- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pSetLayouts-03046**
  If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` has a variable-sized descriptor binding, then `pDescriptorCounts[i]` must be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO`
To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool from which the descriptor sets were allocated.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects.

After calling `vkFreeDescriptorSets`, all descriptor sets in `pDescriptorSets` are invalid.

### Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  All submitted commands that refer to any element of `pDescriptorSets` must have completed execution

- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` `VkDescriptorSet` handles, each element of which must either be a valid handle or `VK_NULL_HANDLE`

- VUID-vkFreeDescriptorSets-descriptorPool-00312
  `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` flag

### Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkFreeDescriptorSets-descriptorPool-parameter
  `descriptorPool` must be a valid `VkDescriptorPool` handle

- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
  `descriptorSetCount` must be greater than 0

- VUID-vkFreeDescriptorSets-descriptorPool-parent
  `descriptorPool` must have been created, allocated, or retrieved from `device`
Each element of *pDescriptorSets* that is a valid handle must have been created, allocated, or retrieved from *descriptorPool*.

### Host Synchronization

- Host access to *descriptorPool* must be externally synchronized
- Host access to each member of *pDescriptorSets* must be externally synchronized

### Return Codes

**Success**
- VK_SUCCESS

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);
```

- *device* is the logical device that owns the descriptor pool.
- *descriptorPool* is the descriptor pool to be reset.
- *flags* is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

### Valid Usage

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of *descriptorPool* (via any allocated descriptor sets) must have completed execution

### Valid Usage (Implicit)

- VUID-vkResetDescriptorPool-device-parameter
  *device* must be a valid VkDevice handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter

897
descriptorPool must be a valid VkDescriptorPool handle

- VUID-vkResetDescriptorPool-flags-zero bitmask flags must be 0
- VUID-vkResetDescriptorPool-descriptorPool-parent descriptorPool must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to descriptorPool must be externally synchronized
- Host access to any VkDescriptorSet objects allocated from descriptorPool must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS

// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;

VkDescriptorPoolResetFlags is a bitmask type for setting a mask, but is currently reserved for future use.

### 14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice device,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);

- device is the logical device that updates the descriptor sets.
- descriptorWriteCount is the number of elements in the pDescriptorWrites array.
- pDescriptorWrites is a pointer to an array of VkWriteDescriptorSet structures describing the descriptor sets to write to.
- descriptorCopyCount is the number of elements in the pDescriptorCopies array.
• **pDescriptorCopies** is a pointer to an array of **VkCopyDescriptorSet** structures describing the descriptor sets to copy between.

The operations described by **pDescriptorWrites** are performed first, followed by the operations described by **pDescriptorCopies**. Within each array, the operations are performed in the order they appear in the array.

Each element in the **pDescriptorWrites** array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the **pDescriptorCopies** array is a **VkCopyDescriptorSet** structure describing an operation copying descriptors between sets.

If the **dstSet** member of any element of **pDescriptorWrites** or **pDescriptorCopies** is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** or **VK_DESCRIPTOR_BINDING.Update UNUSED WHILE PENDING_BIT** bits set, that command buffer becomes invalid.

### Valid Usage

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236**
  For each element \(i\) where **pDescriptorWrites\[i\].descriptorType** is **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**, elements of the **pTexelBufferView** member of **pDescriptorWrites\[i\]** must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237**
  For each element \(i\) where **pDescriptorWrites\[i\].descriptorType** is **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER**, **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER**, **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**, or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**, the **buffer** member of any element of the **pBufferInfo** member of **pDescriptorWrites\[i\]** must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238**
  For each element \(i\) where **pDescriptorWrites\[i\].descriptorType** is **VK_DESCRIPTOR_TYPE_SAMPLER** or **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, and **dstSet** was not allocated with a layout that included immutable samplers for **dstBinding** with **descriptorType**, the **sampler** member of any element of the **pImageInfo** member of **pDescriptorWrites\[i\]** must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239**
  For each element \(i\) where **pDescriptorWrites\[i\].descriptorType** is **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE**, **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE**, **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**, or **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** the **imageView** member of any element of **pDescriptorWrites\[i\]** must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240**
  For each element \(i\) where **pDescriptorWrites\[i\].descriptorType** is
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of pDescriptorWrites[i] must have been created on device

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-None-03047
  The dstSet member of each element of pDescriptorWrites or pDescriptorCopies for bindings which were created without the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set must not be used by any command that was recorded to a command buffer which is in the pending state

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
  Host access to pDescriptorWrites[i].dstSet and pDescriptorCopies[i].dstSet must be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter
  device must be a valid VkDevice handle

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
  If descriptorWriteCount is not 0, pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
  If descriptorCopyCount is not 0, pDescriptorCopies must be a valid pointer to an array of descriptorCopyCount valid VkCopyDescriptorSet structures

The VkWriteDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType            sType;
    const void*                pNext;
    VkDescriptorSet            dstSet;
    uint32_t                    dstBinding;
    uint32_t                    dstArrayElement;
    uint32_t                    descriptorCount;
    VkDescriptorType           descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView*         pTexelBufferView;
} VkWriteDescriptorSet;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

dstSet is the destination descriptor set to update.

dstBinding is the descriptor binding within that set.

dstArrayElement is the starting element in that array. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then dstArrayElement specifies the starting byte offset within the binding.

descrictorCount is the number of descriptors to update. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, then descriptorCount specifies the number of bytes to update. Otherwise, descriptorCount is one of:

- the number of elements in pImageInfo
- the number of elements in pBufferInfo
- the number of elements in pTexelBufferView
- a value matching the dataSize member of a VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain
- a value matching the accelerationStructureCount of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain

descriptorType is a VkDescriptorType specifying the type of each descriptor in pImageInