

The VkAttachmentReference structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
    uint32_t attachment;
    VkImageLayout layout;
} VkAttachmentReference;

• attachment is either an integer value identifying an attachment at the corresponding index in VkRenderPassCreateInfo::pAttachments, or VK_ATTACHMENT_UNUSED to signify that this attachment is not used.
• layout is a VkImageLayout value specifying the layout the attachment uses during the subpass.

Valid Usage

• VUID-VkAttachmentReference-layout-03077
  If attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED, or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

• VUID-VkAttachmentReference-separateDepthStencilLayouts-03313
  If the separateDepthStencilLayouts feature is not enabled, and attachment is not VK_ATTACHMENT_UNUSED, layout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• VUID-VkAttachmentReference-synchronization2-06910
  If the synchronization2 feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

Valid Usage (Implicit)

• VUID-VkAttachmentReference-layout-parameter
**layout must** be a valid `VkImageLayout` value

`VK_SUBPASS_EXTERNAL` is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by `VkSubpassDependency`.

```c
#define VK_SUBPASS_EXTERNAL               (~0U)
```

The `VkSubpassDependency` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;
```

- **srcSubpass** is the subpass index of the first subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **dstSubpass** is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.
- **srcStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- **dependencyFlags** is a bitmask of `VkDependencyFlagBits`.

If **srcSubpass** is equal to **dstSubpass** then the `VkSubpassDependency` does not directly define a dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier **must** be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include framebuffer-space stages in the **srcStageMask** **must** only include framebuffer-space stages in **dstStageMask**, and **must** include `VK_DEPENDENCY_BY_REGION_BIT`. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its **dependencyFlags** **must** include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

If **srcSubpass** and **dstSubpass** are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a dependency between the subpasses identified by **srcSubpass** and **dstSubpass**.

If **srcSubpass** is equal to `VK_SUBPASS_EXTERNAL`, the first synchronization scope includes commands that occur earlier in submission order than the `vkCmdBeginRenderPass` used to begin the render.
pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by `srcSubpass` and any `load`, `store`, or `multisample resolve` operations on attachments used in `srcSubpass`. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the `source stage mask` specified by `srcStageMask`.

If `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, the second synchronization scope includes commands that occur later in `submission order` than the `vkCmdEndRenderPass` used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by `dstSubpass` and any `load`, `store`, and `multisample resolve` operations on attachments used in `dstSubpass`. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`.

The first access scope is limited to accesses in the pipeline stages determined by the `source stage mask` specified by `srcStageMask`. It is also limited to access types in the `source access mask` specified by `srcAccessMask`.

The second access scope is limited to accesses in the pipeline stages determined by the `destination stage mask` specified by `dstStageMask`. It is also limited to access types in the `destination access mask` specified by `dstAccessMask`.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

**Note**

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

### Valid Usage

- **VUID-VkSubpassDependency-srcStageMask-04090**
  If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-VkSubpassDependency-srcStageMask-04091**
If the `tessellationShader` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-VkSubpassDependency-srcStageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-VkSubpassDependency-srcStageMask-03937
  If the `synchronization2` feature is not enabled, `srcStageMask` must not be 0.

- VUID-VkSubpassDependency-srcStageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- VUID-VkSubpassDependency-dstStageMask-04090
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- VUID-VkSubpassDependency-dstStageMask-04091
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- VUID-VkSubpassDependency-dstStageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-VkSubpassDependency-dstStageMask-03937
  If the `synchronization2` feature is not enabled, `dstStageMask` must not be 0.

- VUID-VkSubpassDependency-dstStageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- VUID-VkSubpassDependency-srcSubpass-00864
  `srcSubpass` must be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order.

- VUID-VkSubpassDependency-srcSubpass-00865
  `srcSubpass` and `dstSubpass` must not both be equal to `VK_SUBPASS_EXTERNAL`.

- VUID-VkSubpassDependency-srcSubpass-06809
  If `srcSubpass` is equal to `dstSubpass` and `srcStageMask` includes a framebuffer-space stage, `dstStageMask` must only contain framebuffer-space stages.

- VUID-VkSubpassDependency-srcAccessMask-00868
  Any access flag included in `srcAccessMask` must be supported by one of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

- VUID-VkSubpassDependency-dstAccessMask-00869
  Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

- VUID-VkSubpassDependency-srcSubpass-02243
  If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a
framebuffer-space stage, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT

- VUID-VkSubpassDependency-dependencyFlags-02520
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to VK_SUBPASS_EXTERNAL

- VUID-VkSubpassDependency-dependencyFlags-02521
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to VK_SUBPASS_EXTERNAL

- VUID-VkSubpassDependency-srcSubpass-00872
  If srcSubpass equals dstSubpass and that subpass has more than one bit set in the view mask, then dependencyFlags must include VK_DEPENDENCY_VIEW_LOCAL_BIT

Valid Usage (Implicit)

- VUID-VkSubpassDependency-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- VUID-VkSubpassDependency-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkSubpassDependency-dependencyFlags-parameter
  dependencyFlags must be a valid combination of VkDependencyFlagBits values

When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using VK_ATTACHMENT_LOAD_OP_CLEAR will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

Note
A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of \( N \times M \) dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if
each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If there is no subpass dependency from *VK_SUBPASS_EXTERNAL* to the first subpass that uses an attachment, then an implicit subpass dependency exists from *VK_SUBPASS_EXTERNAL* to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from *initialLayout*. The subpass dependency operates as if defined with the following parameters:

```c
VkSubpassDependency implicitDependency = {
    .srcSubpass = VK_SUBPASS_EXTERNAL,
    .dstSubpass = firstSubpass, // First subpass attachment is used in
    .srcStageMask = VK_PIPELINE_STAGE_NONE,
    .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .srcAccessMask = 0,
    .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                     VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dependencyFlags = 0
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to *VK_SUBPASS_EXTERNAL*, then an implicit subpass dependency exists from the last subpass it is used in to *VK_SUBPASS_EXTERNAL*. The implicit subpass dependency only exists if there exists an automatic layout transition into *finalLayout*. The subpass dependency operates as if defined with the following parameters:

```c
VkSubpassDependency implicitDependency = {
    .srcSubpass = lastSubpass, // Last subpass attachment is used in
    .dstSubpass = VK_SUBPASS_EXTERNAL,
    .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
    .dstStageMask = VK_PIPELINE_STAGE_NONE,
    .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                     VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
    .dstAccessMask = 0,
    .dependencyFlags = 0
};
```

As subpasses *may* overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses *cannot* be known to an application. Instead, an application provides the layout that each attachment *must* be in at the start and end of a render pass, and the layout it *must* be in during each subpass it is
used in. The implementation then must execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.

Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the srcSubpass.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the dstSubpass.

Automatic layout transitions away from initialLayout happen-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from initialLayout happen-after the availability operations for all dependencies with a srcSubpass equal to VK_SUBPASS_EXTERNAL, where dstSubpass uses any aliased attachment.

Automatic layout transitions into finalLayout happen-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions into finalLayout happen-before the visibility operations for all dependencies with a dstSubpass equal to VK_SUBPASS_EXTERNAL, where srcSubpass uses any aliased attachment.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only layout, no subpass dependency needs to be specified between those subpasses. If an implementation treats those layouts separately, it must insert an implicit subpass dependency between those subpasses to separate the uses in each layout. The subpass dependency operates as if defined with the following parameters:

```c
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages =
  VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT |
  VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess =
```

396
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};

A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice device, 
    const VkRenderPassCreateInfo2* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkRenderPass* pRenderPass);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
VkResult vkCreateRenderPass2KHR(
    VkDevice device, 
    const VkRenderPassCreateInfo2* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkRenderPass* pRenderPass);
```

- **device** is the logical device that creates the render pass.
- **pCreateInfo** is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pRenderPass** is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage (Implicit)**

- VUID-vkCreateRenderPass2-device-parameter
  
  `device` must be a valid `VkDevice` handle
• VUID-vkCreateRenderPass2-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkRenderPassCreateInfo structure

• VUID-vkCreateRenderPass2-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateRenderPass2-pRenderPass-parameter
  pRenderPass must be a valid pointer to a VkRenderPass handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkRenderPassCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• attachmentCount is the number of attachments used by this render pass.
• **pAttachments** is a pointer to an array of **attachmentCount** **VkAttachmentDescription2** structures describing the attachments used by the render pass.

• **subpassCount** is the number of subpasses to create.

• **pSubpasses** is a pointer to an array of **subpassCount** **VkSubpassDescription2** structures describing each subpass.

• **dependencyCount** is the number of dependencies between pairs of subpasses.

• **pDependencies** is a pointer to an array of **dependencyCount** **VkSubpassDependency2** structures describing dependencies between pairs of subpasses.

• **correlatedViewMaskCount** is the number of correlation masks.

• **pCorrelatedViewMasks** is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in **VkRenderPassCreateInfo** have the identical effect to those parameters; the child structures are variants of those used in **VkRenderPassCreateInfo** which add **sType** and **pNext** parameters, allowing them to be extended.

If the **VkSubpassDescription2::viewMask** member of any element of **pSubpasses** is not zero, **multiview** functionality is considered to be enabled for this render pass.

**correlatedViewMaskCount** and **pCorrelatedViewMasks** have the same effect as **VkRenderPassMultiviewCreateInfo::correlationMaskCount** and **VkRenderPassMultiviewCreateInfo::pCorrelationMasks**, respectively.

---

**Valid Usage**

• **VUID-VkRenderPassCreateInfo2-None-03049**
  If any two subpasses operate on attachments with overlapping ranges of the same **VkDeviceMemory** object, and at least one subpass writes to that area of **VkDeviceMemory**, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

• **VUID-VkRenderPassCreateInfo2-attachment-03050**
  If the **attachment** member of any element of **pInputAttachments**, **pColorAttachments**, **pResolveAttachments** or **pDepthStencilAttachment**, or the attachment indexed by any element of **pPreserveAttachments** in any element of **pSubpasses** is bound to a range of a **VkDeviceMemory** object that overlaps with any other attachment in any subpass (including the same subpass), the **VkAttachmentDescription2** structures describing them **must** include **VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT** in **flags**.

• **VUID-VkRenderPassCreateInfo2-attachment-03051**
  If the **attachment** member of any element of **pInputAttachments**, **pColorAttachments**, **pResolveAttachments** or **pDepthStencilAttachment**, or any element of **pPreserveAttachments** in any element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED**, then it **must** be less than **attachmentCount**.

• **VUID-VkRenderPassCreateInfo2-pSubpasses-06473**
  If the **pSubpasses** **pNext** chain includes a **VkSubpassDescriptionDepthStencilResolve** structure and the **pDepthStencilResolveAttachment** member is not **NULL** and does not have
the value \texttt{VK\_ATTACHMENT\_UNUSED}, then \texttt{attachment} must be less than \texttt{attachmentCount}.

- \textbf{VUID-VkRenderPassCreateInfo2-pAttachments-02522} 
  For any member of \texttt{pAttachments} with a \texttt{loadOp} equal to \texttt{VK\_ATTACHMENT\_LOAD\_OP\_CLEAR}, the first use of that attachment must not specify a \texttt{layout} equal to \texttt{VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL}, \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_READ\_ONLY\_OPTIMAL}, or \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_STENCIL\_ATTACHMENT\_OPTIMAL}.

- \textbf{VUID-VkRenderPassCreateInfo2-pAttachments-02523} 
  For any member of \texttt{pAttachments} with a \texttt{stencilLoadOp} equal to \texttt{VK\_ATTACHMENT\_LOAD\_OP\_CLEAR}, the first use of that attachment must not specify a \texttt{layout} equal to \texttt{VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL}, \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_READ\_ONLY\_OPTIMAL}, or \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_STENCIL\_READ\_ONLY\_OPTIMAL}.

- \textbf{VUID-VkRenderPassCreateInfo2-p Dependencies-03054} 
  For any element of \texttt{pDependencies}, if the \texttt{srcSubpass} is not \texttt{VK\_SUBPASS\_EXTERNAL}, all stage flags included in the \texttt{srcStageMask} member of that dependency must be a pipeline stage supported by the pipeline identified by the \texttt{pipelineBindPoint} member of the source subpass.

- \textbf{VUID-VkRenderPassCreateInfo2-p Dependencies-03055} 
  For any element of \texttt{pDependencies}, if the \texttt{dstSubpass} is not \texttt{VK\_SUBPASS\_EXTERNAL}, all stage flags included in the \texttt{dstStageMask} member of that dependency must be a pipeline stage supported by the pipeline identified by the \texttt{pipelineBindPoint} member of the destination subpass.

- \textbf{VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056} 
  The set of bits included in any element of \texttt{pCorrelatedViewMasks} must not overlap with the set of bits included in any other element of \texttt{pCorrelatedViewMasks}.

- \textbf{VUID-VkRenderPassCreateInfo2-viewMask-03057} 
  If the \texttt{VkSubpassDescription2::viewMask} member of all elements of \texttt{pSubpasses} is \texttt{0}, \texttt{correlatedViewMaskCount} must be \texttt{0}.

- \textbf{VUID-VkRenderPassCreateInfo2-viewMask-03058} 
  The \texttt{VkSubpassDescription2::viewMask} member of all elements of \texttt{pSubpasses} must either all be \texttt{0}, or all not be \texttt{0}.

- \textbf{VUID-VkRenderPassCreateInfo2-viewMask-03059} 
  If the \texttt{VkSubpassDescription2::viewMask} member of all elements of \texttt{pSubpasses} is \texttt{0}, the \texttt{dependencyFlags} member of any element of \texttt{pDependencies} must not include \texttt{VK\_DEPENDENCY\_VIEW\_LOCAL\_BIT}.

- \textbf{VUID-VkRenderPassCreateInfo2-pDependencies-03060} 
  For any element of \texttt{pDependencies} where its \texttt{srcSubpass} member equals its \texttt{dstSubpass} member, if the \texttt{viewMask} member of the corresponding element of \texttt{pSubpasses} includes more than one bit, its \texttt{dependencyFlags} member must include \texttt{VK\_DEPENDENCY\_VIEW\_LOCAL\_BIT}.

- \textbf{VUID-VkRenderPassCreateInfo2-attachment-02525} 
  If the \texttt{attachment} member of any element of the \texttt{pInputAttachments} member of any element of \texttt{pSubpasses} is not \texttt{VK\_ATTACHMENT\_UNUSED}, the \texttt{aspectMask} member of that element of
**pInputAttachments must** only include aspects that are present in images of the format specified by the element of **pAttachments** specified by **attachment**

- **VUID-VkRenderPassCreateInfo2-srcSubpass-02526**
  The **srcSubpass** member of each element of **pDependencies** must be less than **subpassCount**

- **VUID-VkRenderPassCreateInfo2-dstSubpass-02527**
  The **dstSubpass** member of each element of **pDependencies** must be less than **subpassCount**

- **VUID-VkRenderPassCreateInfo2-pAttachments-04585**
  If any element of **pAttachments** is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass

- **VUID-VkRenderPassCreateInfo2-pAttachments-04586**
  If any element of **pAttachments** is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain **VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkRenderPassCreateInfo2-pAttachments-06244**
  If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED**, the **layout** member of that same structure is either **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, and the **pNext** chain of that structure does not include a **VkAttachmentReferenceStencilLayout** structure, then the element of **pAttachments** with an index equal to **attachment** must not have a format that includes both depth and stencil components

- **VUID-VkRenderPassCreateInfo2-attachment-06245**
  If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED** and the **layout** member of that same structure is either **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**, then the element of **pAttachments** with an index equal to **attachment** must have a format that includes only a stencil component

- **VUID-VkRenderPassCreateInfo2-attachment-06246**
  If the **attachment** member of the **pDepthStencilAttachment** member of an element of **pSubpasses** is not **VK_ATTACHMENT_UNUSED** and the **layout** member of that same structure is either **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** or **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, then the element of **pAttachments** with an index equal to **attachment** must not have a format that includes only a stencil component

---

**Valid Usage (Implicit)**

- **VUID-VkRenderPassCreateInfo2-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2**

- **VUID-VkRenderPassCreateInfo2-pNext-pNext**
  **pNext** must be **NULL**

- **VUID-VkRenderPassCreateInfo2-flags-zerobitmask**
  **flags** must be **0**

- **VUID-VkRenderPassCreateInfo2-pAttachments-parameter**
If `attachmentCount` is not 0, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkAttachmentDescription2` structures

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
  
  `pSubpasses` must be a valid pointer to an array of `subpassCount` valid `VkSubpassDescription2` structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter
  
  If `dependencyCount` is not 0, `pDependencies` must be a valid pointer to an array of `dependencyCount` valid `VkSubpassDependency2` structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
  
  If `correlatedViewMaskCount` is not 0, `pCorrelatedViewMasks` must be a valid pointer to an array of `correlatedViewMaskCount` `uint32_t` values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
  
  `subpassCount` must be greater than 0

The `VkAttachmentDescription2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentDescription2 VkAttachmentDescription2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
• loadOp is a VkAttachmentLoadOp value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.

• storeOp is a VkAttachmentStoreOp value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.

• stencilLoadOp is a VkAttachmentLoadOp value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.

• stencilStoreOp is a VkAttachmentStoreOp value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.

• initialLayout is the layout the attachment image subresource will be in when a render pass instance begins.

• finalLayout is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in VkAttachmentDescription have the identical effect to those parameters.

If the separateDepthStencilLayouts feature is enabled, and format is a depth/stencil format, initialLayout and finalLayout can be set to a layout that only specifies the layout of the depth aspect.

If the pNext chain includes a VkAttachmentDescriptionStencilLayout structure, then the stencilInitialLayout and stencilFinalLayout members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and initialLayout and finalLayout only apply to the depth aspect. For depth-only formats, the VkAttachmentDescriptionStencilLayout structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the VkAttachmentDescriptionStencilLayout structure if present, or initialLayout and finalLayout if not present.

If format is a depth/stencil format, and either initialLayout or finalLayout does not specify a layout for the stencil aspect, then the application must specify the initial and final layouts of the stencil aspect by including a VkAttachmentDescriptionStencilLayout structure in the pNext chain.

Valid Usage

• VUID-VkAttachmentDescription2-format-06698
  format must not be VK_FORMAT_UNDEFINED

• VUID-VkAttachmentDescription2-format-06699
  If format includes a color or depth component and loadOp is VK_ATTACHMENT_LOAD_OP_LOAD, then initialLayout must not be VK_IMAGE_LAYOUT_UNDEFINED

• VUID-VkAttachmentDescription2-finalLayout-00843
  finalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

• VUID-VkAttachmentDescription2-format-03280
  If format is a color format, initialLayout must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
• VUID-VkAttachmentDescription2-format-03281
If format is a depth/stencil format, initialLayout must not be
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-03282
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL
or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03283
If format is a depth/stencil format, finalLayout must not be
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-06487
If format is a color format, initialLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-format-06488
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
or
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284
If the separateDepthStencilLayouts feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285
If the separateDepthStencilLayouts feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

• VUID-VkAttachmentDescription2-format-03286
If format is a color format, initialLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03287
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06906
If format is a depth/stencil format which includes both depth and stencil components,
initialLayout must not be
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL
or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06907
If format is a depth/stencil format which includes both depth and stencil components,
**finalLayout** must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-03290
  If `format` is a depth/stencil format which includes only the depth component, `initialLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-03291
  If `format` is a depth/stencil format which includes only the depth component, `finalLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-synchronization2-06908
  If the `synchronization2` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription2-synchronization2-06909
  If the `synchronization2` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

- VUID-VkAttachmentDescription2-samples-08745
  `samples` must be a bit value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits) for the given `format`

- VUID-VkAttachmentDescription2-pNext-06704
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription2-pNext-06705
  If the `pNext` chain does include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- VUID-VkAttachmentDescription2-format-06249
  If `format` is a depth/stencil format which includes both depth and stencil components, and `initialLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain must include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06250
  If `format` is a depth/stencil format which includes both depth and stencil components, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain must include a `VkAttachmentDescriptionStencilLayout` structure

- VUID-VkAttachmentDescription2-format-06247
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`

- VUID-VkAttachmentDescription2-format-06248
If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `finalLayout must` not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

Valid Usage (Implicit)

- VUID-VkAttachmentDescription2-sType-sType
  sType must be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2`

- VUID-VkAttachmentDescription2-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkAttachmentDescriptionStencilLayout`

- VUID-VkAttachmentDescription2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkAttachmentDescription2-flags-parameter
  `flags` must be a valid combination of `VkAttachmentDescriptionFlagBits` values

- VUID-VkAttachmentDescription2-format-parameter
  `format` must be a valid `VkFormat` value

- VUID-VkAttachmentDescription2-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value

- VUID-VkAttachmentDescription2-loadOp-parameter
  `loadOp` must be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription2-storeOp-parameter
  `storeOp` must be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription2-stencilLoadOp-parameter
  `stencilLoadOp` must be a valid `VkAttachmentLoadOp` value

- VUID-VkAttachmentDescription2-stencilStoreOp-parameter
  `stencilStoreOp` must be a valid `VkAttachmentStoreOp` value

- VUID-VkAttachmentDescription2-initialLayout-parameter
  `initialLayout` must be a valid `VkImageLayout` value

- VUID-VkAttachmentDescription2-finalLayout-parameter
  `finalLayout` must be a valid `VkImageLayout` value

The `VkAttachmentDescriptionStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType   sType;
    void*             pNext;
    VkImageLayout     stencilInitialLayout;
    VkImageLayout     stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```
or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.

### Valid Usage

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-03308**
  
  stencilInitialLayout must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`,
  or
  `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309**
  
  stencilFinalLayout must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`,
  `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`,
  or
  `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310**
  
  stencilFinalLayout must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

### Valid Usage (Implicit)

- **VUID-VkAttachmentDescriptionStencilLayout-sType-sType**
  
  sType must be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_STENCIL_LAYOUT`

- **VUID-VkAttachmentDescriptionStencilLayout-stencilInitialLayout-parameter**
  
  stencilInitialLayout must be a valid `VkImageLayout` value

- **VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-parameter**
  
  stencilFinalLayout must be a valid `VkImageLayout` value

The `VkSubpassDescription2` structure is defined as:
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputMask;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    const uint32_t* pPreserveAttachments;
    uint32_t preserveAttachmentCount;
} VkSubpassDescription2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;

• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is a bitmask of [VkSubpassDescriptionFlagBits](#) specifying usage of the subpass.
• **pipelineBindPoint** is a [VkPipelineBindPoint](#) value specifying the pipeline type supported for this subpass.
• **viewMask** is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
• **inputAttachmentCount** is the number of input attachments.
• **pInputAttachments** is a pointer to an array of [VkAttachmentReference2](#) structures defining the input attachments for this subpass and their layouts.
• **colorAttachmentCount** is the number of color attachments.
• **pColorAttachments** is a pointer to an array of colorAttachmentCount [VkAttachmentReference2](#) structures defining the color attachments for this subpass and their layouts.
• **pResolveAttachments** is **NULL** or a pointer to an array of colorAttachmentCount [VkAttachmentReference2](#) structures defining the resolve attachments for this subpass and their layouts.
• **pDepthStencilAttachment** is a pointer to a [VkAttachmentReference2](#) structure specifying the depth/stencil attachment for this subpass and its layout.
• **preserveAttachmentCount** is the number of preserved attachments.
• **pPreserveAttachments** is a pointer to an array of preserveAttachmentCount render pass attachment
indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in VkSubpassDescription have the identical effect to those parameters.

viewMask has the same effect for the described subpass as VkRenderPassMultiviewCreateInfo::pViewMasks has on each corresponding subpass.

If a VkFragmentShadingRateAttachmentInfoKHR structure is included in the pNext chain, pFragmentShadingRateAttachment is not NULL, and its attachment member is not VK_ATTACHMENT_UNUSED, the identified attachment defines a fragment shading rate attachment for that subpass.

### Valid Usage

- **VUID-VkSubpassDescription2-attachment-06912**
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06913**
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06914**
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06915**
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06916**
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06917**
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- **VUID-VkSubpassDescription2-attachment-06918**
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL
If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR.

If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentReferenceStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

PipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS.

colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR.

If pResolveAttachments is not NULL, for each resolve attachment that does not have the value VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have the value VK_ATTACHMENT_UNUSED.

If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT.
If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT.

Each element of pResolveAttachments must have the same VkFormat as its corresponding color attachment.

All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

If none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, all attachments in pDepthStencilAttachment or pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count.

Each element of pPreserveAttachments must not be VK_ATTACHMENT_UNUSED.

Each element of pPreserveAttachments must not also be an element of any other member of the subpass description.

If any attachment is used by more than one VkAttachmentReference2 member, then each use must use the same layout.

If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must be a valid combination of VkImageAspectFlagBits.

If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must not be 0.

If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED,
then the aspectMask member must not include VK_IMAGE_ASPECT_METADATA_BIT
• VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
  An attachment must not be used in both pDepthStencilAttachment and pColorAttachments
• VUID-VkSubpassDescription2-multiview-06558
  If the multiview feature is not enabled, viewMask must be 0
• VUID-VkSubpassDescription2-viewMask-06706
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount

Valid Usage (Implicit)
• VUID-VkSubpassDescription2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2
• VUID-VkSubpassDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR or VkSubpassDescriptionDepthStencilResolve
• VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique
• VUID-VkSubpassDescription2-flags-zerobitmask
  flags must be 0
• VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value
• VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures
• VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures
• VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures
• VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure
• VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

The VkSubpassDescriptionDepthStencilResolve structure is defined as:
### Definition

```c
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkSubpassDescriptionDepthStencilResolve
    VkSubpassDescriptionDepthStencilResolveKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthResolveMode** is a `VkResolveModeFlagBits` value describing the depth resolve mode.
- **stencilResolveMode** is a `VkResolveModeFlagBits` value describing the stencil resolve mode.
- **pDepthStencilResolveAttachment** is NULL or a pointer to a `VkAttachmentReference2` structure defining the depth/stencil resolve attachment for this subpass and its layout.

If the **pNext** chain of `VkSubpassDescription2` includes a `VkSubpassDescriptionDepthStencilResolve` structure, then that structure describes multisample resolve operations for the depth/stencil attachment in a subpass. If this structure is not included in the **pNext** chain of `VkSubpassDescription2`, or if it is and either **pDepthStencilResolveAttachment** is NULL or its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil resolve attachment will be used in the subpass.

### Valid Usage

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilAttachment** must not be NULL or have the value `VK_ATTACHMENT_UNUSED`

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilAttachment** must not have a sample count of `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180**
  If **pDepthStencilResolveAttachment** is not NULL and does not have the value `VK_ATTACHMENT_UNUSED`, **pDepthStencilResolveAttachment** must have a sample count of `VK_SAMPLE_COUNT_1_BIT`
If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` then it must have an image format whose potential format features contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the `VkFormat` of `pDepthStencilAttachment` must have a depth component with the same number of bits and numeric format.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, and `VkFormat` of `pDepthStencilResolveAttachment` has a stencil component, then the `VkFormat` of `pDepthStencilAttachment` must have a stencil component with the same number of bits and numeric format.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must not both be `VK_RESOLVE_MODE_NONE`.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED` and the `VkFormat` of `pDepthStencilResolveAttachment` has a depth component, then the value of `depthResolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes` or `VK_RESOLVE_MODE_NONE`.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, the `VkFormat` of `pDepthStencilResolveAttachment` has both depth and stencil components, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_TRUE`, then the values of `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`.

If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`. If `pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, `depthResolveMode` and `stencilResolveMode` must be identical or one of them must be `VK_RESOLVE_MODE_NONE`.
Valid Usage (Implicit)

- **VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE`

- **VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter**
  
  If `pDepthStencilResolveAttachment` is not NULL, `pDepthStencilResolveAttachment` must be a valid pointer to a valid `VkAttachmentReference2` structure.

The `VkFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pFragmentShadingRateAttachment** is NULL or a pointer to a `VkAttachmentReference2` structure defining the fragment shading rate attachment for this subpass.
- **shadingRateAttachmentTexelSize** specifies the size of the portion of the framebuffer corresponding to each texel in `pFragmentShadingRateAttachment`.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

Valid Usage

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524**
  
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not `VK_ATTACHMENT_UNUSED`, its layout member must be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525**
  
  If `pFragmentShadingRateAttachment` is not NULL and its attachment member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be a power of two.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526**
If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.width

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.width must be greater than or equal to minFragmentShadingRateAttachmentTexelSize.width

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.height

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be greater than or equal to minFragmentShadingRateAttachmentTexelSize.height

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.width and shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.height and shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter
  If pFragmentShadingRateAttachment is not NULL, pFragmentShadingRateAttachment must be a valid pointer to a valid VkAttachmentReference2 structure
The `VkAttachmentReference2` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReference2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **attachment** is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- **layout** is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) can be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

**aspectMask** is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and `attachment` has a depth/stencil format, `layout` can be set to a layout that only specifies the layout of the depth aspect.

If `layout` only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the `stencilLayout` member of a `VkAttachmentReferenceStencilLayout` structure included in the `pNext` chain. Otherwise, `layout` describes the layout for all relevant image aspects.

### Valid Usage

- **VUID-VkAttachmentReference2-layout-03077**
  If `attachment` is not `VK_ATTACHMENT_UNUSED`, layout must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- **VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313**
If the `separateDepthStencilLayouts` feature is not enabled, and `attachment` is not `VK_ATTACHMENT_UNUSED`, layout must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`,

- VUID-VkAttachmentReference2-synchronization2-06910
  If the `synchronization2` feature is not enabled, layout must not be `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR` or `VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR`

### Valid Usage (Implicit)

- **VUID-VkAttachmentReference2-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2`

- **VUID-VkAttachmentReference2-pNext-pNext**

  `pNext` must be `NULL` or a pointer to a valid instance of `VkAttachmentReferenceStencilLayout`

- **VUID-VkAttachmentReference2-sType-unique**

  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkAttachmentReference2-layout-parameter**

  Layout must be a valid `VkImageLayout` value

The `VkAttachmentReferenceStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stencilLayout** is a `VkImageLayout` value specifying the layout the stencil aspect of the attachment uses during the subpass.

### Valid Usage

- **VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318**
stencilLayout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED,
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

Valid Usage (Implicit)

• VUID-VkAttachmentReferenceStencilLayout-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT

• VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  stencilLayout must be a valid VkImageLayout value

The VkSubpassDependency2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• dstSubpass is the subpass index of the second subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
• **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
• **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
• **dependencyFlags** is a bitmask of `VkDependencyFlagBits`.
• **viewOffset** controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

**viewOffset** has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, **srcStageMask**, **dstStageMask**, **srcAccessMask**, and **dstAccessMask** parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`.

### Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  If the geometryShader feature is not enabled, **srcStageMask** must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  If the tessellationShader feature is not enabled, **srcStageMask** must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-07319**
  If the attachmentFragmentShadingRate feature is not enabled, **srcStageMask** must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubpassDependency2-srcStageMask-03937**
  If the synchronization2 feature is not enabled, **srcStageMask** must not be 0.

- **VUID-VkSubpassDependency2-srcStageMask-07950**
  If the rayTracingPipeline feature is not enabled, **srcStageMask** must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-VkSubpassDependency2-dstStageMask-04090**
  If the geometryShader feature is not enabled, **dstStageMask** must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency2-dstStageMask-04091**
  If the tessellationShader feature is not enabled, **dstStageMask** must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency2-dstStageMask-07319**
  If the attachmentFragmentShadingRate feature is not enabled, **dstStageMask** must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.
• VUID-VkSubpassDependency2-dstStageMask-03937
  If the synchronization feature is not enabled, dstStageMask must not be 0

• VUID-VkSubpassDependency2-dstStageMask-07950
  If the rayTracingPipeline feature is not enabled, dstStageMask must not contain
  VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

• VUID-VkSubpassDependency2-srcSubpass-03084
  srcSubpass must be less than or equal to dstSubpass, unless one of them is
  VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

• VUID-VkSubpassDependency2-srcSubpass-03085
  srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-srcSubpass-06810
  If srcSubpass is equal to dstSubpass and srcStageMask includes a framebuffer-space stage,
  dstStageMask must only contain framebuffer-space stages

• VUID-VkSubpassDependency2-srcAccessMask-03088
  Any access flag included in srcAccessMask must be supported by one of the pipeline stages
  in srcStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency2-dstAccessMask-03089
  Any access flag included in dstAccessMask must be supported by one of the pipeline stages
  in dstStageMask, as specified in the table of supported access types

• VUID-VkSubpassDependency2-dependencyFlags-03090
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to
  VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-dependencyFlags-03091
  If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to
  VK_SUBPASS_EXTERNAL

• VUID-VkSubpassDependency2-srcSubpass-02245
  If srcSubpass equals dstSubpass, and srcStageMask and dstStageMask both include a
  framebuffer-space stage, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT

• VUID-VkSubpassDependency2-viewOffset-02530
  If viewOffset is not equal to 0, srcSubpass must not be equal to dstSubpass

• VUID-VkSubpassDependency2-dependencyFlags-03092
  If dependencyFlags does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, viewOffset must be 0

Valid Usage (Implicit)

• VUID-VkSubpassDependency2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2

• VUID-VkSubpassDependency2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkMemoryBarrier2

• VUID-VkSubpassDependency2-sType-unique
The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkSubpassDependency2-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-VkSubpassDependency2-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-VkSubpassDependency2-srcAccessMask-parameter**
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits` values

- **VUID-VkSubpassDependency2-dstAccessMask-parameter**
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits` values

- **VUID-VkSubpassDependency2-dependencyFlags-parameter**
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice device,
    VkRenderPass renderPass,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the render pass.
- `renderPass` is the handle of the render pass to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- **VUID-vkDestroyRenderPass-renderPass-00873**
  All submitted commands that refer to `renderPass` must have completed execution

- **VUID-vkDestroyRenderPass-renderPass-00874**
  If `VkAllocationCallbacks` were provided when `renderPass` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyRenderPass-renderPass-00875**
  If no `VkAllocationCallbacks` were provided when `renderPass` was created, `pAllocator` must be `NULL`

**Valid Usage (Implicit)**

- **VUID-vkDestroyRenderPass-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyRenderPass-renderPass-parameter**
  If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` must be a valid `VkRenderPass` handle
8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both VK_ATTACHMENT_UNUSED or the pointer that would contain the reference is NULL.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as VK_ATTACHMENT_UNUSED.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.

8.4. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```
To create a framebuffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device,
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a `VkFramebufferCreateInfo` structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFramebuffer` is a pointer to a `VkFramebuffer` handle in which the resulting framebuffer object is returned.

**Valid Usage**

- VUID-vkCreateFramebuffer-pCreateInfo-02777
  If `pCreateInfo->flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on `device`.

**Valid Usage (Implicit)**

- VUID-vkCreateFramebuffer-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkCreateFramebuffer-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkFramebufferCreateInfo` structure.

- VUID-vkCreateFramebuffer-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkCreateFramebuffer-pFramebuffer-parameter
  `pFramebuffer` must be a valid pointer to a `VkFramebuffer` handle.

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkFramebufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
    uint32_t width;
    uint32_t height;
    uint32_t layers;
} VkFramebufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFramebufferCreateFlagBits`.
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See Render Pass Compatibility for details.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- `width`, `height` and `layers` define the dimensions of the framebuffer. If the render pass uses multiview, then `layers` must be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass can use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the `width`, `height`, and `layers` of the framebuffer to define the dimensions of the rendering area, and the `rasterizationSamples` from each pipeline's `VkPipelineMultisampleStateCreateInfo` to define the number of samples used in rasterization; however, if `VkPhysicalDeviceFeatures::variableMultisampleRate` is `VK_FALSE`, then all pipelines to be bound with the subpass must have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. In all such cases, `rasterizationSamples` must be a bit value that is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`.

**Valid Usage**

- VUID-VkFramebufferCreateInfo-attachmentCount-00876 `attachmentCount` must be equal to the attachment count specified in `renderPass`
If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a color attachment or resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If renderpass is not VK_NULL_HANDLE, flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a VkFormat value that matches the VkFormat specified by the corresponding VkAttachmentDescription in renderPass.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a samples value that matches the samples value specified by the corresponding VkAttachmentDescription in renderPass.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.width greater than or equal to width.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageCreateInfo::extent.height greater than or equal to height.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input, color, resolve, or depth/stencil attachment by renderPass must have been created with a VkImageViewCreateInfo::subresourceRange.layerCount greater than or equal to layers.
If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` must have a `layerCount` greater than the index of the most significant bit set in any of those view masks.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than the index of the most significant bit set in any of those view masks.

If `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than `layers`.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a `layerCount` equal to 1 or greater than the index of the most significant bit set in any of those view masks.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a width at least as large as \( \lceil \text{width} / \text{texelWidth} \rceil \), where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a height at least as large as \( \lceil \text{height} / \text{texelHeight} \rceil \), where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must only specify a single mip level.

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` must have been created with the identity swizzle.

`width` must be greater than 0

`width` must be less than or equal to `maxFramebufferWidth`

`height` must be greater than 0

`width` must be greater than 0
height must be less than or equal to maxFramebufferHeight

• VUID-VkFramebufferCreateInfo-layers-00889
  layers must be greater than 0

• VUID-VkFramebufferCreateInfo-layers-00890
  layers must be less than or equal to maxFramebufferLayers

• VUID-VkFramebufferCreateInfo-renderPass-02531
  If renderPass was specified with non-zero view masks, layers must be 1

• VUID-VkFramebufferCreateInfo-pAttachments-00891
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is a 2D or 2D array image view taken from a 3D image must not be a depth/stencil format

• VUID-VkFramebufferCreateInfo-flags-03189
  If the imagelessFramebuffer feature is not enabled, flags must not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT

• VUID-VkFramebufferCreateInfo-flags-03190
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain must include a VkFramebufferAttachmentsCreateInfo structure

• VUID-VkFramebufferCreateInfo-flags-03191
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain must be equal to either zero or attachmentCount

• VUID-VkFramebufferCreateInfo-flags-04541
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width

• VUID-VkFramebufferCreateInfo-flags-04542
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to height

• VUID-VkFramebufferCreateInfo-flags-04543
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to ⌈width / texelWidth⌉, where texelWidth is the largest value of shadingRateAttachmentTexelSize.width in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

• VUID-VkFramebufferCreateInfo-flags-04544
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the height member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be greater than or equal to ⌈height / texelHeight⌉, where texelHeight is the largest value of
shadingRateAttachmentTexelSize.height in a 

- **VUID-VkFramebufferCreateInfo-flags-04545**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to layers.

- **VUID-VkFramebufferCreateInfo-flags-04587**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and renderPass was specified with non-zero view masks, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have a layerCount that is either 1, or greater than the index of the most significant bit set in any of those view masks.

- **VUID-VkFramebufferCreateInfo-renderPass-03198**
  If multiview is enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in renderPass.

- **VUID-VkFramebufferCreateInfo-renderPass-04546**
  If multiview is not enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-flags-03201**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-flags-03202**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-flags-03203**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil resolve attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkFramebufferCreateInfo-flags-03204**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to layers.
structure included in the pNext chain that refers to an attachment used as an input attachment by renderPass must include VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkFramebufferCreateInfo-flags-03205
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, at least one element of the pViewFormats member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain must be equal to the corresponding value of VkAttachmentDescription::format used to create renderPass

• VUID-VkFramebufferCreateInfo-flags-04113
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with VkImageViewCreateInfo::viewType not equal to VK_IMAGE_VIEW_TYPE_3D

• VUID-VkFramebufferCreateInfo-flags-04548
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkFramebufferCreateInfo-flags-04549
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a fragment shading rate attachment by renderPass must include VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

Valid Usage (Implicit)

• VUID-VkFramebufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO

• VUID-VkFramebufferCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

• VUID-VkFramebufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkFramebufferCreateInfo-flags-parameter
  flags must be a valid combination of VkFramebufferCreateFlagBits values

• VUID-VkFramebufferCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

• VUID-VkFramebufferCreateInfo-commonparent
  Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;

or the equivalent

typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **attachmentImageInfoCount** is the number of attachments being described.
• **pAttachmentImageInfos** is a pointer to an array of VkFramebufferAttachmentImageInfo structures, each structure describing a number of parameters of the corresponding attachment in a render pass instance.

### Valid Usage (Implicit)

- **VUID-VkFramebufferAttachmentsCreateInfo-sType-sType**
  * **sType must** be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO

- **VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter**
  * If **attachmentImageInfoCount** is not 0, **pAttachmentImageInfos must** be a valid pointer to an array of **attachmentImageInfoCount** valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:

typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageUsageFlags usage;
    uint32_t width;
    uint32_t height;
    uint32_t layerCount;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkFramebufferAttachmentImageInfo;

or the equivalent
// Provided by VK_KHR_imageless_framebuffer

typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageCreateFlagBits`, matching the value of `VkImageCreateInfo::flags` used to create an image that will be used with this framebuffer.
- `usage` is a bitmask of `VkImageUsageFlagBits`, matching the value of `VkImageCreateInfo::usage` used to create an image used with this framebuffer.
- `width` is the width of the image view used for rendering.
- `height` is the height of the image view used for rendering.
- `layerCount` is the number of array layers of the image view used for rendering.
- `viewFormatCount` is the number of entries in the `pViewFormats` array, matching the value of `VkImageFormatListCreateInfo::viewFormatCount` used to create an image used with this framebuffer.
- `pViewFormats` is a pointer to an array of `VkFormat` values specifying all of the formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, must be created with parameters that are identical to those specified here.

---

**Valid Usage (Implicit)**

- VUID-VkFramebufferAttachmentImageInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`
- VUID-VkFramebufferAttachmentImageInfo-pNext-pNext `pNext` must be `NULL`
- VUID-VkFramebufferAttachmentImageInfo-flags-parameter `flags` must be a valid combination of `VkImageCreateFlagBits` values
- VUID-VkFramebufferAttachmentImageInfo-usage-parameter `usage` must be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkFramebufferAttachmentImageInfo-usage-required bitmask `usage` must not be `0`
- VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter If `viewFormatCount` is not `0`, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:
typedef enum VkFramebufferCreateFlagBits {
VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
} VkFramebufferCreateFlagBits;

VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT specifies that image views are not specified, and only attachment compatibility information will be provided via a VkFramebufferAttachmentImageInfo structure.

typedef VkFlags VkFramebufferCreateFlags;

VkFramebufferCreateFlags is a bitmask type for setting a mask of zero or more VkFramebufferCreateFlagBits.

To destroy a framebuffer, call:

void vkDestroyFramebuffer(
    VkDevice device,
    VkFramebuffer framebuffer,
    const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the framebuffer.
- framebuffer is the handle of the framebuffer to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyFramebuffer-framebuffer-00892
  All submitted commands that refer to framebuffer must have completed execution

- VUID-vkDestroyFramebuffer-framebuffer-00893
  If VkAllocationCallbacks were provided when framebuffer was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyFramebuffer-framebuffer-00894
  If no VkAllocationCallbacks were provided when framebuffer was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkDestroyFramebuffer-framebuffer-parameter
  
  If framebuffer is not VK_NULL_HANDLE, framebuffer must be a valid VkFramebuffer handle

- VUID-vkDestroyFramebuffer-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyFramebuffer-framebuffer-parent
  
  If framebuffer is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to framebuffer must be externally synchronized

8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT pipeline stage. Load operations for attachments with a color format execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias.

Note

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, writes to one aspect may also result in read-modify-write operations for the other aspect.

Note

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when
Load operations that **can** be used for a render pass are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
    VK_ATTACHMENT_LOAD_OP_LOAD = 0,
    VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
    VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
} VkAttachmentLoadOp;
```

- **VK_ATTACHMENT_LOAD_OP_LOAD** specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`.

- **VK_ATTACHMENT_LOAD_OP_CLEAR** specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits **must** be represented in the attachment’s format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components **may** be represented in a format with a precision higher than the attachment format, but **must** be represented with the same range. When such a component is loaded via the `loadOp`, it will be converted into an implementation-dependent format used by the render pass. Such components **must** be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via `storeOp`. Conversions occur as described in [Numeric Representation and Computation](#) and [Fixed-Point Data Conversions](#).

### 8.6. Render Pass Store Operations

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` pipeline stage. Store operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.
Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_STORE_OP_NONE`.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect may also result in read-modify-write operations for the other aspect.

As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of `VkAttachmentDescription::storeOp` and `stencilStoreOp`, specifying how the contents of the attachment are treated, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- **VK_ATTACHMENT_STORE_OP_STORE** specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and may be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type `VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT`. For attachments with a color format, this uses the access type `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`.

- **VK_ATTACHMENT_STORE_OP_NONE** specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to `VK_ATTACHMENT_STORE_OP_DONT_CARE` and with matching access semantics.
VK_ATTACHMENT_STORE_OP_DONT_CARE can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.

Multisample resolve operations for attachments execute in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage. A final resolve operation for all pixels in the render area happens-after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation may have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with VK_ACCESS_COLOR_ATTACHMENT_READ_BIT. Access to the single sample attachment can be synchronized with VK_ACCESS_COLOR_ATTACHMENT_READ_BIT and VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images writes to one aspect may also result in read-modify-write operations for the other aspect.

Note

As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:

```c
// Provided by VK_VERSION_1_2
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
} VkResolveModeFlagBits;
```
or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;
```

- **VK_RESOLVE_MODE_NONE** indicates that no resolve operation is done.
- **VK_RESOLVE_MODE_SAMPLE_ZERO_BIT** indicates that result of the resolve operation is equal to the value of sample 0.
- **VK_RESOLVE_MODE_AVERAGE_BIT** indicates that result of the resolve operation is the average of the sample values.
- **VK_RESOLVE_MODE_MIN_BIT** indicates that result of the resolve operation is the minimum of the sample values.
- **VK_RESOLVE_MODE_MAX_BIT** indicates that result of the resolve operation is the maximum of the sample values.

When no resolve mode is specified, **VK_RESOLVE_MODE_AVERAGE_BIT** is used.

or the equivalent

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;
```

`VkResolveModeFlags` is a bitmask type for setting a mask of zero or more `VkResolveModeFlagBits`.

### 8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.
To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- VUID-vkCmdBeginRenderPass-initialLayout-00895
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass-initialLayout-01758
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass-initialLayout-02842
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must...
have been created with a usage value including

\texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}

• VUID-vkCmdBeginRenderPass-stencilInitialLayout-02843
  If any of the \texttt{stencilInitialLayout} or \texttt{stencilFinalLayout} member of the
  \texttt{VkAttachmentDescriptionStencilLayout} structures or the \texttt{stencilLayout} member of the
  \texttt{VkAttachmentReferenceStencilLayout} structures specified when creating the render pass
  specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is
  \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_ATTACHMENT\_OPTIMAL},
  or \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_READ\_ONLY\_OPTIMAL} then the corresponding attachment image
  view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must}
  have been created with a usage value including \texttt{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}

• VUID-vkCmdBeginRenderPass-initialLayout-00897
  If any of the \texttt{initialLayout} or \texttt{finalLayout} member of the \texttt{VkAttachmentDescription}
  structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when
  creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is
  \texttt{VK\_IMAGE\_LAYOUT\_SHADER\_READ\_ONLY\_OPTIMAL} then the corresponding attachment image
  view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must}
  have been created with a usage value including \texttt{VK\_IMAGE\_USAGE\_SAMPLED\_BIT} or
  \texttt{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}

• VUID-vkCmdBeginRenderPass-initialLayout-00898
  If any of the \texttt{initialLayout} or \texttt{finalLayout} member of the \texttt{VkAttachmentDescription}
  structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when
  creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is
  \texttt{VK\_IMAGE\_LAYOUT\_TRANSFER\_SRC\_OPTIMAL} then the corresponding attachment image
  view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must}
  have been created with a usage value including \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_SRC\_BIT}

• VUID-vkCmdBeginRenderPass-initialLayout-00899
  If any of the \texttt{initialLayout} or \texttt{finalLayout} member of the \texttt{VkAttachmentDescription}
  structures or the \texttt{layout} member of the \texttt{VkAttachmentReference} structures specified when
  creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is
  \texttt{VK\_IMAGE\_LAYOUT\_TRANSFER\_DST\_OPTIMAL} then the corresponding attachment image
  view of the framebuffer specified in the \texttt{framebuffer} member of \texttt{pRenderPassBegin} \textbf{must}
  have been created with a usage value including \texttt{VK\_IMAGE\_USAGE\_TRANSFER\_DST\_BIT}

• VUID-vkCmdBeginRenderPass-initialLayout-00900
  If the \texttt{initialLayout} member of any of the \texttt{VkAttachmentDescription} structures specified
  when creating the render pass specified in the \texttt{renderPass} member of \texttt{pRenderPassBegin} is
  not \texttt{VK\_IMAGE\_LAYOUT\_UNDEFINED}, then each such \texttt{initialLayout} \textbf{must} be equal to the current
  layout of the corresponding attachment image subresource of the framebuffer specified
  in the \texttt{framebuffer} member of \texttt{pRenderPassBegin}

• VUID-vkCmdBeginRenderPass-srcStageMask-06451
  The \texttt{srcStageMask} members of any element of the \texttt{pDependencies} member of
  \texttt{VkRenderPassCreateInfo} used to create \texttt{renderPass} \textbf{must} be supported by the capabilities
  of the queue family identified by the \texttt{queueFamilyIndex} member of the
  \texttt{VkCommandPoolCreateInfo} used to create the command pool which \texttt{commandBuffer} was
allocated from

- VUID-vkCmdBeginRenderPass-dstStageMask-06452
  The \texttt{dstStageMask} members of any element of the \texttt{pDependencies} member of \texttt{VkRenderPassCreateInfo} used to create \texttt{renderPass} must be supported by the capabilities of the queue family identified by the \texttt{queueFamilyIndex} member of the \texttt{VkCommandPoolCreateInfo} used to create the command pool which \texttt{commandBuffer} was allocated from.

- VUID-vkCmdBeginRenderPass-framebuffer-02532
  For any attachment in \texttt{framebuffer} that is used by \texttt{renderPass} and is bound to memory locations that are also bound to another attachment used by \texttt{renderPass}, and if at least one of those uses causes either attachment to be written to, both attachments must have had the \texttt{VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT} set.

- VUID-vkCmdBeginRenderPass-framebuffer-09045
  If any attachments specified in \texttt{framebuffer} are used by \texttt{renderPass} and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

### Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle.

- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
  \texttt{pRenderPassBegin} must be a valid pointer to a valid \texttt{VkRenderPassBeginInfo} structure.

- VUID-vkCmdBeginRenderPass-contents-parameter
  \texttt{contents} must be a valid \texttt{VkSubpassContents} value.

- VUID-vkCmdBeginRenderPass-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording} state.

- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations.

- VUID-vkCmdBeginRenderPass-renderpass
  This command must only be called outside of a render pass instance.

- VUID-vkCmdBeginRenderPass-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBeginRenderPass-bufferlevel
  \texttt{commandBuffer} must be a primary \texttt{VkCommandBuffer}.

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized.

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally...
Alternatively to begin a render pass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
  Both the `framebuffer` and `renderPass` members of `pRenderPassBegin` must have been created on the same `VkDevice` that `commandBuffer` was allocated on.
- VUID-vkCmdBeginRenderPass2-initialLayout-03094
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when
creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03096**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_STENCIL_ATTACHMENT_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-02844**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_STENCIL_ATTACHMENT_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845**
  If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_STENCIL_ATTACHMENT_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03097**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03098**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`.
creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03099**
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

- **VUID-vkCmdBeginRenderPass2-initialLayout-03100**
  If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin`.

- **VUID-vkCmdBeginRenderPass2-srcStageMask-06453**
  The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

- **VUID-vkCmdBeginRenderPass2-dstStageMask-06454**
  The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

- **VUID-vkCmdBeginRenderPass2-framebuffer-02533**
  For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.

- **VUID-vkCmdBeginRenderPass2-framebuffer-09046**
  If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginRenderPass2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter**
pRenderPassBegin must be a valid pointer to a valid VkRenderPassBeginInfo structure

- VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter
  pSubpassBeginInfo must be a valid pointer to a valid VkSubpassBeginInfo structure

- VUID-vkCmdBeginRenderPass2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRenderPass2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass2-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginRenderPass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The VkRenderPassBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    VkFramebuffer framebuffer;
    VkRect2D renderArea;
    uint32_t clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `renderPass` is the render pass to begin an instance of.
• `framebuffer` is the framebuffer containing the attachments that are used with the render pass.
• `renderArea` is the render area that is affected by the render pass instance, and is described in more detail below.
• `clearValueCount` is the number of elements in `pClearValues`.

`pClearValues` is a pointer to an array of `clearValueCount` `VkClearValue` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area must be contained within the framebuffer dimensions.

**Note**

There may be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

### Valid Usage

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  `clearValueCount` must be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`

- **VUID-VkRenderPassBeginInfo-clearValueCount-04962**
  If `clearValueCount` is not 0, `pClearValues` must be a valid pointer to an array of `clearValueCount` `VkClearValue` unions

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  `renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`

- **VUID-VkRenderPassBeginInfo-None-08996**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0

- **VUID-VkRenderPassBeginInfo-None-08997**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.height` must be greater than 0

- **VUID-VkRenderPassBeginInfo-pNext-02850**
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02851**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0

- **VUID-VkRenderPassBeginInfo-pNext-02852**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x + renderArea.extent.width` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02853**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y + renderArea.extent.height` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02856**
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-pNext-02857**
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.y + extent.height` of each element of `pDeviceRenderAreas` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with

- **VUID-VkRenderPassBeginInfo-framebuffer-03207**
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that did not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and the `pNext` chain includes a `VkRenderPassAttachmentBeginInfo` structure, its `attachmentCount` must be zero

- **VUID-VkRenderPassBeginInfo-framebuffer-03208**
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `attachmentCount` of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be equal to the value of `VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount` used to create `framebuffer`

- **VUID-VkRenderPassBeginInfo-framebuffer-02780**
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must have been created on the same `VkDevice` as `framebuffer` and `renderPass`

- **VUID-VkRenderPassBeginInfo-framebuffer-03209**
  If `framebuffer` was created with a `VkFramebufferCreateInfo::flags` value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a
**VkImageView** of an image created with a value of **VkImageCreateInfo::flags** equal to the **flags** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-04627**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** with an inherited **usage** equal to the **usage** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-03211**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** with a width equal to the **width** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-03212**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** with a height equal to the **height** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-03213**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** of an image created with a value of **VkImageFormatListCreateInfo::viewFormatCount** equal to the **viewFormatCount** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-03214**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** of an image created with a value of **VkImageFormatListCreateInfo::pViewFormats** equal to the set of elements in the **pViewFormats** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**

- **VUID-VkRenderPassBeginInfo-framebuffer-03215**
  If **framebuffer** was created with a **VkFramebufferCreateInfo::flags** value that included **VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT**, each element of the **pAttachments** member of a **VkRenderPassAttachmentBeginInfo** structure included in the **pNext** chain **must** be a **VkImageView** of an image created with a set of elements in **VkImageFormatListCreateInfo::pViewFormats** equal to the set of elements in the **pViewFormats** member of the corresponding element of **VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos** used to create **framebuffer**
If `framebuffer` was created with a `VkFramebufferCreateInfo`:flags value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageViewCreateInfo`:format equal to the corresponding value of `VkAttachmentDescription`:format in `renderPass`.

If `framebuffer` was created with a `VkFramebufferCreateInfo`:flags value that included `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of the `pAttachments` member of a `VkRenderPassAttachmentBeginInfo` structure included in the `pNext` chain must be a `VkImageView` of an image created with a value of `VkImageCreateInfo`:samples equal to the corresponding value of `VkAttachmentDescription`:samples in `renderPass`.

---

### Valid Usage (Implicit)

- **VUID-VkRenderPassBeginInfo-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO`

- **VUID-VkRenderPassBeginInfo-pNext-pNext**  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo` or `VkRenderPassAttachmentBeginInfo`

- **VUID-VkRenderPassBeginInfo-sType-unique**  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkRenderPassBeginInfo-renderPass-parameter**  
  `renderPass` must be a valid `VkRenderPass` handle

- **VUID-VkRenderPassBeginInfo-framebuffer-parameter**  
  `framebuffer` must be a valid `VkFramebuffer` handle

- **VUID-VkRenderPassBeginInfo-commonparent**  
  Both of `framebuffer`, and `renderPass` must have been created, allocated, or retrieved from the same `VkDevice`

---

The `VkSubpassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
```
typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **contents** is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

### Valid Usage ( Implicit )

- **VUID-VkSubpassBeginInfo-sType-sType**  
  `sType` **must** be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`

- **VUID-VkSubpassBeginInfo-pNext-pNext**  
  `pNext` **must** be `NULL`

- **VUID-VkSubpassBeginInfo-contents-parameter**  
  `contents` **must** be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
} VkSubpassContents;
```

- **VK_SUBPASS_CONTENTS_INLINE** specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers **must** not be executed within the subpass.

- **VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS** specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and `vkCmdExecuteCommands` is the only valid command in the command buffer until `vkCmdNextSubpass` or `vkCmdEndRenderPass`.

If the **pNext** chain of `VkRenderPassBeginInfo` or `VkRenderingInfo` includes a `VkDeviceGroupRenderPassBeginInfo` structure, then that structure includes a device mask and set of render areas for the render pass instance.

The `VkDeviceGroupRenderPassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupRenderPassBeginInfo;
```
```c
uint32_t deviceRenderAreaCount;
const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceMask** is the device mask for the render pass instance.
- **deviceRenderAreaCount** is the number of elements in the `pDeviceRenderAreas` array.
- **pDeviceRenderAreas** is a pointer to an array of VkRect2D structures defining the render area for each physical device.

The **deviceMask** serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass load, store, and multisample resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If **deviceRenderAreaCount** is not zero, then the elements of `pDeviceRenderAreas` override the value of VkRenderPassBeginInfo::renderArea, and provide a render area specific to each physical device. These render areas serve the same purpose as VkRenderPassBeginInfo::renderArea, including controlling the region of attachments that are cleared by VK_ATTACHMENT_LOAD_OP_CLEAR and that are resolved into resolve attachments.

If this structure is not present, the render pass instance's device mask is the value of VkDeviceGroupCommandBufferBeginInfo::deviceMask. If this structure is not present or if **deviceRenderAreaCount** is zero, VkRenderPassBeginInfo::renderArea is used for all physical devices.

### Valid Usage

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905**
  
  `deviceMask` **must** be a valid device mask value

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906**
  
  `deviceMask` **must** not be zero

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907**
  
  `deviceMask` **must** be a subset of the command buffer's initial device mask

- **VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908**
  
  `deviceRenderAreaCount` **must** either be zero or equal to the number of physical devices in the logical device
The offset.x member of any element of pDeviceRenderAreas must be greater than or equal to 0.

The offset.y member of any element of pDeviceRenderAreas must be greater than or equal to 0.

The sum of the offset.x and extent.width members of any element of pDeviceRenderAreas must be less than or equal to maxFramebufferWidth.

The sum of the offset.y and extent.height members of any element of pDeviceRenderAreas must be less than or equal to maxFramebufferHeight.

The extent.width member of any element of pDeviceRenderAreas must be greater than 0.

The extent.height member of any element of pDeviceRenderAreas must be greater than 0.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO.

If deviceRenderAreaCount is not 0, pDeviceRenderAreas must be a valid pointer to an array of deviceRenderAreaCount VkRect2D structures.

The VkRenderPassAttachmentBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
• attachmentCount is the number of attachments.
• pAttachments is a pointer to an array of VkImageView handles, each of which will be used as the corresponding attachment in the render pass instance.

Valid Usage

• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218  
  Each element of pAttachments must only specify a single mip level

• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219  
  Each element of pAttachments must have been created with the identity swizzle

• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114  
  Each element of pAttachments must have been created with VkImageViewCreateInfo ::viewType not equal to VK_IMAGE_VIEW_TYPE_3D

Valid Usage (Implicit)

• VUID-VkRenderPassAttachmentBeginInfo-sType-sType  
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_ATTACHMENT_BEGIN_INFO

• VUID-VkRenderPassAttachmentBeginInfo-pAttachments-parameter  
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles

To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
  VkDevice device,
  VkRenderPass renderPass,
  VkExtent2D* pGranularity);
```

• device is the logical device that owns the render pass.
• renderPass is a handle to a render pass.
• pGranularity is a pointer to a VkExtent2D structure in which the granularity is returned.

The conditions leading to an optimal renderArea are:

• the offset.x member in renderArea is a multiple of the width member of the returned VkExtent2D (the horizontal granularity).
• the offset.y member in renderArea is a multiple of the height member of the returned VkExtent2D (the vertical granularity).
• either the extent.width member in renderArea is a multiple of the horizontal granularity or offset.x+extent.width is equal to the width of the framebuffer in the VkRenderPassBeginInfo.
either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or
`offset.y+extent.height` is equal to the `height` of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.

**Valid Usage (Implicit)**

- VUID-vkGetRenderAreaGranularity-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetRenderAreaGranularity-renderPass-parameter
  - `renderPass` must be a valid `VkRenderPass` handle
- VUID-vkGetRenderAreaGranularity-pGranularity-parameter
  - `pGranularity` must be a valid pointer to a `VkExtent2D` structure
- VUID-vkGetRenderAreaGranularity-renderPass-parent
  - `renderPass` must have been created, allocated, or retrieved from `device`

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application can record the commands for that subpass.

**Valid Usage**

- VUID-vkCmdNextSubpass-None-00909
  - The current subpass index must be less than the number of subpasses in the render pass minus one
Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdNextSubpass-contents-parameter
  
  contents must be a valid VkSubpassContents value

- VUID-vkCmdNextSubpass-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdNextSubpass-renderpass
  
  This command must only be called inside of a render pass instance

- VUID-vkCmdNextSubpass-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdNextSubpass-bufferlevel
  
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(
  VkCommandBuffer commandBuffer,
  const VkSubpassBeginInfo* pSubpassBeginInfo,
  const VkSubpassEndInfo* pSubpassEndInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassBeginInfo* pSubpassBeginInfo,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.

`vkCmdNextSubpass2` is semantically identical to `vkCmdNextSubpass`, except that it is extensible, and that `contents` is provided as part of an extensible structure instead of as a flat parameter.

### Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index **must** be less than the number of subpasses in the render pass minus one

### Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  `pSubpassBeginInfo` **must** be a valid pointer to a valid `VkSubpassBeginInfo` structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdNextSubpass2-renderpass
  This command **must** only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdNextSubpass2-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

Valid Usage

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index must be equal to the number of subpasses in the render pass minus one.
- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance must not have been begun with `vkCmdBeginRendering`.
- VUID-vkCmdEndRenderPass-None-07004
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` must have been called subsequently within the same subpass.

Valid Usage (Implicit)

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdEndRenderPass-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRenderPass-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass- videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- commandBuffer is the command buffer in which to end the current render pass instance.
• `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.

### Valid Usage

- **VUID-vkCmdEndRenderPass2-None-03103**
  The current subpass index **must** be equal to the number of subpasses in the render pass minus one

- **VUID-vkCmdEndRenderPass2-None-06171**
  The current render pass instance **must** not have been begun with `vkCmdBeginRendering`

- **VUID-vkCmdEndRenderPass2-None-07005**
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndRenderPass2-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter**
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure

- **VUID-vkCmdEndRenderPass2-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdEndRenderPass2-renderpass**
  This command **must** only be called inside of a render pass instance

- **VUID-vkCmdEndRenderPass2-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdEndRenderPass2-bufferlevel**
  `commandBuffer` **must** be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

### Valid Usage (Implicit)

- `VUID-VkSubpassEndInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- `VUID-VkSubpassEndInfo-pNext-pNext`  
  `pNext` must be `NULL`

### 8.9. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

#### 8.9.1. Sampling from a read-only attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.
However, because `VK_ATTACHMENT_STORE_OP_STORE` and `VK_ATTACHMENT_STORE_OP_DONT_CARE` may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as the store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As `VK_ATTACHMENT_STORE_OP_NONE` is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this store operation, coupled with a load operation that also performs no writes.

8.9.2. Non-overlapping access between resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that `load` and `store` operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

8.9.3. Depth/stencil and input attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written must be in a read-only layout, and writes to it must be disabled in the draw state. For example, to read from stencil while writing depth, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` (or equivalent), and the stencil write mask must be set to 0. Similarly to read from depth while writing stencil, the attachment must be in `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL` (or equivalent), and depth write enable must be set to `VK_FALSE`.

8.9.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A `VkSubpassDependency` in a render pass object can synchronize attachment writes and multisample resolve operations from a prior subpass for subsequent input attachment reads.
- A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)
```

To create a shader module, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateShaderModule(
    VkDevice device,
    const VkShaderModuleCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkShaderModule* pShaderModule);
```

- `device` is the logical device that creates the shader module.
• **pCreateInfo** is a pointer to a `VkShaderModuleCreateInfo` structure.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **pShaderModule** is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

### Valid Usage

- **VUID-vkCreateShaderModule-pCreateInfo-06905**  
  If `pCreateInfo` is not `NULL`, `pCreateInfo->pNext` must be `NULL`

### Valid Usage (Implicit)

- **VUID-vkCreateShaderModule-device-parameter**  
  `device` must be a valid `VkDevice` handle
- **VUID-vkCreateShaderModule-pCreateInfo-parameter**  
  `pCreateInfo` must be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- **VUID-vkCreateShaderModule-pAllocator-parameter**  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateShaderModule-pShaderModule-parameter**  
  `pShaderModule` must be a valid pointer to a `VkShaderModule` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkShaderModuleCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkShaderModuleCreateFlags flags;
    size_t codeSize;
    const uint32_t* pCode;
} VkShaderModuleCreateInfo;
```
 VkShaderModuleCreateInfo;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by `pCode`.

### Valid Usage

- **VUID-VkShaderModuleCreateInfo-codeSize-08735**
  - `codeSize` must be a multiple of 4

- **VUID-VkShaderModuleCreateInfo-pCode-08736**
  - `pCode` must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

- **VUID-VkShaderModuleCreateInfo-pCode-08737**
  - `pCode` must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-08738**
  - `pCode` must declare the Shader capability for SPIR-V code

- **VUID-VkShaderModuleCreateInfo-pCode-08739**
  - `pCode` must not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-08740**
  - `pCode` declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderModuleCreateInfo-pCode-08741**
  - `pCode` must not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

- **VUID-VkShaderModuleCreateInfo-pCode-08742**
  - `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderModuleCreateInfo-codeSize-01085**
  - `codeSize` must be greater than 0

### Valid Usage (Implicit)

- **VUID-VkShaderModuleCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO`

- **VUID-VkShaderModuleCreateInfo-flags-zerobitmask**
  - `flags` must be zero
flags must be 0

- VUID-VkShaderModuleCreateInfo-pCode-parameter
  pCode must be a valid pointer to an array of \( \frac{\text{codeSize}}{4} \) uint32_t values

// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;

VkShaderModuleCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a shader module, call:

// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(VkDevice device, VkShaderModule shaderModule, const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the shader module.
- shaderModule is the handle of the shader module to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

A shader module can be destroyed while pipelines created using its shaders are still in use.

Valid Usage

- VUID-vkDestroyShaderModule-shaderModule-01092
  If VkAllocationCallbacks were provided when shaderModule was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyShaderModule-shaderModule-01093
  If no VkAllocationCallbacks were provided when shaderModule was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyShaderModule-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyShaderModule-shaderModule-parameter
  If shaderModule is not VK_NULL_HANDLE, shaderModule must be a valid VkShaderModule handle

- VUID-vkDestroyShaderModule-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
### VkAllocationCallbacks structure

- VUID-vkDestroyShaderModule-shaderModule-parent
  - If `shaderModule` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `shaderModule` **must** be externally synchronized

## 9.2. Binding Shaders

Before a shader can be used it **must** be first bound to the command buffer.

Calling `vkCmdBindPipeline` binds all stages corresponding to the `VkPipelineBindPoint`.

The following table describes the relationship between shader stages and pipeline bind points:

<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>VK_SHADER_STAGE_VERTEX_BIT</code></td>
<td><code>VK_PIPELINE_BIND_POINT_GRAPHICS</code></td>
<td>all drawing commands</td>
</tr>
<tr>
<td><code>VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>VK_SHADER_STAGE_GEOMETRY_BIT</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td><code>VK_SHADER_STAGE_FRAGMENT_BIT</code></td>

</tbody>
</table>
9.3. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

9.3.1. Shader Termination

A shader invocation that is terminated has finished executing instructions.

Executing OpReturn in the entry point, or executing OpTerminateInvocation in any function will terminate an invocation. Implementations may also terminate a shader invocation when OpKill is executed in any function; otherwise it becomes a helper invocation.

In addition to the above conditions, helper invocations are terminated when all non-helper invocations in the same derivative group either terminate or become helper invocations via OpKill.

A shader stage for a given command completes execution when all invocations for that stage have terminated.

9.4. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- **Vertex** and **tessellation evaluation** shaders will be invoked at least once for each unique vertex, as defined in those sections.
- **Fragment** shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

Note
The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The Memory Model appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is Visible-To a read, and what constitutes a Data Race.

Applications must not cause a data race.

The SPIR-V SubgroupMemory, CrossWorkgroupMemory, and AtomicCounterMemory memory semantics are ignored. Sequentially consistent atomic and barriers are not supported and SequentiallyConsistent is treated as AcquireRelease. SequentiallyConsistent should not be used.

9.5. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their Location decorations. Additionally, data can be provided by or communicated to special functions provided by the execution environment using BuiltIn decorations.

In many cases, the same BuiltIn decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as BuiltIn is documented in the following sections.

9.6. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.6.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.
It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see \texttt{vertexPipelineStoresAndAtomics}).

9.7. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and \texttt{can} also output additional per-patch data. The input patch is sized according to the \texttt{patchControlPoints} member of \texttt{VkPipelineTessellationStateCreateInfo}, as part of input assembly.

The size of the output patch is controlled by the \texttt{OpExecutionMode OutputVertices} specified in the tessellation control or tessellation evaluation shaders, which \texttt{must} be specified in at least one of the shaders. The size of the input and output patches \texttt{must} each be greater than zero and less than or equal to \texttt{VkPhysicalDeviceLimits::maxTessellationPatchSize}.

9.7.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each \texttt{output} vertex in a patch. If the subpass includes multiple views in its view mask, the shader \texttt{may} be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader \texttt{can} read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the \texttt{OpControlBarrier} instruction \texttt{can} be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

9.8. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation’s relative position within the subdivided patch, and outputs a single vertex and its associated data.

9.8.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader \texttt{may} be invoked separately for each view.
9.9. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.9.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.10. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.11. Compute Shaders

Compute shaders are invoked via vkCmdDispatch and vkCmdDispatchIndirect commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.12. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using OpTraceRayKHR instructions and process the results.

9.12.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the pRaygenShaderBindingTable parameter or .
9.13. Intersection Shaders

Intersection shaders enable the implementation of arbitrary, application defined geometric primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

9.13.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\text{min}}, t_{\text{max}}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

9.15. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call `OpTraceRayKHR` to recursively trace rays.

9.15.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been
9.16. Miss Shaders

Miss shaders can access the ray payload and can trace new rays through the `OpTraceRayKHR` instruction, but cannot access attributes since they are not associated with an intersection.

9.16.1. Miss Shader Execution

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

9.17. Callable Shaders

Callable shaders can access a callable payload that works similarly to ray payloads to do subroutine work.

9.17.1. Callable Shader Execution

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

9.18. Interpolation decorations

Variables in the Input storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

**Note**

Interpolation decorations can be present on input and output variables in pre-rasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. Lines and polygons are interpolated in the same way as the primitive’s clip coordinates. If the NoPerspective decoration is present, linear interpolation is instead used for lines and polygons. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the Flat decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the provoking vertex. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type must be decorated with Flat.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the Centroid decoration is used, the interpolation position used for the variable must also fall within the bounds of the primitive being rasterized.
- If the Sample decoration is used, the interpolation position used for the variable must be at the
position of the sample being shaded by the current fragment shader invocation.

- If a sample count of 1 is used, the interpolation position must be at the center of the fragment area.

**Note**
As **Centroid** restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with **Centroid**.

If the **PerVertexKHR** decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

### 9.19. Static Use

A SPIR-V module declares a global object in memory using the `OpVariable` instruction, which results in a pointer `x` to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a instruction with `x` as an id operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

### 9.20. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

#### 9.20.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the **CrossDevice** scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands can be used to communicate between devices.

#### 9.20.2. Device

All invocations executed on a single device form a *device scope instance*.

If the **vulkanMemoryModel** and **vulkanMemoryModelDeviceScope** features are enabled, this scope is represented in SPIR-V by the **Device Scope**, which can be used as a Memory Scope for barrier and atomic operations.

If both the **shaderDeviceClock** and **vulkanMemoryModelDeviceScope** features are enabled, using the
Device Scope with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Invocations executing on different devices in a device group operate in separate device scope instances.

### 9.20.3. Queue Family

Invocations executed by queues in a given queue family form a queue family scope instance.

This scope is identified in SPIR-V as the QueueFamily Scope if the `vulkanMemoryModel` feature is enabled, or if not, the Device Scope, which can be used as a Memory Scope for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the Device Scope with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same device scope instance.

### 9.20.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a command scope instance. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific Scope for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same queue-family scope instance.

For shaders without defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

### 9.20.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a primitive scope instance.

There is no specific Scope for communication across invocations in a primitive scope instance.

Any generated helper invocations are included in this scope instance.
Each invocation in a primitive scope instance must be in the same command scope instance.

Any input variables decorated with `Flat` are uniform within a primitive scope instance.

### 9.20.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a shader call scope instance.

The `ShaderCallKHR` Scope can be used as `Memory Scope` for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

### 9.20.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the `Workgroup` storage class.

The `Workgroup` Scope can be used as both an `Execution Scope` and `Memory Scope` for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

When variables declared with the `Workgroup` storage class are explicitly laid out (hence they are also decorated with `Block`), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the `Workgroup` storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with `Workgroup` storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the Standard Storage Buffer Layout rules, and with `Boolean` values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

### 9.20.8. Subgroup

A subgroup (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The `Subgroup` Scope can be used as both an `Execution Scope` and `Memory Scope` for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the `shaderSubgroupClock` feature is enabled, using the `Subgroup` Scope with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup must be in the same local workgroup.
In other shader stages, each invocation in a subgroup must be in the same device scope instance.

Only shader stages that support subgroup operations have defined subgroups.

**Note**
In shaders, there are two kinds of uniformity that are of primary interest to applications: uniform within an invocation group (a.k.a. dynamically uniform), and uniform within a subgroup scope.

While one could make the assumption that being uniform in invocation group implies being uniform in subgroup scope, it is not necessarily the case for shader stages without defined workgroups.

For shader stages with defined workgroups however, the relationship between invocation group and subgroup scope is well defined as a subgroup is a subset of the workgroup, and the workgroup is the invocation group. If a value is uniform in invocation group, it is by definition also uniform in subgroup scope. This is important if writing code like:

```cpp
uniform texture2D Textures[];
uint dynamicallyUniformValue = gl_WorkGroupID.x;
vec4 value = texelFetch(Textures[dynamicallyUniformValue],
coord, 0);
```

```cpp
vec4 subgroupUniformValue = subgroupBroadcastFirst(dynamicallyUniformValue);
```

In shader stages without defined workgroups, this gets complicated. Due to scoping rules, there is no guarantee that a subgroup is a subset of the invocation group, which in turn defines the scope for dynamically uniform. In graphics, the invocation group is a single draw command, except for multi-draw situations, and indirect draws with drawCount > 1, where there are multiple invocation groups, one per `DrawIndex`.

```cpp
// Assume SubgroupSize = 8, where 3 draws are packed together.
// Two subgroups were generated.
uniform texture2D Textures[];
```

```cpp
uint dynamicallyUniformValue = gl_DrawID;
uint notActuallyDynamicallyUniformAnymore = subgroupBroadcastFirst(dynamicallyUniformValue);
vec4 value = texelFetch(Textures[notActuallyDynamicallyUniformAnymore],
coord, 0);
```

Another problematic scenario is when a shader attempts to help the compiler
notice that a value is uniform in subgroup scope to potentially improve performance.

```c
layout(location = 0) flat in dynamicallyUniformIndex;
// Vertex shader might have emitted a value that depends only on
// gl_DrawID,
// making it dynamically uniform.
// Give knowledge to compiler that the flat input is dynamically uniform,
// as this is not a guarantee otherwise.
```

```c
uint uniformIndex = subgroupBroadcastFirst(dynamicallyUniformIndex);
DrawData d = UBO.perDrawData[uniformIndex];
```

For implementations where subgroups are packed across draws, the implementation must make sure to handle descriptor indexing correctly. From the specification’s point of view, a dynamically uniform index does not require `NonUniform` decoration, and such an implementation will likely either promote descriptor indexing into `NonUniform` on its own, or handle non-uniformity implicitly.

### 9.20.9. Quad

A **quad scope instance** is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent subgroup invocation indices \(s_i\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
- \(s_0\) is an integer multiple of 4.

Each invocation in a quad scope instance **must** be in the same **subgroup**.

In a fragment shader, each invocation in a quad scope instance **must** be in the same **primitive**.
Fragment and compute shaders have defined quad scope instances. If the `quadOperationsInAllStages` limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.20.10. Invocation

The smallest scope is a single invocation; this is represented by the **Invocation Scope** in SPIR-V. Fragment shader invocations must be in a primitive scope instance. Invocations in shaders that have defined workgroups must be in a local workgroup. Invocations in shaders that have a defined subgroup scope must be in a subgroup. Invocations in shaders that have a defined quad scope must be in a quad scope instance. All invocations in all stages must be in a command scope instance.

### 9.21. Group Operations

Group operations are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the **Subgroup** scope can be used for these operations; the `subgroupSupportedOperations` limit defines which types of operation can be used.

#### 9.21.1. Basic Group Operations

Basic group operations include the use of **OpGroupNonUniformElect**, **OpControlBarrier**, **OpMemoryBarrier**, and atomic operations.

**OpGroupNonUniformElect** can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return `true`.

The Memory Model appendix defines the operation of barriers and atomics.

#### 9.21.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

- Do all active group invocations agree that an expression is true?
- Do any active group invocations evaluate an expression to true?
- Do all active group invocations have the same value of an expression?
Note
These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.21.3. Arithmetic Group Operations
The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.21.5. Shuffle Group Operations
The shuffle group operations allow invocations to read values from other invocations within a group.

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.21.7. Clustered Group Operations
The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

9.22. Quad Group Operations
Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this
scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute quad group operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For `OpGroupNonUniformQuadBroadcast` this value is equal to Index. For `OpGroupNonUniformQuadSwap`, it is equal to the implicit Index used by each participating invocation.

### 9.23. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation’s x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification. A derivative group is equivalent to the primitive scope instance for a fragment shader invocation.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group. All dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group. For other derivative operations, results are undefined if a dynamic instance is executed in control flow that is not uniform within the derivative group.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

Derivative operations calculate their results as the difference between the result of P across invocations in the quad. For fine derivative operations (OpDPdxFine and OpDPdyFine), the values of DPdx(P_i) are calculated as

\[
\text{DPdx}(P_i) = \text{DPdx}(P_1) = P_1 - P_0 \\
\text{DPdx}(P_2) = \text{DPdx}(P_3) = P_3 - P_2
\]

and the values of DPdy(P_i) are calculated as

\[
\text{DPdy}(P_0) = \text{DPdy}(P_2) = P_2 - P_0 \\
\text{DPdy}(P_1) = \text{DPdy}(P_3) = P_3 - P_1
\]

where i is the index of each invocation as described in Quad.
Coarse derivative operations (\texttt{OpDPdxCoarse} and \texttt{OpDPdyCoarse}), calculate their results in roughly the same manner, but \textbf{may} only calculate two values instead of four (one for each of DPdx and DPdy), reusing the same result no matter the originating invocation. If an implementation does this, it \textbf{should} use the fine derivative calculations described for \( P_0 \).

\textit{Note}

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[
\begin{align*}
\text{DPdx}(P_n)' &= \frac{\text{DPdx}(P_n)}{w} \\
\text{DPdy}(P_n)' &= \frac{\text{DPdy}(P_n)}{h}
\end{align*}
\]

where \( w \) and \( h \) are the size of the fragments in the quad, and \( \text{DPdx}(P_n)' \) and \( \text{DPdy}(P_n)' \) are the pixel derivatives.

The results for \texttt{OpDPdx} and \texttt{OpDPdy} \textbf{may} be calculated as either fine or coarse derivatives, with implementations favouring the most efficient approach. Implementations \textbf{must} choose coarse or fine consistently between the two.

Executing \texttt{OpFwidthFine}, \texttt{OpFwidthCoarse}, or \texttt{OpFwidth} is equivalent to executing the corresponding \texttt{OpDPdx*} and \texttt{OpDPdy*} instructions, taking the absolute value of the results, and summing them.

Executing an \texttt{OpImage*Sample*ImplicitLod} instruction is equivalent to executing \texttt{OpDPdx(Coordinate)} and \texttt{OpDPdy(Coordinate)}, and passing the results as the \texttt{Grad} operands \( dx \) and \( dy \).

\textit{Note}

It is expected that using the \texttt{ImplicitLod} variants of sampling functions will be substantially more efficient than using the \texttt{ExplicitLod} variants with explicitly generated derivatives.

\section*{9.24. Helper Invocations}

When performing \texttt{derivative} or \texttt{quad group} operations in a fragment shader, additional invocations \textbf{may} be spawned in order to ensure correct results. These additional invocations are known as \textit{helper invocations} and \textbf{can} be identified by a non-zero value in the \texttt{HelperInvocation} built-in. Stores and atomics performed by helper invocations \textbf{must} not have any effect on memory except for the \texttt{Function}, \texttt{Private} and \texttt{Output} storage classes, and values returned by atomic instructions in helper invocations are undefined.
Note
While storage to Output storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. Output variables in fragment shaders can be read from as well, and they behave more like Private variables for the duration of the shader invocation.

For group operations other than derivative and quad group operations, helper invocations may be treated as inactive even if they would be considered otherwise active.

Helper invocations may become permanently inactive if all invocations in a quad scope instance become helper invocations.

9.25. Cooperative Matrices

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:

```c
// Provided by VK_KHR_cooperative_matrix
VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesKHR* pProperties);
```

- **physicalDevice** is the physical device.
- **pPropertyCount** is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- **pProperties** is either NULL or a pointer to an array of VkCooperativeMatrixPropertiesKHR structures.

If **pProperties** is NULL, then the number of cooperative matrix properties available is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If **pPropertyCount** is less than the number of cooperative matrix properties available, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available cooperative matrix properties were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter

482
physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkCooperativeMatrixPropertiesKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Each VkCooperativeMatrixPropertiesKHR structure describes a single supported combination of types for a matrix multiply/add operation (OpCooperativeMatrixMulAddKHR). The multiply can be described in terms of the following variables and types (in SPIR-V pseudocode):

```
%A is of type OpTypeCooperativeMatrixKHR %ATYPE %scope %MSize %KSize %MatrixAKHR
%B is of type OpTypeCooperativeMatrixKHR %BType %scope %KSize %NSize %MatrixBKHR
%C is of type OpTypeCooperativeMatrixKHR %CType %scope %MSize %NSize
.MatrixAccumulatorKHR
%Result is of type OpTypeCooperativeMatrixKHR %ResultType %scope %MSize %NSize
.MatrixAccumulatorKHR

%Result = %A * %B + %C // using OpCooperativeMatrixMulAddKHR
```

A matrix multiply with these dimensions is known as an MxNxK matrix multiply.

The VkCooperativeMatrixPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
} VkCooperativeMatrixPropertiesKHR;
```
VkComponentTypeKHR ResultType;
VkBool32 saturatingAccumulation;
VkScopeKHR scope;
} VkCooperativeMatrixPropertiesKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **MSize** is the number of rows in matrices \( A \), \( C \), and \( \text{Result} \).
- **KSize** is the number of columns in matrix \( A \) and rows in matrix \( B \).
- **NSize** is the number of columns in matrices \( B \), \( C \), \( \text{Result} \).
- **AType** is the component type of matrix \( A \), of type VkComponentTypeKHR.
- **BType** is the component type of matrix \( B \), of type VkComponentTypeKHR.
- ** CType** is the component type of matrix \( C \), of type VkComponentTypeKHR.
- **ResultType** is the component type of matrix \( \text{Result} \), of type VkComponentTypeKHR.
- **saturatingAccumulation** indicates whether the SaturatingAccumulation operand to OpCooperativeMatrixMulAddKHR must be present.
- **scope** is the scope of all the matrix types, of type VkScopeKHR.

If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR.

At least one entry in the list **must** have power of two values for all of **MSize**, **KSize**, and **NSize**.

---

**Valid Usage (Implicit)**

- VUID-VkCooperativeMatrixPropertiesKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR
- VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext
  pNext **must** be NULL
- VUID-VkCooperativeMatrixPropertiesKHR-AType-parameter
  AType **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeMatrixPropertiesKHR-BType-parameter
  BType **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeMatrixPropertiesKHR-CType-parameter
  CType **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeMatrixPropertiesKHR-ResultType-parameter
  ResultType **must** be a valid VkComponentTypeKHR value
- VUID-VkCooperativeMatrixPropertiesKHR-scope-parameter
  scope **must** be a valid VkScopeKHR value

Possible values for VkScopeKHR include:
// Provided by VK_KHR_cooperative_matrix

typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
} VkScopeKHR;

• **VK_SCOPE_DEVICE_KHR** corresponds to SPIR-V **Device** scope.
• **VK_SCOPE_WORKGROUP_KHR** corresponds to SPIR-V **Workgroup** scope.
• **VK_SCOPE_SUBGROUP_KHR** corresponds to SPIR-V **Subgroup** scope.
• **VK_SCOPE_QUEUE_FAMILY_KHR** corresponds to SPIR-V **QueueFamily** scope.

All enum values match the corresponding SPIR-V value.

Possible values for **VkComponentTypeKHR** include:

// Provided by VK_KHR_cooperative_matrix

typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
} VkComponentTypeKHR;

• **VK_COMPONENT_TYPE_FLOAT16_KHR** corresponds to SPIR-V **OpTypeFloat 16**.
• **VK_COMPONENT_TYPE_FLOAT32_KHR** corresponds to SPIR-V **OpTypeFloat 32**.
• **VK_COMPONENT_TYPE_FLOAT64_KHR** corresponds to SPIR-V **OpTypeFloat 64**.
• **VK_COMPONENT_TYPE_SINT8_KHR** corresponds to SPIR-V **OpTypeInt 8 1**.
• **VK_COMPONENT_TYPE_SINT16_KHR** corresponds to SPIR-V **OpTypeInt 16 1**.
• **VK_COMPONENT_TYPE_SINT32_KHR** corresponds to SPIR-V **OpTypeInt 32 1**.
• **VK_COMPONENT_TYPE_SINT64_KHR** corresponds to SPIR-V **OpTypeInt 64 1**.
• **VK_COMPONENT_TYPE_UINT8_KHR** corresponds to SPIR-V **OpTypeInt 8 0**.
• **VK_COMPONENT_TYPE_UINT16_KHR** corresponds to SPIR-V **OpTypeInt 16 0**.
• **VK_COMPONENT_TYPE_UINT32_KHR** corresponds to SPIR-V **OpTypeInt 32 0**.
• VK_COMPONENT_TYPE_UINT64_KHR corresponds to SPIR-V OpTypeInt 64 0.
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which can read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.
Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as dynamic is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

### 10.1. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```c
// Provided by VK_VERSION_1_0
```
VkResult vkCreateComputePipelines(
    VkDevice device, 
    VkPipelineCache pipelineCache, 
    uint32_t createInfoCount, 
    const VkComputePipelineCreateInfo* pCreateInfos, 
    const VkAllocationCallbacks* pAllocator, 
    VkPipeline* pPipelines);

- **device** is the logical device that creates the compute pipelines.
- **pipelineCache** is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the pCreateInfos and pPipelines arrays.
- **pCreateInfos** is a pointer to an array of VkComputePipelineCreateInfo structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of VkPipeline handles in which the resulting compute pipeline objects are returned.

### Valid Usage

- **VUID-vkCreateComputePipelines-flags-00695**
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element.

- **VUID-vkCreateComputePipelines-flags-00696**
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

- **VUID-vkCreateComputePipelines-pipelineCache-02873**
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized.

### Valid Usage (Implicit)

- **VUID-vkCreateComputePipelines-device-parameter**
  device must be a valid VkDevice handle.

- **VUID-vkCreateComputePipelines-pipelineCache-parameter**
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle.

- **VUID-vkCreateComputePipelines-pCreateInfos-parameter**
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkComputePipelineCreateInfo structures.
• VUID-vkCreateComputePipelines-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
  `VkAllocationCallbacks` structure

• VUID-vkCreateComputePipelines-pPipelines-parameter
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles

• VUID-vkCreateComputePipelines-createInfoCount-arraylength
  `createInfoCount` must be greater than 0

• VUID-vkCreateComputePipelines-pipelineCache-parent
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from
  `device`

---

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkComputePipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkPipelineCreateFlags flags;
  VkPipelineShaderStageCreateInfo stage;
  VkPipelineLayout layout;
  VkPipeline basePipelineHandle;
  int32_t basePipelineIndex;
} VkComputePipelineCreateInfo;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
• `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
• `layout` is the description of binding locations used by both the pipeline and descriptor sets used
  with the pipeline.
• `basePipelineHandle` is a pipeline to derive from.
• `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive
  from.
The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in **Pipeline Derivatives**.

### Valid Usage

- **VUID-VkComputePipelineCreateInfo-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` must be a valid handle to a compute `VkPipeline`

- **VUID-VkComputePipelineCreateInfo-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be a valid index into the calling command's `pCreateInfos` parameter

- **VUID-VkComputePipelineCreateInfo-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` must be -1 or `basePipelineHandle` must be `VK_NULL_HANDLE`

- **VUID-VkComputePipelineCreateInfo-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` must match both the shader stage and range

- **VUID-VkComputePipelineCreateInfo-layout-07988**
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` must match the shader stage

- **VUID-VkComputePipelineCreateInfo-layout-07989**
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` must match the descriptor type

- **VUID-VkComputePipelineCreateInfo-layout-07991**
  If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` must match the descriptor count

- **VUID-VkComputePipelineCreateInfo-stage-00701**
  The `stage` member of `stage` must be `VK_SHADER_STAGE_COMPUTE_BIT`

- **VUID-VkComputePipelineCreateInfo-stage-00702**
  The shader code for the entry point identified by `stage` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the [Shader Interfaces](#) chapter

- **VUID-VkComputePipelineCreateInfo-layout-01687**
  The number of resources in `layout` accessible to the compute shader stage must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`

- **VUID-VkComputePipelineCreateInfo-flags-03364**
  `flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

- **VUID-VkComputePipelineCreateInfo-flags-03365**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`

- **VUID-VkComputePipelineCreateInfo-flags-03366**
  `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`
• VUID-VkComputePipelineCreateInfo-flags-03367
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR

• VUID-VkComputePipelineCreateInfo-flags-03368
  flags must not include
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR

• VUID-VkComputePipelineCreateInfo-flags-03369
  flags must not include
  VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR

• VUID-VkComputePipelineCreateInfo-flags-03370
  flags must not include
  VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkComputePipelineCreateInfo-flags-03576
  flags must not include
  VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

• VUID-VkComputePipelineCreateInfo-pipelineCreationCacheControl-02875
  If the pipelineCreationCacheControl feature is not enabled, flags must not include
  VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or
  VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

• VUID-VkComputePipelineCreateInfo-pipelineStageCreationFeedbackCount-06566
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it
  must be 1

---

Valid Usage (Implicit)

• VUID-VkComputePipelineCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO

• VUID-VkComputePipelineCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineCreationFeedbackCreateInfo

• VUID-VkComputePipelineCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkComputePipelineCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits values

• VUID-VkComputePipelineCreateInfo-stage-parameter
  stage must be a valid VkPipelineShaderStageCreateInfo structure

• VUID-VkComputePipelineCreateInfo-layout-parameter
  layout must be a valid VkPipelineLayout handle

• VUID-VkComputePipelineCreateInfo-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkDevice

The VkPipelineShaderStageCreateInfo structure is defined as:
typedef struct VkPipelineShaderStageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineShaderStageCreateFlags flags;
    VkShaderStageFlagBits stage;
    VkShaderModule module;
    const char* pName;
    const VkSpecializationInfo* pSpecializationInfo;
} VkPipelineShaderStageCreateInfo;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineShaderStageCreateFlagBits` specifying how the pipeline shader stage will be generated.
- `stage` is a `VkShaderStageFlagBits` value specifying a single pipeline stage.
- `module` is a `VkShaderModule` object containing the shader code for this stage.
- `pName` is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- `pSpecializationInfo` is a pointer to a `VkSpecializationInfo` structure, as described in `Specialization Constants`, or `NULL`.

The shader code used by the pipeline is defined by `module`.

**Valid Usage**

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the `geometryShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the `tessellationShader` feature is not enabled, `stage` must not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkPipelineShaderStageCreateInfo-stage-00706
  `stage` must not be `VK_SHADER_STAGE_ALL_GRAPHICS`, or `VK_SHADER_STAGE_ALL`

- VUID-VkPipelineShaderStageCreateInfo-pName-00707
  `pName` must be the name of an `OpEntryPoint` in `module` with an execution model that matches `stage`

- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
  If the identified entry point includes any variable in its interface that is declared with the `ClipDistance` `BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxClipDistances`

- VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709
If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxCullDistances`.

- **VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710**
  If the identified entry point includes any variables in its interface that are declared with the `ClipDistance` or `CullDistance BuiltIn` decoration, those variables must not have array sizes which sum to more than `VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances`.

- **VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711**
  If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable must not have an array size greater than `VkPhysicalDeviceLimits::maxSampleMaskWords`.

- **VUID-VkPipelineShaderStageCreateInfo-stage-00712**
  If `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, the identified entry point must not include any input variable in its interface that is decorated with `CullDistance`.

- **VUID-VkPipelineShaderStageCreateInfo-stage-00713**
  If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size must be greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

- **VUID-VkPipelineShaderStageCreateInfo-stage-00714**
  If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point must have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`.

- **VUID-VkPipelineShaderStageCreateInfo-stage-02596**
  If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it must write the same value to `Layer` for all vertices of a given primitive.

- **VUID-VkPipelineShaderStageCreateInfo-stage-02597**
  If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it must write the same value to `ViewportIndex` for all vertices of a given primitive.

- **VUID-VkPipelineShaderStageCreateInfo-stage-00718**
  If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point must not include any output variables in its interface decorated with `CullDistance`.

- **VUID-VkPipelineShaderStageCreateInfo-stage-06685**
  If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations...
must either discard the fragment, or write or initialize the value of $FragDepth$

- VUID-VkPipelineShaderStageCreateInfo-flags-02784
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARIABLE_SUBGROUP_SIZE_BIT flag set, the subgroupSizeControl feature must be enabled.

- VUID-VkPipelineShaderStageCreateInfo-flags-02785
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the computeFullSubgroups feature must be enabled.

- VUID-VkPipelineShaderStageCreateInfo-flags-08989
  If flags includes VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT, stage must be VK_SHADER_STAGE_COMPUTE_BIT.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02754
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, flags must not have the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARIABLE_SUBGROUP_SIZE_BIT flag set.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02755
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the subgroupSizeControl feature must be enabled, and stage must be a valid bit specified in requiredSubgroupSizeStages.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02756
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain and stage is VK_SHADER_STAGE_COMPUTE_BIT, the local workgroup size of the shader must be less than or equal to the product of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize and maxComputeWorkgroupSubgroups.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02757
  If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain and flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set, the local workgroup size in the X dimension of the pipeline must be a multiple of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02758
  If flags has both the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT and VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARIABLE_SUBGROUP_SIZE_BIT flags set, the local workgroup size in the X dimension of the pipeline must be a multiple of maxSubgroupSize.

- VUID-VkPipelineShaderStageCreateInfo-pNext-02759
  If flags has the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag set and flags does not have the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARIABLE_SUBGROUP_SIZE_BIT flag set and no VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain, the local workgroup size in the X dimension of the pipeline must be a multiple of subgroupSize.

- VUID-VkPipelineShaderStageCreateInfo-module-08987
  If module uses the OpTypeCooperativeMatrixKHR instruction with a Scope equal to Subgroup, then the local workgroup size in the X dimension of the pipeline must be a multiple of subgroupSize.
- VUID-VkPipelineShaderStageCreateInfo-module-06716
  module must be a valid VkShaderModule

- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06719
  The shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants

## Valid Usage (Implicit)

- VUID-VkPipelineShaderStageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO

- VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineShaderStageResolvedSubgroupSizeCreateInfo or VkShaderModuleCreateInfo

- VUID-VkPipelineShaderStageCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPipelineShaderStageCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineShaderStageCreateFlagBits values

- VUID-VkPipelineShaderStageCreateInfo-stage-parameter
  stage must be a valid VkShaderStageFlagBits value

- VUID-VkPipelineShaderStageCreateInfo-module-parameter
  If module is not VK_NULL_HANDLE, module must be a valid VkShaderModule handle

- VUID-VkPipelineShaderStageCreateInfo-pName-parameter
  pName must be a null-terminated UTF-8 string

- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
  If pSpecializationInfo is not NULL, pSpecializationInfo must be a valid pointer to a valid VkSpecializationInfo structure

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateInfoFlags;
```

VkPipelineShaderStageCreateInfoFlags is a bitmask type for setting a mask of zero or more VkPipelineShaderStageCreateFlagBits.

Possible values of the flags member of VkPipelineShaderStageCreateInfo specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {

    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
```

496
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT specifies that the SubgroupSize may vary in the shader stage.

VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT specifies that the subgroup sizes must be launched with all invocations active in the compute stage.

Note
If VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT and VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT are specified and minSubgroupSize does not equal maxSubgroupSize and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of SubgroupSize is to make it a multiple of maxSubgroupSize. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which can be set by commands and structures, specifying one or more shader stages, are:

VK_SHADER_STAGE_VERTEX_BIT specifies the vertex stage.

VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT specifies the tessellation control stage.

VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT specifies the tessellation evaluation stage.
• **VK_SHADER_STAGE_GEOMETRY_BIT** specifies the geometry stage.
• **VK_SHADER_STAGE_FRAGMENT_BIT** specifies the fragment stage.
• **VK_SHADER_STAGE_COMPUTE_BIT** specifies the compute stage.
• **VK_SHADER_STAGE_ALL_GRAPHICS** is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
• **VK_SHADER_STAGE_ALL** is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
• **VK_SHADER_STAGE_RAYGEN_BIT_KHR** specifies the ray generation stage.
• **VK_SHADER_STAGE_ANY_HIT_BIT_KHR** specifies the any-hit stage.
• **VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR** specifies the closest hit stage.
• **VK_SHADER_STAGE_MISS_BIT_KHR** specifies the miss stage.
• **VK_SHADER_STAGE_INTERSECTION_BIT_KHR** specifies the intersection stage.
• **VK_SHADER_STAGE_CALLABLE_BIT_KHR** specifies the callable stage.

                  Note

**VK_SHADER_STAGE_ALL_GRAPHICS** only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not have the desired effect in all cases.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;

VkShaderStageFlags is a bitmask type for setting a mask of zero or more VkShaderStageFlagBits.

The VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **requiredSubgroupSize** is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure is included in the pNext chain of VkPipelineShaderStageCreateInfo, it specifies that the pipeline shader stage being compiled has a required subgroup size.
Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  requiredSubgroupSize must be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
  requiredSubgroupSize must be greater or equal to minSubgroupSize
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
  requiredSubgroupSize must be less than or equal to maxSubgroupSize

Valid Usage (Implicit)

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType
  sType must be
  VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO

10.2. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkGraphicsPipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- `device` is the logical device that creates the graphics pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting graphics
pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

### Valid Usage

- **VUID-vkCreateGraphicsPipelines-flags-00720**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not -1, `basePipelineIndex` must be less than the index into `pCreateInfos` that corresponds to that element.

- **VUID-vkCreateGraphicsPipelines-flags-00721**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-02876**
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

### Note

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` on `flags` for any element of `pCreateInfos` while passing `VK_NULL_HANDLE` for `pipelineCache`.

### Valid Usage (Implicit)

- **VUID-vkCreateGraphicsPipelines-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCreateGraphicsPipelines-pipelineCache-parameter**
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.

- **VUID-vkCreateGraphicsPipelines-pCreateInfos-parameter**
  `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkGraphicsPipelineCreateInfo` structures.

- **VUID-vkCreateGraphicsPipelines-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkCreateGraphicsPipelines-pPipelines-parameter**
  `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.

- **VUID-vkCreateGraphicsPipelines-createInfoCount-arraylength**
  `createInfoCount` must be an ic array length.
createInfoCount must be greater than 0

- VUID-vkCreateGraphicsPipelines-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkGraphicsPipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of **stageCount** VkPipelineShaderStageCreateInfo structures
describing the set of the shader stages to be included in the graphics pipeline.

- `pVertexInputState` is a pointer to a `VkPipelineVertexInputStateCreateInfo` structure.
- `pInputAssemblyState` is a pointer to a `VkPipelineInputAssemblyStateCreateInfo` structure which determines input assembly behavior for vertex shading, as described in Drawing Commands.
- `pTessellationState` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure defining tessellation state used by tessellation shaders.
- `pViewportState` is a pointer to a `VkPipelineViewportStateCreateInfo` structure defining viewport state used when rasterization is enabled.
- `pRasterizationState` is a pointer to a `VkPipelineRasterizationStateCreateInfo` structure defining rasterization state.
- `pMultisampleState` is a pointer to a `VkPipelineMultisampleStateCreateInfo` structure defining multisample state used when rasterization is enabled.
- `pDepthStencilState` is a pointer to a `VkPipelineDepthStencilStateCreateInfo` structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering.
- `pColorBlendState` is a pointer to a `VkPipelineColorBlendStateCreateInfo` structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering.
- `pDynamicState` is a pointer to a `VkPipelineDynamicStateCreateInfo` structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.

- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `renderPass` is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- `subpass` is the index of the subpass in the render pass where this pipeline will be used.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

**Vertex Input State**

Vertex input state is defined by:

- `VkPipelineVertexInputStateCreateInfo`
- `VkPipelineInputAssemblyStateCreateInfo`
This state must be specified to create a complete graphics pipeline.

**Pre-Rasterization Shader State**

Pre-rasterization shader state is defined by:

- `VkPipelineShaderStageCreateInfo` entries for:
  - Vertex shaders
  - Tessellation control shaders
  - Tessellation evaluation shaders
  - Geometry shaders
- Within the `VkPipelineLayout`, the full pipeline layout must be specified.
- `VkPipelineViewportStateCreateInfo`
- `VkPipelineRasterizationStateCreateInfo`
- `VkPipelineTessellationStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`

This state must be specified to create a complete graphics pipeline.

**Fragment Shader State**

Fragment shader state is defined by:

- A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
- Within the `VkPipelineLayout`, the full pipeline layout must be specified.
- `VkPipelineMultisampleStateCreateInfo` if `sample shading` is enabled or `renderpass` is not `VK_NULL_HANDLE`
- `VkPipelineDepthStencilStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag

If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state must be specified to create a complete graphics pipeline.

**Fragment Output State**

Fragment output state is defined by:

- `VkPipelineColorBlendStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
• VkPipelineMultisampleStateCreateInfo
• VkPipelineRenderingCreateInfo

If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state **must** be specified to create a complete graphics pipeline.

**Dynamic State**

Dynamic state values set via `pDynamicState` **must** be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. For example, if a pipeline only included pre-rasterization shader state, then any dynamic state value corresponding to depth or stencil testing has no effect.

**Complete Graphics Pipelines**

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state as specified in the above sections.

---

**Valid Usage**

- VUID-VkGraphicsPipelineCreateInfo-flags-07984
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid handle to a graphics `VkPipeline`

- VUID-VkGraphicsPipelineCreateInfo-flags-07985
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter

- VUID-VkGraphicsPipelineCreateInfo-flags-07986
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be `VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-layout-07987
  If a push constant block is declared in a shader, a push constant range in `layout` **must** match both the shader stage and range

- VUID-VkGraphicsPipelineCreateInfo-layout-07988
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the shader stage

- VUID-VkGraphicsPipelineCreateInfo-layout-07989
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the descriptor type

- VUID-VkGraphicsPipelineCreateInfo-layout-07991
  If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` **must** match the descriptor count

- VUID-VkGraphicsPipelineCreateInfo-stage-00727
  If the pipeline requires pre-rasterization shader state the `stage` member of one element of `pStages` **must** be `VK_SHADER_STAGE_VERTEX_BIT`

- VUID-VkGraphicsPipelineCreateInfo-pStages-00729
If the pipeline requires **pre-rasterization shader state** and **pStages** includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00730**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00731**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes a tessellation control shader stage and a tessellation evaluation shader stage, **pTessellationState** **must** be a valid pointer to a valid **VkPipelineTessellationStateCreateInfo** structure.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00732**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, the shader code of at least one stage **must** contain an **OpExecutionMode** instruction specifying the type of subdivision in the pipeline.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00733**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, and the shader code of both stages contain an **OpExecutionMode** instruction specifying the type of subdivision in the pipeline, they **must** both specify the same subdivision mode.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00734**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, the shader code of at least one stage **must** contain an **OpExecutionMode** instruction specifying the output patch size in the pipeline.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00735**
  If the pipeline requires **pre-rasterization shader state** and **pStages** includes tessellation shader stages, and the shader code of both contain an **OpExecutionMode** instruction specifying the output patch size in the pipeline, they **must** both specify the same patch size.

- **VUID-VkGraphicsPipelineCreateInfo-Vertex-07722**
  If the pipeline is being created with a **Vertex Execution Model** and no **TessellationEvaluation** or **Geometry Execution Model**, and the **topology** member of **pInputAssembly** **must** be **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**.

- **VUID-VkGraphicsPipelineCreateInfo-Vertex-07723**
  If the pipeline is being created with a **TessellationEvaluation Execution Model**, no **Geometry Execution Model**, uses the **PointSize** **Execution Model**, and shaderTessellationAndGeometryPointSize is enabled, a **PointSize** decorated variable **must** be written to.

- **VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723**
  If there is a tessellation shader stage, the **topology** member of **pInputAssembly** **must** be **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**.
If the pipeline is being created with a **TessellationEvaluation Execution Model**, no **Geometry Execution Model**, uses the **PointMode Execution Mode**, and **shaderTessellationAndGeometryPointSize** is not enabled, a **PointSize** decorated variable **must** not be written to.

If the pipeline is being created with a **Geometry Execution Model**, uses the **OutputPoints Execution Mode**, and **shaderTessellationAndGeometryPointSize** is enabled, a **PointSize** decorated variable **must** be written to for every vertex emitted.

If the pipeline is being created with a **Geometry Execution Model**, uses the **OutputPoints Execution Mode**, and **shaderTessellationAndGeometryPointSize** is not enabled, a **PointSize** decorated variable **must** not be written to.

If the pipeline requires **pre-rasterization shader state** and **pStages** includes a geometry shader stage, and does not include any tessellation shader stages, its shader code **must** contain an **OpExecutionMode** instruction specifying an input primitive type that is **compatible** with the primitive topology specified in **pInputAssembly**.

If the pipeline requires **pre-rasterization shader state** and **pStages** includes a geometry shader stage, and also includes tessellation shader stages, its shader code **must** contain an **OpExecutionMode** instruction specifying an input primitive type that is **compatible** with the primitive topology that is output by the tessellation stages.

If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, it includes both a fragment shader and a geometry shader, and the fragment shader code reads from an input variable that is decorated with **PrimitiveId**, then the geometry shader code **must** write to a matching output variable, decorated with **PrimitiveId**, in all execution paths.

If **renderPass** is not **VK_NULL_HANDLE** and the pipeline is being created with **fragment shader state** the fragment shader **must** not read from any input attachment that is defined as **VK_ATTACHMENT_UNUSED** in **subpass**.

If the pipeline requires **pre-rasterization shader state** and multiple pre-rasterization shader stages are included in **pStages**, the shader code for the entry points identified by those **pStages** and the rest of the state identified by this structure **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter.

If the pipeline requires **pre-rasterization shader state** and **fragment shader state**, the fragment shader and last **pre-rasterization shader stage** and any relevant state **must** adhere to the pipeline linking rules described in the **Shader Interfaces** chapter.

If **renderPass** is not **VK_NULL_HANDLE**, and the pipeline is being created with **fragment shader state**...
output interface state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-07609**
  If renderPass is not VK_NULL_HANDLE, and the pipeline is being created with fragment output interface state, and the pColorBlendState pointer is not NULL, and the subpass uses color attachments, the attachmentCount member of pColorBlendState must be equal to the colorAttachmentCount used to create subpass.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130**
  If the pipeline requires pre-rasterization shader state, and pViewportState->pViewports is not dynamic, then pViewportState->pViewports must be a valid pointer to an array of valid VkViewport structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131**
  If the pipeline requires pre-rasterization shader state, and pViewportState->pScissors is not dynamic, then pViewportState->pScissors must be a valid pointer to an array of valid VkRect2D structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749**
  If the pipeline requires pre-rasterization shader state, and the wideLines feature is not enabled, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_WIDTH, the lineWidth member of pRasterizationState must be 1.0.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00750**
  If the pipeline requires pre-rasterization shader state, and the rasterizerDiscardEnable member of pRasterizationState is VK_FALSE, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-pViewportState-04892**
  If the pipeline requires pre-rasterization shader state, and the graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00751**
  If the pipeline requires fragment output interface state, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891**
  If the pipeline is being created with fragment shader state, the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06043**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06044**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130**
  If the pipeline requires pre-rasterization shader state, and pViewportState->pViewports is not dynamic, then pViewportState->pViewports must be a valid pointer to an array of valid VkViewport structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131**
  If the pipeline requires pre-rasterization shader state, and pViewportState->pScissors is not dynamic, then pViewportState->pScissors must be a valid pointer to an array of valid VkRect2D structures.

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749**
  If the pipeline requires pre-rasterization shader state, and the wideLines feature is not enabled, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_WIDTH, the lineWidth member of pRasterizationState must be 1.0.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00750**
  If the pipeline requires pre-rasterization shader state, and the rasterizerDiscardEnable member of pRasterizationState is VK_FALSE, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-pViewportState-04892**
  If the pipeline requires pre-rasterization shader state, and the graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-00751**
  If the pipeline requires fragment output interface state, pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891**
  If the pipeline is being created with fragment shader state, the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06043**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure.

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06044**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.
interface state, and subpass uses color attachments, **pColorBlendState must** be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754**
  - If the pipeline requires **pre-rasterization shader state**, the `depthBiasClamp` feature is not enabled, no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BIAS`, and the `depthBiasEnable` member of `pRasterizationState` is `VK_TRUE`, the `depthBiasClamp` member of `pRasterizationState` **must** be `0.0`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00755**
  - If the pipeline requires **fragment shader state**, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_DEPTH_BOUNDS`, and the `depthBoundsTestEnable` member of `pDepthStencilState` is `VK_TRUE`, the `minDepthBounds` and `maxDepthBounds` members of `pDepthStencilState` **must** be between `0.0` and `1.0`, inclusive

- **VUID-VkGraphicsPipelineCreateInfo-subpass-00758**
  - If the pipeline requires **fragment output interface state**, `rasterizationSamples` is not dynamic, and `subpass` does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` member of `pMultisampleState` **must** follow the rules for a zero-attachment subpass

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06046**
  - If `renderPass` is not `VK_NULL_HANDLE`, `subpass` **must** be a valid subpass within `renderPass`

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06047**
  - If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with **pre-rasterization shader state**, `subpass` viewMask is not `0`, and `multiviewTessellationShader` is not enabled, then `pStages` **must** not include tessellation shaders

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06048**
  - If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with **pre-rasterization shader state**, `subpass` viewMask is not `0`, and `multiviewGeometryShader` is not enabled, then `pStages` **must** not include a geometry shader

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06049**
  - If `renderPass` is not `VK_NULL_HANDLE`, the pipeline is being created with **pre-rasterization shader state**, and `subpass` viewMask is not `0`, all of the shaders in the pipeline **must** not write to the Layer built-in output

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06050**
  - If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with **pre-rasterization shader state**, and `subpass` viewMask is not `0`, then all of the shaders in the pipeline **must** not include variables decorated with the Layer built-in decoration in their interfaces

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-07717**
  - If `renderPass` is not `VK_NULL_HANDLE` and the pipeline is being created with **pre-rasterization shader state**, and `subpass` viewMask is not `0`, then all of the shaders in the pipeline **must** not include variables decorated with the ViewMask built-in decoration in their interfaces

- **VUID-VkGraphicsPipelineCreateInfo-flags-00764**
  - **flags must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag
• VUID-VkGraphicsPipelineCreateInfo-pStages-01565
If the pipeline requires fragment shader state and an input attachment was referenced by an aspectMask at renderPass creation time, the fragment shader must only read from the aspects that were specified for that input attachment.

• VUID-VkGraphicsPipelineCreateInfo-layout-01688
The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources.

• VUID-VkGraphicsPipelineCreateInfo-pStages-02097
If the pipeline requires vertex input state, and pVertexInputState is not dynamic, then pVertexInputState must be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure.

• VUID-VkGraphicsPipelineCreateInfo-Input-07904
If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription::location.

• VUID-VkGraphicsPipelineCreateInfo-Input-08733
If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription::format.

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929
If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

• VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930
If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format must have a 64-bit component.

• VUID-VkGraphicsPipelineCreateInfo-pStages-02098
If the pipeline requires vertex input state, pInputAssemblyState must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

• VUID-VkGraphicsPipelineCreateInfo-flags-03371
flags must not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR.

• VUID-VkGraphicsPipelineCreateInfo-flags-03372
flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR.

• VUID-VkGraphicsPipelineCreateInfo-flags-03373
flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR.

• VUID-VkGraphicsPipelineCreateInfo-flags-03374
flags must not include VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR.
- **VUID-VkGraphicsPipelineCreateInfo-flags-03375**
  
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03376**
  
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03377**
  
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03577**
  
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378**
  
  If the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_STENCIL_OP`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379**
  
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380**
  
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount` must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132**
  
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_VIEWPORT` must not be present

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133**
  
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `VK_DYNAMIC_STATE_SCISSOR` must not be present

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868**
  
  If the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`, `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`, or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869**
  
  If the `extendedDynamicState2LogicOp` feature is not enabled, there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
If the `extendedDynamicState2PatchControlPoints` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`.

If the `pipelineCreationCacheControl` feature is not enabled, flags **must not** include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must be** greater than or equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must be** greater than or equal to 1.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must be** a power-of-two value.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must be** a power-of-two value.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` **must be** less than or equal to 4.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must be** less than or equal to 4.

If the pipeline requires pre-rasterization shader state or fragment shader state and `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `pipelineFragmentShadingRate` feature is not enabled, `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width` and `VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height` **must both be** equal to 1.
• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
  If the pipeline requires pre-rasterization shader state or fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0]` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
  If the pipeline requires pre-rasterization shader state or fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` must be a valid `VkFragmentShadingRateCombinerOpKHR` value.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
  If the pipeline requires pre-rasterization shader state or fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `primitiveFragmentShadingRate` feature is not enabled,
  `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
  If the pipeline requires pre-rasterization shader state or fragment shader state and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, and the `attachmentFragmentShadingRate` feature is not enabled,
  `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

• VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
  If the pipeline requires pre-rasterization shader state and the
  `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported,
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is not included in `pDynamicState->pDynamicStates`, and
  `VkPipelineViewportStateCreateInfo::viewportCount` is greater than 1, entry points specified in `pStages` must not write to the `PrimitiveShadingRateKHR` built-in.

• VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504
  If the pipeline requires pre-rasterization shader state and the
  `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and entry points specified in `pStages` write to the `ViewportIndex` built-in, they must not also write to the `PrimitiveShadingRateKHR` built-in.

• VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506
  If the pipeline requires pre-rasterization shader state or fragment shader state, the
  `fragmentShadingRateNonTrivialCombinerOps` limit is not supported, and
  `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` is not included in `pDynamicState->pDynamicStates`, elements of `VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578
  All elements of the `pDynamicStates` member of `pDynamicState` must not be
  `VK_DYNAMIC_STATERAY TRACING_PIPELINE_STACK_SIZE_KHR`.
If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, **renderPass must** be **VK_NULL_HANDLE** or a valid render pass object.

If the **dynamicRendering** feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, **renderPass must** not be **VK_NULL_HANDLE**.

If the **multiview** feature is not enabled, the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and **renderPass is VK_NULL_HANDLE**, **VkPipelineRenderingCreateInfo::viewMask must be 0**.

If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and **renderPass is VK_NULL_HANDLE**, the index of the most significant bit in **VkPipelineRenderingCreateInfo::viewMask must be** less than **maxMultiviewViewCount**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, and **VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0**, **VkPipelineRenderingCreateInfo::pColorAttachmentFormats must** be a valid pointer to an array of **colorAttachmentCount valid VkFormat values**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, each element of **VkPipelineRenderingCreateInfo::pColorAttachmentFormats must** be a valid **VkFormat value**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, and any element of **VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED**, that format must be a format with potential format features that include **VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, **VkPipelineRenderingCreateInfo::depthAttachmentFormat must be** a valid **VkFormat value**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, **VkPipelineRenderingCreateInfo::stencilAttachmentFormat must be** a valid **VkFormat value**.

If the pipeline requires fragment output interface state, and **renderPass is VK_NULL_HANDLE**, and **VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED**, it must be a format with potential format features that include **VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT**.
If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format with potential format features that include VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a depth component.

If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, it must be a format that includes a stencil component.

If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::depthAttachmentFormat is not VK_FORMAT_UNDEFINED, and VkPipelineRenderingCreateInfo::stencilAttachmentFormat is not VK_FORMAT_UNDEFINED, depthAttachmentFormat must equal stencilAttachmentFormat.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment shader state and fragment output interface state, and either of VkPipelineRenderingCreateInfo::depthAttachmentFormat or VkPipelineRenderingCreateInfo::stencilAttachmentFormat are not VK_FORMAT_UNDEFINED, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not equal to 0, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure.

If renderPass is VK_NULL_HANDLE and the pipeline is being created with fragment output interface state, pColorBlendState->attachmentCount must be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewTessellationShader feature is not enabled, then pStages must not include tessellation shaders.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages must not include a geometry shader.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages must not include a geometry shader.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages must not include a geometry shader.

If renderPass is VK_NULL_HANDLE, the pipeline is being created with pre-rasterization shader state, VkPipelineRenderingCreateInfo::viewMask is not 0, and the multiviewGeometryShader feature is not enabled, then pStages must not include a geometry shader.
If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, all of the shaders in the pipeline must not write to the `Layer` built-in output

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06059**
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, all of the shaders in the pipeline must not include variables decorated with the `Layer` built-in decoration in their interfaces

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-07719**
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, all of the shaders in the pipeline must not include variables decorated with the `ViewIndex` built-in decoration in their interfaces

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06061**
  If the pipeline requires fragment shader state and `renderPass` is `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include the `InputAttachment` capability

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06062**
  If the pipeline requires fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, for each color attachment format defined by the `pColorAttachmentFormats` member of `VkPipelineRenderingCreateInfo`, if its potential format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594**
  If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be equal to `stageCount`

- **VUID-VkGraphicsPipelineCreateInfo-pStages-06600**
  If the pipeline requires pre-rasterization shader state or fragment shader state, `pStages` must be a valid pointer to an array of `stageCount` valid `VkPipelineShaderStageCreateInfo` structures

- **VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601**
  If the pipeline requires pre-rasterization shader state, `pRasterizationState` must be a valid pointer to a valid `VkPipelineRasterizationStateCreateInfo` structure

- **VUID-VkGraphicsPipelineCreateInfo-layout-06602**
  If the pipeline requires fragment shader state or pre-rasterization shader state, `layout` must be a valid `VkPipelineLayout` handle

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-06603**
  If pre-rasterization shader state, fragment shader state, or fragment output state, and `renderPass` is not `VK_NULL_HANDLE`, `renderPass` must be a valid `VkRenderPass` handle

- **VUID-VkGraphicsPipelineCreateInfo-stageCount-06604**
  If the pipeline requires pre-rasterization shader state or fragment shader state, `stageCount` must be greater than 0

- **VUID-VkGraphicsPipelineCreateInfo-pStages-06894**
If the pipeline requires pre-rasterization shader state but not fragment shader state, elements of `pStages` must not have `stage` set to `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkGraphicsPipelineCreateInfo-pStages-06895
  If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of `pStages` must not have `stage` set to a shader stage which participates in pre-rasterization

- VUID-VkGraphicsPipelineCreateInfo-pStages-06896
  If the pipeline requires pre-rasterization shader state, all elements of `pStages` must have a `stage` set to a shader stage which participates in fragment shader state or pre-rasterization shader state

- VUID-VkGraphicsPipelineCreateInfo-stage-06897
  If the pipeline requires fragment shader state but not pre-rasterization shader state, any value of `stage` must not be set in more than one element of `pStages`

- VUID-VkGraphicsPipelineCreateInfo-renderPass-08744
  If `renderPass` is `VK_NULL_HANDLE`, the pipeline requires fragment output state or fragment shader state, the pipeline enables sample shading, `rasterizationSamples` is not dynamic, and the `pNext` chain includes a `VkPipelineRenderingCreateInfo` structure, `rasterizationSamples` must be a bit value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits) for every element of `depthAttachmentFormat`, `stencilAttachmentFormat` and the `pColorAttachmentFormats` array which is not `VK_FORMAT_UNDEFINED`

- VUID-VkGraphicsPipelineCreateInfo-None-08893
  The pipeline must be created with pre-rasterization shader state

- VUID-VkGraphicsPipelineCreateInfo-pStages-08894
  If `pStages` includes a vertex shader stage, the pipeline must be created with vertex input state

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-08896
  If `pDynamicState->pDynamicStates` includes `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`, or if it does not and `pRasterizationState->rasterizerDiscardEnable` is `VK_FALSE`, the pipeline must be created with fragment shader state and fragment output interface state

- VUID-VkGraphicsPipelineCreateInfo-None-09043
  If the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the `colorWriteMask` member of the corresponding element of `pColorBlendState->pAttachments` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them

**Valid Usage (Implicit)**

- VUID-VkGraphicsPipelineCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO`

- VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkAttachmentSampleCountInfoAMD`,

516
The `VkPipelineRenderingCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewMask` is the viewMask used for rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments used in this pipeline.
- `depthAttachmentFormat` is a `VkFormat` value defining the format of the depth attachment used in this pipeline.
- `stencilAttachmentFormat` is a `VkFormat` value defining the format of the stencil attachment used in this pipeline.
When a pipeline is created without a `VkRenderPass`, if the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a `VkRenderPass`, `viewMask` and `colorAttachmentCount` are 0, and `depthAttachmentFormat` and `stencilAttachmentFormat` are `VK_FORMAT_UNDEFINED`. If a graphics pipeline is created with a valid `VkRenderPass`, parameters of this structure are ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to `NULL` when beginning rendering.

### Valid Usage (Implicit)

- `VUID-VkPipelineRenderingCreateInfo-sType-sType`  
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RENDERING_CREATE_INFO`  

Bits which can be set in

- `VkGraphicsPipelineCreateInfo::flags`
- `VkComputePipelineCreateInfo::flags`
- `VkRayTracingPipelineCreateInfoKHR::flags`

specify how a pipeline is created, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {
    VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
    VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,
    VK_PIPELINE_CREATE_DERIVATIVE_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_PIPELINE_CREATE_DISPATCH_BASE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT = 0x00000100,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT = 0x00000200,
    // Provided by VK_KHR_dynamic_rendering with VK_KHR_fragment_shading_rate
    VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_dynamic_rendering with VK_EXT_fragment_density_map
    VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00400000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR = 0x00004000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR = 0x00008000
}
```
VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT spe­cifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT spec­i­fies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

VK_PIPELINE_CREATE_DERIVATIVE_BIT spec­i­fies that the pipeline to be created will be a child of a previously created parent pipeline.

VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT spec­i­fies that any shader input variables decorated as ViewIndex will be assigned values as if they were decorated as DeviceIndex.

VK_PIPELINE_CREATE_DISPATCH_BASE spec­i­fies that a compute pipeline can be used with vkCmdDispatchBase with a non-zero base workgroup.

VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR spec­i­fies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR spec­i­fies that the shader
compiler should capture the internal representations of pipeline executables produced by the
compile process which can later be retrieved by calling
vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag must not affect
the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation
time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee
that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR
from each library, and any linked pipelines, separately.

- **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline cannot be used directly, and
  instead defines a pipeline library that can be combined with other pipelines using the
  VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing pipelines.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit
  shader will always be present when an any-hit shader would be executed. A NULL any-hit
  shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader
  group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit
  shader will always be present when a closest hit shader would be executed. A NULL closest hit
  shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader
  group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will
  always be present when a miss shader would be executed. A NULL miss shader is a miss shader
  which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of
  zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an
  intersection shader will always be present when an intersection shader would be executed. A NULL
  intersection shader is an intersection shader which is effectively VK_SHADER_UNUSED_KHR,
  such as from a shader group consisting entirely of zeros.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be
  skipped during traversal using OpTraceRayKHR.

- **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR** specifies that AABB primitives will be
  skipped during traversal using OpTraceRayKHR.

- **VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the
  shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and
  replay).

- **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** specifies that pipeline creation will
  fail if a compile is required for creation of a valid VkPipeline object; VK_PIPELINE_COMPILE_REQUIRED
  will be returned by pipeline creation, and the VkPipeline will be set to VK_NULL_HANDLE.

- When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT** specifies
  that control will be returned to the application if any individual pipeline returns a result which
  is not VK_SUCCESS rather than continuing to create additional pipelines.

- **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the
  pipeline will be used with a fragment shading rate attachment and dynamic rendering.

It is valid to set both **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** and
VK_PIPELINE_CREATE_DERIVATIVE_BIT. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

VkPipelineCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.

The VkPipelineDynamicStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `dynamicStateCount` is the number of elements in the `pDynamicStates` array.
- `pDynamicStates` is a pointer to an array of VkDynamicState values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

**Valid Usage**

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of `pDynamicStates` must be unique

**Valid Usage (Implicit)**

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  `pNext` must be NULL
- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  `flags` must be 0
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If `dynamicStateCount` is not 0, `pDynamicStates` must be a valid pointer to an array of
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;

VkPipelineDynamicStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the VkPipelineDynamicStateCreateInfo::pDynamicStates property of the currently active pipeline, each of whose elements must be one of the values:

// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
    VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
    VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
    VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
    VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_CULL_MODE = 1000267000,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_FRONT_FACE = 1000267001,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY = 1000267002,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT = 1000267003,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT = 1000267004,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE = 1000267005,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE = 1000267006,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE = 1000267007,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTHCOMPARE_OP = 1000267008,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE = 1000267009,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE = 1000267010,
    // Provided by VK_VERSION_1_3
    VK_DYNAMIC_STATE_STENCILOP = 1000267011,
} VkDynamicState;
• **VK_DYNAMIC_STATE_VIEWPORT** specifies that the pViewports state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetViewport before any drawing commands. The number of viewports used by a pipeline is still specified by the viewportCount member of VkPipelineViewportStateCreateInfo.

• **VK_DYNAMIC_STATE_SCISSOR** specifies that the pScissors state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetScissor before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the scissorCount member of VkPipelineViewportStateCreateInfo.

• **VK_DYNAMIC_STATE_LINE_WIDTH** specifies that the lineWidth state in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetLineWidth before any drawing commands that generate line primitives for the rasterizer.

• **VK_DYNAMIC_STATE_DEPTH_BIAS** specifies that the depthBiasConstantFactor, depthBiasClamp and depthBiasSlopeFactor states in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetDepthBias before any draws are performed with depth bias enabled.

• **VK_DYNAMIC_STATE_BLEND_CONSTANTS** specifies that the blendConstants state in VkPipelineColorBlendStateCreateInfo will be ignored and must be set dynamically with vkCmdSetBlendConstants before any draws are performed with a pipeline state with VkPipelineColorBlendAttachmentState member blendEnable set to VK_TRUE and any of the blend functions using a constant blend color.

• **VK_DYNAMIC_STATE_DEPTH_BOUNDS** specifies that the minDepthBounds and maxDepthBounds states of VkPipelineDepthStencilStateCreateInfo will be ignored and must be set dynamically with vkCmdSetDepthBounds before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member depthBoundsTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK** specifies that the compareMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and must be set dynamically with vkCmdSetStencilCompareMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.

• **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the writeMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and must be set dynamically with vkCmdSetStencilWriteMask before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE.
• **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the reference state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and **must** be set dynamically with `vkCmdSetStencilReference` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_CULL_MODE** specifies that the cullMode state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetCullMode` before any drawing commands.

• **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the frontFace state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetFrontFace` before any drawing commands.

• **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the topology state in `VkPipelineInputAssemblyStateCreateInfo` only specifies the topology class, and the specific topology order and adjacency **must** be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.

• **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the viewportCount and pViewports state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetViewportWithCount` before any draw call.

• **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the scissorCount and pScissors state in `VkPipelineViewportStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetScissorWithCount` before any draw call.

• **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the stride state in `VkVertexInputBindingDescription` will be ignored and **must** be set dynamically with `vkCmdBindVertexBuffers2` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the depthTestEnable state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthTestEnable` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the depthWriteEnable state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthWriteEnable` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the depthCompareOp state in `VkPipelineDepthStencilStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthCompareOp` before any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to **VK_TRUE**.

• **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the rasterizerDiscardEnable state in `
**VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetRasterizerDiscardEnable** before any drawing commands.

- **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the **depthBiasEnable** state in **VkPipelineRasterizationStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetDepthBiasEnable** before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the **primitiveRestartEnable** state in **VkPipelineInputAssemblyStateCreateInfo** will be ignored and **must** be set dynamically with **vkCmdSetPrimitiveRestartEnable** before any drawing commands.

- **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in **VkPipelineFragmentShadingRateStateCreateInfoKHR** will be ignored and **must** be set dynamically with **vkCmdSetFragmentShadingRateKHR** before any drawing commands.

- **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with **vkCmdSetRayTracingPipelineStackSizeKHR** before any ray tracing calls are performed.

### 10.2.1. Valid Combinations of Stages for Graphics Pipelines

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by **Fragment Operations** state. This **can** be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid **VkPipelineShaderStageCreateInfo** with **module** and **pName** selecting an entry point from a shader module, where that entry point is valid for the stage specified by **stage**.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

**For example:**

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
    - **VkPipelineVertexInputStateCreateInfo**
    - **VkPipelineInputAssemblyStateCreateInfo**
    - **VkPipelineViewportStateCreateInfo**
    - **VkPipelineRasterizationStateCreateInfo**
    - **VkPipelineMultisampleStateCreateInfo**
- VkPipelineDepthStencilStateCreateInfo

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with tessellation and geometry shaders
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Tessellation Control Shader
    - Tessellation Evaluation Shader
    - Geometry Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineTessellationStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineDepthStencilStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo

10.3. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

VK_SHADER_UNUSED_KHR is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.
To create ray tracing pipelines, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(
    VkDevice device,              // Logical device
    VkDeferredOperationKHR deferredOperation,  // Request deferral object
    VkPipelineCache pipelineCache,  // Pipeline cache
    uint32_t createInfoCount,  // Number of createInfos
    const VkRayTracingPipelineCreateInfoKHR* pCreateInfos,  // Pipeline create info
    const VkAllocationCallbacks* pAllocator,  // Host memory allocator
    VkPipeline* pPipelines);  // Anti aliasing
```

- `device` is the logical device that creates the ray tracing pipelines.
- `deferredOperation` is `VK_NULL_HANDLE` or the handle of a valid `VkDeferredOperationKHR` request deferral object for this command.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkRayTracingPipelineCreateInfoKHR` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` error is returned if the implementation is unable to reuse the shader group handles provided in `VkRayTracingShaderGroupCreateInfoKHR ::pShaderGroupCaptureReplayHandle` when `VkPhysicalDeviceRayTracingPipelineFeaturesKHR ::rayTracingPipelineShaderGroupHandleCaptureReplay` is enabled.

**Valid Usage**

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03415**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and the `basePipelineIndex` member of that same element is not `-1`, `basePipelineIndex` **must** be less than the index into `pCreateInfos` that corresponds to that element

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03416**
  If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline **must** have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set

- **VUID-vkCreateRayTracingPipelinesKHR-flags-03816**
flags **must** not contain the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903
  If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache **must** be externally synchronized`

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation **must** be complete`

- VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586
  The rayTracingPipeline feature **must** be enabled

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587
  If `deferredOperation` is not `VK_NULL_HANDLE`, the `flags` member of elements of `pCreateInfos **must** not include `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`

---

**Valid Usage (Implicit)**

- VUID-vkCreateRayTracingPipelinesKHR-device-parameter
  `device **must** be a valid `VkDevice` handle`

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation **must** be a valid `VkDeferredOperationKHR` handle

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache **must** be a valid `VkPipelineCache` handle`

- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter
  `pCreateInfos **must** be a valid pointer to an array of `createInfoCount` valid `VkRayTracingPipelineCreateInfoKHR` structures`

- VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter
  `pPipelines **must** be a valid pointer to an array of `createInfoCount` `VkPipeline` handles`

- VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength
  `createInfoCount **must** be greater than 0`

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from
Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS

The `VkRayTracingPipelineCreateInfoKHR` structure is defined as:

```cpp
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    uint32_t groupCount;
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups;
    uint32_t maxPipelineRayRecursionDepth;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    const VkPipelineInterfaceCreateInfoKHR* pLibraryInterface;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkRayTracingPipelineCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the ray tracing pipeline.
- `groupCount` is the number of entries in the `pGroups` array.
- `pGroups` is a pointer to an array of `groupCount` `VkRayTracingShaderGroupCreateInfoKHR` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.
tracing pipeline.

- **maxPipelineRayRecursionDepth** is the maximum recursion depth of shaders executed by this pipeline.
- **pLibraryInfo** is a pointer to a VkPipelineLibraryCreateInfoKHR structure defining pipeline libraries to include.
- **pLibraryInterface** is a pointer to a VkRayTracingPipelineInterfaceCreateInfoKHR structure defining additional information when using pipeline libraries.
- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from.
- **basePipelineIndex** is an index into the pCreateInfos parameter to use as a pipeline to derive from.

The parameters basePipelineHandle and basePipelineIndex are described in more detail in Pipeline Derivatives.

When VK_PIPELINE_CREATE_LIBRARY_BIT_KHR is specified, this pipeline defines a pipeline library which cannot be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which can be included in future pipeline creation.

If pipeline libraries are included in pLibraryInfo, shaders defined in those libraries are treated as if they were defined as additional entries in pStages, appended in the order they appear in the pLibraries array and in the pStages array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in pGroups, appended in the order they appear in the pLibraries array and in the pGroups array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR is not provided is computed as described in Ray Tracing Pipeline Stack.

### Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR(flags)-07984**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle must be a valid handle to a ray tracing VkPipeline

- **VUID-VkRayTracingPipelineCreateInfoKHR(flags)-07985**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's
pCreateInfos parameter

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, basePipelineIndex must be -1 or basePipelineHandle must be VK_NULL_HANDLE

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987
  If a push constant block is declared in a shader, a push constant range in layout must match both the shader stage and range

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988
  If a resource variables is declared in a shader, a descriptor slot in layout must match the shader stage

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07989
  If a resource variables is declared in a shader, a descriptor slot in layout must match the descriptor type

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991
  If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426
  The shader code for the entry points identified by pStages, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources

- VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT or VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the stage member of at least one element of pStages, including those implicitly added by pLibraryInfo, must be VK_SHADER_STAGE_RAYGEN_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  maxPipelineRayRecursionDepth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If pLibraryInfo is not NULL and its libraryCount member is greater than 0, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraries-03591
  Each element of pLibraryInfo->pLibraries must have been created with the value of maxPipelineRayRecursionDepth equal to that in this pipeline
If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with a layout that is compatible with the layout in this pipeline.

If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with values of the maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize members of pLibraryInterface equal to those in this pipeline.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR bit set.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR bit set.

If the VK_KHR_pipeline_library extension is not enabled, pLibraryInfo and pLibraryInterface must be NULL.

If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, for any element of pGroups with a type of VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the anyHitShader of that
element must not be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471
  If flags includes VK_PIPELINE_CREATERAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, for any element of pGroups with a type of VKRAY_TRACING_SHADERGROUP_TYPE_TRIANGLES_HIT_GROUP_KHR or VKRAY_TRACING_SHADERGROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR, the closestHitShader of that element must not be VK_SHADER_UNUSED_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the rayTraversalPrimitiveCulling feature is not enabled, flags must not include VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  flags must not include both VK_PIPELINE_CREATERAY_TRACING_SKIP_TRIANGLES_BIT_KHR and VK_PIPELINE_CREATERAY_TRACING_SKIP_AABBS_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If flags includes VK_PIPELINE_CREATERAY_TRACING_SHADERGROUPHANDLE_CAPTURE_REPLAY_BIT_KHR, rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled

• VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  If VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay is VK_TRUE and the pShaderGroupCaptureReplayHandle member of any element of pGroups is not NULL, flags must include VK_PIPELINE_CREATERAY_TRACING_SHADERGROUPHANDLE_CAPTURE_REPLAY_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If pLibraryInfo is NULL or its libraryCount is 0, stageCount must not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and either pLibraryInfo is NULL or its libraryCount is 0, groupCount must not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState must be VK_DYNAMIC_STATERAY_TRACING_PIPELINE_STACK_SIZE_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

• VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR
Valid Usage (Implicit)

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineCreationFeedbackCreateInfo

- VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-parameter
  flags must be a valid combination of VkPipelineCreateFlagBits values

- VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter
  If stageCount is not 0, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter
  If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoKHR structures

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter
  If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter
  If pLibraryInterface is not NULL, pLibraryInterface must be a valid pointer to a valid VkRayTracingPipelineInterfaceCreateInfoKHR structure

- VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure

- VUID-VkRayTracingPipelineCreateInfoKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-VkRayTracingPipelineCreateInfoKHR-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkRayTracingShaderGroupCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkRayTracingShaderGroupTypeKHR type;
  uint32_t generalShader;
  uint32_t closestHitShader;
  uint32_t anyHitShader;
  uint32_t intersectionShader;
} VkRayTracingShaderGroupCreateInfoKHR;
```
const void* pShaderGroupCaptureReplayHandle;

} VkRayTracingShaderGroupCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is the type of hit group specified in this structure.
- **generalShader** is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **closestHitShader** is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **anyHitShader** is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **intersectionShader** is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- **pShaderGroupCaptureReplayHandle** is `NULL` or a pointer to replay information for this shader group queried from `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`, as described in Ray Tracing Capture Replay. Ignored if `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_FALSE`.

### Valid Usage

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `generalShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

535
If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` then `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  `closestHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
  `anyHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into `VkRayTracingPipelineCreateInfoKHR::pStages` referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then `pShaderGroupCaptureReplayHandle` must not be provided if it has not been provided on a previous call to ray tracing pipeline creation.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604**
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_FALSE` then the caller must guarantee that no ray tracing pipeline creation commands with `pShaderGroupCaptureReplayHandle` provided execute simultaneously with ray tracing pipeline creation commands without `pShaderGroupCaptureReplayHandle` provided.

### Valid Usage (Implicit)

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter**
  `type` must be a valid `VkRayTracingShaderGroupTypeKHR` value.

Possible values of `type` in `VkRayTracingShaderGroupCreateInfoKHR` are:

```c
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
} VkRayTracingShaderGroupTypeKHR;
```

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR** indicates a shader group with a single
VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR** specifies a shader group that only hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.

- **VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR** specifies a shader group that only intersects with custom geometry and must contain an intersection shader and may contain closest hit and any-hit shaders.

Note
For current group types, the hit group type could be inferred from the presence or absence of the intersection shader, but we provide the type explicitly for future hit groups that do not have that property.

The `VkRayTracingPipelineInterfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxPipelineRayPayloadSize** is the maximum payload size in bytes used by any shader in the pipeline.
- **maxPipelineRayHitAttributeSize** is the maximum attribute structure size in bytes used by any shader in the pipeline.

`maxPipelineRayPayloadSize` is calculated as the maximum number of bytes used by any block declared in the `RayPayloadKHR` or `IncomingRayPayloadKHR` storage classes. `maxPipelineRayHitAttributeSize` is calculated as the maximum number of bytes used by any block declared in the `HitAttributeKHR` storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block's members.

Note
There is no explicit upper limit for `maxPipelineRayPayloadSize`, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.
Valid Usage

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605
  maxPipelineRayHitAttributeSize must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize

Valid Usage (Implicit)

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR

• VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
  VkDevice device,  
  VkPipeline pipeline,  
  uint32_t firstGroup,  
  uint32_t groupCount,  
  size_t dataSize,  
  void* pData);
```

• device is the logical device containing the ray tracing pipeline.
• pipeline is the ray tracing pipeline object containing the shaders.
• firstGroup is the index of the first group to retrieve a handle for from the
  VkRayTracingPipelineCreateInfoKHR::pGroups array.
• groupCount is the number of shader handles to retrieve.
• dataSize is the size in bytes of the buffer pointed to by pData.
• pData is a pointer to a user-allocated buffer where the results will be written.

Valid Usage

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619
  pipeline must be a ray tracing pipeline

• VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050
  firstGroup must be less than the number of shader groups in pipeline

• VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline
• VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420
dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize × groupCount

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-03482
pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

Valid Usage (Implicit)

• VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter
pipeline must be a valid VkPipeline handle

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

• VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength
dataSize must be greater than 0

• VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent
pipeline must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF DEVICE_MEMORY

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

• device is the logical device containing the ray tracing pipeline.
• pipeline is the ray tracing pipeline object containing the shaders.
• firstGroup is the index of the first group to retrieve a handle for from the
VkRayTracingPipelineCreateInfoKHR::pGroups array.

- **groupCount** is the number of shader handles to retrieve.
- **dataSize** is the size in bytes of the buffer pointed to by pData.
- **pData** is a pointer to a user-allocated buffer where the results will be written.

Once queried, this opaque data can be provided at pipeline creation time (in a subsequent execution), using VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle, as described in Ray Tracing Capture Replay.

### Valid Usage

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  firstGroup must be less than the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  The sum of firstGroup and groupCount must be less than or equal to the number of shader groups in pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  dataSize must be at least VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  pipeline must have been created with a flags that included VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07830
  pipeline must not have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

### Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  pipeline must be a valid VkPipeline handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  dataSize must be greater than 0
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t group,
    VkShaderGroupShaderKHR groupShader);
```

- **device** is the logical device containing the ray tracing pipeline.
- **pipeline** is the ray tracing pipeline object containing the shaders groups.
- **group** is the index of the shader group to query.
- **groupShader** is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

Valid Usage

• VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  *pipeline must* be a ray tracing pipeline

• VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  The value of **group** must be less than the number of shader groups in **pipeline**

• VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  The shader identified by **groupShader** in **group** must not be **VK_SHADER_UNUSED_KHR**

Valid Usage (Implicit)

• VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
  **device must** be a valid **VkDevice** handle
- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter**
  pipeline must be a valid VkPipeline handle

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter**
  groupShader must be a valid VkShaderGroupShaderKHR value

- **VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent**
  pipeline must have been created, allocated, or retrieved from device

Possible values of groupShader in vkGetRayTracingShaderGroupStackSizeKHR are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- **VK_SHADER_GROUP_SHADER_GENERAL_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::generalShader`
- **VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::closestHitShader`
- **VK_SHADER_GROUP_SHADER_ANY_HIT_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::anyHitShader`
- **VK_SHADER_GROUP_SHADER_INTERSECTION_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::intersectionShader`

To **dynamically set** the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,
    uint32_t pipelineStackSize);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pipelineStackSize is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, the stack size is computed as described in **Ray Tracing Pipeline Stack**.

### Valid Usage

- **VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610**
pipelineStackSize must be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call.

Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

10.4. Pipeline Destruction

To destroy a pipeline, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(  
    VkDevice device,  
    VkPipeline pipeline,  
    const VkAllocationCallbacks* pAllocator);
```
• **device** is the logical device that destroys the pipeline.

• **pipeline** is the handle of the pipeline to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyPipeline-pipeline-00765
  All submitted commands that refer to **pipeline** must have completed execution

- VUID-vkDestroyPipeline-pipeline-00766
  If **VkAllocationCallbacks** were provided when **pipeline** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyPipeline-pipeline-00767
  If no **VkAllocationCallbacks** were provided when **pipeline** was created, **pAllocator** must be **NULL**

## Valid Usage (Implicit)

- VUID-vkDestroyPipeline-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyPipeline-pipeline-parameter
  If **pipeline** is not **VK_NULL_HANDLE**, **pipeline** must be a valid **VkPipeline** handle

- VUID-vkDestroyPipeline-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyPipeline-pipeline-parent
  If **pipeline** is a valid handle, it must have been created, allocated, or retrieved from **device**

## Host Synchronization

- Host access to **pipeline** must be externally synchronized

### 10.5. Multiple Pipeline Creation

Multiple pipelines can be created simultaneously by passing an array of **VkGraphicsPipelineCreateInfo**, **VkRayTracingPipelineCreateInfoKHR**, or **VkComputePipelineCreateInfo** structures into the **vkCreateGraphicsPipelines**, **vkCreateRayTracingPipelinesKHR**, and **vkCreateComputePipelines** commands, respectively. Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities within a group-create.

When an application attempts to create many pipelines in a single command, it is possible that some subset may fail creation. In that case, the corresponding entries in the **pPipelines** output
array will be filled with VK_NULL_HANDLE values. If any pipeline fails creation despite valid arguments (for example, due to out of memory errors), the VkResult code returned by vkCreate*Pipelines will indicate why. The implementation will attempt to create all pipelines, and only return VK_NULL_HANDLE values for those that actually failed.

If creation fails for a pipeline that had VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT set, pipelines at an index in the pPipelines array greater than or equal to that of the failing pipeline must be set to VK_NULL_HANDLE.

If multiple pipelines fail to be created, the VkResult must be the return value of any of the pipelines which did not return VK_SUCCESS.

10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the Vk*PipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```
10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice device,
    const VkPipelineCacheCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineCache* pPipelineCache);
```

- `device` is the logical device that creates the pipeline cache object.
- `pCreateInfo` is a pointer to a `VkPipelineCacheCreateInfo` structure containing initial parameters for the pipeline cache object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineCache` is a pointer to a `VkPipelineCache` handle in which the resulting pipeline cache object is returned.

**Note**

Applications can track and manage the total host memory size of a pipeline cache object using the `pAllocator`. Applications can limit the amount of data retrieved from a pipeline cache object in `vkGetPipelineCacheData`. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the `vkCreateGraphicsPipelines`, `vkCreateRayTracingPipelinesKHR`, and `vkCreateComputePipelines` commands. If the pipeline cache passed into these commands is not `VK_NULL_HANDLE`, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object can be used in multiple threads simultaneously.

If flags of `pCreateInfo` includes `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, all commands that modify the returned pipeline cache object must be externally synchronized.

**Note**

Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the `vkCreate*Pipelines` commands.

**Valid Usage (Implicit)**

- VUID-vkCreatePipelineCache-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreatePipelineCache-pCreateInfo-parameter
**pCreateInfo** must be a valid pointer to a valid `VkPipelineCacheCreateInfo` structure

- **VUID-vkCreatePipelineCache-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreatePipelineCache-pPipelineCache-parameter**
  `pPipelineCache` must be a valid pointer to a `VkPipelineCache` handle

---

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

---

The `VkPipelineCacheCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCacheCreateFlags flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkPipelineCacheCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineCacheCreateFlagBits` specifying the behavior of the pipeline cache.
- **initialDataSize** is the number of bytes in `pInitialData`. If `initialDataSize` is zero, the pipeline cache will initially be empty.
- **pInitialData** is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If `initialDataSize` is zero, `pInitialData` is ignored.

---

### Valid Usage

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  If `initialDataSize` is not 0, it must be equal to the size of `pInitialData`, as returned by `vkGetPipelineCacheData` when `pInitialData` was originally retrieved.
• VUID-VkPipelineCacheCreateInfo-initialDataSize-00769
  If initialDataSize is not 0, pInitialData must have been retrieved from a previous call to vkGetPipelineCacheData

• VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT

Valid Usage (Implicit)

• VUID-VkPipelineCacheCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO

• VUID-VkPipelineCacheCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkPipelineCacheCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineCacheCreateFlagBits values

• VUID-VkPipelineCacheCreateInfo-pInitialData-parameter
  If initialDataSize is not 0, pInitialData must be a valid pointer to an array of initialDataSize bytes

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;

VkPipelineCacheCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineCacheCreateFlagBits.

Bits which can be set in VkPipelineCacheCreateInfo::flags, specifying behavior of the pipeline cache, are:

typedef enum VkPipelineCacheCreateFlagBits {
  // Provided by VK_VERSION_1_3
  VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
} VkPipelineCacheCreateFlagBits;

• VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

// Provided by VK_VERSION_1_0
VkResult `vkMergePipelineCaches`

- `device` is the logical device that owns the pipeline cache objects.
- `dstCache` is the handle of the pipeline cache to merge results into.
- `srcCacheCount` is the length of the `pSrcCaches` array.
- `pSrcCaches` is a pointer to an array of pipeline cache handles, which will be merged into `dstCache`. The previous contents of `dstCache` are included after the merge.

**Note**
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

**Valid Usage**

- VUID-vkMergePipelineCaches-dstCache-00770
dstCache must not appear in the list of source caches

**Valid Usage (Implicit)**

- VUID-vkMergePipelineCaches-device-parameter
device must be a valid VkDevice handle
- VUID-vkMergePipelineCaches-dstCache-parameter
dstCache must be a valid VkPipelineCache handle
- VUID-vkMergePipelineCaches-pSrcCaches-parameter
pSrcCaches must be a valid pointer to an array of srcCacheCount valid VkPipelineCache handles
- VUID-vkMergePipelineCaches-srcCacheCount-arraylength
srcCacheCount must be greater than 0
- VUID-vkMergePipelineCaches-dstCache-parent
dstCache must have been created, allocated, or retrieved from device
- VUID-vkMergePipelineCaches-pSrcCaches-parent
Each element of pSrcCaches must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to dstCache must be externally synchronized
10.7.3. Retrieving Pipeline Cache Data

Data can be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

- `device` is the logical device that owns the pipeline cache.
- `pipelineCache` is the pipeline cache to retrieve data from.
- `pDataSize` is a pointer to a `size_t` value related to the amount of data in the pipeline cache, as described below.
- `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the maximum size of the data that can be retrieved from the pipeline cache, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the user to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the maximum size that can be retrieved by the pipeline cache, at most `pDataSize` bytes will be written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all of the pipeline cache was returned.

Any data written to `pData` is valid and can be provided as the `pInitialData` member of the `VkPipelineCacheCreateInfo` structure passed to `vkCreatePipelineCache`.

Two calls to `vkGetPipelineCacheData` with the same parameters must retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to `pData` must be a header as described in the Pipeline Cache Header section.

If `pDataSize` is less than what is necessary to store this header, nothing will be written to `pData` and zero will be written to `pDataSize`. 
### Valid Usage (Implicit)

- **VUID-vkGetPipelineCacheData-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetPipelineCacheData-pipelineCache-parameter**
  
  `pipelineCache` must be a valid `VkPipelineCache` handle

- **VUID-vkGetPipelineCacheData-pDataSize-parameter**
  
  `pDataSize` must be a valid pointer to a `size_t` value

- **VUID-vkGetPipelineCacheData-pData-parameter**
  
  If the value referenced by `pDataSize` is not 0, and `pData` is not `NULL`, `pData` must be a valid pointer to an array of `pDataSize` bytes

- **VUID-vkGetPipelineCacheData-pipelineCache-parent**
  
  `pipelineCache` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

### 10.7.4. Pipeline Cache Header

Applications *can* store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline compiles, however, *may* depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data *must* begin with a valid pipeline cache header.

**Note**

Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;

- **headerSize** is the length in bytes of the pipeline cache header.
- **headerVersion** is a VkPipelineCacheHeaderVersion enum value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- **vendorID** is the VkPhysicalDeviceProperties::vendorID of the implementation.
- **deviceID** is the VkPhysicalDeviceProperties::deviceID of the implementation.
- **pipelineCacheUUID** is the VkPhysicalDeviceProperties::pipelineCacheUUID of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

### Valid Usage

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  headerSize must be 32
- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  headerVersion must be VK_PIPELINE_CACHE_HEADER_VERSION_ONE
- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
  headerSize must not exceed the size of the pipeline cache

### Valid Usage (Implicit)

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  headerVersion must be a valid VkPipelineCacheHeaderVersion value

Possible values of the headerVersion value of the pipeline cache header are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
```
10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,          // Provided by VK_VERSION_1_0
    VkPipelineCache pipelineCache,      // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);    // Provided by VK_VERSION_1_0
```

- `device` is the logical device that destroys the pipeline cache object.
- `pipelineCache` is the handle of the pipeline cache to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyPipelineCache-pipelineCache-00771**
  If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyPipelineCache-pipelineCache-00772**
  If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyPipelineCache-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyPipelineCache-pipelineCache-parameter**
  If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` **must** be a valid `VkPipelineCache` handle.

- **VUID-vkDestroyPipelineCache-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyPipelineCache-pipelineCache-parent**
  If `pipelineCache` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

---
Host Synchronization

• Host access to pipelineCache must be externally synchronized

10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the VkPipeline is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

Note

Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each VkPipelineShaderStageCreateInfo structure contains a pSpecializationInfo member, which can be NULL to indicate no specialization constants, or point to a VkSpecializationInfo structure.

The VkSpecializationInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t dataSize;
    const void* pData;
} VkSpecializationInfo;
```

• mapEntryCount is the number of entries in the pMapEntries array.

• pMapEntries is a pointer to an array of VkSpecializationMapEntry structures, which map constant IDs to offsets in pData.

• dataSize is the byte size of the pData buffer.

• pData contains the actual constant values to specialize with.

Valid Usage

• VUID-VkSpecializationInfo-offset-00773
  The offset member of each element of pMapEntries must be less than dataSize

• VUID-VkSpecializationInfo-pMapEntries-00774
  The size member of each element of pMapEntries must be less than or equal to dataSize minus offset

• VUID-VkSpecializationInfo-constantID-04911
  The constantID value of each element of pMapEntries must be unique within pMapEntries
Valid Usage (Implicit)

- **VUID-VkSpecializationInfo-pMapEntries-parameter**
  
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures.

- **VUID-VkSpecializationInfo-pData-parameter**
  
  If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes.

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

- `constantID` is the ID of the specialization constant in SPIR-V.
- `offset` is the byte offset of the specialization constant value within the supplied data buffer.
- `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

Valid Usage

- **VUID-VkSpecializationMapEntry-constantID-00776**
  
  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` must be the byte size of `VkBool32`.

In human readable SPIR-V:

```spirv
OpDecorate %x SpecId 13 ; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42 ; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3  ; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgs size BuiltIn WorkgroupSize ; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0 ; declare an unsigned 32-bit type
%uvect3 = OpTypeVector %i32 3 ; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1 ; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1 ; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1 ; declare the .z component of WorkgroupSize
%wgs size = OpSpecConstantComposite %uvect3 %x %y %z ; declare WorkgroupSize
```
From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```c
const VkSpecializationMapEntry entries[] = {
    { .constantID = 13,
      .offset = 0 * sizeof(uint32_t),
      .size = sizeof(uint32_t) },
    { .constantID = 42,
      .offset = 1 * sizeof(uint32_t),
      .size = sizeof(uint32_t) },
    { .constantID = 3,
      .offset = 2 * sizeof(uint32_t),
      .size = sizeof(uint32_t) }
};
const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4
const VkSpecializationInfo info = {
    .mapEntryCount = 3,
    .pMapEntries = entries,
    .dataSize = 3 * sizeof(uint32_t),
    .pData = data,
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```spir-v
OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%1 = OpSpecConstant %32 -1 ; some signed 32-bit integer constant
```
From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```c
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] = {
    {
        .constantID = 0,
        .offset = offsetof(SpecializationData, data0),
        .size = sizeof(SpecializationData::data0)
    },
    {
        .constantID = 12,
        .offset = offsetof(SpecializationData, data1),
        .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

const VkSpecializationInfo info = {
    .mapEntryCount = 2,
    .pMapEntries = entries,
    .dataSize = sizeof(data),
    .pdata = &data,
};
```

It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the
VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. The application must maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation mechanisms:

The VkPipelineLibraryCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is a pointer to an array of VkPipeline structures specifying pipeline libraries to use when creating a pipeline.

### Valid Usage

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381
  Each element of `pLibraries` must have been created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR

### Valid Usage (Implicit)

- VUID-VkPipelineLibraryCreateInfoKHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_PIPELINE_LIBRARY_CREATE_INFO_KHR
- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-parameter
  If `libraryCount` is not 0, `pLibraries` must be a valid pointer to an array of `libraryCount` valid `VkPipeline` handles

Pipelines created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR libraries can depend on other pipeline libraries in VkPipelineLibraryCreateInfoKHR.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.
10.10. Pipeline Binding

Once a pipeline has been created, it can be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point. Commands that do not interact with the given pipeline type must not be affected by the pipeline state.

**Valid Usage**

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` must be a compute pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` must be a graphics pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00781
  If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline must match that set in the previous pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` must be a ray
tracing pipeline

• VUID-vkCmdBindPipeline-pipelineBindPoint-06721
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `commandBuffer` must not be a protected command buffer

• VUID-vkCmdBindPipeline-pipeline-03382
  `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set

Valid Usage (Implicit)

• VUID-vkCmdBindPipeline-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdBindPipeline-pipelineBindPoint-parameter
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

• VUID-vkCmdBindPipeline-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle

• VUID-vkCmdBindPipeline-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdBindPipeline-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

• VUID-vkCmdBindPipeline-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindPipeline-commonparent
  Both of `commandBuffer`, and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of `vkCmdBindPipeline::pipelineBindPoint`, specifying the bind point of a pipeline
object, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
} VkPipelineBindPoint;
```

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR` specifies binding as a ray tracing pipeline.

## 10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time. Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by another pipeline bind with that state specified as static.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands must be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.

- If the state is not included (corresponding pointer in `VkGraphicsPipelineCreateInfo` was NULL or was ignored) in the new pipeline object, then that command buffer state is not disturbed.

Dynamic state that does not affect the result of operations can be left undefined.

**Note**

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if this state is specified as dynamic in the pipeline object.
10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,
    const VkPipelineInfoKHR* pPipelineInfo,
    uint32_t* pExecutableCount,
    VkPipelineExecutablePropertiesKHR* pProperties);
```

- `device` is the device that created the pipeline.
- `pPipelineInfo` describes the pipeline being queried.
- `pExecutableCount` is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkPipelineExecutablePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of pipeline executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of pipeline executables associated with the pipeline, at most `pExecutableCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Valid Usage

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The `pipelineExecutableInfo` feature must be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The `pipeline` member of `pPipelineInfo` must have been created with `device`

Valid Usage (Implicit)

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  `pPipelineInfo` must be a valid pointer to a valid `VkPipelineInfoKHR` structure
- VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCountKHR-parameter
  `pExecutableCount` must be a valid pointer to a `uint32_t` value
If the value referenced by `pExecutableCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pExecutableCount` `VkPipelineExecutablePropertiesKHR` structures.

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stages` is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- `name` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- `description` is an array of `VK_MAX_DESCRIPTION_SIZE char` containing a null-terminated UTF-8 string which is a human readable description for this pipeline executable.
- `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations may reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and `stages` should be considered a best effort hint. Because the application cannot rely on the `stages` field to provide an exact description, `name` and `description` provide a human readable name and description which more accurately describes the pipeline executable.
The `VkPipelineInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkPipeline         pipeline;
} VkPipelineInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is a `VkPipeline` handle.

Each pipeline executable may have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics may include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which may aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice   device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t*  pStatisticCount,
    VkPipelineExecutableStatisticKHR* pStatistics);
```
• **device** is the device that created the pipeline.

• **pExecutableInfo** describes the pipeline executable being queried.

• **pStatisticCount** is a pointer to an integer related to the number of statistics available or queried, as described below.

• **pStatistics** is either **NULL** or a pointer to an array of **VkPipelineExecutableStatisticKHR** structures.

If **pStatistics** is **NULL**, then the number of statistics associated with the pipeline executable is returned in **pStatisticCount**. Otherwise, **pStatisticCount** must point to a variable set by the user to the number of elements in the **pStatistics** array, and on return the variable is overwritten with the number of structures actually written to **pStatistics**. If **pStatisticCount** is less than the number of statistics associated with the pipeline executable, at most **pStatisticCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available statistics were returned.

### Valid Usage

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272**
  The **pipelineExecutableInfo** feature **must** be enabled

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273**
  The **pipeline** member of **pExecutableInfo** **must** have been created with **device**

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274**
  The **pipeline** member of **pExecutableInfo** **must** have been created with **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR**

### Valid Usage (Implicit)

- **VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter**
  **device** **must** be a valid **VkDevice** handle

- **VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter**
  **pExecutableInfo** **must** be a valid pointer to a valid **VkPipelineExecutableInfoKHR** structure

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter**
  **pStatisticCount** **must** be a valid pointer to a **uint32_t** value

- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter**
  If the value referenced by **pStatisticCount** is not **0**, and **pStatistics** is not **NULL**, **pStatistics** **must** be a valid pointer to an array of **pStatisticCount** **VkPipelineExecutableStatisticKHR** structures
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkPipelineExecutableInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the pipeline executable to query in the array of executable properties returned by `vkGetPipelineExecutablePropertiesKHR`.

Valid Usage

- VUID-VkPipelineExecutableInfoKHR-executableIndex-03275
  `executableIndex` must be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`.

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INFO_KHR`
- VUID-VkPipelineExecutableInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkPipelineExecutableInfoKHR-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle
The VkPipelineExecutableStatisticKHR structure is defined as:

```c
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **name** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- **description** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- **format** is a VkPipelineExecutableStatisticFormatKHR value specifying the format of the data found in **value**.
- **value** is the value of this statistic.

### Valid Usage (Implicit)

- VUID-VkPipelineExecutableStatisticKHR-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR

- VUID-VkPipelineExecutableStatisticKHR-pNext-pNext
  
  **pNext** must be NULL

The VkPipelineExecutableStatisticFormatKHR enum is defined as:

```c
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;
```

- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR** specifies that the statistic is returned as a 32-bit boolean value which **must** be either VK_TRUE or VK_FALSE and **should** be read from the b32 field of VkPipelineExecutableStatisticValueKHR.
- **VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR** specifies that the statistic is returned as a
signed 64-bit integer and should be read from the \texttt{i64} field of 
\texttt{VkPipelineExecutableStatisticValueKHR}.

- \texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR} specifies that the statistic is returned as an 
unsigned 64-bit integer and should be read from the \texttt{u64} field of 
\texttt{VkPipelineExecutableStatisticValueKHR}.

- \texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR} specifies that the statistic is returned as a 
64-bit floating-point value and should be read from the \texttt{f64} field of 
\texttt{VkPipelineExecutableStatisticValueKHR}.

The \texttt{VkPipelineExecutableStatisticValueKHR} union is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32 b32;
    int64_t i64;
    uint64_t u64;
    double f64;
} VkPipelineExecutableStatisticValueKHR;
```

- \texttt{b32} is the 32-bit boolean value if the \texttt{VkPipelineExecutableStatisticFormatKHR} is 
\texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR}.

- \texttt{i64} is the signed 64-bit integer value if the \texttt{VkPipelineExecutableStatisticFormatKHR} is 
\texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR}.

- \texttt{u64} is the unsigned 64-bit integer value if the \texttt{VkPipelineExecutableStatisticFormatKHR} is 
\texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR}.

- \texttt{f64} is the 64-bit floating-point value if the \texttt{VkPipelineExecutableStatisticFormatKHR} is 
\texttt{VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR}.

Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler's internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:

```
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);
```

- \texttt{device} is the device that created the pipeline.

- \texttt{pExecutableInfo} describes the pipeline executable being queried.

- \texttt{pInternalRepresentationCount} is a pointer to an integer related to the number of internal
representations available or queried, as described below.

- \textit{pInternalRepresentations} is either \texttt{NULL} or a pointer to an array of \texttt{VkPipelineExecutableInternalRepresentationKHR} structures.

If \textit{pInternalRepresentations} is \texttt{NULL}, then the number of internal representations associated with the pipeline executable is returned in \textit{pInternalRepresentationCount}. Otherwise, \textit{pInternalRepresentationCount} must point to a variable set by the user to the number of elements in the \textit{pInternalRepresentations} array, and on return the variable is overwritten with the number of structures actually written to \textit{pInternalRepresentations}. If \textit{pInternalRepresentationCount} is less than the number of internal representations associated with the pipeline executable, at most \textit{pInternalRepresentationCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation should order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.

### Valid Usage

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276
  The pipelineExecutableInfo feature must be enabled

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277
  The pipeline member of \texttt{pExecutableInfo} must have been created with device

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278
  The pipeline member of \texttt{pExecutableInfo} must have been created with \texttt{VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR}

### Valid Usage (Implicit)

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter
device must be a valid \texttt{VkDevice} handle

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter
  \texttt{pExecutableInfo} must be a valid pointer to a valid \texttt{VkPipelineExecutableInfoKHR} structure

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentationCount-parameter
  \textit{pInternalRepresentationCount} must be a valid pointer to a \texttt{uint32_t} value

- VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pInternalRepresentations-parameter
  If the value referenced by \textit{pInternalRepresentationCount} is not 0, and \textit{pInternalRepresentations} is not \texttt{NULL}, \textit{pInternalRepresentations} must be a valid pointer to an array of \texttt{VkPipelineExecutableInternalRepresentationKHR} structures
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineExecutableInternalRepresentationKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32 isText;
    size_t dataSize;
    void* pData;
} VkPipelineExecutableInternalRepresentationKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **name** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
- **description** is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
- **isText** specifies whether the returned data is text or opaque data. If isText is VK_TRUE then the data returned in pData is text and is guaranteed to be a null-terminated UTF-8 string.
- **dataSize** is an integer related to the size, in bytes, of the internal representation's data, as described below.
- **pData** is either NULL or a pointer to a block of data into which the implementation will write the internal representation.

If pData is NULL, then the size, in bytes, of the internal representation data is returned in dataSize. Otherwise, dataSize must be the size of the buffer, in bytes, pointed to by pData and on return dataSize is overwritten with the number of bytes of data actually written to pData including any trailing null character. If dataSize is less than the size, in bytes, of the internal representation's data, at most dataSize bytes of data will be written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representation was returned.

If isText is VK_TRUE and pData is not NULL and dataSize is not zero, the last byte written to pData will
be a null character.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR`

- VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext
  
  `pNext` **must** be `NULL`

### 10.13. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a `VkPipelineCreationFeedbackCreateInfo` structure to the `pNext` chain of `VkGraphicsPipelineCreateInfo`, `VkRayTracingPipelineCreateInfoKHR`, or `VkComputePipelineCreateInfo`. The `VkPipelineCreationFeedbackCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedbackCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreationFeedback* pPipelineCreationFeedback;
    uint32_t pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedback* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pPipelineCreationFeedback` is a pointer to a `VkPipelineCreationFeedback` structure.
- `pipelineStageCreationFeedbackCount` is the number of elements in `pPipelineStageCreationFeedbacks`.
- `pPipelineStageCreationFeedbacks` is a pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedback` structures.

An implementation **should** write pipeline creation feedback to `pPipelineCreationFeedback` and **may** write pipeline stage creation feedback to `pPipelineStageCreationFeedbacks`. An implementation **must** set or clear the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT` in `VkPipelineCreationFeedback`::`flags` for `pPipelineCreationFeedback` and every element of `pPipelineStageCreationFeedbacks`.

**Note**

One common scenario for an implementation to skip per-stage feedback is when `VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT` is set in `pPipelineCreationFeedback`.

When chained to `VkRayTracingPipelineCreateInfoKHR`, or `VkGraphicsPipelineCreateInfo`, the i
element of `pPipelineStageCreationFeedbacks` corresponds to the `i` element of `VkRayTracingPipelineCreateInfoKHR::pStages`, or `VkGraphicsPipelineCreateInfo::pStages`. When chained to `VkComputePipelineCreateInfo`, the first element of `pPipelineStageCreationFeedbacks` corresponds to `VkComputePipelineCreateInfo::stage`.

### Valid Usage (Implicit)

- **VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO`.

- **VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter**  
  `pPipelineCreationFeedback` must be a valid pointer to a `VkPipelineCreationFeedback` structure.

- **VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks-parameter**  
  If `pipelineStageCreationFeedbackCount` is not 0, `pPipelineStageCreationFeedbacks` must be a valid pointer to an array of `pipelineStageCreationFeedbackCount` `VkPipelineCreationFeedback` structures.

The `VkPipelineCreationFeedback` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags flags;
    uint64_t duration;
} VkPipelineCreationFeedback;
```

- **flags** is a bitmask of `VkPipelineCreationFeedbackFlagBits` providing feedback about the creation of a pipeline or of a pipeline stage.

- **duration** is the duration spent creating a pipeline or pipeline stage in nanoseconds.

If the `VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT` is not set in `flags`, an implementation must not set any other bits in `flags`, and the values of all other `VkPipelineCreationFeedback` data members are undefined.

Possible values of the `flags` member of `VkPipelineCreationFeedback` are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT =
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT =
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT =
```
**VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** indicates that the base pipeline specified by the `basePipelineHandle` or `basePipelineIndex` member of the `Vk*PipelineCreateInfo` structure was used to accelerate the creation of the pipeline.

An implementation should set the **VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT** bit if it was able to avoid a significant amount of work by using the base pipeline.

**Note**

While “significant amount of work” is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

```
// Provided by VK_VERSION_1_3
typedef VkFlags VkPipelineCreationFeedbackFlags;
```

`VkPipelineCreationFeedbackFlags` is a bitmask type for providing zero or more `VkPipelineCreationFeedbackFlagBits`.
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, host memory and device memory.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

Note

This memory may be used to store the implementation's representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this can be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a VkAllocationCallbacks structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
    PFN_vkAllocationFunction pfnAllocation;
    PFN_vkReallocationFunction pfnReallocation;
    PFN_vkFreeFunction pfnFree;
    PFN_vkInternalAllocationNotification pfnInternalAllocation;
    PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- **pUserData** is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in VkAllocationCallbacks are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value can vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- **pfnAllocation** is a PFN_vkAllocationFunction pointer to an application-defined memory allocation function.

- **pfnReallocation** is a PFN_vkReallocationFunction pointer to an application-defined memory reallocation function.

- **pfnFree** is a PFN_vkFreeFunction pointer to an application-defined memory free function.

- **pfnInternalAllocation** is a PFN_vkInternalAllocationNotification pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- **pfnInternalFree** is a PFN_vkInternalFreeNotification pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- **VUID-VkAllocationCallbacks-pfnAllocation-00632**
  
  `pfnAllocation` must be a valid pointer to a valid user-defined `PFN_vkAllocationFunction`

- **VUID-VkAllocationCallbacks-pfnReallocation-00633**
  
  `pfnReallocation` must be a valid pointer to a valid user-defined `PFN_vkReallocationFunction`

- **VUID-VkAllocationCallbacks-pfnFree-00634**
  
  `pfnFree` must be a valid pointer to a valid user-defined `PFN_vkFreeFunction`

- **VUID-VkAllocationCallbacks-pfnInternalAllocation-00635**
  
  If either of `pfnInternalAllocation` or `pfnInternalFree` is not NULL, both must be valid callbacks

The type of `pfnAllocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and must be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

If `pfnAllocation` is unable to allocate the requested memory, it must return NULL. If the allocation was successful, it must return a valid pointer to memory allocation containing at least `size` bytes, and with the pointer value being a multiple of `alignment`.

**Note**

Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, `pfnAllocation` (or `pfnReallocation`) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected `VkInstance` objects are going to operate correctly (even `vkDestroyInstance`), and the application must ensure it cleans up properly via other means (e.g. process termination).
If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it **must** treat this as a runtime error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in **Return Codes**.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it **may** do so, and **must** not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(
    void* pUserData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` **must** be either `NULL` or a pointer previously returned by `pfnReallocation` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and **must** be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

If the reallocation was successful, `pfnReallocation` **must** return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to `min(original size, new size) - 1` **must** be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation **should** be freed.

If `pOriginal` is `NULL`, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocation` **must** behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-`NULL`, the implementation **must** ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-`NULL` the application **must** not free the old allocation.

`pfnReallocation` **must** follow the same **rules for return values as** `PFN_vkAllocationFunction`.

The type of `pfnFree` is:
typedef void (VKAPI_PTR *PFN_vkFreeFunction)(
    void* pUserData,
    void* pMemory);

- **pUserData** is the value specified for **VkAllocationCallbacks::pUserData** in the allocator specified by the application.
- **pMemory** is the allocation to be freed.

**pMemory** may be **NULL**, which the callback **must** handle safely. If **pMemory** is non-NULL, it **must** be a pointer previously allocated by **PFNAllocation** or **PFNReallocation**. The application **should** free this memory.

The type of **PFNInternalAllocation** is:

```c
typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);
```

- **pUserData** is the value specified for **VkAllocationCallbacks::pUserData** in the allocator specified by the application.
- **size** is the requested size of an allocation.
- **allocationType** is a **VkInternalAllocationType** value specifying the requested type of an allocation.
- **allocationScope** is a **VkSystemAllocationScope** value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of **PFNInternalFree** is:

```c
typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);
```

- **pUserData** is the value specified for **VkAllocationCallbacks::pUserData** in the allocator specified by the application.
- **size** is the requested size of an allocation.
• **allocationType** is a `VkInternalAllocationType` value specifying the requested type of an allocation.

• **allocationScope** is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an *allocation scope* defining its lifetime and which object it is associated with. Possible values passed to the `allocationScope` parameter of the callback functions specified by `VkAllocationCallbacks`, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

• **VK_SYSTEM_ALLOCATION_SCOPE_COMMAND** specifies that the allocation is scoped to the duration of the Vulkan command.

• **VK_SYSTEM_ALLOCATION_SCOPE_OBJECT** specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.

• **VK_SYSTEM_ALLOCATION_SCOPE_CACHE** specifies that the allocation is scoped to the lifetime of a `VkPipelineCache` object.

• **VK_SYSTEM_ALLOCATION_SCOPE_DEVICE** specifies that the allocation is scoped to the lifetime of the Vulkan device.

• **VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE** specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of **VK_SYSTEM_ALLOCATION_SCOPE_OBJECT** or **VK_SYSTEM_ALLOCATION_SCOPE_CACHE**, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

• If an allocation is scoped to the duration of a command, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_COMMAND` allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent `VkDevice` has an allocator it will be used, else if the parent `VkInstance` has an allocator it will be used. Else,

• If an allocation is associated with a `VkPipelineCache` object, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_CACHE` allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
• If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object's type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

• If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

• If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

• Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool’s allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

• VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a `vkCreate*` command, a *compatible* allocator **must** be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `PFNAllocation` or `PFNReallocation` in each can be freed with `PFNReallocation` or `PFNFree` in the other. An allocator **must** not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-NULL allocator is used, the `PFNAllocation`, `PFNReallocation` and `PFNFree` members **must** be non-NULL and point to valid implementations of the callbacks. An application can choose to not provide informational callbacks by setting both `PFNInternalAllocation` and `PFNInternalFree` to NULL. `PFNInternalAllocation` and `PFNInternalFree` **must** either both be NULL or both be non-NULL.

If `PFNAllocation` or `PFNReallocation` fail, the implementation **may** fail object creation and/or generate a `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

**`PFNAllocation` or `PFNReallocation` may** be called in the following situations:

- **Allocations scoped to a `VkDevice` or `VkInstance` may** be allocated from any API command.
- **Allocations scoped to a command may** be allocated from any API command.
- **Allocations scoped to a `VkPipelineCache` may** only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- **Allocations scoped to a `VkDescriptorPool` may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- **Allocations scoped to a `VkCommandPool` may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
- **Allocations scoped to any other object may** only be allocated in that object's `vkCreate*` command.

**`PFNFree`, or `PFNReallocation` with zero size, may** be called in the following situations:

- **Allocations scoped to a `VkDevice` or `VkInstance` may** be freed from any API command.

---

580
• Allocations scoped to a command **must** be freed by any API command which allocates such memory.

• Allocations scoped to a `VkPipelineCache` **may** be freed from `vkDestroyPipelineCache`.

• Allocations scoped to a `VkDescriptorPool` **may** be freed from:
  ◦ any command that takes the pool as a direct argument

• Allocations scoped to a `VkCommandPool` **may** be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ `vkResetCommandBuffer` whose `commandBuffer` was allocated from that `VkCommandPool`

• Allocations scoped to any other object **may** be freed in that object’s `vkDestroy*` command.

• Any command that allocates host memory **may** also free host memory of the same scope.

### 11.2. Device Memory

*Device memory* is memory that is visible to the device— for example the contents of the image or buffer objects, which **can** be natively used by the device.

#### 11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties
    (VkPhysicalDevice physicalDevice,
     VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties` structure in which the properties are returned.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter`
  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- `VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter`
  
  `pMemoryProperties` **must** be a valid pointer to a `VkPhysicalDeviceMemoryProperties` structure

The `VkPhysicalDeviceMemoryProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;

- `memoryTypeCount` is the number of valid elements in the `memoryTypes` array.
- `memoryTypes` is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the memory types that can be used to access memory allocated from the heaps specified by `memoryHeaps`.
- `memoryHeapCount` is the number of valid elements in the `memoryHeaps` array.
- `memoryHeaps` is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the memory heaps from which memory can be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type’s heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap must include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they may all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation must advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` must have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT

• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_LAZY_ALLOCATED_BIT
• VK_MEMORY_PROPERTY_PROTECTED_BIT
• VK_MEMORY_PROPERTY_PROTECTED_BIT | VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT

There must be at least one memory type with both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bits set in its propertyFlags. There must be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set in its propertyFlags.

For each pair of elements X and Y returned in memoryTypes, X must be placed at a lower index position than Y if:

• the set of bit flags returned in the propertyFlags member of X is a strict subset of the set of bit flags returned in the propertyFlags member of Y; or
• the propertyFlags members of X and Y are equal, and X belongs to a memory heap with greater performance (as determined in an implementation-specific manner)

Note

There is no ordering requirement between X and Y elements for the case their propertyFlags members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if instead VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT was before VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT, the list would still be in a valid order.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```
// Find a memory in 'memoryTypeBitsRequirement' that includes all of
// 'requiredProperties'
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
                        ...)
```
VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;
        const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;
        if (isRequiredMemoryType && hasRequiredProperties) {
            return static_cast<int32_t>(memoryIndex);
        }
    }
    // failed to find memory type
    return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
if (memoryType == -1) // not found; try fallback properties
    memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, requiredProperties);

VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

#define VK_MAX_MEMORY_TYPES 32U

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

#define VK_MAX_MEMORY_HEAPS 16U

To query memory properties, call:
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

• physicalDevice is the handle to the device to query.
• pMemoryProperties is a pointer to a VkPhysicalDeviceMemoryProperties2 structure in which the properties are returned.

vkGetPhysicalDeviceMemoryProperties2 behaves similarly to vkGetPhysicalDeviceMemoryProperties, with the ability to return extended information in a pNext chain of output structures.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter
  pMemoryProperties must be a valid pointer to a VkPhysicalDeviceMemoryProperties2 structure

The VkPhysicalDeviceMemoryProperties2 structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;

or the equivalent

// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
memoryProperties is a VkPhysicalDeviceMemoryProperties structure which is populated with the same values as in vkGetPhysicalDeviceMemoryProperties.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2
- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  pNext must be NULL

The VkMemoryHeap structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- size is the total memory size in bytes in the heap.
- flags is a bitmask of VkMemoryHeapFlagBits specifying attribute flags for the heap.

Bits which may be set in VkMemoryHeap::flags, indicating attribute flags for the heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
    // Provided by VK_KHR_device_group_creation
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR = VK_MEMORY_HEAP_MULTI_INSTANCE_BIT,
} VkMemoryHeapFlagBits;
```

- VK_MEMORY_HEAP_DEVICE_LOCAL_BIT specifies that the heap corresponds to device-local memory. Device-local memory may have different performance characteristics than host-local memory, and may support different memory property flags.
- VK_MEMORY_HEAP_MULTI_INSTANCE_BIT specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryHeapFlags;
```

VkMemoryHeapFlags is a bitmask type for setting a mask of zero or more VkMemoryHeapFlagBits.
The `VkMemoryType` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- `heapIndex` describes which memory heap this memory type corresponds to, and **must** be less than `memoryHeapCount` from the `VkPhysicalDeviceMemoryProperties` structure.
- `propertyFlags` is a bitmask of `VkMemoryPropertyFlagBits` of properties for this memory type.

Bits which **may** be set in `VkMemoryType::propertyFlags`, indicating properties of a memory type, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
} VkMemoryPropertyFlagBits;
```

- `VK_MEMORY_PROPERTYDEVICE_LOCAL_BIT` bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` set.
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit specifies that memory allocated with this type **can** be mapped for host access using `vkMapMemory`.
- `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit specifies that the host cache management commands `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are not needed to flush host writes to the device or make device writes visible to the host, respectively.
- `VK_MEMORY_PROPERTY_HOST_CACHED_BIT` bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however, uncached memory is always host coherent.
- `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` and `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` set. Additionally, the object’s backing memory **may** be provided by the implementation lazily as specified in Lazy Allocated Memory.
- `VK_MEMORY_PROPERTY_PROTECTED_BIT` bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types **must** not have `VK_MEMORY_PROPERTY_PROTECTED_BIT` set and any of
VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set, or VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, or
VK_MEMORY_PROPERTY_HOST_CACHED_BIT set.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;
```

VkMemoryPropertyFlags is a bitmask type for setting a mask of zero or more
VkMemoryPropertyFlagBits.

### 11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the
API by a VkDeviceMemory handle:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

### 11.2.3. Device Memory Allocation

To allocate memory objects, call:

```
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice device,
    const VkMemoryAllocateInfo* pAllocateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDeviceMemory* pMemory);
```

- **device** is the logical device that owns the memory.
- **pAllocateInfo** is a pointer to a VkMemoryAllocateInfo structure describing parameters of the
  allocation. A successfully returned allocation must use the requested parameters—no
  substitution is permitted by the implementation.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pMemory** is a pointer to a VkDeviceMemory handle in which information about the allocated
  memory is returned.

Allocations returned by vkAllocateMemory are guaranteed to meet any alignment requirement of the
implementation. For example, if an implementation requires 128 byte alignment for images and 64
byte alignment for buffers, the device memory returned through this mechanism would be 128-byte
aligned. This ensures that applications can correctly suballocate objects of different types
(with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected
memory objects, even if those memory objects were previously freed.

**Note**
The contents of memory allocated by one application *should* not be a function of data from protected memory objects of another application, even if those memory objects were previously freed.

The maximum number of valid memory allocations that *can* exist simultaneously within a VkDevice *may* be restricted by implementation- or platform-dependent limits. The `maxMemoryAllocationCount` feature describes the number of allocations that *can* exist simultaneously before encountering these internal limits.

**Note**
For historical reasons, if `maxMemoryAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

**Note**
Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the `VK_MEMORY_PROPERTY_PROTECTED_BIT` property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications *should* use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms *may* have a limit on the maximum size of a single allocation. For example, certain systems *may* fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error `VK_ERROR_OUT_OF_DEVICE_MEMORY` *must* be returned. This limit is advertised in `VkPhysicalDeviceMemoryProperties::maxMemoryAllocationSize`.

### Valid Usage

- **VUID-vkAllocateMemory-pAllocateInfo-01713**
  
  `pAllocateInfo->allocationSize` *must* be less than or equal to `VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size` where `memindex = VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex` as returned by `vkGetPhysicalDeviceMemoryProperties` for the `VkPhysicalDevice` that `device` was created from.
pAllocateInfo->memoryTypeIndex must be less than VkPhysicalDeviceMemoryProperties::memoryTypeCount as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that device was created from.

VUID-vkAllocateMemory-maxMemoryAllocationCount-04101
There must be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory allocations currently allocated on the device.

Valid Usage (Implicit)

VUID-vkAllocateMemory-device-parameter
device must be a valid VkDevice handle

VUID-vkAllocateMemory-pAllocateInfo-parameter
pAllocateInfo must be a valid pointer to a valid VkMemoryAllocateInfo structure

VUID-vkAllocateMemory-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

VUID-vkAllocateMemory-pMemory-parameter
pMemory must be a valid pointer to a VkDeviceMemory handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_EXTERNAL_HANDLE
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkMemoryAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

• sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `allocationSize` is the size of the allocation in bytes.

• `memoryTypeIndex` is an index identifying a memory type from the `memoryTypes` array of the `VkPhysicalDeviceMemoryProperties` structure.

The internal data of an allocated device memory object must include a reference to implementation-specific resources, referred to as the memory object’s payload. Applications can also import and export that internal data to and from device memory objects to share data between Vulkan instances and other compatible APIs. A `VkMemoryAllocateInfo` structure defines a memory import operation if its `pNext` chain includes one of the following structures:

- `VkImportMemoryWin32HandleInfoKHR` with a non-zero `handleType` value
- `VkImportMemoryFdInfoKHR` with a non-zero `handleType` value

If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT`, `allocationSize` is ignored. The implementation must query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory must not modify the content of the memory. Implementations must ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations must also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

Note

How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible.

Importing memory must not increase overall heap usage within a system. However, it must affect the following per-process values:

- `VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount`

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code.
Valid Usage

- **VUID-VkMemoryAllocateInfo-None-06657**
  The parameters must not define more than one import operation

- **VUID-VkMemoryAllocateInfo-allocationSize-07897**
  If the parameters do not define an import or export operation, allocationSize must be greater than 0

- **VUID-VkMemoryAllocateInfo-allocationSize-07898**
  If the parameters define an export operation, allocationSize must be greater than 0

- **VUID-VkMemoryAllocateInfo-pNext-00639**
  If the pNext chain includes a VkExportMemoryAllocateInfo structure, and any of the handle types specified in VkExportMemoryAllocateInfo::handleTypes require a dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures, or by vkGetPhysicalDeviceExternalBufferProperties in VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures, the pNext chain must include a VkMemoryDedicatedAllocateInfo or VkDedicatedAllocationMemoryAllocateInfoNV structure with either its image or buffer member set to a value other than VK_NULL_HANDLE

- **VUID-VkMemoryAllocateInfo-allocationSize-01742**
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, then the values of allocationSize and memoryTypeIndex must match those specified when the payload being imported was created

- **VUID-VkMemoryAllocateInfo-None-00643**
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by VkMemoryAllocateFlagsInfo must match the mask specified when the payload being imported was allocated

- **VUID-VkMemoryAllocateInfo-None-00644**
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to vkAllocateMemory must match the list of physical devices that comprise the logical device on which the payload was originally allocated

- **VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645**
  If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of memoryTypeIndex must be one of those returned by vkGetMemoryWin32HandlePropertiesKHR

- **VUID-VkMemoryAllocateInfo-allocationSize-01743**
  If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, then the values of allocationSize
and memoryTypeIndex must match those specified when the payload being imported was created

- VUID-VkMemoryAllocateInfo-allocationSize-00647
  If the parameters define an import operation and the external handle type is VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, allocationSize must match the size specified when creating the Direct3D 12 heap from which the payload was extracted

- VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648
  If the parameters define an import operation and the external handle is a POSIX file descriptor created outside of the Vulkan API, the value of memoryTypeIndex must be one of those returned by vkGetMemoryFdPropertiesKHR

- VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872
  If the protectedMemory feature is not enabled, the VkMemoryAllocateInfo::memoryTypeIndex must not indicate a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress is not zero, VkMemoryAllocateFlagsInfo::flags must include VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

- VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature must be enabled

- VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT, the bufferDeviceAddress feature must be enabled

- VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation, VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

Valid Usage (Implicit)

- VUID-VkMemoryAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO

- VUID-VkMemoryAllocateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExportMemoryAllocateInfo, VkExportMemoryWin32HandleInfoKHR, VkImportMemoryFdInfoKHR, VkImportMemoryWin32HandleInfoKHR, VkMemoryAllocateFlagsInfo, VkMemoryDedicatedAllocateInfo, or VkMemoryOpaqueCaptureAddressAllocateInfo

- VUID-VkMemoryAllocateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

If the pNext chain includes a VkMemoryDedicatedAllocateInfo structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.
The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- VUID-VkMemoryDedicatedAllocateInfo-image-01432
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- VUID-VkMemoryDedicatedAllocateInfo-image-01433
  If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- VUID-VkMemoryDedicatedAllocateInfo-image-01434
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01435
  If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the buffer

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01436
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must have been created without `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` set in `VkBufferCreateInfo::flags`

- VUID-VkMemoryDedicatedAllocateInfo-image-01876
  If `image` is not `VK_NULL_HANDLE` and `VkMemoryAllocateInfo` defines a memory import operation with handle type `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, or...
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-buffer-01877
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-image-01878
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

• VUID-VkMemoryDedicatedAllocateInfo-image-01797
  If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags

Valid Usage (Implicit)

• VUID-VkMemoryDedicatedAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORYDEDICATEDALLOCATEINFO

• VUID-VkMemoryDedicatedAllocateInfo-image-parameter
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

• VUID-VkMemoryDedicatedAllocateInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

• VUID-VkMemoryDedicatedAllocateInfo-commonparent
  Both of buffer, and image that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

When allocating memory whose payload may be exported to another process or Vulkan instance, add a VkExportMemoryAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure, specifying the handle types that may be exported.
The `VkExportMemoryAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more memory handle types the application can export from the resulting allocation. The application can request multiple handle types for the same allocation.

### Valid Usage

- **VUID-VkExportMemoryAllocateInfo-handleTypes-00656**
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`

### Valid Usage (Implicit)

- **VUID-VkExportMemoryAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO`

- **VUID-VkExportMemoryAllocateInfo-handleTypes-parameter**
  `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

### 11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a `VkExportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkExportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
} VkExportMemoryWin32HandleInfoKHR;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `pAttributes` is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
• `dwAccess` is a `DWORD` specifying access rights of the handle.
• `name` is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If `VkExportMemoryAllocateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportMemoryAllocateInfo` is included in the `pNext` chain of `VkMemoryAllocateInfo` with a Windows `handleType`, but either `VkExportMemoryWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

- `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`

The implementation **must** ensure the access rights allow read and write access to the memory.

---

### Valid Usage

- VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657
  If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure **must** not be included in the `pNext` chain of `VkMemoryAllocateInfo`

### Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR`
- VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter
If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value.

To import memory from a Windows handle, add a `VkImportMemoryWin32HandleInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure.

The `VkImportMemoryWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of `handle` or `name`.
- `handle` is `NULL` or the external handle to import.
- `name` is `NULL` or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the `CloseHandle` system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

**Note**

Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct `VkDeviceMemory` object.

**Valid Usage**

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658
  If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`
- VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
The memory from which handle was exported, or the memory named by name must have been created on the same underlying physical device as device

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660
  If handleType is not 0, it must be defined as an NT handle or a global share handle

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439
  If handleType is not VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT,
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or
  VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, name must be NULL

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01440
  If handleType is not 0 and handle is NULL, name must name a valid memory resource of the type specified by handleType

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00661
  If handleType is not 0 and name is NULL, handle must be a valid handle of the type specified by handleType

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01441
  If handle is not NULL, name must be NULL

- VUID-VkImportMemoryWin32HandleInfoKHR-name-01519
  If name is not NULL, it must obey any requirements listed for handleType in external memory handle types compatibility

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To export a Windows handle representing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice device,
    const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- device is the logical device that created the device memory being exported.
- pGetWin32HandleInfo is a pointer to a VkMemoryGetWin32HandleInfoKHR structure containing
parameters of the export operation.

- `pHandle` will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application and hold a reference to their payload. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

**Note**

Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

### Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandleKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter `pGetWin32HandleInfo` must be a valid pointer to a valid `VkMemoryGetWin32HandleInfoKHR` structure
- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter `pHandle` must be a valid pointer to a `HANDLE` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkDeviceMemory           memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• memory is the memory object from which the handle will be exported.
• handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle requested.

The properties of the handle returned depend on the value of handleType. See VkExternalMemoryHandleTypeFlagBits for a description of the properties of the defined external memory handle types.

### Valid Usage

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662
  handleType must have been included in VkExportMemoryAllocateInfo::handleTypes when memory was created

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663
  If handleType is defined as an NT handle, vkGetMemoryWin32HandleKHR must be called no more than once for each valid unique combination of memory and handleType

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664
  handleType must be defined as an NT handle or a global share handle

### Valid Usage (Implicit)

- VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR

- VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter
  handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    HANDLE handle,
    VkMemoryWin32HandlePropertiesKHR* pMemoryWin32HandleProperties);
```

- device is the logical device that will be importing handle.
• `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle handle.

• `handle` is the handle which will be imported.

• `pMemoryWin32HandleProperties` is a pointer to a `VkMemoryWin32HandlePropertiesKHR` structure in which properties of `handle` are returned.

### Valid Usage

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
  `handle` must point to a valid Windows memory handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
  `handleType` must not be one of the handle types defined as opaque

### Valid Usage (Implicit)

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  `handleType` must be a valid `VkInternalMemoryHandleTypeFlagBits` value

- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
  `pMemoryWin32HandleProperties` must be a valid pointer to a `VkMemoryWin32HandlePropertiesKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkMemoryWin32HandlePropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType   sType;
    void*              pNext;
    uint32_t           memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```
• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkStructureType.html) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

### Valid Usage (Implicit)

- VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`

- VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext
  
  `pNext` must be **NULL**

### 11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a [VkImportMemoryFdInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkImportMemoryFdInfoKHR.html) structure to the `pNext` chain of the [VkMemoryAllocateInfo](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkAllocateMemory.html) structure. The [VkImportMemoryFdInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkImportMemoryFdInfoKHR.html) structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType           sType;
    const void*               pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int                        fd;
} VkImportMemoryFdInfoKHR;
```

• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkStructureType.html) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **handleType** is a [VkExternalMemoryHandleTypeFlagBits](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkExternalMemoryHandleTypeFlagBits.html) value specifying the handle type of `fd`.

• **fd** is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct [VkDeviceMemory](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkDeviceMemory.html) object.

### Valid Usage

- VUID-VkImportMemoryFdInfoKHR-handleType-00667
  
  If `handleType` is not 0, it must be supported for import, as reported by
VkExternalImageFormatProperties or VkExternalBufferProperties

- VUID-VkImportMemoryFdInfoKHR-fd-00668
  The memory from which fd was exported must have been created on the same underlying physical device as device

- VUID-VkImportMemoryFdInfoKHR-handleType-00669
  If handleType is not 0, it must be VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT

- VUID-VkImportMemoryFdInfoKHR-handleType-00670
  If handleType is not 0, fd must be a valid handle of the type specified by handleType

- VUID-VkImportMemoryFdInfoKHR-fd-01520
  fd must obey any requirements listed for handleType in external memory handle types compatibility

Valid Usage (Implicit)

- VUID-VkImportMemoryFdInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR

- VUID-VkImportMemoryFdInfoKHR-handleType-parameter
  If handleType is not 0, handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice device,
    const VkMemoryGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- device is the logical device that created the device memory being exported.
- pGetFdInfo is a pointer to a VkMemoryGetFdInfoKHR structure containing parameters of the export operation.
- pFd will return a file descriptor referencing the payload of the device memory object.

Each call to vkGetMemoryFdKHR must create a new file descriptor holding a reference to the memory object’s payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the close system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically.
when an `execve` system call is made.

**Valid Usage (Implicit)**

- VUID-vkGetMemoryFdKHR-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
  `pGetFdInfo` **must** be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure
- VUID-vkGetMemoryFdKHR-pFd-parameter
  `pFd` **must** be a valid pointer to an `int` value

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

**Valid Usage**

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
**Valid Usage (Implicit)**

- **VUID-VkMemoryGetFdInfoKHR-sType-sType**
  
  **sType must be** VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR

- **VUID-VkMemoryGetFdInfoKHR-pNext-pNext**
  
  **pNext must be** NULL

- **VUID-VkMemoryGetFdInfoKHR-memory-parameter**
  
  **memory must be** a valid VkDeviceMemory handle

- **VUID-VkMemoryGetFdInfoKHR-handleType-parameter**
  
  **handleType must be** a valid VkExternalMemoryHandleTypeFlagBits value

POSIX file descriptor memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    int fd,
    VkMemoryFdPropertiesKHR* pMemoryFdProperties);
```

- **device** is the logical device that will be importing **fd**.
- **handleType** is a VkExternalMemoryHandleTypeFlagBits value specifying the type of the handle **fd**.
- **fd** is the handle which will be imported.
- **pMemoryFdProperties** is a pointer to a VkMemoryFdPropertiesKHR structure in which the properties of the handle **fd** are returned.

**Valid Usage**

- **VUID-vkGetMemoryFdPropertiesKHR-fd-00673**
  
  **fd must point to a valid POSIX file descriptor memory handle**

- **VUID-vkGetMemoryFdPropertiesKHR-handleType-00674**
  
  **handleType must not be** VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT
Valid Usage (Implicit)

- VUID-vkGetMemoryFdPropertiesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
handleType must be a valid VkExternalMemoryHandleTypeFlagBits value

- VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
pMemoryFdProperties must be a valid pointer to a VkMemoryFdPropertiesKHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkMemoryFdPropertiesKHR structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryTypeBits is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR

- VUID-VkMemoryFdPropertiesKHR-pNext-pNext
pNext must be NULL

11.2.6. Device Group Memory Allocations

If the pNext chain of VkMemoryAllocateInfo includes a VkMemoryAllocateFlagsInfo structure, then
that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The `VkMemoryAllocateFlagsInfo` structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryAllocateFlagsInfo {
    VkStructureType sType;
    const void* pNext;
    VkMemoryAllocateFlags flags;
    uint32_t deviceMask;
} VkMemoryAllocateFlagsInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- `deviceMask` is a mask of physical devices in the logical device, indicating that memory must be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap may consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

```
Note

In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.
```

```
Valid Usage

- VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` must be a valid device mask
```

608
If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` must not be zero.

**Valid Usage (Implicit)**

- **VUID-VkMemoryAllocateFlagsInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO`
- **VUID-VkMemoryAllocateFlagsInfo-flags-parameter**
  - `flags` must be a valid combination of `VkMemoryAllocateFlagBits` values

Bits which can be set in `VkMemoryAllocateFlagsInfo::flags`, controlling device memory allocation, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,
    // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,
    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- **VK_MEMORY_ALLOCATEDEVICEMASK_BIT** specifies that memory will be allocated for the devices in `VkMemoryAllocateFlagsInfo::deviceMask`.
- **VK_MEMORY_ALLOCATEDEVICEADDRESS_BIT** specifies that the memory can be attached to a buffer object created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit set in `usage`, and that the memory handle can be used to retrieve an opaque address via `vkGetDeviceMemoryOpaqueCaptureAddress`.
- **VK_MEMORY_ALLOCATEDEVICEADDRESS_CAPTUREREPLAY_BIT** specifies that the memory's address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see `VkBufferOpaqueCaptureAddressCreateInfo` for more detail.
typedef VkFlags VkMemoryAllocateFlags;

or the equivalent

typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;

VkMemoryAllocateFlags is a bitmask type for setting a mask of zero or more VkMemoryAllocateFlagBits.

11.2.7. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a VkMemoryOpaqueCaptureAddressAllocateInfo structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkMemoryOpaqueCaptureAddressAllocateInfo structure is defined as:

typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
  VkStructureType sType;
  const void* pNext;
  uint64_t opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;

or the equivalent

typedef VkMemoryOpaqueCaptureAddressAllocateInfo VkMemoryOpaqueCaptureAddressAllocateInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **opaqueCaptureAddress** is the opaque capture address requested for the memory allocation.

If opaqueCaptureAddress is zero, no specific address is requested.

If opaqueCaptureAddress is not zero, it should be an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created memory allocation on the same implementation.

**Note**

In most cases, it is expected that a non-zero opaqueAddress is an address retrieved from vkGetDeviceMemoryOpaqueCaptureAddress on an identically created
memory allocation. If this is not the case, it is likely that `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Valid Usage (Implicit)

- `VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO`

11.2.8. Freeing Device Memory

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice
    device,
    VkDeviceMemory
    memory,
    const VkAllocationCallbacks*
    pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be freed.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.

Before freeing a memory object, an application **must** ensure the memory object is no longer in use by the device — for example by command buffers in the *pending state*. Memory **can** be freed whilst still bound to resources, but those resources **must** not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object’s payload may **not** be immediately released by the implementation, but **must** be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the `Resource Memory Association` section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

**Note**

As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation **must** guarantee that writes that have not been flushed do not affect any other memory.
Valid Usage

• VUID-vkFreeMemory-memory-00677
  All submitted commands that refer to memory (via images or buffers) must have completed execution

Valid Usage (Implicit)

• VUID-vkFreeMemory-device-parameter
device must be a valid VkDevice handle

• VUID-vkFreeMemory-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

• VUID-vkFreeMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkFreeMemory-memory-parent
  If memory is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to memory must be externally synchronized

11.2.9. Host Access to Device Memory Objects

Memory objects created with vkAllocateMemory are not directly host accessible.

Memory objects created with the memory property VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT are considered mappable. Memory objects must be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
  VkDevice device,                                                 // device
  VkDeviceMemory memory,                                          // memory
  VkDeviceSize offset,                                            // offset
  VkDeviceSize size,                                              // size
  VkMemoryMapFlags flags,                                         // flags
  void** ppData);                                                 // ppData
```

• device is the logical device that owns the memory.

• memory is the VkDeviceMemory object to be mapped.
• offset is a zero-based byte offset from the beginning of the memory object.
• size is the size of the memory range to map, or VK_WHOLE_SIZE to map from offset to the end of
  the allocation.
• flags is reserved for future use.
• ppData is a pointer to a void* variable in which a host-accessible pointer to the beginning of the
  mapped range is returned. This pointer minus offset must be aligned to at least
  VkPhysicalDeviceLimits::minMemoryMapAlignment.

After a successful call to vkMapMemory the memory object memory is considered to be currently host
mapped.

Note
It is an application error to call vkMapMemory on a memory object that is already
host mapped.

Note
vkMapMemory will fail if the implementation is unable to allocate an appropriately
sized contiguous virtual address range, e.g. due to virtual address space
fragmentation or platform limits. In such cases, vkMapMemory must return
VK_ERROR_MEMORY_MAP_FAILED. The application can improve the likelihood of success
by reducing the size of the mapped range and/or removing unneeded mappings
using vkUnmapMemory.

vkMapMemory does not check whether the device memory is currently in use before returning the
host-accessible pointer. The application must guarantee that any previously submitted command
that writes to this range has completed before the host reads from or writes to that range, and that
any previously submitted command that reads from that range has completed before the host
writes to that region (see here for details on fulfilling such a guarantee). If the device memory was
allocated without the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, these guarantees must be made for
an extended range: the application must round down the start of the range to the nearest multiple
of VkPhysicalDeviceLimits::nonCoherentAtomSize, and round the end of the range up to the nearest
multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize.

While a range of device memory is host mapped, the application is responsible for synchronizing
both device and host access to that memory range.

Note
It is important for the application developer to become meticulously familiar with
all of the mechanisms described in the chapter on Synchronization and Cache
Control as they are crucial to maintaining memory access ordering.

Calling vkMapMemory is equivalent to calling vkMapMemory2KHR with an empty pNext chain.

Valid Usage

• VUID-vkMapMemory-memory-00678
Memory must not be currently host mapped

- VUID-vkMapMemory-offset-00679
  Offset must be less than the size of memory

- VUID-vkMapMemory-size-00680
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- VUID-vkMapMemory-size-00681
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of the memory minus offset

- VUID-vkMapMemory-memory-00682
  Memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

- VUID-vkMapMemory-memory-00683
  Memory must not have been allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkMapMemory-device-parameter
  Device must be a valid VkDevice handle

- VUID-vkMapMemory-memory-parameter
  Memory must be a valid VkDeviceMemory handle

- VUID-vkMapMemory-flags-zero-bitmask
  Flags must be 0

- VUID-vkMapMemory-ppData-parameter
  PpData must be a valid pointer to a pointer value

- VUID-vkMapMemory-memory-parent
  Memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_MEMORY_MAP_FAILED
typedef VkFlags VkMemoryMapFlags;

VkMemoryMapFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Alternatively, to retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkMapMemory2KHR(
    VkDevice device,
    const VkMemoryMapInfoKHR* pMemoryMapInfo,
    void** ppData);
```

- `device` is the logical device that owns the memory.
- `pMemoryMapInfo` is a pointer to a `VkMemoryMapInfoKHR` structure describing parameters of the map.
- `ppData` is a pointer to a `void *` variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus `VkMemoryMapInfoKHR::offset` must be aligned to at least `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

This function behaves identically to `vkMapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

### Valid Usage (Implicit)

- VUID-vkMapMemory2KHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkMapMemory2KHR-pMemoryMapInfo-parameter
  - `pMemoryMapInfo` must be a valid pointer to a valid `VkMemoryMapInfoKHR` structure
- VUID-vkMapMemory2KHR-ppData-parameter
  - `ppData` must be a valid pointer to a pointer value

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_MEMORY_MAP_FAILED`
The VkMemoryMapInfoKHR structure is defined as:

```c
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryMapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryMapFlags flags;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMemoryMapInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **memory** is the `VkDeviceMemory` object to be mapped.
- **offset** is a zero-based byte offset from the beginning of the memory object.
- **size** is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.

### Valid Usage

- `VUID-VkMemoryMapInfoKHR-memory-07958`
  - `memory` must not be currently host mapped

- `VUID-VkMemoryMapInfoKHR-offset-07959`
  - `offset` must be less than the size of `memory`

- `VUID-VkMemoryMapInfoKHR-size-07960`
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be greater than 0

- `VUID-VkMemoryMapInfoKHR-size-07961`
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` must be less than or equal to the size of the `memory` minus `offset`

- `VUID-VkMemoryMapInfoKHR-memory-07962`
  - `memory` must have been created with a memory type that reports `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT`

- `VUID-VkMemoryMapInfoKHR-memory-07963`
  - `memory` must not have been allocated with multiple instances

### Valid Usage (Implicit)

- `VUID-VkMemoryMapInfoKHR-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_MAP_INFO_KHR`

- `VUID-VkMemoryMapInfoKHR-pNext-pNext`
  - `pNext` must be `NULL` or a pointer to a structure extending this structure.
pNext must be NULL

- VUID-VkMemoryMapInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkMemoryMapInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

**Host Synchronization**

- Host access to memory must be externally synchronized

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

**Note**

If the memory object was created with the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

After a successful call to `vkMapMemory` or `vkMapMemory2KHR` the memory object memory is considered to be currently *host mapped*.

To flush ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice device,                      // Logical device that owns the memory ranges.
    uint32_t memoryRangeCount,            // Length of the pMemoryRanges array.
    const VkMappedMemoryRange* pMemoryRanges); // Pointer to an array of VkMappedMemoryRange structures describing the memory ranges to flush.
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the `VK_ACCESS_HOST_WRITE_BIT` access type.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If `pMemoryRanges` includes sets of `nonCoherentAtomSize` bytes where no bytes have...
been written by the host, those bytes must not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed may not ever be visible to the device. However, implementations must ensure that writes that have not been flushed do not become visible to any other memory.

**Note**
The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

### Valid Usage (Implicit)
- VUID-vkFlushMappedMemoryRanges-device-parameter
  - device must be a valid `VkDevice` handle
- VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  - `pMemoryRanges` must be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures
- VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  - `memoryRangeCount` must be greater than 0

### Return Codes
**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To invalidate ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice device,
    uint32_t memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
- `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to invalidate.
vkInvalidateMappedMemoryRanges guarantees that device writes to the memory ranges described by pMemoryRanges, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

Note
Mapping non-coherent memory does not implicitly invalidate that memory.

Valid Usage (Implicit)

- VUID-vkInvalidateMappedMemoryRanges-device-parameter
  device must be a valid VkDevice handle
- VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter
  pMemoryRanges must be a valid pointer to an array of memoryRangeCount valid VkMappedMemoryRange structures
- VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength
  memoryRangeCount must be greater than 0

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkMappedMemoryRange structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMappedMemoryRange {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMappedMemoryRange;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memory` is the memory object to which this range belongs.
• `offset` is the zero-based byte offset from the beginning of the memory object.
• `size` is either the size of range, or `VK_WHOLE_SIZE` to affect the range from `offset` to the end of the current mapping of the allocation.

### Valid Usage

- VUID-VkMappedMemoryRange-memory-00684
  - `memory` must be currently host mapped

- VUID-VkMappedMemoryRange-size-00685
  - If `size` is not equal to `VK_WHOLE_SIZE`, `offset` and `size` must specify a range contained within the currently mapped range of `memory`

- VUID-VkMappedMemoryRange-size-00686
  - If `size` is equal to `VK_WHOLE_SIZE`, `offset` must be within the currently mapped range of `memory`

- VUID-VkMappedMemoryRange-offset-00687
  - `offset` must be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`

- VUID-VkMappedMemoryRange-size-01389
  - If `size` is equal to `VK_WHOLE_SIZE`, the end of the current mapping of `memory` must either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize` bytes from the beginning of the memory object, or be equal to the end of the memory object

- VUID-VkMappedMemoryRange-size-01390
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` must either be a multiple of `VkPhysicalDeviceLimits::nonCoherentAtomSize`, or `offset` plus `size` must equal the size of `memory`

### Valid Usage (Implicit)

- VUID-VkMappedMemoryRange-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE`

- VUID-VkMappedMemoryRange-pNext-pNext
  - `pNext` must be `NULL`

- VUID-VkMappedMemoryRange-memory-parameter
  - `memory` must be a valid `VkDeviceMemory` handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
  VkDevice device,
```
VkDeviceMemory memory);

- `device` is the logical device that owns the memory.
- `memory` is the memory object to be unmapped.

Calling `vkUnmapMemory` is equivalent to calling `vkUnmapMemory2KHR` with an empty `pNext` chain and the flags parameter set to zero.

### Valid Usage

- VUID-vkUnmapMemory-memory-00689
  
  `memory` must be currently host mapped

### Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkUnmapMemory-memory-parameter
  
  `memory` must be a valid `VkDeviceMemory` handle

- VUID-vkUnmapMemory-memory-parent
  
  `memory` must have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `memory` must be externally synchronized

Alternatively, to unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkUnmapMemory2KHR(
    VkDevice device,
    const VkMemoryUnmapInfoKHR* pMemoryUnmapInfo);
```

- `device` is the logical device that owns the memory.
- `pMemoryUnmapInfo` is a pointer to a `VkMemoryUnmapInfoKHR` structure describing parameters of the unmap.

This function behaves identically to `vkUnmapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.
Valid Usage (Implicit)

- VUID-vkUnmapMemory2KHR-device-parameter
devicemust be a valid VkDevice handle

- VUID-vkUnmapMemory2KHR-pMemoryUnmapInfo-parameter
pMemoryUnmapInfo must be a valid pointer to a valid VkMemoryUnmapInfoKHR structure

Return Codes

**Success**
- VK_SUCCESS

The VkMemoryUnmapInfoKHR structure is defined as:

```c
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryUnmapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryUnmapFlagsKHR flags;
    VkDeviceMemory memory;
} VkMemoryUnmapInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **memory** is the VkDeviceMemory object to be unmapped.

Valid Usage

- VUID-VkMemoryUnmapInfoKHR-memory-07964
memory must be currently host mapped

Valid Usage (Implicit)

- VUID-VkMemoryUnmapInfoKHR-sType-sType
sTypemust be VK_STRUCTURE_TYPE_MEMORY_UNMAP_INFO_KHR

- VUID-VkMemoryUnmapInfoKHR-pNext-pNext
pNext must be NULL

- VUID-VkMemoryUnmapInfoKHR-flags-zerobitmask
flags must be 0

- VUID-VkMemoryUnmapInfoKHR-memory-parameter

memory must be a valid VkDeviceMemory handle

Host Synchronization

• Host access to memory must be externally synchronized

// Provided by VK_KHR_map_memory2
typedef VkFlags VkMemoryUnmapFlagsKHR;

VkMemoryMapFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

11.2.10. Lazily Allocated Memory

If the memory object is allocated from a heap with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set, that object’s backing memory may be provided by the implementation lazily. The actual committed size of the memory may initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a VkImage whose usage flags include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT.

Note

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed may allow some implementations to never allocate memory for such attachments.

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize* pCommittedMemoryInBytes);

• device is the logical device that owns the memory.

• memory is the memory object being queried.

• pCommittedMemoryInBytes is a pointer to a VkDeviceSize value in which the number of bytes currently committed is returned, on success.

The implementation may update the commitment at any time, and the value returned by this query may be out of date.

The implementation guarantees to allocate any committed memory from the heapIndex indicated by
the memory type that the memory object was created with.

**Valid Usage**

- VUID-vkGetDeviceMemoryCommitment-memory-00690
  memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

**Valid Usage (Implicit)**

- VUID-vkGetDeviceMemoryCommitment-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetDeviceMemoryCommitment-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
  pCommittedMemoryInBytes must be a valid pointer to a VkDeviceSize value

- VUID-vkGetDeviceMemoryCommitment-memory-parent
  memory must have been created, allocated, or retrieved from device

### 11.2.11. Protected Memory

*Protected memory* divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- **Memory:**
  - Unprotected device memory, which can be visible to the device and can be visible to the host
  - Protected device memory, which can be visible to the device but must not be visible to the host

- **Resources:**
  - Unprotected images and unprotected buffers, to which unprotected memory can be bound
  - Protected images and protected buffers, to which protected memory can be bound

- **Command buffers:**
  - Unprotected command buffers, which can be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which can be submitted to a protected-capable device queue to execute protected queue operations

- **Device queues:**
  - Unprotected device queues, to which unprotected command buffers can be submitted
Protected-capable device queues, to which unprotected command buffers or protected command buffers can be submitted

- Queue submissions
  - Unprotected queue submissions, through which unprotected command buffers can be submitted
  - Protected queue submissions, through which protected command buffers can be submitted
- Queue operations
  - Unprotected queue operations
  - Protected queue operations

Protected Memory Access Rules

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_FALSE, applications must not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault is VK_TRUE, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations must not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation must guarantee that:

- Protected device memory must never be visible to the host.
- Values written to unprotected device memory must not be a function of values from protected memory.

11.2.12. Peer Memory Features

Peer memory is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory may not be supported by a device.

To determine how peer memory can be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
  VkDevice device,
  uint32_t heapIndex,
  uint32_t localDeviceIndex,
```
or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

- `device` is the logical device that owns the memory.
- `heapIndex` is the index of the memory heap from which the memory is allocated.
- `localDeviceIndex` is the device index of the physical device that performs the memory access.
- `remoteDeviceIndex` is the device index of the physical device that the memory is allocated for.
- `pPeerMemoryFeatures` is a pointer to a `VkPeerMemoryFeatureFlags` bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

### Valid Usage

- VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691
  `heapIndex` must be less than `memoryHeapCount`

- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692
  `localDeviceIndex` must be a valid device index

- VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693
  `remoteDeviceIndex` must be a valid device index

- VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694
  `localDeviceIndex` must not equal `remoteDeviceIndex`

### Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter
  `pPeerMemoryFeatures` must be a valid pointer to a `VkPeerMemoryFeatureFlags` value

Bits which may be set in `vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures`, indicating supported peer memory features, are:
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
}

or the equivalent

typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;

• **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any vkCmdCopy* command.

• **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any vkCmdCopy* command.

• **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.

• **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.

**Note**

The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.
typedef VkFlags VkPeerMemoryFeatureFlags;

or the equivalent

typedef VkPeerMemoryFeatureFlagsKHR VkPeerMemoryFeatureFlags;

\texttt{VkPeerMemoryFeatureFlags} is a bitmask type for setting a mask of zero or more \texttt{VkPeerMemoryFeatureFlagBits}.

11.2.13. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device, 
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

or the equivalent command

```
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device, 
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- \texttt{device} is the logical device that the memory object was allocated on.
- \texttt{pInfo} is a pointer to a \texttt{VkDeviceMemoryOpaqueCaptureAddressInfo} structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of \texttt{pInfo->memory}.

If the memory object was allocated with a non-zero value of \texttt{VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress}, the return value \textbf{must} be the same address.

\begin{itemize}
  \item \textbf{Note}
  \textbf{Note}
  \end{itemize}

The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.
Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-03335
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkDeviceMemoryOpaqueCaptureAddressInfo structure

The VkDeviceMemoryOpaqueCaptureAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memory specifies the memory whose address is being queried.

Valid Usage

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336
  memory must have been allocated with VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT
Valid Usage (Implicit)

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType**  
  
  **sType** must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext**  
  
  **pNext** must be `NULL`

- **VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter**  
  
  **memory** must be a valid `VkDeviceMemory` handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images can be multidimensional and may have associated metadata.

Other resource types, such as acceleration structures use buffers as the backing store for opaque data structures.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice device,
    const VkBufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBuffer* pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBuffer` is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-flags-00911
  If the `flags` member of `pCreateInfo` includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT, creating this VkBuffer must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize
Valid Usage (Implicit)

- **VUID-vkCreateBuffer-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure

- **VUID-vkCreateBuffer-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateBuffer-pBuffer-parameter**
  
  `pBuffer` must be a valid pointer to a `VkBuffer` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize size;
    VkBufferUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkBufferCreateFlagBits` specifying additional parameters of the buffer.
- `size` is the size in bytes of the buffer to be created.
- `usage` is a bitmask of `VkBufferUsageFlagBits` specifying allowed usages of the buffer.
- `sharingMode` is a `VkSharingMode` value specifying the sharing mode of the buffer when it will be
accessed by multiple queue families.

- queueFamilyIndexCount is the number of entries in the pQueueFamilyIndices array.
- pQueueFamilyIndices is a pointer to an array of queue families that will access this buffer. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

## Valid Usage

- **VUID-VkBufferCreateInfo-size-00912**
  size must be greater than 0

- **VUID-VkBufferCreateInfo-sharingMode-00913**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid pointer to an array of queueFamilyIndexCount uint32_t values

- **VUID-VkBufferCreateInfo-sharingMode-00914**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

- **VUID-VkBufferCreateInfo-sharingMode-01419**
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- **VUID-VkBufferCreateInfo-flags-00915**
  If the sparseBinding feature is not enabled, flags must not contain VK_BUFFER_CREATE_SPARSE_BINDING_BIT

- **VUID-VkBufferCreateInfo-flags-00916**
  If the sparseResidencyBuffer feature is not enabled, flags must not contain VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

- **VUID-VkBufferCreateInfo-flags-00917**
  If the sparseResidencyAliased feature is not enabled, flags must not contain VK_BUFFER_CREATE_SPARSE_ALIASED_BIT

- **VUID-VkBufferCreateInfo-flags-00918**
  If flags contains VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT, it must also contain VK_BUFFER_CREATE_SPARSE_BINDING_BIT

- **VUID-VkBufferCreateInfo-pNext-00920**
  If the pNext chain includes a VkExternalMemoryBufferCreateInfo structure, its handleTypes member must only contain bits that are also in VkExternalBufferProperties::externalMemoryProperties.compatibleHandleTypes, as returned by vkGetPhysicalDeviceExternalBufferProperties with pExternalBufferInfo->handleType equal to any one of the handle types specified in VkExternalMemoryBufferCreateInfo::handleTypes

- **VUID-VkBufferCreateInfo-flags-01887**
  If the protectedMemory feature is not enabled, flags must not contain
VK_BUFFER_CREATE_PROTECTED_BIT

- VUID-VkBufferCreateInfo-None-01888
  If any of the bits VK_BUFFER_CREATE_SPARSE_BINDING_BIT, VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT are set, VK_BUFFER_CREATE_PROTECTED_BIT must not also be set.

- VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
  If VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress is not zero, flags must include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

- VUID-VkBufferCreateInfo-flags-06549
  If flags includes VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the bufferDeviceAddressCaptureReplay feature must be enabled.

- VUID-VkBufferCreateInfo-usage-04813
  If usage includes VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR or VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying a decode operation.

- VUID-VkBufferCreateInfo-usage-04814
  If usage includes VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR or VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation.

- VUID-VkBufferCreateInfo-size-06409
  size must be less than or equal to VkPhysicalDeviceMaintenance4Properties::maxBufferSize

Valid Usage (Implicit)

- VUID-VkBufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO

- VUID-VkBufferCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkBufferOpaqueCaptureAddressCreateInfo, VkExternalMemoryBufferCreateInfo, or VkVideoProfileListInfoKHR

- VUID-VkBufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferCreateInfo-flags-parameter
  flags must be a valid combination of VkBufferCreateFlagBits values

- VUID-VkBufferCreateInfo-usage-parameter
  usage must be a valid combination of VkBufferUsageFlagBits values

- VUID-VkBufferCreateInfo-usage-requiredbitmask
  634
**usage** must not be 0

- VUID-VkBufferCreateInfo-sharingMode-parameter
  sharingMode must be a valid VkSharingMode value

Bits which **can** be set in VkBufferCreateInfo::usage, specifying usage behavior of a buffer, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
    VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR,
    VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR,
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR,
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR,
    VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR,
    VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR,
    VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR,
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR,
} VkBufferUsageFlagBits;
```

- **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** specifies that the buffer can be used as the source of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).

- **VK_BUFFER_USAGE_TRANSFER_DST_BIT** specifies that the buffer can be used as the destination of a transfer command.

- **VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT** specifies that the buffer can be used to create a
A suitable `VkBufferView` for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.

- `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` specifies that the buffer can be used to create a `VkBufferView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.

- `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` specifies that the buffer can be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.

- `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` specifies that the buffer can be used in a `VkDescriptorBufferInfo` suitable for occupying a `VkDescriptorSet` slot either of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

- `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` specifies that the buffer is suitable for passing as the `buffer` parameter to `vkCmdBindIndexBuffer`.

- `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` specifies that the buffer is suitable for passing as an element of the `pBuffers` array to `vkCmdBindVertexBuffers`.

- `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` specifies that the buffer is suitable for passing as the `buffer` parameter to `vkCmdDrawIndirect`, `vkCmdDrawIndexedIndirect`, or `vkCmdDispatchIndirect`.

- `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` specifies that the buffer is suitable for use as a Shader Binding Table.

- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR` specifies that the buffer is suitable for storage space for a `VkAccelerationStructureKHR`.

- `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` specifies that the buffer can be used to retrieve a buffer device address via `vkGetBufferDeviceAddress` and use that address to access the buffer’s memory from a shader.

- `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.

- `VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR` is reserved for future use.

- `VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR` specifies that the buffer can be used as the destination video bitstream buffer in a video encode operation.

- `VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` is reserved for future use.

// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;

`VkBufferUsageFlags` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits`.

Bits which can be set in `VkBufferCreateInfo::flags`, specifying additional parameters of a buffer, are:

```cpp
typedef VkFlags VkBufferUsageFlags;
``
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
    // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT
} VkBufferCreateFlagBits;

- **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** specifies that the buffer will be backed using sparse memory binding.
- **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** specifies that the buffer can be partially backed using sparse memory binding. Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.
- **VK_BUFFER_CREATE_SPARSE_ALIASED_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag must also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.
- **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.
- **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.

See Sparse Resource Features and Physical Device Features for details of the sparse memory features supported on a device.

typedef VkFlags VkBufferCreateFlags;

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

To define a set of external memory handle types that may be used as backing store for a buffer, add a **VkExternalMemoryBufferCreateInfo** structure to the pNext chain of the **VkBufferCreateInfo** structure. The **VkExternalMemoryBufferCreateInfo** structure is defined as:

typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
VkExternalMemoryBufferCreateInfo

or the equivalent

```
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

**Note**

A `VkExternalMemoryBufferCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- VUID-VkExternalMemoryBufferCreateInfo-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO`
- VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter
  - `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

To request a specific device address for a buffer, add a `VkBufferOpaqueCaptureAddressCreateInfo` structure to the `pNext` chain of the `VkBufferCreateInfo` structure. The `VkBufferOpaqueCaptureAddressCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_2
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_buffer_device_address
typedef VkBufferOpaqueCaptureAddressCreateInfo VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `opaqueCaptureAddress` is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it **should** be an address retrieved from `vkGetBufferOpaqueCaptureAddress` for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Apps **should** avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

### Valid Usage (Implicit)

- `VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType` 
  
  `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO`

To destroy a buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.

- `buffer` is the buffer to destroy.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- **VUID-vkDestroyBuffer-buffer-00922**
  All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, **must** have completed execution

- **VUID-vkDestroyBuffer-buffer-00923**
  If `VkAllocationCallbacks` were provided when `buffer` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyBuffer-buffer-00924**
  If no `VkAllocationCallbacks` were provided when `buffer` was created, `pAllocator` **must** be `NULL`

Valid Usage (Implicit)

- **VUID-vkDestroyBuffer-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyBuffer-buffer-parameter**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle

- **VUID-vkDestroyBuffer-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyBuffer-buffer-parent**
  If `buffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `buffer` **must** be externally synchronized

12.2. Buffer Views

A *buffer view* represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using *image operations*. In order to create a valid buffer view, the `buffer` **must** have been created with at least one of the following usage flags:

- `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`
- `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

Buffer views are represented by `VkBufferView` handles:

```c
// Provided by VK_VERSION_1_0
```
To create a buffer view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice device, 
    const VkBufferViewCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkBufferView* pView);
```

- `device` is the logical device that creates the buffer view.
- `pCreateInfo` is a pointer to a `VkBufferViewCreateInfo` structure containing parameters to be used to create the buffer view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a `VkBufferView` handle in which the resulting buffer view object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateBufferView-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkBufferViewCreateInfo` structure
- VUID-vkCreateBufferView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateBufferView-pView-parameter
  `pView` must be a valid pointer to a `VkBufferView` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBufferViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkBufferViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer buffer;
    VkFormat format;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkBufferViewCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **buffer** is a `VkBuffer` on which the view will be created.
- **format** is a `VkFormat` describing the format of the data elements in the buffer.
- **offset** is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- **range** is a size in bytes of the buffer view. If `range` is equal to `VK_WHOLE_SIZE`, the range from `offset` to the end of the buffer is used. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of the texel block size of `format`, the nearest smaller multiple is used.

### Valid Usage

- **VUID-VkBufferViewCreateInfo-offset-00925**
  offset must be less than the size of buffer

- **VUID-VkBufferViewCreateInfo-range-00928**
  If range is not equal to `VK_WHOLE_SIZE`, range must be greater than 0

- **VUID-VkBufferViewCreateInfo-range-00929**
  If range is not equal to `VK_WHOLE_SIZE`, range must be an integer multiple of the texel block size of format

- **VUID-VkBufferViewCreateInfo-range-00930**
  If range is not equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by (\(\lfloor\frac{\text{range}}{(\text{texel block size})}\rfloor \times (\text{texels per block})\)) where texel block size and texels per block are as defined in the Compatible Formats table for format, must be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`

- **VUID-VkBufferViewCreateInfo-offset-00931**
  If range is not equal to `VK_WHOLE_SIZE`, the sum of offset and range must be less than or equal to the size of buffer

- **VUID-VkBufferViewCreateInfo-range-04059**
  If range is equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by (\(\lfloor\frac{\text{size} - \text{offset}}{(\text{texel block size})}\rfloor \times (\text{texels per block})\)) where size is the size of buffer, and texel block size and texels per block are as defined in the Compatible Formats table for format, must be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`
• VUID-VkBufferViewCreateInfo-buffer-00932
  buffer must have been created with a usage value containing at least one of
  VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

• VUID-VkBufferViewCreateInfo-buffer-00933
  If buffer was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, then format features of format must contain VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT

• VUID-VkBufferViewCreateInfo-buffer-00934
  If buffer was created with usage containing VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, then format features of format must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT

• VUID-VkBufferViewCreateInfo-buffer-00935
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkBufferViewCreateInfo-offset-02749
  If the texelBufferAlignment feature is not enabled, offset must be a multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment

• VUID-VkBufferViewCreateInfo-offset-02750
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, offset must be a multiple of the lesser of VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes or, if VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

• VUID-VkBufferViewCreateInfo-offset-02751
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, offset must be a multiple of the lesser of VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes or, if VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead

Valid Usage (Implicit)

• VUID-VkBufferViewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO

• VUID-VkBufferViewCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkBufferViewCreateInfo-flags-zerobitmask
  flags must be 0

• VUID-VkBufferViewCreateInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-VkBufferViewCreateInfo-format-parameter
**format** must be a valid **VkFormat** value

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;
```

**VkBufferViewCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBufferView(
    VkDevice device,
    VkBufferView bufferView,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the buffer view.
- **bufferView** is the buffer view to destroy.
- **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.

### Valid Usage

- **VUID-vkDestroyBufferView-bufferView-00936**
  All submitted commands that refer to **bufferView** must have completed execution.

- **VUID-vkDestroyBufferView-bufferView-00937**
  If **VkAllocationCallbacks** were provided when **bufferView** was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyBufferView-bufferView-00938**
  If no **VkAllocationCallbacks** were provided when **bufferView** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- **VUID-vkDestroyBufferView-device-parameter**
  **device** must be a valid **VkDevice** handle.

- **VUID-vkDestroyBufferView-bufferView-parameter**
  If **bufferView** is not **VK_NULL_HANDLE**, **bufferView** must be a valid **VkBufferView** handle.

- **VUID-vkDestroyBufferView-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- **VUID-vkDestroyBufferView-bufferView-parent**
  If **bufferView** is a valid handle, it must have been created, allocated, or retrieved from
Host Synchronization

- Host access to `bufferView` must be externally synchronized.

### 12.2.1. Buffer View Format Features

Valid uses of a `VkBufferView` may depend on the buffer view's *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is supported, then the buffer view's set of *format features* is the value of `VkFormatProperties3::bufferFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same *format* as `VkBufferViewCreateInfo::format`.

### 12.3. Images

Images represent multidimensional - up to 3 - arrays of data which can be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by `VkImage` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice device,
    const VkImageCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImage* pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pImage` is a pointer to a `VkImage` handle in which the resulting image object is returned.
Valid Usage

• VUID-vkCreateImage-flags-00939
If the flags member of pCreateInfo includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, creating this VkImage must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed VkPhysicalDeviceLimits::sparseAddressSpaceSize.

Valid Usage (Implicit)

• VUID-vkCreateImage-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateImage-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

• VUID-vkCreateImage-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateImage-pImage-parameter
pImage must be a valid pointer to a VkImage handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
} VkImageCreateInfo;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.

• **imageType** is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.

• **format** is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.

• **extent** is a `VkExtent3D` describing the number of data elements in each dimension of the base level.

• **mipLevels** describes the number of levels of detail available for minified sampling of the image.

• **arrayLayers** is the number of layers in the image.

• **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.

• **tiling** is a `VkImageTiling` value specifying the tiling arrangement of the texel blocks in memory.

• **usage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the image.

• **sharingMode** is a `VkSharingMode` value specifying the sharing mode of the image when it will be accessed by multiple queue families.

• **queueFamilyIndexCount** is the number of entries in the `pQueueFamilyIndices` array.

• **pQueueFamilyIndices** is a pointer to an array of queue families that will access this image. It is ignored if **sharingMode** is not `VK_SHARING_MODE_CONCURRENT`.

• **initialLayout** is a `VkImageLayout` value specifying the initial `VkImageLayout` of all image subresources of the image. See Image Layouts.

Images created with **tiling** equal to `VK_IMAGE_TILING_LINEAR` have further restrictions on their limits and capabilities compared to images created with **tiling** equal to `VK_IMAGE_TILING_OPTIMAL`. Creation of images with tiling `VK_IMAGE_TILING_LINEAR` may not be supported unless other parameters meet all of the constraints:

• **imageType** is `VK_IMAGE_TYPE_2D`

• **format** is not a depth/stencil format

• **mipLevels** is 1

• **arrayLayers** is 1

• **samples** is `VK_SAMPLE_COUNT_1_BIT`

• **usage** only includes `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and/or `VK_IMAGE_USAGE_TRANSFER_DST_BIT`
Images created with one of the formats that require a sampler Y'C_bC_r conversion, have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring Y'C_bC_r conversion may not be supported unless other parameters meet all of the constraints:

- **imageType** is VK_IMAGE_TYPE_2D
- **mipLevels** is 1
- **arrayLayers** is 1, unless otherwise indicated by VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties
- **samples** is VK_SAMPLE_COUNT_1_BIT

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed maxResourceSize, then vkCreateImage must fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure may occur even when all image creation parameters satisfy their valid usage requirements.

**Note**

For images created without VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for the format the image is created with.

For images created with VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for at least one of the formats a VkImageView created from the image can have (see Image Views for more detail).

### Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, VkImageCreateInfo::arrayLayers is limited by imageCreateMaxArrayLayers, defined below; and VkImageCreateInfo::samples is limited by imageCreateSampleCounts, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of VkImageCreateInfo.

- Let VkBool32 imageCreateMaybeLinear indicate if the resultant image may be linear. (The definition below is trivial because certain extensions are disabled in this build of the specification).
  - If tiling is VK_IMAGE_TILING_LINEAR, then imageCreateMaybeLinear is VK_TRUE.
  - If tiling is VK_IMAGE_TILING_OPTIMAL, then imageCreateMaybeLinear is VK_FALSE.
- Let VkFormatFeatureFlags imageCreateFormatFeatures be the set of valid format features available during image creation.
If tiling is VK_IMAGE_TILING_LINEAR, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.

If tiling is VK_IMAGE_TILING_OPTIMAL, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.

Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2[]`, possibly multiple times, as follows:

- The parameters `VkPhysicalDeviceImageFormatInfo2::format`, `imageType`, `tiling`, `usage`, and `flags` must be equal to those in `VkImageCreateInfo`.
- If `VkImageCreateInfo::pNext` contains a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` is not 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must contain a `VkPhysicalDeviceExternalImageFormatInfo` structure whose `handleType` is not 0; and `vkGetPhysicalDeviceImageFormatProperties2` must be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.
- If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is 0, then `VkPhysicalDeviceImageFormatInfo2::pNext` must either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is 0.
- If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure then `VkPhysicalDeviceImageFormatInfo2::pNext` must also contain the same `VkVideoProfileListInfoKHR` structure on each call.
- If any call to `vkGetPhysicalDeviceImageFormatProperties2` returns an error, then `imageCreateImageFormatPropertiesList` is defined to be the empty list.

Let `uint32_t imageCreateMaxMipLevels` be the minimum value of `VkImageFormatProperties::maxMipLevels` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

Let `uint32_t imageCreateMaxArrayLayers` be the minimum value of `VkImageFormatProperties::maxArrayLayers` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

Let `VkExtent3D imageCreateMaxExtent` be the component-wise minimum over all `VkImageFormatProperties::maxExtent` values in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

Let `VkSampleCountFlags imageCreateSampleCounts` be the intersection of each `VkImageFormatProperties::sampleCounts` in `imageCreateImageFormatPropertiesList`. The value is undefined if `imageCreateImageFormatPropertiesList` is empty.

Let `VkVideoFormatPropertiesKHR videoFormatProperties[]` be defined as follows:

- If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure, then
  -
videoFormatProperties is the list of structures obtained by calling `vkGetPhysicalDeviceVideoFormatPropertiesKHR` with `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` equal to the `usage` member of `VkImageCreateInfo` and `VkPhysicalDeviceVideoFormatInfoKHR::pNext` containing the same `VkVideoProfileListInfoKHR` structure chained to `VkImageCreateInfo`.

- If `VkImageCreateInfo::pNext` contains no `VkVideoProfileListInfoKHR` structure, then `videoFormatProperties` is an empty list.

Let `VkBool32 supportedVideoFormat` indicate if the image parameters are supported by the specified video profiles.

- `supportedVideoFormat` is `VK_TRUE` if there exists an element in the `videoFormatProperties` list for which all of the following conditions are true:
  - `VkImageCreateInfo::format` equals `VkVideoFormatPropertiesKHR::format`.
  - `VkImageCreateInfo::flags` only contains bits also set in `VkVideoFormatPropertiesKHR::imageCreateFlags`.
  - `VkImageCreateInfo::imageType` equals `VkVideoFormatPropertiesKHR::imageType`.
  - `VkImageCreateInfo::tiling` equals `VkVideoFormatPropertiesKHR::imageTiling`.
  - `VkImageCreateInfo::usage` only contains bits also set in `VkVideoFormatPropertiesKHR::imageUsageFlags`.
- Otherwise `supportedVideoFormat` is `VK_FALSE`.

### Valid Usage

- **VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251**
  Each of the following values (as described in Image Creation Limits) must not be undefined: `imageCreateMaxMipLevels`, `imageCreateMaxArrayLayers`, `imageCreateMaxExtent`, and `imageCreateSampleCounts`

- **VUID-VkImageCreateInfo-sharingMode-00941**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values

- **VUID-VkImageCreateInfo-sharingMode-00942**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- **VUID-VkImageCreateInfo-sharingMode-01420**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the physicalDevice that was used to create device

- **VUID-VkImageCreateInfo-format-00943**
  `format` must not be `VK_FORMAT_UNDEFINED`

- **VUID-VkImageCreateInfo-extent-00944**
  `extent` must not be `VK_FORMAT_UNDEFINED`
extent.width must be greater than 0

• VUID-VkImageCreateInfo-extent-00945
  extent.height must be greater than 0

• VUID-VkImageCreateInfo-extent-00946
  extent.depth must be greater than 0

• VUID-VkImageCreateInfo-mipLevels-00947
  mipLevels must be greater than 0

• VUID-VkImageCreateInfo-arrayLayers-00948
  arrayLayers must be greater than 0

• VUID-VkImageCreateInfo-flags-00949
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, imageType must be
  VK_IMAGE_TYPE_2D

• VUID-VkImageCreateInfo-flags-08865
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, extent.width and extent.height
  must be equal

• VUID-VkImageCreateInfo-flags-08866
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, arrayLayers must be greater than
  or equal to 6

• VUID-VkImageCreateInfo-flags-00950
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, imageType must be
  VK_IMAGE_TYPE_3D

• VUID-VkImageCreateInfo-extent-02252
  extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in
  Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02253
  extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in
  Image Creation Limits)

• VUID-VkImageCreateInfo-extent-02254
  extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in
  Image Creation Limits)

• VUID-VkImageCreateInfo-imageType-00956
  If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1

• VUID-VkImageCreateInfo-imageType-00957
  If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

• VUID-VkImageCreateInfo-mipLevels-00958
  mipLevels must be less than or equal to the number of levels in the complete mipmap
  chain based on extent.width, extent.height, and extent.depth

• VUID-VkImageCreateInfo-mipLevels-02255
  mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image
  Creation Limits)

• VUID-VkImageCreateInfo-arrayLayers-02256
arrayLayers **must** be less than or equal to `imageCreateMaxArrayLayers` (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-imageType-00961
  If `imageType` is `VK_IMAGE_TYPE_3D`, arrayLayers **must** be 1

- VUID-VkImageCreateInfo-samples-02257
  If `samples` is not `VK_SAMPLE_COUNT_1_BIT`, then `imageType` **must** be `VK_IMAGE_TYPE_2D`, `flags` **must** not contain `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT`, `mipLevels` **must** be equal to 1, and `imageCreateMaybeLinear` (as defined in Image Creation Limits) **must** be `VK_FALSE`

- VUID-VkImageCreateInfo-usage-00963
  If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, then bits other than `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` **must** not be set

- VUID-VkImageCreateInfo-usage-00964
  If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.width` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferWidth`

- VUID-VkImageCreateInfo-usage-00965
  If `usage` includes `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, `extent.height` **must** be less than or equal to `VkPhysicalDeviceLimits::maxFramebufferHeight`

- VUID-VkImageCreateInfo-usage-00966
  If `usage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, `usage` **must** also contain at least one of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

- VUID-VkImageCreateInfo-samples-02258
  `samples` **must** be a bit value that is set in `imageCreateSampleCounts` (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-usage-00968
  If the shaderStorageImageMultisample feature is not enabled, and `usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, `samples` **must** be `VK_SAMPLE_COUNT_1_BIT`

- VUID-VkImageCreateInfo-flags-00969
  If the sparseBinding feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`

- VUID-VkImageCreateInfo-flags-01924
  If the sparseResidencyAliased feature is not enabled, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`

- VUID-VkImageCreateInfo-tiling-04121
  If `tiling` is `VK_IMAGE_TILING_LINEAR`, `flags` **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

- VUID-VkImageCreateInfo-imageType-00970
  If `imageType` is `VK_IMAGE_TYPE_1D`, `flags` **must** not contain
• VUID-VkImageCreateInfo-imageType-00971
  If the `sparseResidencyImage2D` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_2D`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-imageType-00972
  If the `sparseResidencyImage3D` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_3D`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-imageType-00973
  If the `sparseResidency2Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_2_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-imageType-00974
  If the `sparseResidency4Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_4_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-imageType-00975
  If the `sparseResidency8Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_8_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-imageType-00976
  If the `sparseResidency16Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_16_BIT`, flags **must** not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`

• VUID-VkImageCreateInfo-flags-00987
  If flags contains `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`, it **must** also contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`

• VUID-VkImageCreateInfo-None-01925
  If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` **must** not also be set

• VUID-VkImageCreateInfo-flags-01890
  If the `protectedMemory` feature is not enabled, flags **must** not contain `VK_IMAGE_CREATE_PROTECTED_BIT`

• VUID-VkImageCreateInfo-None-01891
  If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_CREATE_PROTECTED_BIT` **must** not also be set

• VUID-VkImageCreateInfo-pNext-00990
  If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure, its `handleTypes` member **must** only contain bits that are also in `VkExternalImageFormatProperties::externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceImageFormatProperties2` with `format`, `imageType`, `tiling`, `usage`, and
flags equal to those in this structure, and with a 
VkPhysicalDeviceExternalImageFormatInfo structure included in the pNext chain, with a 
handleType equal to any one of the handle types specified in 
VkExternalMemoryImageCreateInfo::handleTypes

- VUID-VkImageCreateInfo-physicalDeviceCount-01421
  If the logical device was created with VkDeviceGroupDeviceCreateInfo ::physicalDeviceCount equal to 1, flags must not contain 
  VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT

- VUID-VkImageCreateInfo-flags-02259
  If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then 
  mipLevels must be one, arrayLayers must be one, imageType must be VK_IMAGE_TYPE_2D. and 
  imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE

- VUID-VkImageCreateInfo-flags-01572
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then 
  format must be a compressed image format

- VUID-VkImageCreateInfo-flags-01573
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags must also 
  contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

- VUID-VkImageCreateInfo-initialLayout-00993
  initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkImageCreateInfo-pNext-01443
  If the pNext chain includes a VkExternalMemoryImageCreateInfo or 
  VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, 
  initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkImageCreateInfo-format-06410
  If the image format is one of the formats that require a sampler Y′CbCr conversion, 
  mipLevels must be 1

- VUID-VkImageCreateInfo-format-06411
  If the image format is one of the formats that require a sampler Y′CbCr conversion, samples 
  must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-format-06412
  If the image format is one of the formats that require a sampler Y′CbCr conversion, 
  imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-imageCreateFormatFeatures-02260
  If format is a multi-planar format, and if imageCreateFormatFeatures (as defined in Image 
  Creation Limits) does not contain VK_FORMAT_FEATURE_DISJOINT_BIT, then flags must not contain 
  VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-01577
  If format is not a multi-planar format, and flags does not include 
  VK_IMAGE_CREATE_ALIAS_BIT, flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-04712
  If format has a _422 or _420 suffix, width must be a multiple of 2

- VUID-VkImageCreateInfo-format-04713
If format has a _420 suffix, height must be a multiple of 2

- **VUID-VkImageCreateInfo-format-02795**
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageCreateInfo-format-02796**
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also not include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageCreateInfo-format-02797**
  If format is a depth-stencil format, usage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- **VUID-VkImageCreateInfo-format-02798**
  If format is a depth-stencil format, usage does not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, and the pNext chain includes a VkImageStencilUsageCreateInfo structure, then its VkImageStencilUsageCreateInfo ::stencilUsage member must also not include VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT

- **VUID-VkImageCreateInfo-Format-02536**
  If format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage member including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, extent.width must be less than or equal to VkPhysicalDeviceLimits::maxFramebufferWidth

- **VUID-VkImageCreateInfo-imageView2DOn3DImage-04459**
  If the shaderStorageImageMultisample feature is not enabled, format is a depth-stencil format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

- **VUID-VkImageCreateInfo-imageType-02082**
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType must be VK_IMAGE_TYPE_2D

- **VUID-VkImageCreateInfo-samples-02083**
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples must be VK_SAMPLE_COUNT_1_BIT
If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR:imageView2DOn3DImage is VK_FALSE, flags must not contain VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT

- VUID-VkImageCreateInfo-multisampleArrayImage-04460
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR:multisampleArrayImage is VK_FALSE, and samples is not VK_SAMPLE_COUNT_1_BIT, then arrayLayers must be 1

- VUID-VkImageCreateInfo-pNext-06722
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo:viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo:pViewFormats must either be compatible with the format as described in the compatibility table or, if flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, be an uncompressed format that is size-compatible with format

- VUID-VkImageCreateInfo-flags-04738
  If flags does not contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the pNext chain includes a VkImageFormatListCreateInfo structure, then VkImageFormatListCreateInfo:viewFormatCount must be 0 or 1

- VUID-VkImageCreateInfo-usage-04815
  If usage includes VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying a decode operation

- VUID-VkImageCreateInfo-usage-04816
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation

- VUID-VkImageCreateInfo-pNext-06811
  If the pNext chain includes a VkVideoProfileListInfoKHR structure with profileCount greater than 0, then supportedVideoFormat must be VK_TRUE

Valid Usage (Implicit)

- VUID-VkImageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO

- VUID-VkImageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryImageCreateInfo, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkImageSwapchainCreateInfoKHR, or VkVideoProfileListInfoKHR
The `VkImageStencilUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stencilUsage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the stencil aspect of the image.

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageStencilUsageCreateInfo` structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of the image **must** only be used as specified by `stencilUsage`. When this structure is not included in the `pNext` chain of `VkImageCreateInfo`, the stencil aspect of an image **must** only be used...
as specified by `VkImageCreateInfo::usage`. Use of other aspects of an image are unaffected by this structure.

This structure can also be included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using `vkGetPhysicalDeviceImageFormatProperties2`. When this structure is not included in the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` then the implicit value of `stencilUsage` matches that of `VkPhysicalDeviceImageFormatInfo2::usage`.

### Valid Usage

- **VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539**
  
  If `stencilUsage` includes `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`, it **must** not include bits other than `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

### Valid Usage (Implicit)

- **VUID-VkImageStencilUsageCreateInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO`

- **VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter**
  
  `stencilUsage` **must** be a valid combination of `VkImageUsageFlagBits` values

- **VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitmask**
  
  `stencilUsage` **must** not be 0

To define a set of external memory handle types that may be used as backing store for an image, add a `VkExternalMemoryImageCreateInfo` structure to the `pNext` chain of the `VkImageCreateInfo` structure. The `VkExternalMemoryImageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType         sType;
    const void*             pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryImageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

### Note

658
A `VkExternalMemoryImageCreateInfo` structure with a non-zero `handleTypes` field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying one or more external memory handle types.

### Valid Usage (Implicit)

- `VUID-VkExternalMemoryImageCreateInfo-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO`
- `VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter` 
  `handleTypes` must be a valid combination of `VkExternalMemoryHandleTypeFlagBits` values

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageSwapchainCreateInfoKHR` structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The `VkImageSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is `VK_NULL_HANDLE` or a handle of a swapchain that the image will be bound to.

### Valid Usage

- `VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995` 
  If `swapchain` is not `VK_NULL_HANDLE`, the fields of `VkImageCreateInfo` must match the implied image creation parameters of the swapchain
Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR`

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
  
  If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` must be a valid `VkSwapchainKHR` handle

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageFormatListCreateInfo` structure, then that structure contains a list of all formats that can be used when creating views of this image.

The `VkImageFormatListCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkImageFormatListCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_image_format_list
typedefVkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is a pointer to an array of `VkFormat` values specifying all formats which can be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the `VkImageFormatListCreateInfo` structure were not included in the `pNext` chain of `VkImageCreateInfo`.

Valid Usage (Implicit)

- VUID-VkImageFormatListCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO`

- VUID-VkImageFormatListCreateInfo-pViewFormats-parameter
  
  If `viewFormatCount` is not 0, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values
Bits which can be set in

- VkImageViewUsageCreateInfo::usage
- VkImageStencilUsageCreateInfo::stencilUsage
- VkImageCreateInfo::usage

specify intended usage of an image, and are:

```c
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00000100,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00002000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00004000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR = 0x00008000,
    #endif
} VkImageUsageFlagBits;
```

- **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** specifies that the image can be used as the source of a transfer command.
- **VK_IMAGE_USAGE_TRANSFER_DST_BIT** specifies that the image can be used as the destination of a transfer command.
- **VK_IMAGE_USAGE_SAMPLED_BIT** specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and be sampled by a shader.
• `VK_IMAGE_USAGE_STORAGE_BIT` specifies that the image can be used to create a `VkImageView` suitable for occupying a `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.

• `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for use as a color or resolve attachment in a `VkFramebuffer`.

• `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for use as a depth/stencil or depth/stencil resolve attachment in a `VkFramebuffer`.

• `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` specifies that implementations may support using memory allocations with the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` to back an image with this usage. This bit can be set for any image that can be used to create a `VkImageView` suitable for use as a color, resolve, depth/stencil, or input attachment.

• `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` specifies that the image can be used to create a `VkImageView` suitable for occupying `VkDescriptorSet` slot of type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.

• `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` specifies that the image can be used to create a `VkImageView` suitable for use as a fragment shading rate attachment.

• `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR` specifies that the image can be used as a decode output picture in a video decode operation.

• `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR` is reserved for future use.

• `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` specifies that the image can be used as an output reconstructed picture or an input reference picture in a video decode operation.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR` is reserved for future use.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` specifies that the image can be used as an encode input picture in a video encode operation.

• `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` specifies that the image can be used as an output reconstructed picture or an input reference picture in a video encode operation.

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;

`VkImageUsageFlags` is a bitmask type for setting a mask of zero or more `VkImageUsageFlagBits`.

When creating a `VkImageView` one of the following `VkImageUsageFlagBits` must be set:

• `VK_IMAGE_USAGE_SAMPLED_BIT`

• `VK_IMAGE_USAGE_STORAGE_BIT`

• `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`

• `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

• `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

• `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT`
• VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
• VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
• VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
• VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

Bits which can be set in VkImageCreateInfo::flags, specifying additional parameters of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
    // Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
    // Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
    // Provided by VK_KHR_bind_memory2
    VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
} VkImageCreateFlagBits;
```

• VK_IMAGE_CREATE_SPARSE_BINDING_BIT specifies that the image will be backed using sparse
memory binding.

- **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

- **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a VkImageView with a different format from the image. For multi-planar formats, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a VkImageView can be created of a plane of the image.

- **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**.

- **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image can be used to create a VkImageView of type **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.

- **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.

- **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image can be used with a non-zero value of the splitInstanceBindRegionCount member of a VkBindImageMemoryDeviceGroupInfo structure passed into vkBindImageMemory2. This flag also has the effect of making the image use the standard sparse image block dimensions.

- **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** specifies that the image having a compressed format can be used to create a VkImageView with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

- **VK_IMAGE_CREATE_EXTENDED_USAGE_BIT** specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a VkImageView created from the image can have.

- **VK_IMAGE_CREATE_DISJOINT_BIT** specifies that an image with a multi-planar format must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a disjoint image from an image without this bit set.

- **VK_IMAGE_CREATE_ALIAS_BIT** specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a disjoint image can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in Compatible formats of planes of multi-planar formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo structure whose handleTypes member is not 0, it is as if **VK_IMAGE_CREATE_ALIAS_BIT** is set.

See Sparse Resource Features and Sparse Physical Device Features for more details.
typedef VkFlags VkImageCreateFlags;

VkImageCreateFlags is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits.

Possible values of VkImageCreateInfo::imageType, specifying the basic dimensionality of an image, are:

- VK_IMAGE_TYPE_1D specifies a one-dimensional image.
- VK_IMAGE_TYPE_2D specifies a two-dimensional image.
- VK_IMAGE_TYPE_3D specifies a three-dimensional image.

Possible values of VkImageCreateInfo::tiling, specifying the tiling arrangement of texel blocks in an image, are:

- VK_IMAGE_TILING_OPTIMAL specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).
- VK_IMAGE_TILING_LINEAR specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).

To query the memory layout of an image subresource, call:

void vkGetImageSubresourceLayout(
  VkDevice device,
  VkImage image,
  const VkImageSubresource* pSubresource,
  VkSubresourceLayout* pLayout);

- device is the logical device that owns the image.
- image is the image whose layout is being queried.
• \( p\text{Subresource} \) is a pointer to a \( \text{VkImageSubresource} \) structure selecting a specific image subresource from the image.

• \( p\text{Layout} \) is a pointer to a \( \text{VkSubresourceLayout} \) structure in which the layout is returned.

The image must be linear. The returned layout is valid for host access.

If the image's format is a multi-planar format, then \( \text{vkGetImageSubresourceLayout} \) describes one plane of the image.

\( \text{vkGetImageSubresourceLayout} \) is invariant for the lifetime of a single image.

### Valid Usage

- **VUID-vkGetImageSubresourceLayout-image-07789**
  - \( \text{image} \) must have been created with \( \text{tiling} \) equal to \( \text{VK_IMAGE_TILING_LINEAR} \)

- **VUID-vkGetImageSubresourceLayout-aspectMask-00997**
  - The \( \text{aspectMask} \) member of \( p\text{Subresource} \) must only have a single bit set

- **VUID-vkGetImageSubresourceLayout-mipLevel-01716**
  - The \( \text{mipLevel} \) member of \( p\text{Subresource} \) must be less than the \( \text{mipLevels} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- **VUID-vkGetImageSubresourceLayout-arrayLayer-01717**
  - The \( \text{arrayLayer} \) member of \( p\text{Subresource} \) must be less than the \( \text{arrayLayers} \) specified in \( \text{VkImageCreateInfo} \) when \( \text{image} \) was created

- **VUID-vkGetImageSubresourceLayout-format-08886**
  - If \( \text{format} \) of the \( \text{image} \) is a color format, \( \text{tiling} \) of the \( \text{image} \) is \( \text{VK_IMAGE_TILING_LINEAR} \) or \( \text{VK_IMAGE_TILING_OPTIMAL} \), and does not have a multi-planar image format, the \( \text{aspectMask} \) member of \( p\text{Subresource} \) must be \( \text{VK_IMAGE_ASPECT_COLOR_BIT} \)

- **VUID-vkGetImageSubresourceLayout-format-04462**
  - If \( \text{format} \) of the \( \text{image} \) has a depth component, the \( \text{aspectMask} \) member of \( p\text{Subresource} \) must contain \( \text{VK_IMAGE_ASPECT_DEPTH_BIT} \)

- **VUID-vkGetImageSubresourceLayout-format-04463**
  - If \( \text{format} \) of the \( \text{image} \) has a stencil component, the \( \text{aspectMask} \) member of \( p\text{Subresource} \) must contain \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \)

- **VUID-vkGetImageSubresourceLayout-format-04464**
  - If \( \text{format} \) of the \( \text{image} \) does not contain a stencil or depth component, the \( \text{aspectMask} \) member of \( p\text{Subresource} \) must not contain \( \text{VK_IMAGE_ASPECT_DEPTH_BIT} \) or \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \)

- **VUID-vkGetImageSubresourceLayout-tiling-08717**
  - If \( \text{tiling} \) of the \( \text{image} \) is \( \text{VK_IMAGE_TILING_LINEAR} \) and has a multi-planar image format, then the \( \text{aspectMask} \) member of \( p\text{Subresource} \) must be a single valid multi-planar aspect mask
Valid Usage (Implicit)

- **VUID-vkGetImageSubresourceLayout-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkGetImageSubresourceLayout-image-parameter**
  
  *image* must be a valid *VkImage* handle

- **VUID-vkGetImageSubresourceLayout-pSubresource-parameter**
  
  *pSubresource* must be a valid pointer to a valid *VkImageSubresource* structure

- **VUID-vkGetImageSubresourceLayout-pLayout-parameter**
  
  *pLayout* must be a valid pointer to a *VkSubresourceLayout* structure

- **VUID-vkGetImageSubresourceLayout-image-parent**
  
  *image* must have been created, allocated, or retrieved from *device*

The *VkImageSubresource* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

- *aspectMask* is a *VkImageAspectFlags* value selecting the image *aspect*.
- *mipLevel* selects the mipmap level.
- *arrayLayer* selects the array layer.

Valid Usage (Implicit)

- **VUID-VkImageSubresource-aspectMask-parameter**
  
  *aspectMask* must be a valid combination of *VkImageAspectFlagBits* values

- **VUID-VkImageSubresource-aspectMask-requiredbitmask**
  
  *aspectMask* must not be 0

Information about the layout of the image subresource is returned in a *VkSubresourceLayout* structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubresourceLayout {
    VkDeviceSize offset;
    VkDeviceSize size;
    VkDeviceSize rowPitch;
    VkDeviceSize arrayPitch;
} VkSubresourceLayout;
```
VkDeviceSize depthPitch;
} VkSubresourceLayout;

- **offset** is the byte offset from the start of the image or the plane where the image subresource begins.
- **size** is the size in bytes of the image subresource. **size** includes any extra memory that is required based on **rowPitch**.
- **rowPitch** describes the number of bytes between each row of texels in an image.
- **arrayPitch** describes the number of bytes between each array layer of an image.
- **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is **linear**, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset
```

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent array layers. **depthPitch** is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
                     *compressedTexelBlockByteSize + offset;
```

The value of **arrayPitch** is undefined for images that were not created as arrays. **depthPitch** is defined only for 3D images.

If the image has a single-plane color format, then the **aspectMask** member of **VkImageSubresource** must be **VK_IMAGE_ASPECT_COLOR_BIT**.

If the image has a depth/stencil format, then **aspectMask** must be either **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT**. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different **offset** and **size** representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same **offset** and **size** are returned and represent the interleaved memory allocation.
If the image has a multi-planar format, then the aspectMask member of VkImageSubresource must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or (for 3-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT. Querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that plane. If the image is disjoint, then the offset is relative to the base address of the plane. If the image is non-disjoint, then the offset is relative to the base address of the image.

To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,        // Provided by VK_VERSION_1_0
    VkImage image,         // Provided by VK_VERSION_1_0
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image.
- `image` is the image to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyImage-image-01000**
  All submitted commands that refer to `image`, either directly or via a `VkImageView`, must have completed execution

- **VUID-vkDestroyImage-image-01001**
  If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyImage-image-01002**
  If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` must be NULL

- **VUID-vkDestroyImage-image-04882**
  `image` must not have been acquired from `vkGetSwapchainImagesKHR`

### Valid Usage (Implicit)

- **VUID-vkDestroyImage-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyImage-image-parameter**
  If `image` is not `VK_NULL_HANDLE`, `image` must be a valid `VkImage` handle

- **VUID-vkDestroyImage-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyImage-image-parent**
Host Synchronization

• Host access to `image` must be externally synchronized

12.3.1. Image Format Features

Valid uses of a `VkImage` may depend on the image’s format features, defined below. Such constraints are documented in the affected valid usage statement.

• If the image was created with `VK_IMAGE_TILING_LINEAR`, then its set of format features is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same format as `VkImageCreateInfo::format`.

• If the image was created with `VK_IMAGE_TILING_OPTIMAL`, then its set of format features is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same format as `VkImageCreateInfo::format`.

12.3.2. Image Mip Level Sizing

A complete mipmap chain is the full set of mip levels, from the largest mip level provided, down to the minimum mip level size.

Conventional Images

For conventional images, the dimensions of each successive mip level, n+1, are:

\[
width_{n+1} = \max(\lceil width_n/2 \rceil, 1)
\]

\[
height_{n+1} = \max(\lceil height_n/2 \rceil, 1)
\]

\[
depth_{n+1} = \max(\lceil depth_n/2 \rceil, 1)
\]

where `width_n`, `height_n`, and `depth_n` are the dimensions of the next larger mip level, n.

The minimum mip level size is:

• 1 for one-dimensional images,
• 1x1 for two-dimensional images, and
• 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:
\[ \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) + 1 \]

where \( \text{width}_0 \), \( \text{height}_0 \), and \( \text{depth}_0 \) are the dimensions of the largest (most detailed) mip level, 0.

## 12.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a `vkCmdPipelineBarrier` or a `vkCmdWaitEvents` command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see VkSubpassDependency).

Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the `separateDepthStencilLayouts` feature is enabled.

### Note

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo::initialLayout` member. The `initialLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`. If it is `VK_IMAGE_LAYOUT_PREINITIALIZED`, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is `VK_IMAGE_LAYOUT_UNDEFINED`, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the `VK_IMAGE_LAYER всем initialize` or `VK_IMAGE_LAYOUT_GENERAL` layout. Calling `vkGetImageSubresourceLayout` for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,

    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of `VkImageCreateInfo`. This layout **can** be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and **can** be populated by data, but that it has not yet been initialized by the driver. Image memory **cannot** be transitioned into this layout. This layout **can** be used as the `initialLayout` member of `VkImageCreateInfo`. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data **can** be written to memory immediately, without first executing a layout transition. Currently, **VK_IMAGE_LAYOUT_PREINITIALIZED** is only useful with linear images because there is not a standard layout defined for **VK_IMAGE_TILING_OPTIMAL** images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that **must** only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** **must** only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** usage bit enabled.
• **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.

• **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_SAMPLED_BIT** or **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** usage bits enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**). This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display.

• **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be
used for any usage the image supports.

- **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** must only be used as a decode output picture in a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR** is reserved for future use.

- **VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR** is reserved for future use.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR** must only be used as an encode input picture in a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** usage bit enabled.

- **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR** usage bit enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see Clear Commands and Copy Commands). For use as a framebuffer attachment, this is a member in the substructures of the **VkRenderPassCreateInfo** (see Render Pass). For use in a descriptor set, this is a member in the **VkDescriptorImageInfo** structure (see Descriptor Set Updates).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

- Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.

- Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.
When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else be VK_IMAGE_LAYOUT_UNDEFINED (implying that the contents of the image subresource need not be preserved). The new layout used in a transition must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, image views representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by VkImageView handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

VK_REMAINING_ARRAY_LAYERS is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS (~0U)
```

VK_REMAINING_MIP_LEVELS is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS (~0U)
```

The types of image views that can be created are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

To create an image view, call:

```c
// Provided by VK_VERSION_1_0
```
VkResult vkCreateImageView(
    VkDevice device, 
    const VkImageViewCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkImageView* pView);

- **device** is the logical device that creates the image view.
- **pCreateInfo** is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pView** is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImageView-pView-parameter
  - `pView` must be a valid pointer to a `VkImageView` handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkImageViewCreateInfo` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkImageViewCreateFlags flags;
    VkImage             image;
} VkImageViewCreateInfo;
```
VkImageViewCreateInfo

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkImageViewCreateFlagBits` specifying additional parameters of the image view.
- **image** is a `VkImage` on which the view will be created.
- **viewType** is a `VkImageViewType` value specifying the type of the image view.
- **format** is a `VkFormat` specifying the format and type used to interpret texel blocks of the image.
- **components** is a `VkComponentMapping` structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- **subresourceRange** is a `VkImageSubresourceRange` structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the image creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter **usage** specifying the allowed usages of the image view that, by default, takes the value of the corresponding **usage** parameter specified in `VkImageCreateInfo` at image creation time. The implicit usage can be overridden by adding a `VkImageViewUsageCreateInfo` structure to the **pNext** chain, but the view usage must be a subset of the image usage. If **image** has a depth-stencil format and was created with a `VkImageStencilUsageCreateInfo` structure included in the **pNext** chain of `VkImageCreateInfo`, the usage is calculated based on the subresource.aspectMask provided:

- If **aspectMask** includes only `VK_IMAGE_ASPECT_STENCIL_BIT`, the implicit usage is equal to `VkImageStencilUsageCreateInfo::stencilUsage`.
- If **aspectMask** includes only `VK_IMAGE_ASPECT_DEPTH_BIT`, the implicit usage is equal to `VkImageCreateInfo::usage`.
- If both aspects are included in **aspectMask**, the implicit usage is equal to the intersection of `VkImageCreateInfo::usage` and `VkImageStencilUsageCreateInfo::stencilUsage`.

If **image** was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, and if the **format** of the image is not multi-planar, **format** can be different from the image's format, but if **image** was created without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and they are not equal they must be compatible. Image format compatibility is defined in the Format Compatibility Classes section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the **format**, with only the interpretation of the bit pattern changing.

If **image** was created with a multi-planar format, and the image view's **aspectMask** is one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, the view's aspect mask is considered to be equivalent to `VK_IMAGE_ASPECT_COLOR_BIT` when used as a framebuffer attachment.
Values intended to be used with one view format may not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating point denorm or NaN may be flushed or canonicalized when written or read through a view with a floating point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to \( -2^b \) may be changed to \( -2^b + 1 \) as described in Conversion from Normalized Fixed-Point to Floating-Point.

If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with the image’s format as described above; or must be an uncompressed format, in which case it must be size-compatible with the image’s format. In this case, the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The VkComponentMapping components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping must be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any VkImageView used with a combined image sampler that enables sampler \( Y’C_bC_r \) conversion.

If the image view is to be used with a sampler which supports sampler \( Y’C_bC_r \) conversion, an identically defined object of type VkSamplerYcbcrConversion to that used to create the sampler must be passed to vkCreateImageView in a VkSamplerYcbcrConversionInfo included in the pNext chain of VkImageViewCreateInfo. Conversely, if a VkSamplerYcbcrConversion object is passed to vkCreateImageView, an identically defined VkSamplerYcbcrConversion object must be used when sampling the image.

If the image has a multi-planar format, subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, and usage includes VK_IMAGE_USAGE_SAMPLED_BIT, then the format must be identical to the image format and the sampler to be used with the image view must enable sampler \( Y’C_bC_r \) conversion.

When such an image is used in a video coding operation, the sampler \( Y’C_bC_r \) conversion has no effect.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the image has a multi-planar format, and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler \( Y’C_bC_r \) conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{plane}, v_{plane})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{color}, v_{color})\) unnormalized coordinates of the
color aspect for which chroma reconstruction operations operate on the same \((u_{plane}, v_{plane})\) or \((i_{plane}, j_{plane})\) coordinates.

Table 11. Image type and image view type compatibility requirements

Valid Usage

- **VUID-VkImageViewCreateInfo-image-01003**
  If image was not created with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT then viewType must not be VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-VkImageViewCreateInfo-viewType-01004**
  If the imageCubeArray feature is not enabled, viewType must not be VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-VkImageViewCreateInfo-image-06723**
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D_ARRAY

- **VUID-VkImageViewCreateInfo-image-06727**
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D

- **VUID-VkImageViewCreateInfo-image-04970**
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1

- **VUID-VkImageViewCreateInfo-image-04971**
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then VkImageCreateInfo::flags must not contain any of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

- **VUID-VkImageViewCreateInfo-image-04972**
  If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then viewType must be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- **VUID-VkImageViewCreateInfo-image-04441**
  image must have been created with a usage value containing at least one of the usages
defined in the valid image usage list for image views

- VUID-VkImageViewCreateInfo-None-02273
  The format features of the resultant image view must contain at least one bit

- VUID-VkImageViewCreateInfo-usage-02274
  If usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT

- VUID-VkImageViewCreateInfo-usage-02275
  If usage contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT

- VUID-VkImageViewCreateInfo-usage-02276
  If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view’s format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-usage-02277
  If usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view’s format features must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-usage-02652
  If usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then the image view’s format features must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-subresourceRange-01478
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-subresourceRange-01718
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-image-01482
  If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-subresourceRange-01483
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-image-02724
  If image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to
If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.layerCount` must be non-zero and `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in Image Mip Level Sizing.

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, but without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, and if the format of the `image` is not a multi-planar format, `format` must be compatible with the format used to create `image`, as defined in Format Compatibility Classes.

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` must be compatible with, or must be an uncompressed format that is size-compatible with, the format used to create `image`.

If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain of the `VkImageCreateInfo` structure used when creating `image` and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then `format` must be one of the formats in `VkImageFormatListCreateInfo::pViewFormats`.

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, if the format of the `image` is a multi-planar format, and if `subresourceRange.aspectMask` is one of the multi-planar aspect masks, then `format` must be compatible with the `VkFormat` for the plane of the `image` format indicated by `subresourceRange.aspectMask`, as defined in Compatible formats of planes of multi-planar formats.

`subresourceRange.aspectMask` must only have at most 1 valid multi-planar aspect mask.

If `image` was not created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, or if the format of the `image` is a multi-planar format and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_COLOR_BIT`, `format` must be identical to the format used to create `image`.

If the image view requires a sampler Y’CbCr conversion and `usage` contains `VK_IMAGE_USAGE_SAMPLED_BIT`, then the `pNext` chain must include a `VkSamplerYcbcrConversionInfo` structure with a conversion value other than `VK_NULL_HANDLE`.
• VUID-VkImageViewCreateInfo-format-04714
  If `format` has a \_422 or \_420 suffix then `image` must have been created with a width that is a multiple of 2

• VUID-VkImageViewCreateInfo-format-04715
  If `format` has a \_420 suffix then `image` must have been created with a height that is a multiple of 2

• VUID-VkImageViewCreateInfo-pNext-01970
  If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a `conversion` value other than `VK_NULL_HANDLE`, all members of `components` must have the identity swizzle

• VUID-VkImageViewCreateInfo-pNext-06658
  If the `pNext` chain includes a `VkSamplerYcbcrConversionInfo` structure with a `conversion` value other than `VK_NULL_HANDLE`, `format` must be the same used in `VkSamplerYcbcrConversionCreateInfo::format`

• VUID-VkImageViewCreateInfo-image-01020
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

• VUID-VkImageViewCreateInfo-subResourceRange-01021
  `viewType` must be compatible with the type of `image` as shown in the view type compatibility table

• VUID-VkImageViewCreateInfo-image-02086
  If `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `viewType` must be `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

• VUID-VkImageViewCreateInfo-usage-04550
  If the `attachmentFragmentShadingRate` feature is enabled, and the `usage` for the image view includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, then the image view's `format` features must contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

• VUID-VkImageViewCreateInfo-usage-04551
  If the `attachmentFragmentShadingRate` feature is enabled, and the `usage` for the image view includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, and `layeredShadingRateAttachments` is `VK_FALSE`, `subresourceRange.layerCount` must be 1

• VUID-VkImageViewCreateInfo-pNext-02662
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`

• VUID-VkImageViewCreateInfo-pNext-02663
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the
**VkImageStencilUsageCreateInfo** structure used to create image

- **VUID-VkImageViewCreateInfo-pNext-02664**
  If the pNext chain includes a **VkImageViewUsageCreateInfo** structure, image was created with a **VkImageStencilUsageCreateInfo** structure included in the pNext chain of **VkImageCreateInfo**, and subresourceRange.aspectMask includes bits other than **VK_IMAGE_ASPECT_STENCIL_BIT**, the usage member of the **VkImageViewUsageCreateInfo** structure must not include any bits that were not set in the usage member of the **VkImageCreateInfo** structure used to create image.

- **VUID-VkImageViewCreateInfo-imageViewType-04973**
  If viewType is **VK_IMAGE_VIEW_TYPE_1D**, **VK_IMAGE_VIEW_TYPE_2D**, or **VK_IMAGE_VIEW_TYPE_3D**; and subresourceRange.layerCount is not **VK_REMAINING_ARRAY_LAYERS**, then subresourceRange.layerCount must be 1.

- **VUID-VkImageViewCreateInfo-imageViewType-04974**
  If viewType is **VK_IMAGE_VIEW_TYPE_1D**, **VK_IMAGE_VIEW_TYPE_2D**, or **VK_IMAGE_VIEW_TYPE_3D**; and subresourceRange.layerCount is **VK_REMAINING_ARRAY_LAYERS**, then the remaining number of layers must be 1.

- **VUID-VkImageViewCreateInfo-viewType-02960**
  If viewType is **VK_IMAGE_VIEW_TYPE_CUBE** and subresourceRange.layerCount is not **VK_REMAINING_ARRAY_LAYERS**, subresourceRange.layerCount must be 6.

- **VUID-VkImageViewCreateInfo-viewType-02961**
  If viewType is **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY** and subresourceRange.layerCount is **VK_REMAINING_ARRAY_LAYERS**, the remaining number of layers must be a multiple of 6.

- **VUID-VkImageViewCreateInfo-viewType-02962**
  If viewType is **VK_IMAGE_VIEW_TYPE_CUBE** and subresourceRange.layerCount is **VK_REMAINING_ARRAY_LAYERS**, the remaining number of layers must be 6.

- **VUID-VkImageViewCreateInfo-viewType-02963**
  If viewType is **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY** and subresourceRange.layerCount is **VK_REMAINING_ARRAY_LAYERS**, the remaining number of layers must be a multiple of 6.

- **VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is **VK_FALSE**, all elements of components must have the identity swizzle.

- **VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is **VK_FALSE**, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image.

- **VUID-VkImageViewCreateInfo-image-04817**
  If image was created with usage containing **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**, **VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR**, or **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR**, then the viewType must be **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.

- **VUID-VkImageViewCreateInfo-image-04818**
  If image was created with usage containing **VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR**, then the viewType must be **VK_IMAGE_VIEW_TYPE_2D**.
VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPBBIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

Valid Usage (Implicit)

- VUID-VkImageViewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO

- VUID-VkImageViewCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkImageViewUsageCreateInfo or VkSamplerYcbcrConversionInfo

- VUID-VkImageViewCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageViewCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkImageViewCreateInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageViewCreateInfo-viewType-parameter
  viewType must be a valid VkImageViewType value

- VUID-VkImageViewCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkImageViewCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkImageViewCreateInfo-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure

Bits which can be set in VkImageViewCreateInfo::flags, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
    } VkImageViewCreateFlagBits;
```

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

VkImageViewCreateFlags is a bitmask type for setting a mask of zero or more VkImageViewCreateFlagBits.

The set of usages for the created image view can be restricted compared to the parent image's usage flags by adding a VkImageViewUsageCreateInfo structure to the pNext chain of
The `VkImageViewUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags usage;
} VkImageViewUsageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

### Valid Usage (Implicit)

- `VUID-VkImageViewUsageCreateInfo-sType-sType`          
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`

- `VUID-VkImageViewUsageCreateInfo-usage-parameter`      
  `usage` **must** be a valid combination of `VkImageUsageFlagBits` values

- `VUID-VkImageViewUsageCreateInfo-usage-required bitmask`  
  `usage` **must** not be `0`

The `VkImageSubresourceRange` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceRange {
    VkImageAspectFlags aspectMask;
    uint32_t baseMipLevel;
    uint32_t levelCount;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceRange;
```
• `aspectMask` is a bitmask of `VkImageAspectFlagBits` specifying which aspect(s) of the image are included in the view.

• `baseMipLevel` is the first mipmap level accessible to the view.

• `levelCount` is the number of mipmap levels (starting from `baseMipLevel`) accessible to the view.

• `baseArrayLayer` is the first array layer accessible to the view.

• `layerCount` is the number of array layers (starting from `baseArrayLayer`) accessible to the view.

The number of mipmap levels and array layers must be a subset of the image subresources in the image. If an application wants to use all mipmap levels or array layers in an image after the `baseMipLevel` or `baseArrayLayer`, it can set `levelCount` and `layerCount` to the special values `VK_REMAINING_MIP_LEVELS` and `VK_REMAINING_ARRAY_LAYERS` without knowing the exact number of mipmap levels or layers.

For cube and cube array image views, the layers of the image view starting at `baseArrayLayer` correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is `layerCount` / 6, and image array layer (`baseArrayLayer + i`) is face index (i mod 6) of cube i / 6. If the number of layers in the view, whether set explicitly in `layerCount` or implied by `VK_REMAINING_ARRAY_LAYERS`, is not a multiple of 6, the last cube map in the array must not be accessed.

`aspectMask` must be only `VK_IMAGE_ASPECT_COLOR_BIT`, `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` if `format` is a color, depth-only or stencil-only format, respectively, except if `format` is a multi-planar format. If using a depth/stencil format with both depth and stencil components, `aspectMask` must include at least one of `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`, and can include both.

When the `VkImageSubresourceRange` structure is used to select a subset of the slices of a 3D image’s mipmap level in order to create a 2D or 2D array image view of a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT`, `baseArrayLayer` and `layerCount` specify the first slice index and the number of slices to include in the created image view. Such an image view can be used as a framebuffer attachment that refers only to the specified range of slices of the selected mipmap level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mipmap level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the `aspectMask` must only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the `aspectMask` is ignored and both depth and stencil image subresources are used.

When creating a `VkImageView`, if sampler Y’C_bC_r conversion is enabled in the sampler, the `aspectMask` of a `subresourceRange` used by the `VkImageView` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

When creating a `VkImageView`, if sampler Y’C_bC_r conversion is not enabled in the sampler and the image format is multi-planar, the image must have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `VkImageView`’s `subresourceRange` must
be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT.

### Valid Usage

- **VUID-VkImageSubresourceRange-levelCount-01720**
  
  If `levelCount` is not `VK_REMAINING_MIP_LEVELS`, it must be greater than 0

- **VUID-VkImageSubresourceRange-layerCount-01721**
  
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it must be greater than 0

- **VUID-VkImageSubresourceRange-aspectMask-01670**
  
  If `aspectMask` includes VK_IMAGE_ASPECT_COLOR_BIT, then it must not include any of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

### Valid Usage (Implicit)

- **VUID-VkImageSubresourceRange-aspectMask-parameter**
  
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- **VUID-VkImageSubresourceRange-aspectMask-requiredbitmask**
  
  `aspectMask` must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
    // Provided by VK_KHR_maintenance4
    VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;
```
• **VK_IMAGE_ASPECT_NONE** specifies no image aspect, or the image aspect is not applicable.

• **VK_IMAGE_ASPECT_COLOR_BIT** specifies the color aspect.

• **VK_IMAGE_ASPECT_DEPTH_BIT** specifies the depth aspect.

• **VK_IMAGE_ASPECT_STENCIL_BIT** specifies the stencil aspect.

• **VK_IMAGE_ASPECT_METADATA_BIT** specifies the metadata aspect used for sparse resource operations.

• **VK_IMAGE_ASPECT_PLANE_0_BIT** specifies plane 0 of a *multi-planar* image format.

• **VK_IMAGE_ASPECT_PLANE_1_BIT** specifies plane 1 of a *multi-planar* image format.

• **VK_IMAGE_ASPECT_PLANE_2_BIT** specifies plane 2 of a *multi-planar* image format.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;
```

*VkImageAspectFlags* is a bitmask type for setting a mask of zero or more *VkImageAspectFlagBits*.

The **VkComponentMapping** structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;
```

• *r* is a **VkComponentSwizzle** specifying the component value placed in the R component of the output vector.

• *g* is a **VkComponentSwizzle** specifying the component value placed in the G component of the output vector.

• *b* is a **VkComponentSwizzle** specifying the component value placed in the B component of the output vector.

• *a* is a **VkComponentSwizzle** specifying the component value placed in the A component of the output vector.

**Valid Usage (Implicit)**

• **VUID-VkComponentMapping-r-parameter**
  *r* **must** be a valid **VkComponentSwizzle** value

• **VUID-VkComponentMapping-g-parameter**
  *g* **must** be a valid **VkComponentSwizzle** value

• **VUID-VkComponentMapping-b-parameter**
  *b* **must** be a valid **VkComponentSwizzle** value
Possible values of the members of `VkComponentMapping`, specifying the component values placed in each component of the output vector, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,  
    VK_COMPONENT_SWIZZLE_ZERO = 1,      
    VK_COMPONENT_SWIZZLE_ONE = 2,       
    VK_COMPONENT_SWIZZLE_R = 3,         
    VK_COMPONENT_SWIZZLE_G = 4,         
    VK_COMPONENT_SWIZZLE_B = 5,         
    VK_COMPONENT_SWIZZLE_A = 6,         
} VkComponentSwizzle;
```

- **VK_COMPONENT_SWIZZLE_IDENTITY** specifies that the component is set to the identity swizzle.
- **VK_COMPONENT_SWIZZLE_ZERO** specifies that the component is set to zero.
- **VK_COMPONENT_SWIZZLE_ONE** specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each `VkFormat`.
- **VK_COMPONENT_SWIZZLE_R** specifies that the component is set to the value of the R component of the image.
- **VK_COMPONENT_SWIZZLE_G** specifies that the component is set to the value of the G component of the image.
- **VK_COMPONENT_SWIZZLE_B** specifies that the component is set to the value of the B component of the image.
- **VK_COMPONENT_SWIZZLE_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

To destroy an image view, call:
void vkDestroyImageView(
  VkDevice device,
  VkImageView imageView,
  const VkAllocationCallbacks* pAllocator);

- device is the logical device that destroys the image view.
- imageView is the image view to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to imageView must have completed execution.

- VUID-vkDestroyImageView-imageView-01027
  If VkAllocationCallbacks were provided when imageView was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyImageView-imageView-01028
  If no VkAllocationCallbacks were provided when imageView was created, pAllocator must be NULL.

Valid Usage (Implicit)

- VUID-vkDestroyImageView-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkDestroyImageView-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle.

- VUID-vkDestroyImageView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkDestroyImageView-imageView-parent
  If imageView is a valid handle, it must have been created, allocated, or retrieved from device.

Host Synchronization

- Host access to imageView must be externally synchronized.

12.5.1. Image View Format Features

Valid uses of a VkImageView may depend on the image view’s format features, defined below. Such
constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the Vk_KHR_format_feature_flags2 extension is supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view's set of format features is the value of VkFormatProperties3::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.

- If Vulkan 1.3 is not supported and the Vk_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view's set of format features is the union of the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format.

  ◦ VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

- If Vulkan 1.3 is supported or the Vk_KHR_format_feature_flags2 extension is supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, then the image view's set of format features is the value of VkFormatProperties::optimalTilingFeatures or VkFormatProperties3::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties or vkGetPhysicalDeviceImageFormatProperties2 on the same format as VkImageViewCreateInfo::format.

- If Vulkan 1.3 is not supported and the Vk_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, then the image view's set of format features is the union of the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format.

  ◦ VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  ◦ VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.
Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by `VkAccelerationStructureKHR` handles:

```c
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

To create an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureKHR* pAccelerationStructure);
```

- `device` is the logical device that creates the acceleration structure object.
- `pCreateInfo` is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

The acceleration structure data is stored in the object referred to by `VkAccelerationStructureCreateInfoKHR::buffer`. Once memory has been bound to that buffer, it is populated by commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure may hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures must be fully self-contained. The application can reuse or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.

**Valid Usage**

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If `VkAccelerationStructureCreateInfoKHR::deviceAddress` is not zero, the `accelerationStructureCaptureReplay` feature must be enabled

- VUID-vkCreateAccelerationStructureKHR-device-03489
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCreateAccelerationStructureKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkAccelerationStructureCreateInfoKHR` structure

- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  `pAccelerationStructure` must be a valid pointer to a `VkAccelerationStructureKHR` handle

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The `VkAccelerationStructureCreateInfoKHR` structure is defined as:

```c
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureCreateFlagsKHR createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkAccelerationStructureTypeKHR type;
    VkDeviceAddress deviceAddress;
} VkAccelerationStructureCreateInfoKHR;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

createFlags is a bitmask of VkAccelerationStructureCreateFlagBitsKHR specifying additional creation parameters of the acceleration structure.

buffer is the buffer on which the acceleration structure will be stored.

offset is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and must be a multiple of 256.

size is the size required for the acceleration structure.

type is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure that will be created.

deviceAddress is the device address requested for the acceleration structure if the accelerationStructureCaptureReplay feature is being used.

If deviceAddress is zero, no specific address is requested.

If deviceAddress is not zero, deviceAddress must be an address retrieved from an identically created acceleration structure on the same implementation. The acceleration structure must also be placed on an identically created buffer and at the same offset.

Applications should avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR errors.

Note

The expected usage for this is that a trace capture/replay tool will add the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag to all buffers that use VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and will add VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for an acceleration structure where deviceAddress is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Applications should create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.
Note

VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR when the build is performed.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with vkGetAccelerationStructureBuildSizesKHR. If the acceleration structure is going to be the target of a compacting copy, vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR can be used to obtain the compacted size required.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If deviceAddress is not zero, createFlags must include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR, VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay must be VK_TRUE

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614
  buffer must have been created with a usage value containing VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615
  buffer must not have been created with VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkAccelerationStructureCreateInfoKHR-offset-03616
  The sum of offset and size must be less than the size of buffer

- VUID-VkAccelerationStructureCreateInfoKHR-offset-03734
  offset must be a multiple of 256 bytes

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR

- VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter
  createFlags must be a valid combination of VkAccelerationStructureCreateFlagBitsKHR values
To get the build sizes for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.
- `pMaxPrimitiveCounts` is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values defining the number of primitives built into each geometry.
- `pSizeInfo` is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- For `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `type` and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags` respectively.
  - `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
For each element of either pGeometries or ppGeometries at a given index, its geometryType member is equal to pBuildInfo->geometryType.

For each element of either pGeometries or ppGeometries at a given index, its flags member is equal to the corresponding member of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the vertexFormat and indexType members of geometry.triangles are equal to the corresponding members of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the maxVertex member of geometry.triangles is less than or equal to the corresponding member of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the applicable address in the transformData member of geometry.triangles is not NULL, the corresponding transformData.hostAddress parameter in pBuildInfo is not NULL.

Valid Usage

- VUID-vkGetAccelerationStructureBuildSizesKHR-accelerationStructure-08933
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If pBuildInfo->geometryCount is not 0, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If pBuildInfo->pGeometries or pBuildInfo->ppGeometries has a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each pMaxPrimitiveCounts[i] must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount
Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  buildType must be a valid VkAccelerationStructureBuildTypeKHR value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  pBuildInfo must be a valid pointer to a valid VkAccelerationStructureBuildGeometryInfoKHR structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
  If pMaxPrimitiveCounts is not NULL, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
  pSizeInfo must be a valid pointer to a VkAccelerationStructureBuildSizesInfoKHR structure

The VkAccelerationStructureBuildSizesInfoKHR structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `accelerationStructureSize` is the size in bytes required in a VkAccelerationStructureKHR for a build or update operation.
- `updateScratchSize` is the size in bytes required in a scratch buffer for an update operation.
- `buildScratchSize` is the size in bytes required in a scratch buffer for a build operation.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR

- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext
  pNext must be NULL
Values which can be set in `VkAccelerationStructureCreateInfoKHR::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
} VkAccelerationStructureTypeKHR;
```

- **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- **VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR** is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but must be specified at build time as either top or bottom.

Bits which can be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- **VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR** specifies that the acceleration structure's address can be saved and reused on a subsequent run.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

`VkAccelerationStructureCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkAccelerationStructureCreateFlagBitsKHR`. 

Bits which can be set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` specifying additional parameters for acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
} VkBuildAccelerationStructureFlagBitsKHR;
```
• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration structure can be updated with a mode of **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR** in `VkAccelerationStructureBuildGeometryInfoKHR`.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** to produce a compacted acceleration structure.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR** indicates that the given acceleration structure build should prioritize trace performance over build time.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR** indicates that the given acceleration structure build should prioritize build time over trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR** indicates that this acceleration structure should minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR** indicates that the specified acceleration structure can be used when fetching the vertex positions of a hit triangle.

---

**Note**

`VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` may take more time and memory than a normal build, and so should only be used when those features are needed.

---

```cpp
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;
```

**VkBuildAccelerationStructureFlagsKHR** is a bitmask type for setting a mask of zero or more `VkBuildAccelerationStructureFlagBitsKHR`.

Geometry types are specified by **VkGeometryTypeKHR**, which takes values:

```cpp
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
} VkGeometryTypeKHR;
```
• **VK_GEOMETRY_TYPE_TRIANGLES_KHR** specifies a geometry type consisting of triangles.

• **VK_GEOMETRY_TYPE_AABBS_KHR** specifies a geometry type consisting of axis-aligned bounding boxes.

• **VK_GEOMETRY_TYPE_INSTANCES_KHR** specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
} VkGeometryFlagBitsKHR;
```

• **VK_GEOMETRY_OPAQUE_BIT_KHR** indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.

• **VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR** indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation may invoke the any-hit shader more than once for this geometry.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;
```

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

To destroy an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkDestroyAccelerationStructureKHR(
    VkDevice device,  
    VkAccelerationStructureKHR accelerationStructure, 
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the acceleration structure.

• **accelerationStructure** is the acceleration structure to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-08934
  The **VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure** feature must be enabled

• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442
  All submitted commands that refer to **accelerationStructure** must have completed
• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443
  If VkAllocationCallbacks were provided when accelerationStructure was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444
  If no VkAllocationCallbacks were provided when accelerationStructure was created, pAllocator must be NULL

**Valid Usage (Implicit)**

• VUID-vkDestroyAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter
  If accelerationStructure is not VK_NULL_HANDLE, accelerationStructure must be a valid VkAccelerationStructureKHR handle

• VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent
  If accelerationStructure is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

• Host access to accelerationStructure must be externally synchronized

Possible values of buildType in vkGetAccelerationStructureBuildSizesKHR are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
  VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR requests the memory requirement for operations performed by the host.

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR requests the memory requirement for operations performed by the device.

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR requests the memory requirement for operations performed by either the host, or the device.
To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

- `device` is the logical device that the acceleration structure was created on.
- `pInfo` is a pointer to a `VkAccelerationStructureDeviceAddressInfoKHR` structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of `VkAccelerationStructureCreateInfoKHR::deviceAddress`, the return value will be the same address.

If the acceleration structure was created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`, the returned address **must** be consistent with the relative offset to other acceleration structures with type `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` allocated with the same `VkBuffer`. That is, the difference in returned addresses between the two **must** be the same as the difference in offsets provided at acceleration structure creation.

The returned address **must** be aligned to 256 bytes.

**Note**
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure’s start offset in its storage buffer for acceleration structure types other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

**Valid Usage**

- VUID-vkGetAccelerationStructureDeviceAddressKHR-accelerationStructure-08935
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

**Valid Usage (Implicit)**

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter
  `device` **must** be a valid `VkDevice` handle
• **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkAccelerationStructureDeviceAddressInfoKHR structure

The VkAccelerationStructureDeviceAddressInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• accelerationStructure specifies the acceleration structure whose address is being queried.

**Valid Usage (Implicit)**

• **VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR

• **VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext**
  pNext must be NULL

• **VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter**
  accelerationStructure must be a valid VkAccelerationStructureKHR handle

### 12.7. Resource Memory Association

Resources are initially created as *virtual allocations* with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources must be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:

• creating image or buffer views
• updating descriptor sets
• recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.
In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource. For sparse resources, each instance can be bound to memory arbitrarily differently. For non-sparse resources, each instance can either be bound to the local or a peer instance of the memory, or for images can be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.

**Note**

There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **buffer** is the buffer to query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- VUID-vkGetBufferMemoryRequirements-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter
  - `buffer` must be a valid `VkBuffer` handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
  - `buffer` must have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
    VkMemoryRequirements* pMemoryRequirements);
```
VkImage vkGetImageMemoryRequirements(
    const VkDevice* device,
    const VkImage image,
    VkMemoryRequirements* pMemoryRequirements);

• **device** is the logical device that owns the image.
• **image** is the image to query.
• **pMemoryRequirements** is a pointer to a VkMemoryRequirements structure in which the memory requirements of the image object are returned.

**Valid Usage**

• VUID-vkGetImageMemoryRequirements-image-01588
  image must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set

**Valid Usage (Implicit)**

• VUID-vkGetImageMemoryRequirements-device-parameter
  device must be a valid VkDevice handle
• VUID-vkGetImageMemoryRequirements-image-parameter
  image must be a valid VkImage handle
• VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements structure
• VUID-vkGetImageMemoryRequirements-image-parent
  image must have been created, allocated, or retrieved from device

The VkMemoryRequirements structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;
```

• **size** is the size, in bytes, of the memory allocation required for the resource.
• **alignment** is the alignment, in bytes, of the offset within the allocation required for the resource.
• **memoryTypeBits** is a bitmask and contains one bit set for every supported memory type for the resource. Bit i is set if and only if the memory type i in the VkPhysicalDeviceMemoryProperties structure for the physical device is supported for the resource.

If the resource being queried was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, or
VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT external memory handle type, the value of size
has no meaning and should be ignored.

The implementation guarantees certain properties about the memory requirements returned by
vkGetBufferMemoryRequirements2, vkGetImageMemoryRequirements2,
vkGetDeviceBufferMemoryRequirements, vkGetDeviceImageMemoryRequirements,
vkGetBufferMemoryRequirements and vkGetImageMemoryRequirements:

• The memoryTypeBits member always contains at least one bit set.

• If buffer is a VkBuffer not created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT bit set, or if
image is linear image, then the memoryTypeBits member always contains at least one bit set
corresponding to a VkMemoryType with a propertyFlags that has both the
VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bit set.
In other words, mappable coherent memory can always be attached to these objects.

• If buffer was created with VkExternalMemoryBufferCreateInfo::handleTypes set to 0 or image
was created with VkExternalMemoryImageCreateInfo::handleTypes set to 0, the memoryTypeBits
member always contains at least one bit set corresponding to a VkMemoryType with a
propertyFlags that has the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set.

• The memoryTypeBits member is identical for all VkBuffer objects created with the same value for
the flags and usage members in the VkBufferCreateInfo structure and the handleTypes member
of the VkExternalMemoryBufferCreateInfo structure passed to vkCreateBuffer. Further, if
usage1 and usage2 of type VkBufferUsageFlags are such that the bits set in usage2 are a subset of
the bits set in usage1, and they have the same flags and VkExternalMemoryBufferCreateInfo
::handleTypes, then the bits set in memoryTypeBits returned for usage1 must be a subset of the bits
set in memoryTypeBits returned for usage2, for all values of flags.

• The alignment member is a power of two.

• The alignment member is identical for all VkBuffer objects created with the same combination of
values for the usage and flags members in the VkBufferCreateInfo structure passed to
vkCreateBuffer.

• If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage
objects created with the same combination of values for the flags, imageType, format, extent,
mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure
passed to vkCreateImage.

• The alignment member satisfies the buffer descriptor offset alignment requirements associated
with the VkBuffer’s usage:

  ◦ If usage included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or
  VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, alignment must be an integer multiple of
  VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.

  ◦ If usage included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, alignment must be an integer multiple
  of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment.

  ◦ If usage included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, alignment must be an integer multiple
  of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment.

• For images created with a color format, the memoryTypeBits member is identical for all VkImage
objects created with the same combination of values for the tiling member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the flags member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the flags member, handleTypes member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the usage member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.

• For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the format member, the tiling member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the flags member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the flags member, handleTypes member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the usage member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.

• If the memory requirements are for a `VkImage`, the `memoryTypeBits` member must not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set if the image did not have `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` bit set in the usage member of the `VkImageCreateInfo` structure passed to `vkCreateImage`.

• If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member must not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

**Note**
The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

• The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.

• The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.

**Note**
This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, can be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

• If the maintenance4 feature is enabled, these additional guarantees apply:
  ◦ For a `VkBuffer`, the `size` memory requirement is never greater than that of another `VkBuffer` created with a greater or equal `size` specified in `VkBufferCreateInfo`, all other creation parameters being identical.
  ◦ For a `VkBuffer`, the `size` memory requirement is never greater than the result of aligning `VkBufferCreateInfo::size` with the alignment memory requirement.
  ◦ For a `VkImage`, the `size` memory requirement is never greater than that of another `VkImage` created with a greater or equal value in each of `extent.width`, `extent.height`, and `extent.depth`; all other creation parameters being identical.
  ◦ The memory requirements returned by `vkGetDeviceBufferMemoryRequirements` are identical to those that would be returned by `vkGetBufferMemoryRequirements2` if it were called with a `VkBuffer` created with the same `VkBufferCreateInfo` values.
The memory requirements returned by `vkGetDeviceImageMemoryRequirements` are identical to those that would be returned by `vkGetImageMemoryRequirements2` if it were called with a `VkImage` created with the same `VkImageCreateInfo` values.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkBufferMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure
- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

To determine the memory requirements for a buffer resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);

- **device** is the logical device intended to own the buffer.
- **pInfo** is a pointer to a **VkDeviceBufferMemoryRequirements** structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a **VkMemoryRequirements2** structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter
  *device* must be a valid **VkDevice** handle

- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter
  *pInfo* must be a valid pointer to a valid **VkDeviceBufferMemoryRequirements** structure

- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter
  *pMemoryRequirements* must be a valid pointer to a **VkMemoryRequirements2** structure

The **VkBufferMemoryRequirementsInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **buffer** is the buffer to query.

### Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2

• VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  pNext must be NULL
• VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  buffer must be a valid VkBuffer handle

The VkDeviceBufferMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pCreateInfo is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer to query.

Valid Usage (Implicit)

• VUID-VkDeviceBufferMemoryRequirements-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS
• VUID-VkDeviceBufferMemoryRequirements-pNext-pNext
  pNext must be NULL
• VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkBufferCreateInfo structure

To determine the memory requirements for an image resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```
or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

• `device` is the logical device that owns the image.

• `pInfo` is a pointer to a `VkImageMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

**Valid Usage (Implicit)**

- VUID-vkGetImageMemoryRequirements2-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetImageMemoryRequirements2-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkImageMemoryRequirementsInfo2` structure

- VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

To determine the memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

• `device` is the logical device intended to own the image.

• `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory
requirements of the image object are returned.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceImageMemoryRequirements-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure

- **VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter**
  
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkImageMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

### Valid Usage

- **VUID-VkImageMemoryRequirementsInfo2-image-01589**
  
  If `image` was created with a *multi-planar* format and the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-01590**
  
  If `image` was not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-01591**
  
  If `image` was created with a single-plane format, there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure
Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2`

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  *pNext* must be `NULL` or a pointer to a valid instance of `VkImagePlaneMemoryRequirementsInfo`

- VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The *sType* value of each struct in the *pNext* chain must be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  *image* must be a valid `VkImage` handle

The `VkDeviceImageMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *pCreateInfo* is a pointer to a `VkImageCreateInfo` structure containing parameters affecting creation of the image to query.
- *planeAspect* is a `VkImageAspectFlagBits` value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless `pCreateInfo::flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set.

Valid Usage

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06416
  The *pCreateInfo::pNext* chain must not contain a `VkImageSwapchainCreateInfoKHR` structure

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06417
  If *pCreateInfo::format* specifies a *multi-planar* format and *pCreateInfo::flags* has
VK_IMAGE_CREATE_DISJOINT_BIT set then planeAspect must not be VK_IMAGE_ASPECT_NONE_KHR

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06419
  If pCreateInfo::flags has VK_IMAGE_CREATE_DISJOINT_BIT set and if the pCreateInfo::tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid multi-planar aspect mask.

Valid Usage (Implicit)

- VUID-VkDeviceImageMemoryRequirements-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS

- VUID-VkDeviceImageMemoryRequirements-pNext-pNext
  pNext must be NULL

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

- VUID-VkDeviceImageMemoryRequirements-planeAspect-parameter
  If planeAspect is not 0, planeAspect must be a valid VkImageAspectFlagBits value

To determine the memory requirements for a plane of a disjoint image, add a VkImagePlaneMemoryRequirementsInfo structure to the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

The VkImagePlaneMemoryRequirementsInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- planeAspect is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query.
Valid Usage

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid multi-planar aspect mask.

Valid Usage (Implicit)

- VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO
- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
  planeAspect must be a valid VkImageAspectFlagBits value

The VkMemoryRequirements2 structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```
// Provided by VK_KHR_get_memory_requirements2
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- memoryRequirements is a VkMemoryRequirements structure describing the memory requirements of the resource.

Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2
- VUID-VkMemoryRequirements2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkMemoryDedicatedRequirements
- VUID-VkMemoryRequirements2-sType-unique
  The sType value of each struct in the pNext chain must be unique.
The `VkMemoryDedicatedRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType sType;
    void* pNext;
    VkBool32 prefersDedicatedAllocation;
    VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`, respectively.

Constraints on the values returned for buffer resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried included a `VkExternalMemoryBufferCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`. Otherwise, `requiresDedicatedAllocation` will be `VK_FALSE`.

- When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it must also set `prefersDedicatedAllocation` to `VK_TRUE`.

- If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when buffer was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried included a `VkExternalMemoryImageCreateInfo` structure, and any of the handle types specified in
VkExternalMemoryImageCreateInfo::handleTypes requires dedicated allocation, as reported by vkGetPhysicalDeviceImageFormatProperties2 in VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures.

- requiresDedicatedAllocation will otherwise be VK_FALSE
- If VK_IMAGE_CREATE_SPARSE_BINDING_BIT was set in VkImageCreateInfo::flags when image was created, then both prefersDedicatedAllocation and requiresDedicatedAllocation will be VK_FALSE.

Valid Usage (Implicit)

- VUID-VkMemoryDedicatedRequirements-sType-sType sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS

To attach memory to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device, 
    VkBuffer buffer, 
    VkDeviceMemory memory, 
    VkDeviceSize memoryOffset);
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a VkDeviceMemory object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of memory which is to be bound to the buffer. The number of bytes returned in the VkMemoryRequirements::size member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through VkBindBufferMemoryInfo to `vkBindBufferMemory2`.

Valid Usage

- VUID-vkBindBufferMemory-buffer-07459 buffer must not have been bound to a memory object
- VUID-vkBindBufferMemory-buffer-01030 buffer must not have been created with any sparse memory binding flags
- VUID-vkBindBufferMemory-memoryOffset-01031 memoryOffset must be less than the size of memory
- VUID-vkBindBufferMemory-memory-01035 memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer
memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset.

If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer.

If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero.

If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

Valid Usage (Implicit)

• VUID-vkBindBufferMemory-device-parameter
device must be a valid VkDevice handle
- VUID-vkBindBufferMemory-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-vkBindBufferMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-vkBindBufferMemory-buffer-parent
  buffer must have been created, allocated, or retrieved from device
- VUID-vkBindBufferMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization
- Host access to buffer must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```
or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindBufferMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

- device is the logical device that owns the buffers and memory.
• `bindInfoCount` is the number of elements in `pBindInfos`.

• `pBindInfos` is a pointer to an array of `bindInfoCount` `VkBindBufferMemoryInfo` structures describing buffers and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

*Note*
If `vkBindBufferMemory2` fails, and `bindInfoCount` was greater than one, then the buffers referenced by `pBindInfos` will be in an indeterminate state, and must not be used. Applications should destroy these buffers.

### Valid Usage (Implicit)

- VUID-vkBindBufferMemory2-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkBindBufferMemory2-pBindInfos-parameter
  `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindBufferMemoryInfo` structures

- VUID-vkBindBufferMemory2-bindInfoCount-arraylength
  `bindInfoCount` **must** be greater than 0

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

`VkBindBufferMemoryInfo` contains members corresponding to the parameters of `vkBindBufferMemory`.

The `VkBindBufferMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```
or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

### Valid Usage

- **VUID-VkBindBufferMemoryInfo-buffer-07459**  
  `buffer` must not have been bound to a memory object

- **VUID-VkBindBufferMemoryInfo-buffer-01030**  
  `buffer` must not have been created with any sparse memory binding flags

- **VUID-VkBindBufferMemoryInfo-memoryOffset-01031**  
  `memoryOffset` must be less than the size of `memory`

- **VUID-VkBindBufferMemoryInfo-memory-01035**  
  `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`

- **VUID-VkBindBufferMemoryInfo-memoryOffset-01036**  
  `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`

- **VUID-VkBindBufferMemoryInfo-size-01037**  
  The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer` must be less than or equal to the size of `memory` minus `memoryOffset`

- **VUID-VkBindBufferMemoryInfo-buffer-01444**  
  If `buffer` requires a dedicated allocation (as reported by `vkGetBufferMemoryRequirements2` in `VkMemoryDedicatedRequirements ::requiresDedicatedAllocation` for `buffer`), `memory` must have been allocated with `VkMemoryDedicatedAllocateInfo::buffer` equal to `buffer`

- **VUID-VkBindBufferMemoryInfo-memory-01508**  
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a
VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero

• VUID-VkBindBufferMemoryInfo-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-VkBindBufferMemoryInfo-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-VkBindBufferMemoryInfo-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-VkBindBufferMemoryInfo-memory-02727
  If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

• VUID-VkBindBufferMemoryInfo-pNext-01605
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

Valid Usage (Implicit)

• VUID-VkBindBufferMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO

• VUID-VkBindBufferMemoryInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo

• VUID-VkBindBufferMemoryInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBindBufferMemoryInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-VkBindBufferMemoryInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle
Both of buffer, and memory must have been created, allocated, or retrieved from the same VkDevice.

The VkBindBufferMemoryDeviceGroupInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceIndexCount** is the number of elements in pDeviceIndices.
- **pDeviceIndices** is a pointer to an array of device indices.

If the pNext chain of VkBindBufferMemoryInfo includes a VkBindBufferMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i the buffer is attached to the instance of memory on the physical device with device index pDeviceIndices[i].

If deviceIndexCount is zero and memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of memory.

If deviceIndexCount is zero and memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
  - deviceIndexCount must either be zero or equal to the number of physical devices in the logical device.
All elements of `pDeviceIndices` must be valid device indices.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO`
- If `deviceIndexCount` is not 0, `pDeviceIndices` must be a valid pointer to an array of `deviceIndexCount` `uint32_t` values.

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice device,
    VkImage image,
    VkDeviceMemory memory,
    VkDeviceSize memoryOffset);
```

- `device` is the logical device that owns the image and memory.
- `image` is the image.
- `memory` is the `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`.

**Valid Usage**

- `image` must not have been bound to a memory object
- `image` must not have been created with any sparse memory binding flags
- `memoryOffset` must be less than the size of `memory`
- If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` must have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`
If the `VkMemoryAllocateInfo` provided when memory was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` must be zero.

If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate memory is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created.

If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created.

image must not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set.

memory must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with image.

memoryOffset must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with image.

The difference of the size of memory and memoryOffset must be greater than or equal to the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the same image.

Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
  device must be a valid `VkDevice` handle

- VUID-vkBindImageMemory-image-parameter
  image must be a valid `VkImage` handle

- VUID-vkBindImageMemory-memory-parameter
memory must be a valid VkDeviceMemory handle

- VUID-vkBindImageMemory-image-parent
  image must have been created, allocated, or retrieved from device
- VUID-vkBindImageMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to image must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
  VkDevice device,
  uint32_t bindInfoCount,
  const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
  VkDevice device,
  uint32_t bindInfoCount,
  const VkBindImageMemoryInfo* pBindInfos);
```

- device is the logical device that owns the images and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of VkBindImageMemoryInfo structures, describing images and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.
Note

If `vkBindImageMemory2` fails, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and must not be used. Applications should destroy these images.

Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858
  If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` then all planes of `VkBindImageMemoryInfo::image` must be bound individually in separate `pBindInfos`
- VUID-vkBindImageMemory2-pBindInfos-04006
  `pBindInfos` must not refer to the same image subresource more than once

Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkBindImageMemory2-pBindInfos-parameter
  `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindImageMemoryInfo` structures
- VUID-vkBindImageMemory2-bindInfoCount-arraylength
  `bindInfoCount` must be greater than 0

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

`VkBindImageMemoryInfo` contains members corresponding to the parameters of `vkBindImageMemory`.

The `VkBindImageMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkBindImageMemoryInfo;
```
VkDeviceMemory memory;
VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;

or the equivalent

// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **image** is the image to be attached to memory.
- **memory** is a `VkDeviceMemory` object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

### Valid Usage

1. **VUID-VkBindImageMemoryInfo-image-07460**
   - `image` must not have been bound to a memory object

2. **VUID-VkBindImageMemoryInfo-image-01045**
   - `image` must not have been created with any sparse memory binding flags

3. **VUID-VkBindImageMemoryInfo-memoryOffset-01046**
   - `memoryOffset` must be less than the size of `memory`

4. **VUID-VkBindImageMemoryInfo-image-01445**
   - If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` must have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`

5. **VUID-VkBindImageMemoryInfo-memory-01509**
   - If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` must be zero

6. **VUID-VkBindImageMemoryInfo-None-01901**
   - If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`

7. **VUID-VkBindImageMemoryInfo-None-01902**
   - If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports
VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-VkBindImageMemoryInfo-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryImageCreateInfo ::handleTypes when image was created

• VUID-VkBindImageMemoryInfo-memory-02729
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo ::handleTypes when image was created

• VUID-VkBindImageMemoryInfo-pNext-01615
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

• VUID-VkBindImageMemoryInfo-pNext-01616
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

• VUID-VkBindImageMemoryInfo-pNext-01617
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image

• VUID-VkBindImageMemoryInfo-pNext-01618
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, image must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set

• VUID-VkBindImageMemoryInfo-image-07736
  If image was created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set, then the pNext chain must include a VkBindImagePlaneMemoryInfo structure

• VUID-VkBindImageMemoryInfo-pNext-01619
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain

• VUID-VkBindImageMemoryInfo-pNext-01620
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the
VkImageMemoryRequirementsInfo2 structure’s pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01621
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure’s pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01626
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindImageMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

- VUID-VkBindImageMemoryInfo-pNext-01627
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, and VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount is not zero, then image must have been created with the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit set

- VUID-VkBindImageMemoryInfo-pNext-01628
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions must be valid rectangles contained within the dimensions of image

- VUID-VkBindImageMemoryInfo-pNext-01629
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, the union of the areas of all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions that correspond to the same instance of image must cover the entire image

- VUID-VkBindImageMemoryInfo-image-01630
  If image was created with a valid swapchain handle in VkImageSwapchainCreateInfoKHR::swapchain, then the pNext chain must include a VkBindImageMemorySwapchainInfoKHR structure containing the same swapchain handle

- VUID-VkBindImageMemoryInfo-pNext-01631
  If the pNext chain includes a VkBindImageMemorySwapchainInfoKHR structure, memory must be VK_NULL_HANDLE

- VUID-VkBindImageMemoryInfo-pNext-01632
  If the pNext chain does not include a VkBindImageMemorySwapchainInfoKHR structure, memory must be a valid VkDeviceMemory handle

Valid Usage (Implicit)

- VUID-VkBindImageMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, or `VkBindImagePlaneMemoryInfo`.

The `sType` value of each struct in the `pNext` chain must be unique.

Image must be a valid `VkImage` handle.

Both of `image` and `memory` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
    uint32_t splitInstanceBindRegionCount;
    const VkRect2D* pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

Or the equivalent:

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.
- `pSplitInstanceBindRegions` is a pointer to an array of `VkRect2D` structures describing which regions of the image are attached to each instance of memory.

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` `image` is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.
Let \( N \) be the number of physical devices in the logical device. If \( \text{splitInstanceBindRegionCount} \) is greater than zero, then \( \text{pSplitInstanceBindRegions} \) is a pointer to an array of \( N^2 \) rectangles, where the image region specified by the rectangle at element \( i*N+j \) in resource instance \( i \) is bound to the memory instance \( j \). The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to \( \text{memoryOffset} \), computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of \( \text{image} \), and the block at \( (0,0) \) corresponds to memory starting at \( \text{memoryOffset} \).

If \( \text{splitInstanceBindRegionCount} \) and \( \text{deviceIndexCount} \) are zero and the memory comes from a memory heap with the \( \text{VK_MEMORY_HEAP_MULTI_INSTANCE_BIT} \) bit set, then it is as if \( \text{pDeviceIndices} \) contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If \( \text{splitInstanceBindRegionCount} \) and \( \text{deviceIndexCount} \) are zero and the memory comes from a memory heap without the \( \text{VK_MEMORY_HEAP_MULTI_INSTANCE_BIT} \) bit set, then it is as if \( \text{pDeviceIndices} \) contains an array of zeros. In other words, by default each physical device attaches to instance zero.

### Valid Usage

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633**
  At least one of \( \text{deviceIndexCount} \) and \( \text{splitInstanceBindRegionCount} \) must be zero

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634**
  \( \text{deviceIndexCount} \) must either be zero or equal to the number of physical devices in the logical device

- **VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635**
  All elements of \( \text{pDeviceIndices} \) must be valid device indices

- **VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636**
  \( \text{splitInstanceBindRegionCount} \) must either be zero or equal to the number of physical devices in the logical device squared

- **VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637**
  Elements of \( \text{pSplitInstanceBindRegions} \) that correspond to the same instance of an image must not overlap

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638**
  The \( \text{offset.x} \) member of any element of \( \text{pSplitInstanceBindRegions} \) must be a multiple of the sparse image block width (\( \text{VkSparseImageFormatProperties::imageGranularity.width} \)) of all non-metadata aspects of the image

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639**
  The \( \text{offset.y} \) member of any element of \( \text{pSplitInstanceBindRegions} \) must be a multiple of the sparse image block height (\( \text{VkSparseImageFormatProperties::imageGranularity.height} \)) of all non-metadata aspects of the image

- **VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640**
  The \( \text{extent.width} \) member of any element of \( \text{pSplitInstanceBindRegions} \) must either be a
multiple of the sparse image block width of all non-metadata aspects of the image, or else \( \text{extent.width} + \text{offset.x} \) must equal the width of the image subresource.

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The \( \text{extent.height} \) member of any element of \( \text{pSplitInstanceBindRegions} \) must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else \( \text{extent.height} + \text{offset.y} \) must equal the height of the image subresource.

**Valid Usage (Implicit)**

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORYDEVICEGROUP_INFO} \).

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If \( \text{deviceIndexCount} \) is not 0, \( \text{pDeviceIndices} \) must be a valid pointer to an array of \( \text{deviceIndexCount} \) uint32_t values.

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  If \( \text{splitInstanceBindRegionCount} \) is not 0, \( \text{pSplitInstanceBindRegions} \) must be a valid pointer to an array of \( \text{splitInstanceBindRegionCount} \) VkRect2D structures.

If the \( \text{pNext} \) chain of \( \text{VkBindImageMemoryInfo} \) includes a \( \text{VkBindImageMemorySwapchainInfoKHR} \) structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The \( \text{VkBindImageMemorySwapchainInfoKHR} \) structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- \( \text{sType} \) is a \( \text{VkStructureType} \) value identifying this structure.
- \( \text{pNext} \) is NULL or a pointer to a structure extending this structure.
- \( \text{swapchain} \) is \( \text{VK_NULL_HANDLE} \) or a swapchain handle.
- \( \text{imageIndex} \) is an image index within \( \text{swapchain} \).

If \( \text{swapchain} \) is not NULL, the \( \text{swapchain} \) and \( \text{imageIndex} \) are used to determine the memory that the image is bound to, instead of \( \text{memory} \) and \( \text{memoryOffset} \).

Memory can be bound to a swapchain and use the \( \text{pDeviceIndices} \) or \( \text{pSplitInstanceBindRegions} \) members of \( \text{VkBindImageMemoryDeviceGroupInfo} \).
**Valid Usage**

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  
  `imageIndex` must be less than the number of images in `swapchain`

**Valid Usage (Implicit)**

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR`

- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter

  `swapchain` must be a valid `VkSwapchainKHR` handle

**Host Synchronization**

- Host access to `swapchain` must be externally synchronized

In order to bind *planes* of a *disjoint image*, add a `VkBindImagePlaneMemoryInfo` structure to the `pNext` chain of `VkBindImageMemoryInfo`.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType          sType;
    const void*              pNext;
    VkImageAspectFlagBits    planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.

**Valid Usage**

- VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283

  If the image’s *tiling* is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then
planeAspect must be a single valid multi-planar aspect mask

Valid Usage (Implicit)

- VUID-VkBindImagePlaneMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO
- VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
  planeAspect must be a valid VkImageAspectFlagBits value

Buffer-Image Granularity

The implementation-dependent limit bufferImageGranularity specifies a page-like granularity at which linear and non-linear resources must be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. bufferImageGranularity is specified in bytes, and must be a power of two. Implementations which do not impose a granularity restriction may report a bufferImageGranularity value of one.

Note

Despite its name, bufferImageGranularity is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same VkDeviceMemory object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)

The following property must hold:

resourceA.endPage < resourceB.startPage

That is, the end of the first resource (A) and the beginning of the second resource (B) must be on separate “pages” of size bufferImageGranularity. bufferImageGranularity may be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources can be closer than bufferImageGranularity, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments must all be multiples of the bufferImageGranularity. Therefore, memory bound to sparse resources naturally satisfies the bufferImageGranularity.
**12.8. Resource Sharing Mode**

Buffer and image objects are created with a *sharing mode* controlling how they can be accessed from queues. The supported sharing modes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

**Note**

**VK_SHARING_MODE_CONCURRENT** may result in lower performance access to the buffer or image than **VK_SHARING_MODE_EXCLUSIVE**.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_EXCLUSIVE** must only be accessed by queues in the queue family that has *ownership* of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using **VK_SHARING_MODE_EXCLUSIVE** is owned by some queue family, the application must perform a *queue family ownership transfer* to make the memory contents of a range or image subresource accessible to a different queue family.

**Note**

Images still require a *layout transition* from **VK_IMAGE_LAYOUT_UNDEFINED** or **VK_IMAGE_LAYOUT_PREINITIALIZED** before being used on the first queue.

A queue family can take ownership of an image subresource or buffer range of a resource created with **VK_SHARING_MODE_EXCLUSIVE**, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_CONCURRENT** must only be accessed by queues from the queue families specified through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create info structures.

**12.8.1. External Resource Sharing**

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using
VK_SHARING_MODE_EXCLUSIVE or VK_SHARING_MODE_CONCURRENT. Applications can transfer ownership of a resource’s underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of VK_SHARING_MODE_EXCLUSIVE resources between queues, and is also accomplished using VkBufferMemoryBarrier or VkImageMemoryBarrier operations. To make the contents of the underlying memory accessible in the destination instance or API, applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier’s dstQueueFamilyIndex or srcQueueFamilyIndex parameters are set to the reserved queue family index VK_QUEUE_FAMILY_EXTERNAL to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity can also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a VK_SHARING_MODE_EXCLUSIVE resource, with one exception: Implementations must ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set must not make the contents of memory used by other subresources in the set undefined. An application can define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications may also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout VK_IMAGE_LAYOUT_UNDEFINED and binding it to the same region of external memory as the existing images.

Note
Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.
12.9. Memory Aliasing

A range of a `VkDeviceMemory` allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via `vkBindImageMemory`, `vkBindBufferMemory`, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource \( A \) and resource \( B \), bound respectively to memory range \( A \) and range \( B \). Let paddedRange\(_A\) and paddedRange\(_B\) be, respectively, range \( A \) and range \( B \) aligned to `bufferImageGranularity`. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources alias the memory in the intersection of range \( A \) and range \( B \). If one resource is linear and the other is non-linear, then the resources alias the memory in the intersection of paddedRange\(_A\) and paddedRange\(_B\).

Applications *can* alias memory, but use of multiple aliases is subject to several constraints.

**Note**

Memory aliasing *can* be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-`VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image’s advertised layout) include bytes from the aliased range overlap the range. When a `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layouts, are *host-accessible subresources*. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory *can* be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias *can* be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the `VK_IMAGE_CREATE_ALIAS_BIT` flag set, and both are bound identically to memory except for `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` and `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions`, then they interpret the contents of the memory in consistent ways, and data written to one alias *can* be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both *must* have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag.
• The single-plane image must have a VkFormat that is equivalent to that of the multi-planar image’s individual plane.

• The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.

• The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.

• All other creation parameters must be identical

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from VK_IMAGE_LAYOUT_UNDEFINED to a valid layout before it is used, or from VK_IMAGE_LAYOUT_PREINITIALIZED if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass must declare the attachments using the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT, and follow the other rules listed in that section.

Note
Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.
12.9.1. Resource Memory Overlap

Applications can safely access a resource concurrently as long as the memory locations do not overlap as defined in Memory Location. This includes aliased resources if such aliasing is well-defined. It also includes access from different queues and/or queue families if such concurrent access is supported by the resource. Transfer commands only access memory locations specified by the range of the transfer command.

Note

The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model.
Chapter 13. Samplers

`VkSampler` objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by `VkSampler` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice device,
    const VkSamplerCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSampler* pSampler);
```

- `device` is the logical device that creates the sampler.
- `pCreateInfo` is a pointer to a `VkSamplerCreateInfo` structure specifying the state of the sampler object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSampler` is a pointer to a `VkSampler` handle in which the resulting sampler object is returned.

**Valid Usage**

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There **must** be less than `VkPhysicalDeviceLimits::maxSamplerAllocationCount` `VkSampler` objects currently created on the device

**Valid Usage (Implicit)**

- VUID-vkCreateSampler-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateSampler-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid `VkSamplerCreateInfo` structure

- VUID-vkCreateSampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSampler-pSampler-parameter
  `pSampler` **must** be a valid pointer to a `VkSampler` handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkSamplerCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerCreateFlags flags;
    VkFilter magFilter;
    VkFilter minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float mipLodBias;
    VkBool32 anisotropyEnable;
    float maxAnisotropy;
    VkBool32 compareEnable;
    VkCompareOp compareOp;
    float minLod;
    float maxLod;
    VkBorderColor borderColor;
    VkBool32 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSamplerCreateFlagBits` describing additional parameters of the sampler.
- **magFilter** is a `VkFilter` value specifying the magnification filter to apply to lookups.
- **minFilter** is a `VkFilter` value specifying the minification filter to apply to lookups.
- **mipmapMode** is a `VkSamplerMipmapMode` value specifying the mipmap filter to apply to lookups.
- **addressModeU** is a `VkSamplerAddressMode` value specifying the addressing mode for U coordinates outside [0,1).
- **addressModeV** is a `VkSamplerAddressMode` value specifying the addressing mode for V coordinates outside [0,1).
• **addressModeW** is a `VkSamplerAddressMode` value specifying the addressing mode for W coordinates outside [0,1).

• **mipLodBias** is the bias to be added to mipmap LOD calculation and bias provided by image sampling functions in SPIR-V, as described in the LOD Operation section.

• **anisotropyEnable** is `VK_TRUE` to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or `VK_FALSE` otherwise.

• **maxAnisotropy** is the anisotropy value clamp used by the sampler when `anisotropyEnable` is `VK_TRUE`. If `anisotropyEnable` is `VK_FALSE`, `maxAnisotropy` is ignored.

• **compareEnable** is `VK_TRUE` to enable comparison against a reference value during lookups, or `VK_FALSE` otherwise.
  
  ◦ Note: Some implementations will default to shader state if this member does not match.

• **compareOp** is a `VkCompareOp` value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.

• **minLod** is used to clamp the minimum of the computed LOD value.

• **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set `maxLod` to the constant `VK_LOD_CLAMP_NONE`.

• **borderColor** is a `VkBorderColor` value specifying the predefined border color to use.

• **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to `VK_TRUE`, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When set to `VK_FALSE` the range of image coordinates is zero to one.

When `unnormalizedCoordinates` is `VK_TRUE`, images the sampler is used with in the shader have the following requirements:

◦ The viewType **must** be either `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

◦ The image view **must** have a single layer and a single mip level.

When `unnormalizedCoordinates` is `VK_TRUE`, image built-in functions in the shader that use the sampler have the following requirements:

◦ The functions **must** not use projection.

◦ The functions **must** not use offsets.

---

**Mapping of OpenGL to Vulkan filter modes**

`magFilter` values of `VK_FILTER_NEAREST` and `VK_FILTER_LINEAR` directly correspond to `GL_NEAREST` and `GL_LINEAR` magnification filters. `minFilter` and `mipmapMode` combine to correspond to the similarly named OpenGL minification filter of `GL_minFilter_MIPMAP_mipmapMode` (e.g. `minFilter` of `VK_FILTER_LINEAR` and `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST` correspond to `GL_LINEAR_MIPMAP_NEAREST`).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of `GL_LINEAR` or `GL_NEAREST`, but they **can** be emulated using `VK_SAMPLER_MIPMAP_MODE_NEAREST`, `minLod = 0`, and `maxLod = 0.25`, and using `minFilter = VK_FILTER_LINEAR` or `minFilter = VK_FILTER_NEAREST`, respectively.
Note that using a `maxLod` of zero would cause magnification to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the $\lambda$ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

**Valid Usage**

- **VUID-VkSamplerCreateInfo-mipLodBias-01069**
  The absolute value of `mipLodBias` must be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`

- **VUID-VkSamplerCreateInfo-samplerMipLodBias-04467**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias` is `VK_FALSE`, `mipLodBias` must be zero

- **VUID-VkSamplerCreateInfo-maxLod-01973**
  `maxLod` must be greater than or equal to `minLod`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01070**
  If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01071**
  If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` must be between `1.0` and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive

- **VUID-VkSamplerCreateInfo-minFilter-01645**
  If `Y'CbCr` conversion is enabled and the potential format features of the sampler `Y'CbCr` conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` must be equal to the sampler `Y'CbCr` conversion's `chromaFilter`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072**
  If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` must be equal

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations may return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.
• **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073**
  If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`.

• **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074**
  If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` must be zero.

• **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075**
  If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.

• **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076**
  If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` must be `VK_FALSE`.

• **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077**
  If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` must be `VK_FALSE`.

• **VUID-VkSamplerCreateInfo-addressModeU-01078**
  If any of `addressModeU`, `addressModeV`, or `addressModeW` are `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`, `borderColor` must be a valid `VkBorderColor` value.

• **VUID-VkSamplerCreateInfo-addressModeU-01646**
  If `sampler Y′C_bC_r conversion` is enabled, `addressModeU`, `addressModeV`, and `addressModeW` must be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`, `anisotropyEnable` must be `VK_FALSE`, and `unnormalizedCoordinates` must be `VK_FALSE`.

• **VUID-VkSamplerCreateInfo-None-01647**
  If `sampler Y′C_bC_r conversion` is enabled and the `pNext` chain includes a `VkSamplerReductionModeCreateInfo` structure, then the sampler reduction mode must be set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

• **VUID-VkSamplerCreateInfo-pNext-06726**
  If `samplerFilterMinmax` is not enabled and the `pNext` chain includes a `VkSamplerReductionModeCreateInfo` structure, then the sampler reduction mode must be set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

• **VUID-VkSamplerCreateInfo-addressModeU-01079**
  If `samplerMirrorClampToEdge` is not enabled, and if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not enabled, `addressModeU`, `addressModeV`, and `addressModeW` must not be `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`.

• **VUID-VkSamplerCreateInfo-compareEnable-01080**
  If `compareEnable` is `VK_TRUE`, `compareOp` must be a valid `VkCompareOp` value.

• **VUID-VkSamplerCreateInfo-compareEnable-01423**
  If `compareEnable` is `VK_TRUE`, the `reductionMode` member of `VkSamplerReductionModeCreateInfo` must be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

---

**Valid Usage (Implicit)**

• **VUID-VkSamplerCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO`. 

Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkSamplerReductionModeCreateInfo` or `VkSamplerYcbcrConversionInfo`.

The `sType` value of each struct in the `pNext` chain **must** be unique.

`flags` **must** be 0.

`magFilter` **must** be a valid `VkFilter` value.

`minFilter` **must** be a valid `VkFilter` value.

`mipmapMode` **must** be a valid `VkSamplerMipmapMode` value.

`addressModeU` **must** be a valid ` VkSamplerAddressMode` value.

`addressModeV` **must** be a valid `VkSamplerAddressMode` value.

`addressModeW` **must** be a valid `VkSamplerAddressMode` value.

`VK_LOD_CLAMP_NONE` is a special constant value used for `VkSamplerCreateInfo::maxLod` to indicate that maximum LOD clamping should not be performed.

```c
#define VK_LOD_CLAMP_NONE 1000.0F
```

Bits which **can** be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
} VkSamplerCreateFlagBits;
```

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSamplerCreateFlags;
```

`VkSamplerCreateFlags` is a bitmask type for setting a mask of zero or more `VkSamplerCreateFlagBits`.

The `VkSamplerReductionModeCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
```
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `reductionMode` is a `VkSamplerReductionMode` value controlling how texture filtering combines texel values.

If the `pNext` chain of `VkSamplerCreateInfo` includes a `VkSamplerReductionModeCreateInfo` structure, then that structure includes a mode controlling how texture filtering combines texel values.

If this structure is not present, `reductionMode` is considered to be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

**Valid Usage (Implicit)**

- `VUID-VkSamplerReductionModeCreateInfo-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO`
- `VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter`
  - `reductionMode` must be a valid `VkSamplerReductionMode` value

Reduction modes are specified by `VkSamplerReductionMode`, which takes values:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
} VkSamplerReductionMode;
```

- `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE` specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.
- `VK_SAMPLER_REDUCTION_MODE_MIN` specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- `VK_SAMPLER_REDUCTION_MODE_MAX` specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the `VkSamplerCreateInfo::magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
} VkFilter;

- VK_FILTER_NEAREST specifies nearest filtering.
- VK_FILTER_LINEAR specifies linear filtering.

These filters are described in detail in Texel Filtering.

Possible values of the VkSamplerCreateInfo::mipmapMode, specifying the mipmap mode used for texture lookups, are:

// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;

- VK_SAMPLER_MIPMAP_MODE_NEAREST specifies nearest filtering.
- VK_SAMPLER_MIPMAP_MODE_LINEAR specifies linear filtering.

These modes are described in detail in Texel Filtering.

Possible values of the VkSamplerCreateInfo::addressMode* parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the Wrapping Operation section, are:

// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2, VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE
} VkSamplerAddressMode;

- VK_SAMPLER_ADDRESS_MODE_REPEAT specifies that the repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT specifies that the mirrored repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE specifies that the clamp to edge wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER specifies that the clamp to border wrap mode will be
used.

- **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE** specifies that the mirror clamp to edge wrap mode will be used. This is only valid if `samplerMirrorClampToEdge` is enabled, or if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is enabled.

Comparison operators compare a **reference** and a **test** value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {    VK_COMPARE_OP_NEVER = 0,    VK_COMPARE_OP_LESS = 1,    VK_COMPARE_OP_EQUAL = 2,    VK_COMPARE_OP_LESS_OR_EQUAL = 3,    VK_COMPARE_OP_GREATER = 4,    VK_COMPARE_OP_NOT_EQUAL = 5,    VK_COMPARE_OP_GREATER_OR_EQUAL = 6,    VK_COMPARE_OP_ALWAYS = 7, } VkCompareOp;
```

- **VK_COMPARE_OP_NEVER** specifies that the comparison always evaluates false.
- **VK_COMPARE_OP_LESS** specifies that the comparison evaluates `reference < test`.
- **VK_COMPARE_OP_EQUAL** specifies that the comparison evaluates `reference = test`.
- **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the comparison evaluates `reference <= test`.
- **VK_COMPARE_OP_GREATER** specifies that the comparison evaluates `reference > test`.
- **VK_COMPARE_OP_NOT_EQUAL** specifies that the comparison evaluates `reference != test`.
- **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the comparison evaluates `reference >= test`.
- **VK_COMPARE_OP_ALWAYS** specifies that the comparison always evaluates true.

Comparison operators are used for:

- The **Depth Compare Operation** operator for a sampler, specified by `VkSamplerCreateInfo::compareOp`.
- The stencil comparison operator for the **stencil test**, specified by `vkCmdSetStencilOp::compareOp` or `VkStencilOpState::compareOp`.
- The **Depth Comparison** operator for the **depth test**, specified by `vkCmdSetDepthCompareOp::depthCompareOp` or `VkPipelineDepthStencilStateCreateInfo::depthCompareOp`.

Each such use describes how the **reference** and **test** values for that comparison are determined.

Possible values of `VkSamplerCreateInfo::borderColor`, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
} VkBorderColor;

• VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK specifies a transparent, floating-point format, black color.
• VK_BORDER_COLOR_INT_TRANSPARENT_BLACK specifies a transparent, integer format, black color.
• VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK specifies an opaque, floating-point format, black color.
• VK_BORDER_COLOR_INT_OPAQUE_BLACK specifies an opaque, integer format, black color.
• VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE specifies an opaque, floating-point format, white color.
• VK_BORDER_COLOR_INT_OPAQUE_WHITE specifies an opaque, integer format, white color.

These colors are described in detail in Texel Replacement.

To destroy a sampler, call:

```
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice device,
    VkSampler sampler,
    const VkAllocationCallbacks* pAllocator);
```

• device is the logical device that destroys the sampler.
• sampler is the sampler to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroySampler-sampler-01082
  All submitted commands that refer to sampler must have completed execution

• VUID-vkDestroySampler-sampler-01083
  If VkAllocationCallbacks were provided when sampler was created, a compatible set of callbacks must be provided here

• VUID-vkDestroySampler-sampler-01084
  If no VkAllocationCallbacks were provided when sampler was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroySampler-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroySampler-sampler-parameter
  If sampler is not VK_NULL_HANDLE, sampler must be a valid VkSampler handle

- VUID-vkDestroySampler-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySampler-sampler-parent
  If sampler is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to sampler must be externally synchronized

13.1. Sampler Y'CbCr conversion

To create a sampler with Y'CbCr conversion enabled, add a VkSamplerYcbcrConversionInfo structure to the pNext chain of the VkSamplerCreateInfo structure. To create a sampler Y'CbCr conversion, the samplerYcbcrConversion feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.

A VkSamplerYcbcrConversionInfo must be provided for samplers to be used with image views that access VK_IMAGE_ASPECT_COLOR_BIT if the format is one of the formats that require a sampler Y'CbCr conversion.

The VkSamplerYcbcrConversionInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.

### Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO`

- VUID-VkSamplerYcbcrConversionInfo-conversion-parameter
  
  `conversion` must be a valid `VkSamplerYcbcrConversion` handle

A sampler Y′C_bC_r conversion is an opaque representation of a device-specific sampler Y′C_bC_r conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a `VkSamplerYcbcrConversion`, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- `device` is the logical device that creates the sampler Y′C_bC_r conversion.

- `pCreateInfo` is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler Y′C_bC_r conversion.
- \( \text{pAllocator} \) controls host memory allocation as described in the Memory Allocation chapter.

- \( \text{pYcbcrConversion} \) is a pointer to a \( \text{VkSamplerYcbcrConversion} \) handle in which the resulting sampler \( Y' \text{C}_b \text{C}_r \) conversion is returned.

The interpretation of the configured sampler \( Y' \text{C}_b \text{C}_r \) conversion is described in more detail in the description of sampler \( Y' \text{C}_b \text{C}_r \) conversion in the Image Operations chapter.

### Valid Usage

- VUID-vkCreateSamplerYcbcrConversion-None-01648
  The \( \text{samplerYcbcrConversion} \) feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
  \( \text{device} \) **must** be a valid \( \text{VkDevice} \) handle

- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  \( \text{pCreateInfo} \) **must** be a valid pointer to a valid \( \text{VkSamplerYcbcrConversionCreateInfo} \) structure

- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If \( \text{pAllocator} \) is not NULL, \( \text{pAllocator} \) **must** be a valid pointer to a valid \( \text{VkAllocationCallbacks} \) structure

- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  \( \text{pYcbcrConversion} \) **must** be a valid pointer to a \( \text{VkSamplerYcbcrConversion} \) handle

### Return Codes

**Success**

- \( \text{VK_SUCCESS} \)

**Failure**

- \( \text{VK_ERROR_OUT_OF_HOST_MEMORY} \)
- \( \text{VK_ERROR_OUT_OF_DEVICE_MEMORY} \)

The \( \text{VkSamplerYcbcrConversionCreateInfo} \) structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct \text{VkSamplerYcbcrConversionCreateInfo} {  
    \text{VkStructureType} \text{sType};  
    const \text{void}* \text{pNext};  
    \text{VkFormat} \text{format};  
    \text{VkSamplerYcbcrModelConversion} \text{ycbcrModel};  
    \text{VkSamplerYcbcrRange} \text{ycbcrRange};
} \text{VkSamplerYcbcrConversionCreateInfo};
```
```
VkComponentMapping components;
VkChromaLocation xChromaOffset;
VkChromaLocation yChromaOffset;
VkFilter chromaFilter;
VkBool32 forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```

or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the format of the image from which color information will be retrieved.
- **ycbcrModel** describes the color matrix for conversion between color models.
- **ycbcrRange** describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- **components** applies a swizzle based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- **xChromaOffset** describes the sample location associated with downsampled chroma components in the x dimension. **xChromaOffset** has no effect for formats in which chroma components are not downsampled horizontally.
- **yChromaOffset** describes the sample location associated with downsampled chroma components in the y dimension. **yChromaOffset** has no effect for formats in which the chroma components are not downsampled vertically.
- **chromaFilter** is the filter for chroma reconstruction.
- **forceExplicitReconstruction** can be used to ensure that reconstruction is done explicitly, if supported.

**Note**

Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If `format` supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` the `forceExplicitReconstruction` value behaves as if it was set to `VK_TRUE`.

Sampler Y′C₈₅C₇ conversion objects do not support *external format conversion* without additional extensions defining *external formats*. 
Valid Usage

- VUID-VkSamplerYcbcrConversionCreateInfo-format-04060
  format must represent unsigned normalized values (i.e. the format must be a UNORM format)

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler Y’C_bC_r conversion must support
  VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or
  VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler Y’C_bC_r conversion do not support
  VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not
  be VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding components are downscaled

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler Y’C_bC_r conversion do not support
  VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must
  not be VK_CHROMA_LOCATION_MIDPOINT if the corresponding components are downscaled

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then components.g must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then components.a must be the identity swizzle,
  VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then components.r must be the identity swizzle or
  VK_COMPONENT_SWIZZLE_B

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then components.b must be the identity swizzle or
  VK_COMPONENT_SWIZZLE_R

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  If the format has a _422 or _420 suffix, and if either components.r or components.b is the
  identity swizzle, both values must be the identity swizzle

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r,
  components.g, and components.b must correspond to components of the format; that is,
  components.r, components.g, and components.b must not be VK_COMPONENT_SWIZZLE_ZERO or
  VK_COMPONENT_SWIZZLE_ONE, and must not correspond to a component containing zero or
  one as a consequence of conversion to RGBA

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B components
  obtained by applying the component swizzle to format must each have a bit-depth greater
  than or equal to 8

- VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
  If the potential format features of the sampler Y’C_bC_r conversion do not support
• VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
  If the potential format features of the sampler \texttt{Y'CbCr} conversion do not support \texttt{VK_FORMAT.Feature.Sampled.Image.YCBCR.Conversion.Chroma.Reconstruction.ExplicitForceABLE_BIT}, \texttt{chromaFilter must not be VK.Filter.LINEAR}.

---

**Valid Usage (Implicit)**

• VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
  \texttt{sType must be VK.Structure.TypeSampler.Ycbcr.Conversion.CreateInfo}.

• VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
  \texttt{pNext must be NULL}.

• VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  \texttt{format must be a valid VkFormat value}.

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
  \texttt{ycbcrModel must be a valid VkSamplerYcbcrModelConversion value}.

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
  \texttt{ycbcrRange must be a valid VkSamplerYcbcrRange value}.

• VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  \texttt{components must be a valid VkComponentMapping structure}.

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  \texttt{xChromaOffset must be a valid VkChromaLocation value}.

• VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  \texttt{yChromaOffset must be a valid VkChromaLocation value}.

• VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  \texttt{chromaFilter must be a valid VkFilter value}.

If \texttt{chromaFilter} is \texttt{VK.Filter.NEAREST}, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler \texttt{Y'CbCr} conversion in the Image Operations chapter.

\texttt{VkSamplerYcbcrModelConversion} defines the conversion from the source color model to the shader color model. Possible values are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
};
```
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020,
} VkSamplerYcbcrModelConversion;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY** specifies that the input values to the conversion are unmodified.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY** specifies no model conversion but the inputs are range expanded as for Y′C_bC_r.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.709 and described in the “BT.709 Y′C_bC_r conversion” section of the Khronos Data Format Specification.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.601 and described in the “BT.601 Y′C_bC_r conversion” section of the Khronos Data Format Specification.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020** specifies the color model conversion from Y′C_bC_r to R′G′B′ defined in BT.2020 and described in the “BT.2020 Y′C_bC_r conversion” section of the Khronos Data Format Specification.

In the **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_** color models, for the input to the sampler Y′C_bC_r range expansion and model conversion:

• the Y (Y′ luma) component corresponds to the G component of an RGB image.

• the CB (C_b or “U” blue color difference) component corresponds to the B component of an RGB image.

• the CR (C_r or “V” red color difference) component corresponds to the R component of an RGB image.

• the alpha component, if present, is not modified by color model conversion.
These rules reflect the mapping of components after the component swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

Note
For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the `Sampler Y’C_bC_r Range Expansion` section of the `Image Operations` chapter.

No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma component samples relative to the luma samples, and is defined as:
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
} VkChromaLocation;

or the equivalent

typedef VkChromaLocation VkChromaLocationKHR;

• VK_CHROMA_LOCATION_COSITED_EVEN specifies that downsampled chroma samples are aligned with luma samples with even coordinates.

• VK_CHROMA_LOCATION_MIDPOINT specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler Y'C_R conversion, call:

void vkDestroySamplerYcbcrConversion(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);

or the equivalent command

void vkDestroySamplerYcbcrConversionKHR(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the Y'C_R conversion.

• ycbcrConversion is the conversion to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage (Implicit)

• VUID-vkDestroySamplerYcbcrConversion-device-parameter device must be a valid VkDevice handle
• VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
  If \texttt{ycbcrConversion} is not \texttt{VK_NULL_HANDLE}, \texttt{ycbcrConversion} must be a valid \texttt{VkSamplerYcbcrConversion} handle

• VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
  If \texttt{pAllocator} is not NULL, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

• VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
  If \texttt{ycbcrConversion} is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

• Host access to \texttt{ycbcrConversion} must be externally synchronized
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into descriptor sets, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.
14.1.2. Sampler

A sampler descriptor (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a sampler object, used to control the behavior of sampling operations performed on a sampled image.

14.1.3. Sampled Image

A sampled image (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an image resource via an image view that sampling operations can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

An image subresources for a sampled image must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

14.1.4. Combined Image Sampler

A combined image sampler (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a sampler and an image resource, combining both a sampler and sampled image descriptor into a single descriptor.

If the descriptor refers to a sampler that performs YCbCr conversion, the sampler must only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor can be used freely with any other samplers and images.

An image subresources for a combined image sampler must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

Note
On some implementations, it may be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

14.1.5. Uniform Texel Buffer

A uniform texel buffer (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that image sampling operations can be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for buffer view formats which report format features support for VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT

14.1.6. Storage Texel Buffer

A storage texel buffer (VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that image load, store, and atomic operations can be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike uniform texel buffers, these buffers can also be written to in the same way as for storage images.

Storage texel buffer loads are supported in all shader stages for texel buffer view formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

Atomic operations on storage texel buffers are supported in compute shaders for texel buffer formats which report format features support for VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.
14.1.7. Storage Buffer

A storage buffer (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load, store, and atomic operations can be performed on.

Note
Atomic operations can only be performed on members of certain types as defined in the SPIR-V environment appendix.

14.1.8. Uniform Buffer

A uniform buffer (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load operations can be performed on.

14.1.9. Dynamic Uniform Buffer

A dynamic uniform buffer (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC) is almost identical to a uniform buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

14.1.10. Dynamic Storage Buffer

A dynamic storage buffer (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC) is almost identical to a storage buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

14.1.11. Inline Uniform Block

An inline uniform block (VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK) is almost identical to a uniform buffer, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirection enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors cannot be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding's capacity in bytes.

14.1.12. Input Attachment

An input attachment (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an image resource via an image view that can be used for framebuffer local load operations in fragment shaders.
All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

### 14.1.13. Acceleration Structure

An acceleration structure (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

### 14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

#### 14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by VkDescriptorSetLayout handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```c
// Provided by VK_VERSION_1_0
```
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorSetLayout* pSetLayout);

- **device** is the logical device that creates the descriptor set layout.
- **pCreateInfo** is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSetLayout** is a pointer to a `VkDescriptorSetLayout` handle in which the resulting descriptor set layout object is returned.

Valid Usage (Implicit)
- VUID-vkCreateDescriptorSetLayout-device-parameter: **device** must be a valid `VkDevice` handle
- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter: **pCreateInfo** must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter: If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter: **pSetLayout** must be a valid pointer to a `VkDescriptorSetLayout` handle

Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Information about the descriptor set layout is passed in a `VkDescriptorSetLayoutCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t bindingCount;
} VkDescriptorSetLayoutCreateInfo;
```
const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkDescriptorSetLayoutCreateFlagBits` specifying options for descriptor set layout creation.
- **bindingCount** is the number of elements in `pBindings`.
- **pBindings** is a pointer to an array of `VkDescriptorSetLayoutBinding` structures.

### Valid Usage

- **VUID-VkDescriptorSetLayoutCreateInfo-binding-00279**
  The `VkDescriptorSetLayoutBinding::binding` members of the elements of the `pBindings` array must each have different values.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-00280**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindings` must not have a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-02208**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindings` must not have a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-00281**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then the total number of elements of all bindings must be less than or equal to `VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors`.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-03000**
  If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, `flags` must include `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001**
  If any binding has the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, then all bindings must not have `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`.

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo`. 

---

769
The `sType` value of each struct in the `pNext` chain **must** be unique.

**flags** must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values.

If `bindingCount` is not 0, `pBindings` must be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures.

Bits which **can** be set in `VkDescriptorSetLayoutCreateInfo::flags`, specifying options for descriptor set layout, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
    // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
} VkDescriptorSetLayoutCreateFlagBits;
```

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` specifies that descriptor sets **must** not be allocated using this layout, and descriptors are instead pushed by `vkCmdPushDescriptorSetKHR`.

- `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` specifies that descriptor sets using this layout **must** be allocated from a descriptor pool created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits **may** be higher than the non-UpdateAfterBind limits.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

`VkDescriptorSetLayoutCreateFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorSetLayoutCreateFlagBits`.

The `VkDescriptorSetLayoutBinding` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t binding;
    VkDescriptorType descriptorType;
    uint32_t descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler* pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```
• **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.

• **descriptorType** is a `VkDescriptorType` specifying which type of resource descriptors are used for this binding.

• **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array, except if `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` in which case `descriptorCount` is the size in bytes of the inline uniform block. If `descriptorCount` is zero this binding entry is reserved and the resource **must** not be accessed from any stage via this binding within any pipeline using the set layout.

• **stageFlags** member is a bitmask of `VkShaderStageFlagBits` specifying which pipeline shader stages **can** access a resource for this binding. `VK_SHADER_STAGE_ALL` is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, **can** access the resource.

If a shader stage is not included in `stageFlags`, then a resource **must** not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages **can** use a descriptor binding, and in particular a binding **can** be used by both graphics stages and the compute stage.

• **pImmutableSamplers** affects initialization of samplers. If `descriptorType` specifies a `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` type descriptor, then `pImmutableSamplers` can be used to initialize a set of immutable samplers. Immutable samplers are permanently bound into the set layout and **must** not be changed; updating a `VK_DESCRIPTOR_TYPE_SAMPLER` descriptor with immutable samplers is not allowed and updates to a `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If `pImmutableSamplers` is not NULL, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects **must** not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If `pImmutableSamplers` is NULL, then the sampler slots are dynamic and sampler handles **must** be bound into descriptor sets using this layout. If `descriptorType` is not one of these descriptor types, then `pImmutableSamplers` is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array **may** consume memory in the descriptor set layout even if not all descriptor bindings are used, though it **should** not consume additional memory from the descriptor pool.

**Note**
The maximum binding number specified **should** be as compact as possible to
Valid Usage

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-00282**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` must be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-04604**
  If the `inlineUniformBlock` feature is not enabled, `descriptorType` must not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02209**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be a multiple of 4.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02210**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorCount-00283**
  If `descriptorCount` is not 0, `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-01510**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` must be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`.

Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter**
  `descriptorType` must be a valid `VkDescriptorType` value.

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t bindingCount;
    const VkDescriptorBindingFlags* pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;
```
 VkDescriptorSetLayoutBindingFlagsCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **bindingCount** is zero or the number of elements in **pBindingFlags**.
- **pBindingFlags** is a pointer to an array of `VkDescriptorBindingFlags` bitfields, one for each descriptor set layout binding.

If **bindingCount** is zero or if this structure is not included in the **pNext** chain, the `VkDescriptorBindingFlags` for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the flags in `pBindingFlags[i].`

### Valid Usage

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002**
  If **bindingCount** is not zero, **bindingCount** must equal `VkDescriptorSetLayoutCreateInfo::bindingCount`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003**
  If `VkDescriptorSetLayoutCreateInfo::flags` includes `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of **pBindingFlags** must not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`, or `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004**
  If an element of **pBindingFlags** includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then all other elements of `VkDescriptorSetLayoutCreateInfo::pBindings` must have a smaller value of **binding**

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_IMAGE` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
::descriptorBindingStorageImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingInlineUniformBlockUpdateAfterBind-02211
  If VkPhysicalDeviceInlineUniformBlockFeatures::descriptorBindingInlineUniformBlockUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If VkPhysicalDeviceAccelerationStructureFeaturesKHR::descriptorBindingAccelerationStructureUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
  All bindings with descriptor type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_UPDATE_UNUSED WHILE_PENDING_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, that element's `descriptorType` must not be `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`.

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter
If `bindingCount` is not 0, `pBindingFlags` must be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorSetLayoutBindingFlagsCreateInfo::pBindingFlags`, specifying options for the corresponding descriptor set layout binding, are:

```
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
} VkDescriptorBindingFlagBits;
```

- `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` indicates that descriptors in this binding that are
not dynamically used need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT**. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** indicates that this is a variable-sized descriptor binding whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet*` and `maxPerStageDescriptor*`, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**. In this case, `descriptorCount` specifies the upper bound on the byte size of the binding; thus it counts against the `maxInlineUniformTotalSize` limit instead.

Note

Note that while **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** and **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** both involve updates to descriptor sets after they are bound, **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** is a weaker requirement since it is only about descriptors that are not used, whereas **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** requires the implementation to observe updates to descriptors that are used.

```
// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;
```

`VkDescriptorBindingFlags` is a bitmask type for setting a mask of zero or more `VkDescriptorBindingFlagBits`.

To query information about whether a descriptor set layout can be created, call:

```
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
```
or the equivalent command

```c
// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- `device` is the logical device that would create the descriptor set layout.
- `pCreateInfo` is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- `pSupport` is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet*`, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor*`, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as `maxPerStageDescriptor*` in order to be used in a pipeline layout.

**Note**
This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer may depend on enabled features.

### Valid Usage (Implicit)

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
  - `pSupport` must be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in a
VkDescriptorSetLayoutSupport structure:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance3
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supported` specifies whether the descriptor set layout can be created.

`supported` is set to `VK_TRUE` if the descriptor set can be created, or else is set to `VK_FALSE`.

**Valid Usage (Implicit)**

- `VUID-VkDescriptorSetLayoutSupport-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`

- `VUID-VkDescriptorSetLayoutSupport-pNext-pNext`  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupport`

- `VUID-VkDescriptorSetLayoutSupport-sType-unique`  
  The `sType` value of each struct in the `pNext` chain must be unique

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns additional information about whether the descriptor set layout is supported.

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **maxVariableDescriptorCount** indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **maxVariableDescriptorCount** indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the **VkDescriptorSetLayoutCreateInfo** structure specified in **vkGetDescriptorSetLayoutSupport::pCreateInfo** includes a variable-sized descriptor, then **supported** is determined assuming the requested size of the variable-sized descriptor, and **maxVariableDescriptorCount** is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the **VkDescriptorSetLayoutCreateInfo** structure does not include a variable-sized descriptor, or if the **VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount** feature is not enabled, then **maxVariableDescriptorCount** is set to zero. For the purposes of this command, a variable-sized descriptor binding with a **descriptorCount** of zero is treated as having a **descriptorCount** of four if **descriptorType** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, or one otherwise, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to **maxVariableDescriptorCount** is undefined.

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType**
  
  The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

**GLSL example**

```
//
// binding to a single sampled image descriptor in set 0
//
layout (set=0, binding=0) uniform texture2D mySampledImage;

//
// binding to an array of sampled image descriptors in set 0
//
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

//
// binding to a single uniform buffer descriptor in set 1
//
layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};
```
SPIR-V example

```plaintext
... %1 = OpExtInstImport "GLSL.std.450" ...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
%13 = OpTypePointer UniformConstant %12
%14 = OpVariable %13 UniformConstant
%15 = OpTypeVector %6 4
%16 = OpConstant %10 32
%17 = OpTypeArray %15 %16
%18 = OpTypeStruct %17
%19 = OpTypePointer Uniform %18
%20 = OpVariable %19 Uniform
...
```

API example

```cpp
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
  // binding to a single image descriptor

  ,
  .binding = 0,
  .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
  .descriptorCount = 1,
  .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
```
.ImmutableSamplers = NULL,
},

// binding to an array of image descriptors
{
  .binding = 1,
  .descriptorType = VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
  .descriptorCount = 12,
  .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
  .ImmutableSamplers = NULL
},

// binding to a single uniform buffer descriptor
{
  .binding = 0,
  .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
  .descriptorCount = 1,
  .stageFlags = VK_SHADER_STAGE_FRAGMENT_BIT,
  .ImmutableSamplers = NULL
}
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] = {
  // Information for first descriptor set with two descriptor bindings
  {
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .bindingCount = 2,
    .pBindings = &myDescriptorSetLayoutBinding[0]
  },

  // Information for second descriptor set with one descriptor binding
  {
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .bindingCount = 1,
    .pBindings = &myDescriptorSetLayoutBinding[2]
  }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];

// Create first descriptor set layout
//
myResult = vkCreateDescriptorSetLayout(
  myDevice,
  &myDescriptorSetLayoutCreateInfo[0],
// Create second descriptor set layout
myResult = vkCreateDescriptorSetLayout(
    myDevice,
    &myDescriptorSetLayoutCreateInfo[1],
    NULL,
    &myDescriptorSetLayout[1]);

To destroy a descriptor set layout, call:

// Provided by VK_VERSION_1_0
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);

- **device** is the logical device that destroys the descriptor set layout.
- **descriptorSetLayout** is the descriptor set layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284**
  If **VkAllocationCallbacks** were provided when **descriptorSetLayout** was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285**
  If no **VkAllocationCallbacks** were provided when **descriptorSetLayout** was created, **pAllocator** must be **NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorSetLayout-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter**
  If **descriptorSetLayout** is not **VK_NULL_HANDLE**, **descriptorSetLayout** must be a valid **VkDescriptorSetLayout** handle

- **VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent**
If `descriptorSetLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `descriptorSetLayout` **must** be externally synchronized.

#### 14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that **can** be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice device, const VkPipelineLayoutCreateInfo* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkPipelineLayout* pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the *Memory Allocation* chapter.
- `pPipelineLayout` is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreatePipelineLayout-device-parameter**
  - `device` **must** be a valid `VkDevice` handle
- **VUID-vkCreatePipelineLayout-pCreateInfo-parameter**
  - `pCreateInfo` **must** be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pPipelineLayout` must be a valid pointer to a `VkPipelineLayout` handle.

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineLayoutCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void*pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_tsetLayoutCount;
    const VkDescriptorSetLayout*pSetLayouts;
    uint32_tpushConstantRangeCount;
    const VkPushConstantRange*pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineLayoutCreateFlagBits` specifying options for pipeline layout creation.
- `setLayoutCount` is the number of descriptor sets included in the pipeline layout.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects.
- `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

**Note**

Push constants represent a high speed path to modify constant data in...
pipelines that is expected to outperform memory-backed resource updates.

Valid Usage

- **VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286**
  setLayoutCount must be less than or equal to VkPhysicalDeviceLimits::maxBoundDescriptorSets

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03016**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03017**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03018**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03019**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03020**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03021**
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments
The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindSamplers.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindSampledImages.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindStorageImages.

The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexedProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments.

The total number of bindings with a descriptorType of
VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlocksProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03028
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03029
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03030
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03031
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03032
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03033
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER
accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetStorageImages}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-descriptorType-03035}
  The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-descriptorType-02216}
  The total number of bindings in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_SAMPLER} and \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic}.

• \texttt{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, and \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages}. 

788
• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03042
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`

• VUID-VkPipelineLayoutCreateInfo-descriptorType-02217
The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`

• VUID-VkPipelineLayoutCreateInfo-descriptorType-06531
The total number of descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceVulkan13Properties::maxInlineUniformTotalSize`

• VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292
Any two elements of `pPushConstantRanges` must not include the same stage in `stageFlags`

• VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293
`pSetLayouts` must not contain more than one descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03571
The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures`

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03572
The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures`

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03573
The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to
The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetUpdateAfterBindAccelerationStructures`.

Elements of `pSetLayouts` must be valid `VkDescriptorSetLayout` objects.

Valid Usage (Implicit)

- **VUID-VkPipelineLayoutCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO`.

- **VUID-VkPipelineLayoutCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkPipelineLayoutCreateInfo-flags-zerobitmask**
  
  `flags` must be `0`.

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter**
  
  If `setLayoutCount` is not `0`, `pSetLayouts` must be a valid pointer to an array of `setLayoutCount` valid or `VK_NULL_HANDLE` `VkDescriptorSetLayout` handles.

- **VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter**
  
  If `pushConstantRangeCount` is not `0`, `pPushConstantRanges` must be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures.

```c
typedef enum VkPipelineLayoutCreateFlagBits {
} VkPipelineLayoutCreateFlagBits;
```

All values for this enum are defined by extensions.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;
```

`VkPipelineLayoutCreateFlags` is a bitmask type for setting a mask of `VkPipelineLayoutCreateFlagBits`.

The `VkPushConstantRange` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {
    VkShaderStageFlags stageFlags;
    uint32_t offset;
} VkPushConstantRange;
```
• **stageFlags** is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.

• **offset** and **size** are the start offset and size, respectively, consumed by the range. Both **offset** and **size** are in units of bytes and must be a multiple of 4. The layout of the push constant variables is specified in the shader.

### Valid Usage

- **VUID-VkPushConstantRange-offset-00294**  
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

- **VUID-VkPushConstantRange-offset-00295**  
  offset must be a multiple of 4

- **VUID-VkPushConstantRange-size-00296**  
  size must be greater than 0

- **VUID-VkPushConstantRange-size-00297**  
  size must be a multiple of 4

- **VUID-VkPushConstantRange-size-00298**  
  size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

### Valid Usage (Implicit)

- **VUID-VkPushConstantRange-stageFlags-parameter**  
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- **VUID-VkPushConstantRange-stageFlags-requiredbitmask**  
  stageFlags must not be 0

Once created, pipeline layouts are used as part of pipeline creation (see **Pipelines**), as part of binding descriptor sets (see **Descriptor Set Binding**), and as part of setting push constants (see **Push Constant Updates**). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline must be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in **stageFlags**. The pipeline layout can include entries that are not used by a particular pipeline. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles,
which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with stageFlags including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline.

There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

Table 13. Pipeline Layout Resource Limits

<table>
<thead>

</table>
To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline layout.
- **pipelineLayout** is the pipeline layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If VkAllocationCallbacks were provided when pipelineLayout was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyPipelineLayout-pipelineLayout-00300
  If no VkAllocationCallbacks were provided when pipelineLayout was created, pAllocator must be NULL

- VUID-vkDestroyPipelineLayout-pipelineLayout-02004
  pipelineLayout must not have been passed to any vkCmd* command for any command buffers that are still in the recording state when vkDestroyPipelineLayout is called

### Valid Usage (Implicit)

- VUID-vkDestroyPipelineLayout-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyPipelineLayout-pipelineLayout-parameter
  If pipelineLayout is not VK_NULL_HANDLE, pipelineLayout must be a valid VkPipelineLayout handle

- VUID-vkDestroyPipelineLayout-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyPipelineLayout-pipelineLayout-parent
  If pipelineLayout is a valid handle, it must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to pipelineLayout must be externally synchronized
Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with identically defined descriptor set layouts for sets zero through N, and if they were created with identical push constant ranges.

When binding a descriptor set (see Descriptor Set Binding) to set number N, a previously bound descriptor set bound with lower index M than N is disturbed if the pipeline layouts for set M and N are not compatible for set M. Otherwise, the bound descriptor set in M is not disturbed.

If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout not compatible for set N, then all bindings in sets numbered greater than N are disturbed.

When binding a pipeline, the pipeline can correctly access any previously bound descriptor set N if it was bound with compatible pipeline layout for set N, and it was not disturbed.

Layout compatibility means that descriptor sets can be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets can remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

When a descriptor set is disturbed by binding descriptor sets, the disturbed set is considered to contain undefined descriptors bound with the same pipeline layout as the disturbing descriptor set.

Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N should only be a function of sets [0..N].

Note

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see maxBoundDescriptorSets in Limits).

API example

```cpp
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };;
const VkPushConstantRange ranges[] =
{
  .stageFlags = VK_SHADER_STAGE_VERTEX_BIT,
```
14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice device,
    const VkDescriptorPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorPool* pDescriptorPool);
```
• **device** is the logical device that creates the descriptor pool.
• **pCreateInfo** is a pointer to a `VkDescriptorPoolCreateInfo` structure specifying the state of the descriptor pool object.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
• **pDescriptorPool** is a pointer to a `VkDescriptorPool` handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in `pDescriptorPool`.

---

### Valid Usage (Implicit)

- VUID-vkCreateDescriptorPool-device-parameter  
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateDescriptorPool-pCreateInfo-parameter  
  `pCreateInfo` must be a valid pointer to a valid `VkDescriptorPoolCreateInfo` structure
- VUID-vkCreateDescriptorPool-pAllocator-parameter  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDescriptorPool-pDescriptorPool-parameter  
  `pDescriptorPool` must be a valid pointer to a `VkDescriptorPool` handle

---

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

Additional information about the pool is passed in a `VkDescriptorPoolCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.

• `maxSets` is the maximum number of descriptor sets that can be allocated from the pool.

• `poolSizeCount` is the number of elements in `pPoolSizes`.

• `pPoolSizes` is a pointer to an array of `VkDescriptorPoolSize` structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple `VkDescriptorPoolSize` structures containing the same descriptor type appear in the `pPoolSizes` array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and may lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation must not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation must not cause an allocation failure (note that this is always the case for a pool created without the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation must not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application can create an additional descriptor pool to perform further descriptor set allocations.

If `flags` has the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set, descriptor pool creation may fail with the error `VK_ERROR_FRAGMENTATION` if the total number of descriptors across all pools (including this one) created with this bit set exceeds `maxUpdateAfterBindDescriptorsInAllPools`, or if fragmentation of the underlying hardware resources occurs.

### Valid Usage

- **VUID-VkDescriptorPoolCreateInfo-maxSets-00301**
  - `maxSets` must be greater than 0

### Valid Usage (Implicit)

- **VUID-VkDescriptorPoolCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO`

- **VUID-VkDescriptorPoolCreateInfo-pNext-pNext**
  - `pNext` must be NULL or a pointer to a valid instance of `VkDescriptorPoolInlineUniformBlockCreateInfo`
The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkDescriptorPoolCreateInfo-flags-parameter**
  `flags` must be a valid combination of `VkDescriptorPoolCreateFlagBits` values.

- **VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter**
  If `poolSizeCount` is not 0, `pPoolSizes` must be a valid pointer to an array of `poolSizeCount` valid `VkDescriptorPoolSize` structures.

In order to be able to allocate descriptor sets having inline uniform block bindings, the descriptor pool must be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a `VkDescriptorPoolSize` structure with a `descriptorType` value of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. This can be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfo` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.

**Valid Usage (Implicit)**

- **VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO`.

Bits which can be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
} VkDescriptorPoolCreateFlagBits;
```
• **VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT** specifies that descriptor sets can return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool must not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.

• **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** specifies that descriptor sets allocated from this pool can include bindings with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit set. It is valid to allocate descriptor sets that have bindings that do not set the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit from a pool that has **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** set.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;

VkDescriptorPoolCreateFlags is a bitmask type for setting a mask of zero or more `VkDescriptorPoolCreateFlagBits`.

The `VkDescriptorPoolSize` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType type;
    uint32_t descriptorCount;
} VkDescriptorPoolSize;

• **type** is the type of descriptor.

• **descriptorCount** is the number of descriptors of that type to allocate. If type is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then descriptorCount must be a multiple of 4.

Note
When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the descriptorCount value, as indicated by `VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount`.

**Valid Usage**

• VUID-VkDescriptorPoolSize-descriptorCount-00302
descriptorCount must be greater than 0

• VUID-VkDescriptorPoolSize-type-02218
If type is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then descriptorCount must be a multiple of 4
Valid Usage (Implicit)

• VUID-VkDescriptorPoolSize-type-parameter
type must be a valid VkDescriptorType value

To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    const VkAllocationCallbacks* pAllocator);
```

• device is the logical device that destroys the descriptor pool.
• descriptorPool is the descriptor pool to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

Valid Usage

• VUID-vkDestroyDescriptorPool-descriptorPool-00303
  All submitted commands that refer to descriptorPool (via any allocated descriptor sets) must have completed execution

• VUID-vkDestroyDescriptorPool-descriptorPool-00304
  If VkAllocationCallbacks were provided when descriptorPool was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyDescriptorPool-descriptorPool-00305
  If no VkAllocationCallbacks were provided when descriptorPool was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyDescriptorPool-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyDescriptorPool-descriptorPool-parameter
  If descriptorPool is not VK_NULL_HANDLE, descriptorPool must be a valid VkDescriptorPool handle

• VUID-vkDestroyDescriptorPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
**VkAllocationCallbacks** structure

- VUID-vkDestroyDescriptorPool-descriptorPool-parent
  
  If `descriptorPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `descriptorPool` **must** be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by `VkDescriptorSet` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device,
    const VkDescriptorSetAllocateInfo* pAllocateInfo,
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a `VkDescriptorSetAllocateInfo` structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of `VkDescriptorSet` handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined, with the exception that samplers with a non-null `pImmutableSamplers` are initialized on allocation. Descriptors also become undefined if the underlying resource or view object is destroyed. Descriptor sets containing undefined descriptors **can** still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are dynamically used **must** have been populated before the descriptor set is **consumed**.
- For descriptor set bindings created without the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are statically used **must** have been populated before the descriptor set is **consumed**.
• Descriptor bindings with descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` can be undefined when the descriptor set is consumed; though values in that block will be undefined.

• Entries that are not used by a pipeline can have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation may fail due to lack of space in the descriptor pool. Similarly, the allocation may fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of `VkDescriptorPoolCreateInfo::pPoolSizes` with a type equal to that type.

Additionally, the allocation may also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of `VkDescriptorPoolInlineUniformBlockCreateInfo::maxInlineUniformBlockBindings` used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then `VK_ERROR_OUT_OF_POOL_MEMORY` must be returned.

`vkAllocateDescriptorSets` can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to `VK_NULL_HANDLE` and return the error.

### Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  `pAllocateInfo` must be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure

- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  `pDescriptorSets` must be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` `VkDescriptorSet` handles

- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  `pAllocateInfo->descriptorSetCount` must be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->descriptorPool` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FRAGMENTED_POOL
- VK_ERROR_OUT_OF_POOL_MEMORY

The `VkDescriptorSetAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPool descriptorPool;
    uint32_t descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

Valid Usage

- VUID-VkDescriptorSetAllocateInfo-apiVersion-07895
  If the `VK_KHR_maintenance1` extension is not enabled, `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `descriptorSetCount` must not be greater than the number of sets that are currently available for allocation in `descriptorPool`

- VUID-VkDescriptorSetAllocateInfo-apiVersion-07896
  If the `VK_KHR_maintenance1` extension is not enabled, `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, `descriptorPool` must have enough free descriptor capacity remaining to allocate the descriptor sets of the specified layouts

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308
  Each element of `pSetLayouts` must not have been created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set
Valid Usage (Implicit)

- **VUID-VkDescriptorSetAllocateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`

- **VUID-VkDescriptorSetAllocateInfo-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountAllocateInfo`

- **VUID-VkDescriptorSetAllocateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter**
  - `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter**
  - `pSetLayouts` must be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles

- **VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength**
  - `descriptorSetCount` must be greater than 0

- **VUID-VkDescriptorSetAllocateInfo-commonparent**
  - Both of `descriptorPool`, and the elements of `pSetLayouts` must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t descriptorSetCount;
    const uint32_t* pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorSetCount` is zero or the number of elements in `pDescriptorCounts`.
- `pDescriptorCounts` is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable
lengths are considered to be zero. Otherwise, \texttt{pDescriptorCounts[i]} is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} then \texttt{pDescriptorCounts[i]} specifies the binding's capacity in bytes. If \texttt{VkDescriptorSetAllocateInfo::pSetLayouts[i]} does not include a variable-sized descriptor binding, then \texttt{pDescriptorCounts[i]} is ignored.

### Valid Usage

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045**
  If \texttt{descriptorSetCount} is not zero, \texttt{descriptorSetCount} must equal \texttt{VkDescriptorSetAllocateInfo::descriptorSetCount}

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pSetLayouts-03046**
  If \texttt{VkDescriptorSetAllocateInfo::pSetLayouts[i]} has a variable-sized descriptor binding, then \texttt{pDescriptorCounts[i]} must be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType**
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO}

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter**
  If \texttt{descriptorSetCount} is not 0, \texttt{pDescriptorCounts} must be a valid pointer to an array of \texttt{descriptorSetCount uint32_t} values

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult \textbf{vkFreeDescriptorSets}( \\
  VkDevice device, \\
  VkDescriptorPool descriptorPool, \\
  uint32_t descriptorSetCount, \\
  const VkDescriptorSet* pDescriptorSets);
```

- \texttt{device} is the logical device that owns the descriptor pool.
- \texttt{descriptorPool} is the descriptor pool from which the descriptor sets were allocated.
- \texttt{descriptorSetCount} is the number of elements in the \texttt{pDescriptorSets} array.
- \texttt{pDescriptorSets} is a pointer to an array of handles to \texttt{VkDescriptorSet} objects.

After calling \textbf{vkFreeDescriptorSets}, all descriptor sets in \texttt{pDescriptorSets} are invalid.
Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  All submitted commands that refer to any element of \texttt{pDescriptorSets} must have completed execution

- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  \texttt{pDescriptorSets} must be a valid pointer to an array of \texttt{descriptorSetCount VkDescriptorSet} handles, each element of which must either be a valid handle or \texttt{VK_NULL_HANDLE}

- VUID-vkFreeDescriptorSets-descriptorPool-00312
  \texttt{descriptorPool} must have been created with the \texttt{VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT} flag

Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
  \texttt{device} must be a valid \texttt{VkDevice} handle

- VUID-vkFreeDescriptorSets-descriptorPool-parameter
  \texttt{descriptorPool} must be a valid \texttt{VkDescriptorPool} handle

- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
  \texttt{descriptorSetCount} must be greater than 0

- VUID-vkFreeDescriptorSets-descriptorPool-parent
  \texttt{descriptorPool} must have been created, allocated, or retrieved from \texttt{device}

- VUID-vkFreeDescriptorSets-pDescriptorSets-parent
  Each element of \texttt{pDescriptorSets} that is a valid handle must have been created, allocated, or retrieved from \texttt{descriptorPool}

Host Synchronization

- Host access to \texttt{descriptorPool} must be externally synchronized
- Host access to each member of \texttt{pDescriptorSets} must be externally synchronized

Return Codes

**Success**

- \texttt{VK_SUCCESS}

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
```
VkResult vkResetDescriptorPool(
    VkDevice device, 
    VkDescriptorPool descriptorPool, 
    VkDescriptorPoolResetFlags flags);

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool to be reset.
- `flags` is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

**Valid Usage**

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of `descriptorPool` (via any allocated descriptor sets) **must** have completed execution

**Valid Usage (Implicit)**

- VUID-vkResetDescriptorPool-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter
  `descriptorPool` **must** be a valid `VkDescriptorPool` handle
- VUID-vkResetDescriptorPool-flags-zerobitmask
  `flags` **must** be 0
- VUID-vkResetDescriptorPool-descriptorPool-parent
  `descriptorPool` **must** have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `descriptorPool` **must** be externally synchronized
- Host access to any `VkDescriptorSet` objects allocated from `descriptorPool` **must** be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`
**VkDescriptorPoolResetFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

### 14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;

void vkUpdateDescriptorSets(  
  VkDevice device,  
  uint32_t descriptorWriteCount,  
  const VkWriteDescriptorSet* pDescriptorWrites,  
  uint32_t descriptorCopyCount,  
  const VkCopyDescriptorSet* pDescriptorCopies);
```

- **device** is the logical device that updates the descriptor sets.
- **descriptorWriteCount** is the number of elements in the **pDescriptorWrites** array.
- **pDescriptorWrites** is a pointer to an array of **VkWriteDescriptorSet** structures describing the descriptor sets to write to.
- **descriptorCopyCount** is the number of elements in the **pDescriptorCopies** array.
- **pDescriptorCopies** is a pointer to an array of **VkCopyDescriptorSet** structures describing the descriptor sets to copy between.

The operations described by **pDescriptorWrites** are performed first, followed by the operations described by **pDescriptorCopies**. Within each array, the operations are performed in the order they appear in the array.

Each element in the **pDescriptorWrites** array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the **pDescriptorCopies** array is a **VkCopyDescriptorSet** structure describing an operation copying descriptors between sets.

If the **dstSet** member of any element of **pDescriptorWrites** or **pDescriptorCopies** is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** or **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** bits set, that command buffer becomes invalid.
Valid Usage

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236**
  For each element \( i \) where \( \text{pDescriptorWrites}[i].\text{descriptorType} \) is \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER} \) or \( \text{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} \), elements of the \( \text{pTexelBufferView} \) member of \( \text{pDescriptorWrites}[i] \) **must** have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237**
  For each element \( i \) where \( \text{pDescriptorWrites}[i].\text{descriptorType} \) is \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER} \), \( \text{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER} \), \( \text{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} \), or \( \text{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} \), the buffer member of any element of the \( \text{pBufferInfo} \) member of \( \text{pDescriptorWrites}[i] \) **must** have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238**
  For each element \( i \) where \( \text{pDescriptorWrites}[i].\text{descriptorType} \) is \( \text{VK_DESCRIPTOR_TYPE_SAMPLER} \) or \( \text{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} \), and \( \text{dstSet} \) was not allocated with a layout that included immutable samplers for \( \text{dstBinding} \) with \( \text{descriptorType} \), the sampler member of any element of the \( \text{pImageInfo} \) member of \( \text{pDescriptorWrites}[i] \) **must** have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240**
  For each element \( i \) where \( \text{pDescriptorWrites}[i].\text{descriptorType} \) is \( \text{VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR} \), elements of the \( \text{pAccelerationStructures} \) member of a \( \text{VkWriteDescriptorSetAccelerationStructureKHR} \) structure in the \( \text{pNext} \) chain of \( \text{pDescriptorWrites}[i] \) **must** have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493**
  For each element \( i \) where \( \text{pDescriptorWrites}[i].\text{descriptorType} \) is \( \text{VK_DESCRIPTOR_TYPE_SAMPLER} \), \( \text{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} \), \( \text{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE} \), \( \text{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE} \), or \( \text{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} \), \( \text{pDescriptorWrites}[i].\text{pImageInfo} \) must be a valid pointer to an array of \( \text{pDescriptorWrite}[i].\text{descriptorCount} \) valid \( \text{VkDescriptorImageInfo} \) structures.

- **VUID-vkUpdateDescriptorSets-None-03047**
  Descriptor bindings updated by this command which were created without the \( \text{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} \) or \( \text{VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT} \) bits set **must** not be used by any command that was recorded to a command buffer which is in the \( \text{pending state} \).

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993**
  Host access to \( \text{pDescriptorWrites}[i].\text{dstSet} \) and \( \text{pDescriptorCopies}[i].\text{dstSet} \) **must** be
Externally synchronized unless explicitly denoted otherwise for specific flags

**Valid Usage (Implicit)**

- **VUID-vkUpdateDescriptorSets-device-parameter**
  
  *device* must be a valid *VkDevice* handle

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter**
  
  If *descriptorWriteCount* is not 0, *pDescriptorWrites* must be a valid pointer to an array of *descriptorWriteCount* valid *VkWriteDescriptorSet* structures

- **VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter**
  
  If *descriptorCopyCount* is not 0, *pDescriptorCopies* must be a valid pointer to an array of *descriptorCopyCount* valid *VkCopyDescriptorSet* structures

The *VkWriteDescriptorSet* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType          sType;
    const void*              pNext;
    VkDescriptorSet          dstSet;
    uint32_t                 dstBinding;
    uint32_t                 dstArrayElement;
    uint32_t                 descriptorCount;
    VkDescriptorType         descriptorType;
    const VkDescriptorImageInfo*  pImageInfo;
    const VkDescriptorBufferInfo*  pBufferInfo;
    const VkBufferView*       pTexelBufferView;
} VkWriteDescriptorSet;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is *NULL* or a pointer to a structure extending this structure.
- *dstSet* is the destination descriptor set to update.
- *dstBinding* is the descriptor binding within that set.
- *dstArrayElement* is the starting element in that array. If the descriptor binding identified by *dstSet* and *dstBinding* has a descriptor type of *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK* then *dstArrayElement* specifies the starting byte offset within the binding.
- *descriptorCount* is the number of descriptors to update. If the descriptor binding identified by *dstSet* and *dstBinding* has a descriptor type of *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK*, then *descriptorCount* specifies the number of bytes to update. Otherwise, *descriptorCount* is one of
  - the number of elements in *pImageInfo*
  - the number of elements in *pBufferInfo*
  - the number of elements in *pTexelBufferView*
a value matching the `dataSize` member of a `VkWriteDescriptorSetInlineUniformBlock` structure in the `pNext` chain

- a value matching the `accelerationStructureCount` of a `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain

- `descriptorType` is a `VkDescriptorType` specifying the type of each descriptor in `pImageInfo`, `pBufferInfo`, or `pTexelBufferView`, as described below. It **must** be the same type as the `descriptorType` specified in `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding`. The type of the descriptor also controls which array the descriptors are taken from.

- `pImageInfo` is a pointer to an array of `VkDescriptorImageInfo` structures or is ignored, as described below.

- `pBufferInfo` is a pointer to an array of `VkDescriptorBufferInfo` structures or is ignored, as described below.

- `pTexelBufferView` is a pointer to an array of `VkBufferView` handles as described in the **Buffer Views** section or is ignored, as described below.

Only one of `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members is used according to the descriptor type specified in the `descriptorType` member of the containing `VkWriteDescriptorSet` structure, or none of them in case `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`, or if `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain of `VkWriteDescriptorSet`, as specified below.

If the `dstBinding` has fewer than `descriptorCount` array elements remaining starting from `dstArrayElement`, then the remainder will be used to update the subsequent binding - `dstBinding+1` starting at array element zero. If a binding has a `descriptorCount` of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all `descriptorCount` descriptors. Consecutive bindings **must** have identical `VkDescriptorType`, `VkShaderStageFlags`, `VkDescriptorBindingFlagBits`, and immutable samplers references.

---

**Note**
The same behavior applies to bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` where `descriptorCount` specifies the number of bytes to update while `dstArrayElement` specifies the starting byte offset, thus in this case if the `dstBinding` has a smaller byte size than the sum of `dstArrayElement` and `descriptorCount`, then the remainder will be used to update the subsequent binding - `dstBinding+1` starting at offset zero. This falls out as a special case of the above rule.

---

**Valid Usage**

- **VUID-VkWriteDescriptorSet-dstBinding-00315**
  `dstBinding` **must** be less than or equal to the maximum value of `binding` of all
 VkDescriptorSetLayoutBinding structures specified when dstSet’s descriptor set layout was created

- VUID-VkWriteDescriptorSet-dstBinding-00316
dstBinding must be a binding with a non-zero descriptorCount

- VUID-VkWriteDescriptorSet-descriptorCount-00317
All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must have identical descriptorType and stageFlags

- VUID-VkWriteDescriptorSet-descriptorCount-00318
All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must all either use immutable samplers or must all not use immutable samplers

- VUID-VkWriteDescriptorSet-descriptorType-00319
descriptorType must match the type of dstBinding within dstSet

- VUID-VkWriteDescriptorSet-dstSet-00320
dstSet must be a valid VkDescriptorSet handle

- VUID-VkWriteDescriptorSet-dstArrayElement-00321
The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkWriteDescriptorSet-descriptorType-02219
If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02220
If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02994
If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of pTexelBufferView must be either a valid VkBufferView handle or VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02995
If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and the nullDescriptor feature is not enabled, each element of pTexelBufferView must not be VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-00324
If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, pBufferInfo must be a valid pointer to an array of descriptorCount valid VkDescriptorBufferInfo structures

- VUID-VkWriteDescriptorSet-descriptorType-00325
If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of each element of pImageInfo must be a valid VkSampler object
If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` must be either a valid `VkImageView` handle or `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and the `nullDescriptor` feature is not enabled, the `imageView` member of each element of `pImageInfo` must not be `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must not be `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, the `pNext` chain must include a `VkWriteDescriptorSetInlineUniformBlock` structure whose `dataSize` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureKHR` structure whose `accelerationStructureCount` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, the `imageView` member of each element of `pImageInfo` must have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has a `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` must have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler must have been created with an identically defined `VkSamplerYcbcrConversionInfo` object.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables sampler Y’CgCr conversion must have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an identically defined `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.
If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-VkWriteDescriptorSet-descriptorType-00329**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkWriteDescriptorSet-descriptorType-00330**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00331**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00332**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `VkPhysicalDeviceLimits::maxUniformBufferRange`.

- **VUID-VkWriteDescriptorSet-descriptorType-00333**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the effective range if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `VkPhysicalDeviceLimits::maxStorageBufferRange`.

- **VUID-VkWriteDescriptorSet-descriptorType-00334**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, the `VkBuffer` that each element of `pTexelBufferView` was created from must have been created with `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00335**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, the `VkBuffer` that each element of `pTexelBufferView` was created from must have been created with `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00336**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with the identity swizzle.

- **VUID-VkWriteDescriptorSet-descriptorType-00337**
  
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` set.
• VUID-VkWriteDescriptorSet-descriptorType-04149
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Sampled Image

• VUID-VkWriteDescriptorSet-descriptorType-04150
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Combined Image Sampler

• VUID-VkWriteDescriptorSet-descriptorType-04151
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Input Attachment

• VUID-VkWriteDescriptorSet-descriptorType-04152
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Storage Image

• VUID-VkWriteDescriptorSet-descriptorType-00338
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set

• VUID-VkWriteDescriptorSet-descriptorType-00339
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_STORAGE_BIT` set

• VUID-VkWriteDescriptorSet-descriptorType-02752
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` must not have been allocated with a layout that included immutable samplers for `dstBinding`

---

**Valid Usage (Implicit)**

• VUID-VkWriteDescriptorSet-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`

• VUID-VkWriteDescriptorSet-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkWriteDescriptorSetAccelerationStructureKHR` or `VkWriteDescriptorSetInlineUniformBlock`

• VUID-VkWriteDescriptorSet-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

• VUID-VkWriteDescriptorSet-descriptorType-parameter
  `descriptorType` must be a valid `VkDescriptorType` value

• VUID-VkWriteDescriptorSet-descriptorCount-arraylength
  `descriptorCount` must be greater than 0

• VUID-VkWriteDescriptorSet-commonparent
  Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`
The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which **must** be one of the values:

```c
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
} VkDescriptorType;
```

- `VK_DESCRIPTOR_TYPE_SAMPLER` specifies a **sampler descriptor**.
- `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` specifies a **combined image sampler descriptor**.
- `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` specifies a **sampled image descriptor**.
- `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` specifies a **storage image descriptor**.
- `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` specifies a **uniform texel buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` specifies a **storage texel buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` specifies a **uniform buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` specifies a **storage buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` specifies a **dynamic uniform buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` specifies a **dynamic storage buffer descriptor**.
- `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` specifies an **input attachment descriptor**.
- `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` specifies an **inline uniform block**.

When a descriptor set is updated via elements of `VkWriteDescriptorSet`, members of `pImageInfo`, `pBufferInfo` and `pTexelBufferView` are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For `VK_DESCRIPTOR_TYPE_SAMPLER`, only the `sampler` member of each element of `VkWriteDescriptorSet::pImageInfo` is accessed.
- For `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, only the `imageView` and `imageLayout` members of each
element of `VkWriteDescriptorSet::pImageInfo` are accessed.

- For `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, all members of each element of `VkWriteDescriptorSet::pImageInfo` are accessed.

- For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, all members of each element of `VkWriteDescriptorSet::pBufferInfo` are accessed.

- For `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `VkWriteDescriptorSet::pTexelBufferView` is accessed.

When updating descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the `VkWriteDescriptorSetInlineUniformBlock` structure in the `pNext` chain of `VkWriteDescriptorSet`. When updating descriptors with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, none of the `pImageInfo`, `pBufferInfo`, or `pTexelBufferView` members are accessed, instead the source data of the descriptor update operation is taken from the `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkDescriptorBufferInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- `buffer` is the buffer resource.

- `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.

- `range` is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

**Note**

When setting `range` to `VK_WHOLE_SIZE`, the effective range **must** not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is `VK_WHOLE_SIZE` the effective range is calculated at `vkUpdateDescriptorSets` is by taking the size of `buffer` minus the `offset`. 
Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340
  offset must be less than the size of buffer

- VUID-VkDescriptorBufferInfo-range-00341
  If range is not equal to VK_WHOLE_SIZE, range must be greater than 0

- VUID-VkDescriptorBufferInfo-range-00342
  If range is not equal to VK_WHOLE_SIZE, range must be less than or equal to the size of buffer minus offset

- VUID-VkDescriptorBufferInfo-buffer-02998
  If the nullDescriptor feature is not enabled, buffer must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler sampler;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

- sampler is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.

- imageView is an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

- imageLayout is the layout that the image subresources accessible from imageView will be in at the time this descriptor is accessed. imageLayout is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.

Valid Usage

- VUID-VkDescriptorImageInfo-imageView-06712
  imageView must not be a 2D array image view created from a 3D image
• VUID-VkDescriptorImageInfo-descriptorType-06713
  `imageView` must not be a 2D view created from a 3D image

• VUID-VkDescriptorImageInfo-descriptorType-06714
  `imageView` must not be a 2D view created from a 3D image

• VUID-VkDescriptorImageInfo-imageView-01976
  If `imageView` is created from a depth/stencil image, the `aspectMask` used to create the `imageView` must include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` but not both

• VUID-VkDescriptorImageInfo-imageLayout-00344
  `imageLayout` must match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time this descriptor is accessed as defined by the `image layout matching rules`

• VUID-VkDescriptorImageInfo-sampler-01564
  If `sampler` is used and the `VkFormat` of the image is a multi-planar format, the image must have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` must be a valid multi-planar aspect mask

• VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers` is `VK_FALSE`, then `sampler` must have been created with `VkSamplerCreateInfo::compareEnable` set to `VK_FALSE`

Valid Usage (Implicit)

• VUID-VkDescriptorImageInfo-commonparent
  Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

If the `descriptorType` member of `VkWriteDescriptorSet` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlock` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType   sType;
    const void*       pNext;
    uint32_t          dataSize;
    const void*       pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

• `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• dataSize is the number of bytes of inline uniform block data pointed to by pData.
• pData is a pointer to dataSize number of bytes of data to write to the inline uniform block.

**Valid Usage**

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
  dataSize must be an integer multiple of 4

**Valid Usage (Implicit)**

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK
- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes
- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  dataSize must be greater than 0

The VkWriteDescriptorSetAccelerationStructureKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• accelerationStructureCount is the number of elements in pAccelerationStructures.
• pAccelerationStructures is a pointer to an array of VkAccelerationStructureKHR structures specifying the acceleration structures to update.

**Valid Usage**

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
  accelerationStructureCount must be equal to descriptorCount in the extended structure
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in pAccelerationStructures must have been created with a type of 
  VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or 
  VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
If the `nullDescriptor` feature is not enabled, each element of `pAccelerationStructures` must not be `VK_NULL_HANDLE`.

**Valid Usage (Implicit)**

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR`

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  parameter `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid or `VK_NULL_HANDLE` `VkAccelerationStructureKHR` handles

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  `accelerationStructureCount` must be greater than 0

The `VkCopyDescriptorSet` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet srcSet;
    uint32_t srcBinding;
    uint32_t srcArrayElement;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
} VkCopyDescriptorSet;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSet, srcBinding, and srcArrayElement` are the source set, binding, and array element, respectively. If the descriptor binding identified by `srcSet` and `srcBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `srcArrayElement` specifies the starting byte offset within the binding to copy from.
- `dstSet, dstBinding, and dstArrayElement` are the destination set, binding, and array element, respectively. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset within the binding to copy to.
- `descriptorCount` is the number of descriptors to copy from the source to destination. If `descriptorCount` is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to
VkWriteDescriptorSet above. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

Valid Usage

- VUID-VkCopyDescriptorSet-srcBinding-00345
  srcBinding must be a valid binding within srcSet

- VUID-VkCopyDescriptorSet-srcArrayElement-00346
  The sum of srcArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by srcBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-dstBinding-00347
  dstBinding must be a valid binding within dstSet

- VUID-VkCopyDescriptorSet-dstArrayElement-00348
  The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-dstBinding-02632
  The type of dstBinding within dstSet must be equal to the type of srcBinding within srcSet

- VUID-VkCopyDescriptorSet-srcSet-00349
  If srcSet is equal to dstSet, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-srcBinding-02223
  If the descriptor type of the descriptor set binding specified by srcBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, srcArrayElement must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-dstBinding-02224
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-srcBinding-02225
  If the descriptor type of the descriptor set binding specified by either srcBinding or dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

- VUID-VkCopyDescriptorSet-srcSet-01918
  If srcSet's layout was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then dstSet's layout must also have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04886
If srcSet’s layout was created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then dstSet’s layout must also have been created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-01920
  If the descriptor pool from which srcSet was allocated was created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set, then the descriptor pool from which dstSet was allocated must also have been created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04888
  If the descriptor pool from which srcSet was allocated was created without the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set, then the descriptor pool from which dstSet was allocated must also have been created without the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-dstBinding-02753
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding

---

Valid Usage (Implicit)

- VUID-VkCopyDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET

- VUID-VkCopyDescriptorSet-pNext-pNext
  pNext must be NULL

- VUID-VkCopyDescriptorSet-srcSet-parameter
  srcSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-dstSet-parameter
  dstSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-commonparent
  Both of dstSet, and srcSet must have been created, allocated, or retrieved from the same VkDevice

14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by VkDescriptorUpdateTemplate handles:

```c
// Provided by VK_VERSION_1_1
```
or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

### 14.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, can be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device, 
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device, 
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- `device` is the logical device that creates the descriptor update template.
• pCreateInfo is a pointer to a VkDescriptorUpdateTemplateCreateInfo structure specifying the set of descriptors to update with a single call to vkCmdPushDescriptorSetWithTemplateKHR or vkUpdateDescriptorSetWithTemplate.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

• pDescriptorUpdateTemplate is a pointer to a VkDescriptorUpdateTemplate handle in which the resulting descriptor update template object is returned.

Valid Usage (Implicit)

• VUID-vkCreateDescriptorUpdateTemplate-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDescriptorUpdateTemplateCreateInfo structure

• VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
pDescriptorUpdateTemplate must be a valid pointer to a VkDescriptorUpdateTemplate handle

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDescriptorUpdateTemplateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **descriptorUpdateEntryCount** is the number of elements in the `pDescriptorUpdateEntries` array.

• **pDescriptorUpdateEntries** is a pointer to an array of `VkDescriptorUpdateTemplateEntry` structures describing the descriptors to be updated by the descriptor update template.

• **templateType** specifies the type of the descriptor update template. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET` it can only be used to update descriptor sets with a fixed `descriptorSetLayout`. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR` it can only be used to push descriptor sets using the provided `pipelineBindPoint`, `pipelineLayout`, and `set` number.

• **descriptorSetLayout** is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template must be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`.

• **pipelineBindPoint** is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

• **pipelineLayout** is a `VkPipelineLayout` object used to program the bindings. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

• **set** is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if `templateType` is not `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

### Valid Usage

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350**
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET`, `descriptorSetLayout` must be a valid `VkDescriptorSetLayout` handle.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351**
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`, `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352**
  If `templateType` is `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`,
pipelineLayout must be a valid VkPipelineLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

### Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO

- VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter
  pDescriptorUpdateEntries must be a valid pointer to an array of VkDescriptorUpdateTemplateEntry structures

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter
  templateType must be a valid VkDescriptorUpdateTemplateType value

- VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength
  descriptorUpdateEntryCount must be greater than 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent
  Both of descriptorSetLayout, and pipelineLayout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags
  VkDescriptorUpdateTemplateCreateFlagsKHR;

VkDescriptorUpdateTemplateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the VkDescriptorUpdateTemplateCreateInfo::templateType property, which takes the following values:

// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {

VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
// Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
// Provided by VK_KHR_descriptor_update_template
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;

• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET specifies that the descriptor update template will be used for descriptor set updates only.

• VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR specifies that the descriptor update template will be used for push descriptor updates only.

The VkDescriptorUpdateTemplateEntry structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;

• dstBinding is the descriptor binding to update when using this descriptor update template.

• dstArrayElement is the starting element in the array belonging to dstBinding. If the descriptor binding identified by dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then dstArrayElement specifies the starting byte offset to update.

• descriptorCount is the number of descriptors to update. If descriptorCount is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then
descriptorCount specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.

- descriptorType is a VkDescriptorType specifying the type of the descriptor.
- offset is the offset in bytes of the first binding in the raw data structure.
- stride is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer ptr for each array element j of update entry i is computed using the following formula:

  ```
  const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
  ```

The stride is useful in case the bindings are stored in structs along with other data. If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then the value of stride is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

### Valid Usage

- VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354
dstBinding must be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors

- VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355
dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226
If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227
If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

### Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter
descriptorType must be a valid VkDescriptorType value

To destroy a descriptor update template, call:

```
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
```
or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice device,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356**
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357**
  If no `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, `pAllocator` **must** be NULL

### Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorUpdateTemplate-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter**
  If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle

- **VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent**
  If `descriptorUpdateTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `descriptorUpdateTemplate` **must** be externally synchronized
Once a VkDescriptorUpdateTemplate has been created, descriptor sets can be updated by calling:

```c
// Provided by VK_VERSION_1_1
void vkUpdateDescriptorSetWithTemplate(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

- `device` is the logical device that updates the descriptor set.
- `descriptorSet` is the descriptor set to update
- `descriptorUpdateTemplate` is a VkDescriptorUpdateTemplate object specifying the update mapping between `pData` and the descriptor set to update.
- `pData` is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR handles used to write the descriptors.

**Valid Usage**

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685
  - `pData` must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995
  - Host access to `descriptorSet` must be externally synchronized unless explicitly denoted otherwise for specific flags

**Valid Usage (Implicit)**

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter
  - `device` must be a valid VkDevice handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter
  - `descriptorSet` must be a valid VkDescriptorSet handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter
descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
descriptorUpdateTemplate must have been created, allocated, or retrieved from device

API example

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t    applicationRelatedInformation;
};

struct AppDataStructure {
    VkDescriptorImageInfo    imageInfo;  // a single image info
    VkDescriptorBufferInfo   bufferInfoArray[3];  // 3 buffer infos in an array
    AppBufferView            bufferView[2];  // An application defined structure
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    {
        .binding = 0,
        .dstArrayElement = 0,
        .descriptorCount = 1,
        .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
        .offset = offsetof(AppDataStructure, imageInfo),
        .stride = 0  // stride not required if descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    {
        .binding = 1,
        .dstArrayElement = 0,
        .descriptorCount = 3,
        .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        .offset = offsetof(AppDataStructure, bufferInfoArray),
        .stride = sizeof(VkDescriptorBufferInfo)  // descriptor buffer infos are compact
    },

    // binding to an array of buffer views
    {
        .binding = 2,
        .dstArrayElement = 0,
        .descriptorCount = 2,
        .descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
        .offset = offsetof(AppDataStructure, bufferView) +
```
offsetof(AppBufferView, bufferView),
    .stride = sizeof(AppBufferView) // bufferViews do not have to be compact
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 3,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
    .descriptorSetLayout = myLayout,
    .pipelineBindPoint = 0, // ignored by given templateType
    .pipelineLayout = 0, // ignored by given templateType
    .set = 0, // ignored by given templateType
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet,
    myDescriptorUpdateTemplate, &appData);

14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t firstSet,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets,
    uint32_t dynamicOffsetCount,
    const uint32_t* pDynamicOffsets);
• **commandBuffer** is the command buffer that the descriptor sets will be bound to.

• **pipelineBindPoint** is a **VkPipelineBindPoint** indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.

• **layout** is a **VkPipelineLayout** object used to program the bindings.

• **firstSet** is the set number of the first descriptor set to be bound.

• **descriptorSetCount** is the number of elements in the **pDescriptorSets** array.

• **pDescriptorSets** is a pointer to an array of handles to **VkDescriptorSet** objects describing the descriptor sets to bind to.

• **dynamicOffsetCount** is the number of dynamic offsets in the **pDynamicOffsets** array.

• **pDynamicOffsets** is a pointer to an array of **uint32_t** values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets **pDescriptorSets[0..descriptorSetCount-1]** to set numbers [**firstSet..firstSet+descriptorSetCount-1**] for subsequent bound pipeline commands set by **pipelineBindPoint**. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in **Pipeline Layout Compatibility**.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

When consuming a descriptor, a descriptor is considered valid if the descriptor is not undefined as described by **descriptor set allocation**. A descriptor that was disturbed by **Pipeline Layout Compatibility**, or was never bound by `vkCmdBindDescriptorSets` is not considered valid. If a pipeline accesses a descriptor either statically or dynamically depending on the **VkDescriptorBindingFlagBits**, the consuming descriptor type in the pipeline **must** match the **VkDescriptorType** in **VkDescriptorSetLayoutCreateInfo** for the descriptor to be considered valid.

**Note**
Further validation may be carried out beyond validation for descriptor types, e.g. **Texel Input Validation**.

If any of the sets being bound include dynamic uniform or storage buffers, then **pDynamicOffsets** includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from **pDynamicOffsets** in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. **dynamicOffsetCount** **must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from **pDynamicOffsets**, and the base address of the buffer plus base offset in the
descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the pDescriptorSets must be compatible with the pipeline layout specified by layout. The layout used to program the bindings must also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility section.

The descriptor set contents bound by a call to vkCmdBindDescriptorSets may be consumed at the following times:

- For descriptor bindings created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, the contents may be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
- during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding must not be altered (overwritten by an update command, or freed) between the first point in time that it may be consumed, and when the command completes executing on the queue.

The contents of pDynamicOffsets are consumed immediately during execution of vkCmdBindDescriptorSets. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

Valid Usage

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358
  Each element of pDescriptorSets must have been allocated with a VkDescriptorSetLayout that matches (is the same as, or identically defined as) the VkDescriptorSetLayout at set n in layout, where n is the sum of firstSet and the index into pDescriptorSets

- VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359
dynamicOffsetCount must be equal to the total number of dynamic descriptors in pDescriptorSets

- VUID-vkCmdBindDescriptorSets-firstSet-00360
  The sum of firstSet and descriptorSetCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
  pipelineBindPoint must be supported by the commandBuffer’s parent VkCommandPool’s queue family

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type

835
**VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979**
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715**
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, if the range was set with `VK_WHOLE_SIZE` then `pDynamicOffsets` which corresponds to the descriptor binding must be 0.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-06563**
  Each element of `pDescriptorSets` must be a valid `VkDescriptorSet`.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBindDescriptorSets-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter**
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- **VUID-vkCmdBindDescriptorSets-layout-parameter**
  `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter**
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` valid or `VK_NULL_HANDLE` ` VkDescriptorSet` handles.

- **VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter**
  If `dynamicOffsetCount` is not 0, `pDynamicOffsets` must be a valid pointer to an array of `dynamicOffsetCount uint32_t` values.

- **VUID-vkCmdBindDescriptorSets-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- **VUID-vkCmdBindDescriptorSets-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength**
  `descriptorSetCount` must be greater than 0.

- **VUID-vkCmdBindDescriptorSets-commonparent**
  Each of `commandBuffer`, `layout`, and the elements of `pDescriptorSets` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`. 
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t set,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

**Push descriptors** are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the
lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by pipelineBindPoint until the descriptor is overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in pDescriptorWrites). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the offset member of VkDescriptorBufferInfo can be changed each time the descriptor is written.

Each element of pDescriptorWrites is interpreted as in VkWriteDescriptorSet, except the dstSet member is ignored.

To push an immutable sampler, use a VkWriteDescriptorSet with dstBinding and dstArrayElement selecting the immutable sampler's binding. If the descriptor type is VK_DESCRIPTOR_TYPE_SAMPLER, the pImageInfo parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the sampler member of the pImageInfo parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

Valid Usage

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363
  pipelineBindPoint must be supported by the commandBuffer's parent VkCommandPool's queue family

- VUID-vkCmdPushDescriptorSetKHR-set-00364
  set must be less than VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-vkCmdPushDescriptorSetKHR-set-00365
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures
Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter**
  
  `pipelineBindPoint` **must** be a valid `VkPipelineBindPoint` value

- **VUID-vkCmdPushDescriptorSetKHR-layout-parameter**
  
  `layout` **must** be a valid `VkPipelineLayout` handle

- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter**
  
  `pDescriptorWrites` **must** be a valid pointer to an array of `VkWriteDescriptorSet` structures

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording**
  
  `commandBuffer` **must** be in the **recording** state

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations

- **VUID-vkCmdPushDescriptorSetKHR-videocoding**
  
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength**
  
  `descriptorWriteCount` **must** be greater than 0

- **VUID-vkCmdPushDescriptorSetKHR-commonparent**
  
  Both of `commandBuffer`, and `layout` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

14.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To
do so, call:

```c
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    VkPipelineLayout layout,
    uint32_t set,
    const void* pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It **must** be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This **must** be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.

### Valid Usage

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366**
  The `pipelineBindPoint` specified during the creation of the descriptor update template **must** be supported by the `commandBuffer`’s parent `VkCommandPool`’s queue family

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686**
  `pData` **must** be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-07993**
  `layout` **must** be compatible with the layout used to create `descriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-07994**
  `descriptorUpdateTemplate` **must** have been created with a `templateType` of `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07995**
  `set` **must** be the same value used to create `descriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07304**
  `set` **must** be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07305**
  `set` **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of commandBuffer, descriptorUpdateTemplate, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

API example

```c
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;       // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // ...
};
```
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

---

**Note**

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,
    VkPipelineLayout layout,
    VkShaderStageFlags stageFlags,
    uint32_t offset,
    uint32_t size,
    const void* pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.

Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline's layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout's push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.

**Valid Usage**

- VUID-vkCmdPushConstants-offset-01795
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there must be a push constant range in `layout` that includes that byte and that stage.

- VUID-vkCmdPushConstants-offset-01796
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

- VUID-vkCmdPushConstants-offset-00368
offset must be a multiple of 4
• VUID-vkCmdPushConstants-size-00369
  size must be a multiple of 4
• VUID-vkCmdPushConstants-offset-00370
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize
• VUID-vkCmdPushConstants-size-00371
  size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

Valid Usage (Implicit)
• VUID-vkCmdPushConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdPushConstants-layout-parameter
  layout must be a valid VkPipelineLayout handle
• VUID-vkCmdPushConstants-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values
• VUID-vkCmdPushConstants-stageFlags-required bitmask
  stageFlags must not be 0
• VUID-vkCmdPushConstants-pValues-parameter
  pValues must be a valid pointer to an array of size bytes
• VUID-vkCmdPushConstants-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
• VUID-vkCmdPushConstants-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0
• VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization
• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`, the return value will be the same address that was returned at capture time.

The returned address must satisfy the alignment requirement specified by `VkMemoryRequirements::alignment` for the buffer in `VkBufferDeviceAddressInfo::buffer`.

If multiple `VkBuffer` objects are bound to overlapping ranges of `VkDeviceMemory`,
implementations may return address ranges which overlap. In this case, it is ambiguous which VkBuffer is associated with any given device address. For purposes of valid usage, if multiple VkBuffer objects can be attributed to a device address, a VkBuffer is selected such that valid usage passes, if it exists.

Valid Usage

• VUID-vkGetBufferDeviceAddress-None-06542
  The bufferDeviceAddress feature must be enabled

• VUID-vkGetBufferDeviceAddress-device-06543
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

• VUID-vkGetBufferDeviceAddress-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetBufferDeviceAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The VkBufferDeviceAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• buffer specifies the buffer whose address is being queried.

Valid Usage

• VUID-VkBufferDeviceAddressInfo-buffer-02600
  If buffer is non-sparse and was not created with the
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag, then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  buffer must have been created with VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT

**Valid Usage (Implicit)**

- VUID-VkBufferDeviceAddressInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  pNext must be NULL

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a VkBufferDeviceAddressInfo structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress the return value must be the same address.

**Valid Usage**

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If `device` was created with multiple physical devices, then the
**bufferDeviceAddressMultiDevice** feature **must** be enabled

---

**Valid Usage (Implicit)**

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  
  *device must be a valid *VkDevice* handle*

- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  
  *pInfo must be a valid pointer to a valid *VkBufferDeviceAddressInfo* structure*
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `VkPipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

Note

In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block. They must
• be explicitly declared (there are no implicit built-ins),
• be identified with a `BuiltIn` decoration,
• form object types as described in the `Built-in Variables` section, and
• be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface.

Built-ins must not have any `Location` or `Component` decorations.

### 15.1.2. User-defined Variable Interface

The non-built-in variables listed by `OpEntryPoint` with the `Input` or `Output` storage class form the user-defined variable interface. These must have numeric type or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports `storageInputOutput16`, components can also have a width of 16 bits. These variables must be identified with a `Location` decoration and can also be identified with a `Component` decoration.

### 15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - one is not decorated with `Component` and the other is declared with a `Component` of 0
  - `Interpolation` decorations
  - `RelaxedPrecision` if one is an input variable and the other an output variable
- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the output, and neither is a structure member; or
  - if the `maintenance4` feature is enabled, they are declared as `OpTypeVector` variables, and the output has a `Component Count` value higher than that of the input but the same `Component Type`; or
  - if the input is decorated with `PerVertexKHR`, and is declared in a fragment shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the output, and neither the input nor the output is a structure member; or
  - if in any other case they are declared with an equivalent `OpType*` declaration.
- If both are structures and every member has an interface match.

Note

The word “structure” above refers to both variables that have an `OpTypeStruct` type and interface blocks (which are also declared as `OpTypeStruct`).
All input variables and blocks must have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders can declare and write to output variables that are not declared or read by the subsequent stage.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

15.1.4. Location Assignment

This section describes Location assignments for user-defined variables and how many Location slots are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many Location slots the type consumes.

The Location value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The Component specifies word components within these vector Location slots. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface Location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive Location slots.

If a declared input or output is an array of size \( n \) and each element takes \( m \) Location slots, it will be assigned \( m \times n \) consecutive Location slots starting with the specified Location.

If the declared input or output is an \( n \times m \) 16-, 32- or 64-bit matrix, it will be assigned multiple Location slots starting with the specified Location. The number of Location slots assigned for each matrix will be the same as for an \( n \)-element array of \( m \)-component vectors.

An OpVariable with a structure type that is not a block must be decorated with a Location.

When an OpVariable with a structure type (either block or non-block) is decorated with a Location, the members in the structure type must not be decorated with a Location. The OpVariable's members are assigned consecutive Location slots in declaration order, starting from the first member, which is assigned the Location decoration from the OpVariable.

When a block-type OpVariable is declared without a Location decoration, each member in its structure type must be decorated with a Location. Types nested deeper than the top-level members must not have Location decorations.

The Location slots consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same OpEntryPoint must not be assigned the same Location slot and Component word, either explicitly or implicitly. Any two outputs listed as operands
on the same OpEntryPoint must not be assigned the same Location slot and Component word, either explicitly or implicitly.

The number of input and output Location slots available for a shader input or output interface is limited, and dependent on the shader stage as described in Shader Input and Output Locations. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective Location must have a value less than the number of Location slots available for the given interface, as specified in the “Locations Available” column in Shader Input and Output Locations.

Table 14. Shader Input and Output Locations

### 15.1.5. Component Assignment

The Component decoration allows the Location to be more finely specified for scalars and vectors, down to the individual Component word within a Location slot that are consumed. The Component word within a Location are 0, 1, 2, and 3. A variable or block member starting at Component N will consume Component words N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of Component words gets larger than 3. A scalar 64-bit type will consume two of these Component words in sequence, and a two-component 64-bit vector type will consume all four Component words available within a Location. A three- or four-component 64-bit vector type must not specify a non-zero Component decoration. A three-component 64-bit vector type will consume all four Component words of the first Location and Component 0 and 1 of the second Location. This leaves Component 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A Component decoration must not be specified for any type that is not a scalar or vector.

A four-component 64-bit data type will consume all four Component words of the first Location and all four Component words of the second Location.
15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input Location slots is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of \( i \) is associated with the color attachment indicated by VkRenderingInfo::pColorAttachments[\( i \)]. When using render pass objects, it is associated with the color attachment indicated by VkSubpassDescription::pColorAttachments[\( i \)]. Values are written to those attachments after passing through the blending unit as described in Blending, if enabled. Locations are consumed as described in Location Assignment. The number of available fragment output Location slots is given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

When an active fragment shader invocation finishes, the values of all fragment shader outputs are copied out and used as blend inputs or color attachments writes. If the invocation does not set a value for them, the input values to those blending or color attachment writes are undefined.

Components of the output variables are assigned as described in Component Assignment. Output Component words identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same Location, they must have the same underlying type (floating-point or
integer). Component words which do not correspond to any fragment shader output will also result in undefined values for blending or color attachment writes.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

There must be no output variable which has the same Location, Component, and Index as any other, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either OpTypeFloat or OpTypeInt, and a Width of 32. If storageInputOutput16 is supported, output values written by a fragment shader can be also declared with either OpTypeFloat or OpTypeInt and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion from Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

15.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by InputAttachmentIndex decorations to the input attachments specified in the pInputAttachments array of the VkSubpassDescription structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by OpEntryPoint form the fragment input attachment interface. These variables must be declared with a type of OpTypeImage, a Dim operand of SubpassData, an Arrayed operand of 0, and a Sampled operand of 2. The MS operand of the OpTypeImage must be 0 if the samples field of the corresponding VkAttachmentDescription is VK_SAMPLE_COUNT_1_BIT and 1 otherwise.

A subpass input variable identified with an InputAttachmentIndex decoration of i reads from the input attachment indicated by pInputAttachments[i] member of VkSubpassDescription. If the subpass input variable is declared as an array of size N, it consumes N consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same InputAttachmentIndex whether explicitly declared or implied by an array declaration per image aspect. A multi-aspect image (e.g. a depth/stencil format) can use the same input variable. The number of available input attachment indices is given by the maxPerStageDescriptorInputAttachments member of the VkPhysicalDeviceLimits structure.

Variables identified with the InputAttachmentIndex must only be used by a fragment stage. The numeric format of the subpass input must match the format of the corresponding input attachment, or the values of subpass loads from these variables are undefined. If the framebuffer
attachment contains both depth and stencil aspects, the numeric format of the subpass input determines if depth or stencil aspect is accessed by the shader.

See Input Attachment for more details.

15.4.1. Fragment Input Attachment Compatibility

An input attachment that is statically accessed by a fragment shader must be backed by a descriptor that is equivalent to the VkImageView in the VkFramebuffer, except for subresourceRange.aspectMask. The aspectMask must be equal to the aspect accessed by the shader.

15.5. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

<table>

<td></td>
</tr>
</tbody>
</table>
### 15.6. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage's `OpEntryPoint` with a storage class of `Uniform`, `UniformConstant`, `StorageBuffer`, or `PushConstant`. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

#### 15.6.1. Push Constant Interface

The shader variables defined with a storage class of `PushConstant` that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as `OpTypeStruct`,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in Offset and Stride Assignment.

There must be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block must be placed at an `Offset` such that the entire member is entirely contained within the `VkPushConstantRange` for each `OpEntryPoint` that uses it, and the `stageFlags` for that range must specify the appropriate `VkShaderStageFlagBits` for that stage. The `Offset` decoration for any member of a push constant block must not cause the space required for that member to extend outside the range `[0, maxPushConstantsSize]`.

Any member of a push constant block that is declared as an array must only be accessed with dynamically uniform indices.

#### 15.6.2. Descriptor Set Interface

The descriptor set interface is comprised of the shader variables with the storage class of

<table>
<thead>
<tr>
<th>Shader Stage</th>
<th>Ray Payload</th>
<th>Incoming Ray Payload</th>
<th>Hit Attribute</th>
<th>Callable Data</th>
<th>Incoming Callable Data</th>
</tr>
</thead>
<tbody>

<td></td>
<td>r/w</td>
<td>r/w</td>
<td></td>
</tr>
</tbody>
</table>
StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables must have DescriptorSet and Binding decorations specified, which are assigned and matched with the VkDescriptorSetLayout objects in the pipeline layout as described in DescriptorSet and Binding Assignment.

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpImageRead, OpImageSparseRead, or OpImageWrite operations, except under the following conditions:

- For OpImageWrite, if the image format is listed in the storage without format list and if the shaderStorageImageWriteWithoutFormat feature is enabled and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageWrite, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format is listed in the storage without format list and if the shaderStorageImageReadWithoutFormat feature is enabled and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead, if Dim is SubpassData (indicating a read from an input attachment).

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpAtomic* operations.

Variables identified with the Uniform storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block or BufferBlock decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

Variables identified with the StorageBuffer storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the Uniform storage class must not cause the space required for that variable to extend outside the range [0, maxUniformBufferRange). The Offset decoration for any member of a Block-decorated variable in the
StorageBuffer storage class **must** not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Variables identified with the Uniform storage class **can** also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK. In this case the variable **must** be typed as OpTypeStruct and **cannot** be aggregated into arrays of that type. Further, the Offset decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize})\).

Variables identified with a storage class of UniformConstant and a decoration of InputAttachmentIndex **must** be declared as described in Fragment Input Attachment Interface.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor **can** have a type of OpTypeImage, OpTypeSampler (Sampled=1), or OpTypeSampledImage.

Arrays of any of these types **can** be indexed with constant integral expressions. The following features **must** be enabled and capabilities **must** be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- Storage images (except storage texel buffers and input attachments):
  - Dynamically uniform: shaderStorageImageArrayDynamicIndexing and StorageImageArrayDynamicIndexing
  - Non-uniform: shaderStorageImageArrayNonUniformIndexing and StorageImageArrayNonUniformIndexing

- Storage texel buffers:
  - Dynamically uniform: shaderStorageTexelBufferArrayDynamicIndexing and StorageTexelBufferArrayDynamicIndexing
  - Non-uniform: shaderStorageTexelBufferArrayNonUniformIndexing and StorageTexelBufferArrayNonUniformIndexing

- Input attachments:
  - Dynamically uniform: shaderInputAttachmentArrayDynamicIndexing and InputAttachmentArrayDynamicIndexing
  - Non-uniform: shaderInputAttachmentArrayNonUniformIndexing and InputAttachmentArrayNonUniformIndexing

- Sampled images (except uniform texel buffers), samplers and combined image samplers:
  - Dynamically uniform: shaderSampledImageArrayDynamicIndexing and SampledImageArrayDynamicIndexing
  - Non-uniform: shaderSampledImageArrayNonUniformIndexing and SampledImageArrayNonUniformIndexing

- Uniform texel buffers:
  - Dynamically uniform: shaderUniformTexelBufferArrayDynamicIndexing and UniformTexelBufferArrayDynamicIndexing
• Non-uniform: shaderUniformTexelBufferArrayNonUniformIndexing and UniformTexelBufferArrayNonUniformIndexing

• Uniform buffers:
  • Dynamically uniform: shaderUniformBufferArrayDynamicIndexing and UniformBufferArrayDynamicIndexing
  • Non-uniform: shaderUniformBufferArrayNonUniformIndexing and UniformBufferArrayNonUniformIndexing

• Storage buffers:
  • Dynamically uniform: shaderStorageBufferArrayDynamicIndexing and StorageBufferArrayDynamicIndexing
  • Non-uniform: shaderStorageBufferArrayNonUniformIndexing and StorageBufferArrayNonUniformIndexing

• Acceleration structures:
  • Dynamically uniform: Always supported.
  • Non-uniform: Always supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature must be enabled and the capability must be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature must be enabled and the capability must be declared.

If the combined image sampler enables sampler $Y'CbCr$ conversion, it must be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the shaderSampledImageArrayDynamicIndexing feature.

\(^1\) Where OpTypeImage is referenced, the Dim values Buffer and Subpassdata are only accepted where they are specifically referenced. They do not correspond to resource types where a generic OpTypeImage is specified.

\(^2\) In addition to DescriptorSet and Binding.

**15.6.3. DescriptorSet and Binding Assignment**

A variable decorated with a DescriptorSet decoration of s and a Binding decoration of b indicates
that this variable is associated with the \texttt{VkDescriptorSetLayoutBinding} that has a \texttt{binding} equal to \texttt{b} in \texttt{pSetLayouts[s]} that was specified in \texttt{VkPipelineLayoutCreateInfo}.

\texttt{DescriptorSet} decoration values \textbf{must} be between zero and \texttt{maxBoundDescriptorSets} minus one, inclusive. \texttt{Binding} decoration values \textbf{can} be any 32-bit unsigned integer value, as described in \texttt{Descriptor Set Layout}. Each descriptor set has its own binding name space.

If the \texttt{Binding} decoration is used with an array, the entire array is assigned that binding value. The array \textbf{must} be a single-dimensional array and size of the array \textbf{must} be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set \textbf{must} not be used. If the array is runtime-sized, the \texttt{runtimeDescriptorArray} feature \textbf{must} be enabled and the \texttt{RuntimeDescriptorArray} capability \textbf{must} be declared. The index of each element of the array is referred to as the \texttt{arrayElement}. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an arrayElement of zero.

There is a limit on the number of resources of each type that \textbf{can} be accessed by a pipeline stage as shown in \texttt{Shader Resource Limits}. The “Resources Per Stage” column gives the limit on the number each type of resource that \textbf{can} be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits.

The pipeline layout \textbf{may} include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s \texttt{stageFlags}.

However, if a variable assigned to a given \texttt{DescriptorSet} and \texttt{Binding} is statically used by the entry point for a shader stage, the pipeline layout \textbf{must} contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s \texttt{stageFlags} \textbf{must} include the appropriate \texttt{VkShaderStageFlagBits} for that stage. The variable \textbf{must} be of a valid resource type determined by its SPIR-V type and storage class, as defined in \texttt{Shader Resource and Storage Class Correspondence}. The descriptor set layout binding \textbf{must} be of a corresponding descriptor type, as defined in \texttt{Shader Resource and Descriptor Type Correspondence}.

\begin{quote}
\textbf{Note}
There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are \texttt{statically used} has an impact. If any shader variable identifying a resource is \texttt{statically used} in a shader, then the underlying descriptor bound at the declared set and binding must \texttt{support the declared type in the shader} when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be \texttt{statically used} within the same shader. However, accesses are not automatically synchronized, and \texttt{Aliased} decorations should be used to avoid data hazards (see \texttt{section 2.18.2 Aliasing in the SPIR-V specification}).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not \texttt{supported by the relevant bound descriptor}, that shader can only be executed if
the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` that has multiple corresponding shader variables in the `UniformConstant` storage class, where some could be `OpTypeImage (Sampled=1)`, some could be `OpTypeSampler`, and some could be `OpTypeSampledImage`.

1

Input attachments **can** only be used in the fragment shader stage

### 15.6.4. Offset and Stride Assignment

Certain objects **must** be explicitly laid out using the `Offset`, `ArrayStride`, and `MatrixStride`, as described in **SPIR-V explicit layout validation rules**. All such layouts also **must** conform to the following requirements.

---

Note
The numeric order of Offset decorations does not need to follow member declaration order.

**Alignment Requirements**

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with \( C \) columns and \( R \) rows is equivalent to a \( C \) element array of vectors with \( R \) components.
- A row-major matrix with \( C \) columns and \( R \) rows is equivalent to an \( R \) element array of vectors with \( C \) components.

The *scalar alignment* of the type of an OpTypeStruct member is defined recursively as follows:

- A scalar of size \( N \) has a scalar alignment of \( N \).
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits scalar alignment from the equivalent array declaration.

The *base alignment* of the type of an OpTypeStruct member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the StorageBuffer storage class, StorageBuffer8BitAccess or UniformAndStorageBuffer8BitAccess must be declared in the SPIR-V module.)
- A matrix type inherits base alignment from the equivalent array declaration.

The *extended alignment* of the type of an OpTypeStruct member is similarly defined as follows:

- A scalar or vector type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
- A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to *improperly straddle* if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its
first byte at F and its last byte at L, where floor(F / 16) != floor(L / 16).

- It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

**Standard Buffer Layout**

Every member of an OpTypeStruct that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the scalarBlockLayout feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.

2. If the workgroupMemoryExplicitLayoutScalarBlockLayout feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.

3. All vectors must be aligned according to their scalar alignment.

4. If the uniformBufferStandardLayout feature is not enabled on the device, then any member of an OpTypeStruct with a storage class of Uniform and a decoration of Block must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

**Note**

Even if scalar alignment is supported, it is generally more performant to use the base alignment.

The memory layout must obey the following rules:

- The Offset decoration of any member must be a multiple of its alignment.

- Any ArrayStride or MatrixStride decoration must be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant, and the scalarBlockLayout feature is not enabled on the device.

- The storage class is Workgroup, and either the struct member is not part of a Block or the workgroupMemoryExplicitLayoutScalarBlockLayout feature is not enabled on the device.

- The storage class is any other storage class.

the memory layout must also obey the following rules:

- Vectors must not improperly straddle, as defined above.

- The Offset decoration of a member must not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

**Note**
The \texttt{std430} layout in GLSL satisfies these rules for types using the base alignment. The \texttt{std140} layout satisfies the rules for types using the extended alignment.

15.7. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a \texttt{BuiltIn} SPIR-V decoration. The meaning of each \texttt{BuiltIn} decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values can be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

\texttt{BaryCoordKHR}

The \texttt{BaryCoordKHR} decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

Valid Usage

- \texttt{VUID-BaryCoordKHR-BaryCoordKHR-04154}
  The \texttt{BaryCoordKHR} decoration must be used only within the Fragment Execution Model
- \texttt{VUID-BaryCoordKHR-BaryCoordKHR-04155}
  The variable decorated with \texttt{BaryCoordKHR} must be declared using the Input Storage Class
- \texttt{VUID-BaryCoordKHR-BaryCoordKHR-04156}
  The variable decorated with \texttt{BaryCoordKHR} must be declared as a three-component vector of 32-bit floating-point values

\texttt{BaryCoordNoPerspKHR}

The \texttt{BaryCoordNoPerspKHR} decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

Valid Usage

- \texttt{VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160}
  The \texttt{BaryCoordNoPerspKHR} decoration must be used only within the Fragment Execution Model
- \texttt{VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161}
  The variable decorated with \texttt{BaryCoordNoPerspKHR} must be declared using the Input Storage Class
The variable decorated with `BaryCoordNoPerspKHR` must be declared as a three-component vector of 32-bit floating-point values.

### BaseInstance

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the `firstInstance` parameter to a *direct drawing command* or the `firstInstance` member of a structure consumed by an *indirect drawing command*.

### Valid Usage

- **VUID-BaseInstance-BaseInstance-04181**
  The `BaseInstance` decoration must be used only within the **Vertex Execution Model**

- **VUID-BaseInstance-BaseInstance-04182**
  The variable decorated with `BaseInstance` must be declared using the **Input Storage Class**

- **VUID-BaseInstance-BaseInstance-04183**
  The variable decorated with `BaseInstance` must be declared as a scalar 32-bit integer value

### BaseVertex

Decorating a variable with the `BaseVertex` built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For non-indexed drawing commands, this variable is the `firstVertex` parameter to a *direct drawing command* or the `firstVertex` member of the structure consumed by an *indirect drawing command*. For indexed drawing commands, this variable is the `vertexOffset` parameter to a *direct drawing command* or the `vertexOffset` member of the structure consumed by an *indirect drawing command*.

### Valid Usage

- **VUID-BaseVertex-BaseVertex-04184**
  The `BaseVertex` decoration must be used only within the **Vertex Execution Model**

- **VUID-BaseVertex-BaseVertex-04185**
  The variable decorated with `BaseVertex` must be declared using the **Input Storage Class**

- **VUID-BaseVertex-BaseVertex-04186**
  The variable decorated with `BaseVertex` must be declared as a scalar 32-bit integer value

### ClipDistance

Decorating a variable with the `ClipDistance` built-in decoration will make that variable contain the mechanism for controlling user clipping. `ClipDistance` is an array such that the $i^{th}$ element of the array specifies the clip distance for plane $i$. A clip distance of 0 means the vertex is on the
plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

**Note**
The array variable decorated with `ClipDistance` is explicitly sized by the shader.

**Note**
In the last pre-rasterization shader stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If `ClipDistance` is then used by a fragment shader, `ClipDistance` contains these linearly interpolated values.

**Valid Usage**

- **VUID-ClipDistance-ClipDistance-04187**
  The `ClipDistance` decoration must be used only within the `MeshEXT, MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model`

- **VUID-ClipDistance-ClipDistance-04188**
  The variable decorated with `ClipDistance` within the `MeshEXT, MeshNV, or Vertex Execution Model` must be declared using the `Output Storage Class`

- **VUID-ClipDistance-ClipDistance-04189**
  The variable decorated with `ClipDistance` within the `Fragment Execution Model` must be declared using the `Input Storage Class`

- **VUID-ClipDistance-ClipDistance-04190**
  The variable decorated with `ClipDistance` within the `TessellationControl, TessellationEvaluation, or Geometry Execution Model` must not be declared in a `Storage Class` other than `Input` or `Output`

- **VUID-ClipDistance-ClipDistance-04191**
  The variable decorated with `ClipDistance` must be declared as an array of 32-bit floating-point values

**CullDistance**

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

**Note**
In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

**Note**
If `CullDistance` decorates an input variable, that variable will contain the
corresponding value from the CullDistance decorated output variable from the previous shader stage.

**Valid Usage**

- **VUID-CullDistance-CullDistance-04196**
  The CullDistance decoration must be used only within the MeshEXT, MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model.

- **VUID-CullDistance-CullDistance-04197**
  The variable decorated with CullDistance within the MeshEXT, MeshNV or Vertex Execution Model must be declared using the Output Storage Class.

- **VUID-CullDistance-CullDistance-04198**
  The variable decorated with CullDistance within the Fragment Execution Model must be declared using the Input Storage Class.

- **VUID-CullDistance-CullDistance-04199**
  The variable decorated with CullDistance within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output.

- **VUID-CullDistance-CullDistance-04200**
  The variable decorated with CullDistance must be declared as an array of 32-bit floating-point values.

**CullMaskKHR**

A variable decorated with the CullMaskKHR decoration will specify the cull mask of the ray being processed. The value is given by the Cull Mask parameter passed into one of the OpTrace* instructions.

**Valid Usage**

- **VUID-CullMaskKHR-CullMaskKHR-06735**
  The CullMaskKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- **VUID-CullMaskKHR-CullMaskKHR-06736**
  The variable decorated with CullMaskKHR must be declared using the Input Storage Class.

- **VUID-CullMaskKHR-CullMaskKHR-06737**
  The variable decorated with CullMaskKHR must be declared as a scalar 32-bit integer value.

**DeviceIndex**

The DeviceIndex decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \(0, \max(1, \text{physicalDeviceCount})\), where physicalDeviceCount is the physicalDeviceCount member of VkDeviceGroupDeviceCreateInfo.
Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with `DeviceIndex` **must** be declared using the `Input Storage Class`

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with `DeviceIndex` **must** be declared as a scalar 32-bit integer value

**DrawIndex**

Decorating a variable with the `DrawIndex` built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current vertex shader invocation. For *indirect drawing commands*, `DrawIndex` begins at zero and increments by one for each drawing command executed. The number of drawing commands is given by the `drawCount` parameter. For *direct drawing commands*, `DrawIndex` is always zero. `DrawIndex` is dynamically uniform.

Valid Usage

- VUID-DrawIndex-DrawIndex-04207
  The `DrawIndex` decoration **must** be used only within the `Vertex, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model`

- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with `DrawIndex` **must** be declared using the `Input Storage Class`

- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with `DrawIndex` **must** be declared as a scalar 32-bit integer value

**FragCoord**

Decorating a variable with the `FragCoord` built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the \(x\) and \(y\) components of `FragCoord` reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of `FragCoord` reflect the location of the center of the fragment.

The \(z\) component of `FragCoord` is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w}\).

The **Centroid** interpolation decoration is ignored, but allowed, on `FragCoord`.

Valid Usage

- VUID-FragCoord-FragCoord-04210
The **FragCoord** decoration **must** be used only within the **Fragment Execution Model**

- VUID-FragCoord-FragCoord-04211
  The variable decorated with **FragCoord** **must** be declared using the **Input Storage Class**

- VUID-FragCoord-FragCoord-04212
  The variable decorated with **FragCoord** **must** be declared as a four-component vector of 32-bit floating-point values

**FragDepth**

To have a shader supply a fragment-depth value, the shader **must** declare the **DepthReplacing** execution mode. Such a shader's fragment-depth value will come from the variable decorated with the **FragDepth** built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See **fragment shader depth replacement** for details.

### Valid Usage

- VUID-FragDepth-FragDepth-04213
  The **FragDepth** decoration **must** be used only within the **Fragment Execution Model**

- VUID-FragDepth-FragDepth-04214
  The variable decorated with **FragDepth** **must** be declared using the **Output Storage Class**

- VUID-FragDepth-FragDepth-04215
  The variable decorated with **FragDepth** **must** be declared as a scalar 32-bit floating-point value

- VUID-FragDepth-FragDepth-04216
  If the shader dynamically writes to the variable decorated with **FragDepth**, the **DepthReplacing Execution Mode** **must** be declared

**FrontFacing**

Decorating a variable with the **FrontFacing** built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a **front-facing** polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

### Valid Usage

- VUID-FrontFacing-FrontFacing-04229
  The **FrontFacing** decoration **must** be used only within the **Fragment Execution Model**

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with **FrontFacing** **must** be declared using the **Input Storage Class**

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with **FrontFacing** **must** be declared as a boolean value
GlobalInvocationId

Decorating a variable with the GlobalInvocationId built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus LocalInvocationId.

Valid Usage

- VUID-GlobalInvocationId-GlobalInvocationId-04236
  The GlobalInvocationId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-GlobalInvocationId-GlobalInvocationId-04237
  The variable decorated with GlobalInvocationId must be declared using the Input Storage Class

- VUID-GlobalInvocationId-GlobalInvocationId-04238
  The variable decorated with GlobalInvocationId must be declared as a three-component vector of 32-bit integer values

HelperInvocation

Decorating a variable with the HelperInvocation built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

Note

It is very likely that a helper invocation will have a value of SampleMask fragment shader input value that is zero.

Valid Usage

- VUID-HelperInvocation-HelperInvocation-04239
  The HelperInvocation decoration must be used only within the Fragment Execution Model

- VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with HelperInvocation must be declared using the Input Storage Class

- VUID-HelperInvocation-HelperInvocation-04241
  The variable decorated with HelperInvocation must be declared as a boolean value

HitKindKHR

A variable decorated with the HitKindKHR decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of
OpReportIntersectionKHR. For triangle intersection candidates, this will be one of HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR.

Valid Usage

- VUID-HitKindKHR-HitKindKHR-04242
  The HitKindKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitKindKHR-HitKindKHR-04243
  The variable decorated with HitKindKHR must be declared using the Input Storage Class

- VUID-HitKindKHR-HitKindKHR-04244
  The variable decorated with HitKindKHR must be declared as a scalar 32-bit integer value

HitTriangleVertexPositionsKHR

A variable decorated with the HitTriangleVertexPositionsKHR decoration will specify the object space vertices of the triangle at the current intersection in application-provided order. The positions returned are transformed by the geometry transform, which is performed at standard floating point precision, but without a specifically defined order of floating point operations to perform the matrix multiplication.

Valid Usage

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08747
  The HitTriangleVertexPositionsKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08748
  The variable decorated with HitTriangleVertexPositionsKHR must be declared using the Input Storage Class

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08749
  The variable decorated with HitTriangleVertexPositionsKHR must be declared as an array of three vectors of three 32-bit float values

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08750
  The variable decorated with HitTriangleVertexPositionsKHR must be used only if the value of HitKindKHR is HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR

- VUID-HitTriangleVertexPositionsKHR-None-08751
  The acceleration structure corresponding to the current intersection must have been built with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR

IncomingRayFlagsKHR

A variable with the IncomingRayFlagsKHR decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline must not cause any corresponding flags to be set in variables with this decoration.
**Valid Usage**

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248**
  The `IncomingRayFlagsKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249**
  The variable decorated with `IncomingRayFlagsKHR` **must** be declared using the `Input Storage` Class.

- **VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250**
  The variable decorated with `IncomingRayFlagsKHR` **must** be declared as a scalar 32-bit integer value.

**InstanceCustomIndexKHR**

A variable decorated with the `InstanceCustomIndexKHR` decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in `VkAccelerationStructureInstanceKHR::instanceCustomIndex` for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

**Valid Usage**

- **VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251**
  The `InstanceCustomIndexKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252**
  The variable decorated with `InstanceCustomIndexKHR` **must** be declared using the `Input Storage` Class.

- **VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253**
  The variable decorated with `InstanceCustomIndexKHR` **must** be declared as a scalar 32-bit integer value.

**InstanceId**

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

**Valid Usage**

- **VUID-InstanceId-InstanceId-04254**
  The `InstanceId` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-InstanceId-InstanceId-04255**
  The variable decorated with `InstanceId` **must** be declared using the `Input Storage` Class.

- **VUID-InstanceId-InstanceId-04256**
  The variable decorated with `InstanceId` **must** be declared using the `Input Storage` Class.
The variable decorated with `InstanceId` must be declared as a scalar 32-bit integer value.

**InvocationId**

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

**Valid Usage**

- VUID-InvocationId-InvocationId-04257
  The `InvocationId` decoration must be used only within the `TessellationControl` or `Geometry Execution Model`.

- VUID-InvocationId-InvocationId-04258
  The variable decorated with `InvocationId` must be declared using the `Input Storage Class`.

- VUID-InvocationId-InvocationId-04259
  The variable decorated with `InvocationId` must be declared as a scalar 32-bit integer value.

**InstanceIndex**

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the `firstInstance` member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

**Valid Usage**

- VUID-InstanceIndex-InstanceIndex-04263
  The `InstanceIndex` decoration must be used only within the `Vertex Execution Model`.

- VUID-InstanceIndex-InstanceIndex-04264
  The variable decorated with `InstanceIndex` must be declared using the `Input Storage Class`.

- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with `InstanceIndex` must be declared as a scalar 32-bit integer value.

**LaunchIdKHR**

A variable decorated with the `LaunchIdKHR` decoration will specify the index of the work item being processed. One work item is generated for each of the `width × height × depth` items dispatched by a `vkCmdTraceRaysKHR` command. All shader invocations inherit the same value.
for variables decorated with LaunchIdKHR.

**Valid Usage**

- **VUID-LaunchIdKHR-LaunchIdKHR-04266**
  The LaunchIdKHR decoration **must** be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model.

- **VUID-LaunchIdKHR-LaunchIdKHR-04267**
  The variable decorated with LaunchIdKHR **must** be declared using the Input Storage Class.

- **VUID-LaunchIdKHR-LaunchIdKHR-04268**
  The variable decorated with LaunchIdKHR **must** be declared as a three-component vector of 32-bit integer values.

**LaunchSizeKHR**

A variable decorated with the LaunchSizeKHR decoration will contain the width, height, and depth dimensions passed to the vkCmdTraceRaysKHR command that initiated this shader execution. The width is in the first component, the height is in the second component, and the depth is in the third component.

**Valid Usage**

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04269**
  The LaunchSizeKHR decoration **must** be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model.

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04270**
  The variable decorated with LaunchSizeKHR **must** be declared using the Input Storage Class.

- **VUID-LaunchSizeKHR-LaunchSizeKHR-04271**
  The variable decorated with LaunchSizeKHR **must** be declared as a three-component vector of 32-bit integer values.

**Layer**

Decorating a variable with the Layer built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a vertex, tessellation evaluation, or geometry shader, any variable decorated with Layer can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active pre-rasterization shader stage (in pipeline order) controls the Layer that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the Layer.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with Layer, then the first layer is used. If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with Layer, it **must** write the same value to Layer for all output vertices of a given primitive. If the Layer value is less than 0 or
greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized, fragment shaders may be executed, and the framebuffer values for all layers are undefined.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

### Valid Usage

- **VUID-Layer-Layer-04272**
  The `Layer` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-Layer-Layer-04273**
  If the `shaderOutputLayer` feature is not enabled then the `Layer` decoration must be used only within the `Geometry` or `Fragment Execution Model`.

- **VUID-Layer-Layer-04274**
  The variable decorated with `Layer` within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` must be declared using the `Output Storage Class`.

- **VUID-Layer-Layer-04275**
  The variable decorated with `Layer` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- **VUID-Layer-Layer-04276**
  The variable decorated with `Layer` must be declared as a scalar 32-bit integer value.

- **VUID-Layer-Layer-07039**
  The variable decorated with `Layer` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

### LocalInvocationId

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

**Note**

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.

### Valid Usage

- **VUID-LocalInvocationId-LocalInvocationId-04281**
  The `LocalInvocationId` decoration must be used only within the `GLCompute`, `MeshEXT`,...
The variable decorated with `LocalInvocationId` must be declared using the Input Storage Class.

The variable decorated with `LocalInvocationIndex` must be declared as a three-component vector of 32-bit integer values.

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```
LocalInvocationIndex =
    LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y +
    LocalInvocationId.y * WorkgroupSize.x +
    LocalInvocationId.x;
```

The `LocalInvocationIndex` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model.

The variable decorated with `LocalInvocationIndex` must be declared using the Input Storage Class.

The variable decorated with `LocalInvocationIndex` must be declared as a scalar 32-bit integer value.

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

The `NumSubgroups` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model.

The variable decorated with `NumSubgroups` must be declared using the Input Storage Class.

The variable decorated with `NumSubgroups` must be declared as a scalar 32-bit integer value.
**NumWorkgroups**

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

**Valid Usage**

- VUID-NumWorkgroups-NumWorkgroups-04296
  The `NumWorkgroups` decoration **must** be used only within the GLCompute, MeshEXT, or TaskEXT Execution Model.

- VUID-NumWorkgroups-NumWorkgroups-04297
  The variable decorated with `NumWorkgroups` **must** be declared using the Input Storage Class.

- VUID-NumWorkgroups-NumWorkgroups-04298
  The variable decorated with `NumWorkgroups` **must** be declared as a three-component vector of 32-bit integer values.

**ObjectRayDirectionKHR**

A variable decorated with the `ObjectRayDirectionKHR` decoration will specify the direction of the ray being processed, in object space.

**Valid Usage**

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The `ObjectRayDirectionKHR` decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model.

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300
  The variable decorated with `ObjectRayDirectionKHR` **must** be declared using the Input Storage Class.

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301
  The variable decorated with `ObjectRayDirectionKHR` **must** be declared as a three-component vector of 32-bit floating-point values.

**ObjectRayOriginKHR**

A variable decorated with the `ObjectRayOriginKHR` decoration will specify the origin of the ray being processed, in object space.

**Valid Usage**

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The `ObjectRayOriginKHR` decoration **must** be used only within the IntersectionKHR,
### AnyHitKHR, or ClosestHitKHR Execution Model

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303**
  The variable decorated with `ObjectRayOriginKHR` **must** be declared using the Input Storage Class

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304**
  The variable decorated with `ObjectRayOriginKHR` **must** be declared as a three-component vector of 32-bit floating-point values

### ObjectToWorldKHR

A variable decorated with the `ObjectToWorldKHR` decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

### Valid Usage

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305**
  The `ObjectToWorldKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306**
  The variable decorated with `ObjectToWorldKHR` **must** be declared using the Input Storage Class

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307**
  The variable decorated with `ObjectToWorldKHR` **must** be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values

### PatchVertices

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the `name:patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`. In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

### Valid Usage

- **VUID-PatchVertices-PatchVertices-04308**
  The `PatchVertices` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model

- **VUID-PatchVertices-PatchVertices-04309**
  The variable decorated with `PatchVertices` **must** be declared using the Input Storage Class

- **VUID-PatchVertices-PatchVertices-04310**
  The variable decorated with `PatchVertices` **must** be declared as a scalar 32-bit integer value
**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

**Note**

Depending on how the point is rasterized, `PointCoord` may never reach (0,0) or (1,1).

---

**Valid Usage**

- VUID-PointCoord-PointCoord-04311
  The `PointCoord` decoration **must** be used only within the Fragment Execution Model

- VUID-PointCoord-PointCoord-04312
  The variable decorated with `PointCoord` **must** be declared using the Input Storage Class

- VUID-PointCoord-PointCoord-04313
  The variable decorated with `PointCoord` **must** be declared as a two-component vector of 32-bit floating-point values

**PointSize**

Decorating a variable with the `PointSize` built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with `PointSize` by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

**Note**

When `PointSize` decorates a variable in the Input Storage Class, it contains the data written to the output variable decorated with `PointSize` from the previous shader stage.

---

**Valid Usage**

- VUID-PointSize-PointSize-04314
  The `PointSize` decoration **must** be used only within the MeshEXT, MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- VUID-PointSize-PointSize-04315
  The variable decorated with `PointSize` within the MeshEXT, MeshNV, or Vertex Execution Model **must** be declared using the Output Storage Class

- VUID-PointSize-PointSize-04316
  The variable decorated with `PointSize` within the TessellationControl, TessellationEvaluation, or Geometry Execution Model **must** not be declared using a Storage Class other than Input or Output
The variable decorated with **PointSize** must be declared as a scalar 32-bit floating-point value.

### Position

Decorating a variable with the **Position** built-in decoration will make that variable contain the position of the current vertex. In the last pre-rasterization shader stage, the value of the variable decorated with **Position** is used in subsequent primitive assembly, clipping, and rasterization operations.

**Note**

When **Position** decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with **Position** from the previous shader stage.

### Valid Usage

- **VUID-Position-Position-04318**  
The **Position** decoration must be used only within the MeshEXT, MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- **VUID-Position-Position-04319**  
The variable decorated with **Position** within the MeshEXT, MeshNV, or Vertex Execution Model must be declared using the Output Storage Class

- **VUID-Position-Position-04320**  
The variable decorated with **Position** within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output

- **VUID-Position-Position-04321**  
The variable decorated with **Position** must be declared as a four-component vector of 32-bit floating-point values

### PrimitiveId

Decorating a variable with the **PrimitiveId** built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see [Polygon Mode](#)), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with **PrimitiveId** are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with **PrimitiveId**.
In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

**Note**

When the `PrimitiveId` decoration is applied to an output variable in the geometry shader, the resulting value is seen through the `PrimitiveId` decorated input variable in the fragment shader.

The fragment shader using `PrimitiveId` will need to declare either the `Geometry` or `Tessellation` capability to satisfy the requirement SPIR-V has to use `PrimitiveId`.

**Valid Usage**

- **VUID-PrimitiveId-PrimitiveId-04330**
  The `PrimitiveId` decoration must be used only within the `MeshEXT`, `MeshNV`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `TessellationControl`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-PrimitiveId-Fragment-04331**
  If pipeline contains both the `Fragment` and `Geometry Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `Geometry` shader must write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  If pipeline contains both the `Fragment` and `MeshEXT` or `MeshNV` `Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `MeshEXT` or `MeshNV` shader must write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
  If `Fragment Execution Model` contains a variable decorated with `PrimitiveId`, then either the `MeshShadingEXT`, `MeshShadingNV`, `Geometry` or `Tessellation` capability must also be declared.

- **VUID-PrimitiveId-PrimitiveId-04334**
  The variable decorated with `PrimitiveId` within the `TessellationControl`, `TessellationEvaluation`, `Fragment`, `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` `Execution Model` must be declared using the `Input Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04335**
  The variable decorated with `PrimitiveId` within the `Geometry Execution Model` must be declared using the `Input` or `Output Storage Class`.

882
The variable decorated with PrimitiveId within the MeshEXT or MeshNV Execution Model must be declared using the Output Storage Class.

The variable decorated with PrimitiveId must be declared as a scalar 32-bit integer value.

The variable decorated with PrimitiveId within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration.

**PrimitiveShadingRateKHR**

Decorating a variable with the PrimitiveShadingRateKHR built-in decoration will make that variable contain the primitive fragment shading rate.

The value written to the variable decorated with PrimitiveShadingRateKHR by the last pre-rasterization shader stage in the pipeline is used as the primitive fragment shading rate. Outputs in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with PrimitiveShadingRateKHR, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has PrimitiveShadingRateKHR in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

**Valid Usage**

The PrimitiveShadingRateKHR decoration must be used only within the MeshEXT, MeshNV, Vertex, or Geometry Execution Model.

The variable decorated with PrimitiveShadingRateKHR must be declared using the Output Storage Class.

The variable decorated with PrimitiveShadingRateKHR must be declared as a scalar 32-bit integer value.

The value written to PrimitiveShadingRateKHR must include no more than one of Vertical2Pixels and Vertical4Pixels.

The value written to PrimitiveShadingRateKHR must include no more than one of Horizontal2Pixels and Horizontal4Pixels.

The value written to PrimitiveShadingRateKHR must not have any bits set other than those defined by Fragment Shading Rate Flags enumerants in the SPIR-V specification.
The variable decorated with `PrimitiveShadingRateKHR` within the `MeshEXT` Execution Model must also be decorated with the `PerPrimitiveEXT` decoration.

### RayGeometryIndexKHR

A variable decorated with the `RayGeometryIndexKHR` decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

#### Valid Usage

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345**
  The `RayGeometryIndexKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04346**
  The variable decorated with `RayGeometryIndexKHR` must be declared using the `Input Storage Class`.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04347**
  The variable decorated with `RayGeometryIndexKHR` must be declared as a scalar 32-bit integer value.

### RayTmaxKHR

A variable decorated with the `RayTmaxKHR` decoration will contain the parametric $t_{\text{max}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into `OpTraceRayKHR`.

The $t_{\text{max}}$ value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling `OpReportIntersectionKHR` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into `OpTraceRayKHR`.

#### Valid Usage

- **VUID-RayTmaxKHR-RayTmaxKHR-04348**
  The `RayTmaxKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-RayTmaxKHR-RayTmaxKHR-04349**
  The variable decorated with `RayTmaxKHR` must be declared using the `Input Storage Class`.

- **VUID-RayTmaxKHR-RayTmaxKHR-04350**
  The variable decorated with `RayTmaxKHR` must be declared as a scalar 32-bit floating-point value.
RayTminKHR

A variable decorated with the RayTminKHR decoration will contain the parametric tmin value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into OpTraceRayKHR.

The tmin value remains constant for the duration of the ray query.

Valid Usage

- VUID-RayTminKHR-RayTminKHR-04351
  The RayTminKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-RayTminKHR-RayTminKHR-04352
  The variable decorated with RayTminKHR must be declared using the Input Storage Class

- VUID-RayTminKHR-RayTminKHR-04353
  The variable decorated with RayTminKHR must be declared as a scalar 32-bit floating-point value

SampleId

Decorating a variable with the SampleId built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. SampleId ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with SampleId, Sample Shading is considered enabled with a minSampleShading value of 1.0.

Valid Usage

- VUID-SampleId-SampleId-04354
  The SampleId decoration must be used only within the Fragment Execution Model

- VUID-SampleId-SampleId-04355
  The variable decorated with SampleId must be declared using the Input Storage Class

- VUID-SampleId-SampleId-04356
  The variable decorated with SampleId must be declared as a scalar 32-bit integer value

SampleMask

Decorating a variable with the SampleMask built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the Input storage class decorated with SampleMask will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. SampleMask[] is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (SampleMask[M]) corresponds to sample $32 \times M + B$. 
A variable in the Output storage class decorated with SampleMask is an array of integers forming a bit array in a manner similar to an input variable decorated with SampleMask, but where each bit represents coverage as computed by the shader. This computed SampleMask is combined with the generated coverage mask in the multisample coverage operation.

Variables decorated with SampleMask must be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with SampleMask, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with SampleMask, the sample mask has no effect on the processing of a fragment.

### Valid Usage

- **VUID-SampleMask-SampleMask-04357**
  > The SampleMask decoration must be used only within the Fragment Execution Model

- **VUID-SampleMask-SampleMask-04358**
  > The variable decorated with SampleMask must be declared using the Input or Output Storage Class

- **VUID-SampleMask-SampleMask-04359**
  > The variable decorated with SampleMask must be declared as an array of 32-bit integer values

### SamplePosition

Decorating a variable with the SamplePosition built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If a fragment shader entry point's interface includes an input variable decorated with SamplePosition, Sample Shading is considered enabled with a minSampleShading value of 1.0.

### Valid Usage

- **VUID-SamplePosition-SamplePosition-04360**
  > The SamplePosition decoration must be used only within the Fragment Execution Model

- **VUID-SamplePosition-SamplePosition-04361**
  > The variable decorated with SamplePosition must be declared using the Input Storage Class

- **VUID-SamplePosition-SamplePosition-04362**
  > The variable decorated with SamplePosition must be declared as a two-component vector of 32-bit floating-point values
ShadingRateKHR
Decorating a variable with the ShadingRateKHR built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.

Valid Usage

- VUID-ShadingRateKHR-ShadingRateKHR-04490
  The ShadingRateKHR decoration must be used only within the Fragment Execution Model

- VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with ShadingRateKHR must be declared using the Input Storage Class

- VUID-ShadingRateKHR-ShadingRateKHR-04492
  The variable decorated with ShadingRateKHR must be declared as a scalar 32-bit integer value

SubgroupId
Decorating a variable with the SubgroupId built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, NumSubgroups-1].

Valid Usage

- VUID-SubgroupId-SubgroupId-04367
  The SubgroupId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-SubgroupId-SubgroupId-04368
  The variable decorated with SubgroupId must be declared using the Input Storage Class

- VUID-SubgroupId-SubgroupId-04369
  The variable decorated with SubgroupId must be declared as a scalar 32-bit integer value

SubgroupEqMask
Decorating a variable with the SubgroupEqMask built-in decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the SubgroupLocalInvocationId is set in the variable decorated with SubgroupEqMask. All other bits are set to zero.

SubgroupEqMaskKHR is an alias of SubgroupEqMask.

Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with SubgroupEqMask must be declared using the Input Storage Class

- VUID-SubgroupEqMask-SubgroupEqMask-04371
The variable decorated with `SubgroupEqMask` must be declared as a four-component vector of 32-bit integer values.

**SubgroupGeMask**

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

**Valid Usage**

- VUID-SubgroupGeMask-SubgroupGeMask-04372
  The variable decorated with `SubgroupGeMask` must be declared using the Input Storage Class

- VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with `SubgroupGeMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupGtMask**

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

**Valid Usage**

- VUID-SubgroupGtMask-SubgroupGtMask-04374
  The variable decorated with `SubgroupGtMask` must be declared using the Input Storage Class

- VUID-SubgroupGtMask-SubgroupGtMask-04375
  The variable decorated with `SubgroupGtMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLeMask**

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`. 
Valid Usage

- VUID-SubgroupLeMask-SubgroupLeMask-04376
  The variable decorated with `SubgroupLeMask` must be declared using the `Input Storage Class`

- VUID-SubgroupLeMask-SubgroupLeMask-04377
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLtMask**

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

Valid Usage

- VUID-SubgroupLtMask-SubgroupLtMask-04378
  The variable decorated with `SubgroupLtMask` must be declared using the `Input Storage Class`

- VUID-SubgroupLtMask-SubgroupLtMask-04379
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupLocalInvocationId**

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0, SubgroupSize-1].`

If `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is specified, or if `module` declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the *stage* is a multiple of `SubgroupSize`, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups must be launched with all invocations active, i.e., there is an active invocation with `SubgroupLocalInvocationId` for each value in range `[0, SubgroupSize-1].`

**Note**

There is no direct relationship between `SubgroupLocalInvocationId` and `LocalInvocationId` or `LocalInvocationIndex`. If the pipeline was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]
If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

**Note**

`VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is effectively deprecated when compiling SPIR-V 1.6 shaders, as this behavior is the default for Vulkan with SPIR-V 1.6. This is more aligned with developer expectations, and avoids applications unexpectedly breaking in the future.

### Valid Usage

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380**
  The variable decorated with `SubgroupLocalInvocationId` must be declared using the `Input Storage Class`

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  The variable decorated with `SubgroupLocalInvocationId` must be declared as a scalar 32-bit integer value

### SubgroupSize

Decorating a variable with the `SubgroupSize` builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, or the SPIR-V module is at least version 1.6, the `SubgroupSize` decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between `minSubgroupSize` and `maxSubgroupSize` and must be uniform with `subgroup scope`. The value may vary across a single draw call, and for fragment shaders may vary across a single primitive. In compute dispatches, `SubgroupSize` must be uniform with `command scope`.

If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If SPIR-V module is less than version 1.6 and the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**

The old behavior for `SubgroupSize` is considered deprecated as certain compute algorithms cannot be easily implemented without the guarantees of
VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT and
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT.

**Valid Usage**

- VUID-SubgroupSize-SubgroupSize-04382
  The variable decorated with \texttt{SubgroupSize} must be declared using the\ Input Storage Class

- VUID-SubgroupSize-SubgroupSize-04383
  The variable decorated with \texttt{SubgroupSize} must be declared as a scalar 32-bit integer value

**TessCoord**

Decorating a variable with the \texttt{TessCoord} built-in decoration will make that variable contain the three-dimensional \((u,v,w)\) barycentric coordinate of the tessellated vertex within the patch. \(u, v,\) and \(w\) are in the range \([0,1]\) and vary linearly across the primitive being subdivided. For the tessellation modes of \texttt{Quads} or \texttt{IsoLines}, the third component is always zero.

**Valid Usage**

- VUID-TessCoord-TessCoord-04387
  The \texttt{TessCoord} decoration must be used only within the\ TessellationEvaluation Execution Model

- VUID-TessCoord-TessCoord-04388
  The variable decorated with \texttt{TessCoord} must be declared using the\ Input Storage Class

- VUID-TessCoord-TessCoord-04389
  The variable decorated with \texttt{TessCoord} must be declared as a three-component vector of 32-bit floating-point values

**TessLevelOuter**

Decorating a variable with the \texttt{TessLevelOuter} built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with \texttt{TessLevelOuter} can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with \texttt{TessLevelOuter} can read the values written by the tessellation control shader.

**Valid Usage**

- VUID-TessLevelOuter-TessLevelOuter-04390
  The \texttt{TessLevelOuter} decoration must be used only within the\ TessellationControl or\ TessellationEvaluation Execution Model
• VUID-TessLevelOuter-TessLevelOuter-04391
  The variable decorated with TessLevelOuter within the TessellationControl Execution Model must be declared using the Output Storage Class

• VUID-TessLevelOuter-TessLevelOuter-04392
  The variable decorated with TessLevelOuter within the TessellationEvaluation Execution Model must be declared using the Input Storage Class

• VUID-TessLevelOuter-TessLevelOuter-04393
  The variable decorated with TessLevelOuter must be declared as an array of size four, containing 32-bit floating-point values

TessLevelInner
Decorating a variable with the TessLevelInner built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with TessLevelInner can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with TessLevelInner can read the values written by the tessellation control shader.

Valid Usage

• VUID-TessLevelInner-TessLevelInner-04394
  The TessLevelInner decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

• VUID-TessLevelInner-TessLevelInner-04395
  The variable decorated with TessLevelInner within the TessellationControl Execution Model must be declared using the Output Storage Class

• VUID-TessLevelInner-TessLevelInner-04396
  The variable decorated with TessLevelInner within the TessellationEvaluation Execution Model must be declared using the Input Storage Class

• VUID-TessLevelInner-TessLevelInner-04397
  The variable decorated with TessLevelInner must be declared as an array of size two, containing 32-bit floating-point values

VertexIndex
Decorating a variable with the VertexIndex built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the firstVertex parameter to vkCmdDraw or the firstVertex member of a structure consumed by vkCmdDrawIndirect and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the vertexOffset parameter to vkCmdDrawIndexed or the vertexOffset member of the structure consumed by vkCmdDrawIndexedIndirect.
**Valid Usage**

- VUID-VertexIndex-VertexIndex-04398  
The `VertexIndex` decoration **must** be used only within the **Vertex Execution Model**
- VUID-VertexIndex-VertexIndex-04399  
The variable decorated with `VertexIndex` **must** be declared using the **Input Storage Class**
- VUID-VertexIndex-VertexIndex-04400  
The variable decorated with `VertexIndex` **must** be declared as a scalar 32-bit integer value

**ViewIndex**

The `ViewIndex` decoration **can** be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

**Valid Usage**

- VUID-ViewIndex-ViewIndex-04401  
The `ViewIndex` decoration **must** be used only within the **MeshEXT, Vertex, Geometry, TessellationControl, TessellationEvaluation** or **Fragment Execution Model**
- VUID-ViewIndex-ViewIndex-04402  
The variable decorated with `ViewIndex` **must** be declared using the **Input Storage Class**
- VUID-ViewIndex-ViewIndex-04403  
The variable decorated with `ViewIndex` **must** be declared as a scalar 32-bit integer value

**ViewportIndex**

Decorating a variable with the `ViewportIndex` built-in decoration will make that variable contain the index of the viewport.

In a vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportIndex` can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform and scissor rectangle.

The last active **pre-rasterization shader stage** (in pipeline order) controls the `ViewportIndex` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportIndex`. 

*Note*

`VertexIndex` starts at the same starting value for each instance.
If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with ViewportIndex then the first viewport is used. If a pre-rasterization shader stage shader entry point's interface includes a variable decorated with ViewportIndex, it must write the same value to ViewportIndex for all output vertices of a given primitive.

In a fragment shader, the variable decorated with ViewportIndex contains the viewport index of the primitive that the fragment invocation belongs to.

Valid Usage

- **VUID-ViewportIndex-ViewportIndex-04404**
  The ViewportIndex decoration must be used only within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

- **VUID-ViewportIndex-ViewportIndex-04405**
  If the shaderOutputViewportIndex feature is not enabled then the ViewportIndex decoration must be used only within the Geometry or Fragment Execution Model

- **VUID-ViewportIndex-ViewportIndex-04406**
  The variable decorated with ViewportIndex within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model must be declared using the Output Storage Class

- **VUID-ViewportIndex-ViewportIndex-04407**
  The variable decorated with ViewportIndex within the Fragment Execution Model must be declared using the Input Storage Class

- **VUID-ViewportIndex-ViewportIndex-04408**
  The variable decorated with ViewportIndex must be declared as a scalar 32-bit integer value

- **VUID-ViewportIndex-ViewportIndex-07060**
  The variable decorated with ViewportIndex within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration

**WorkgroupId**
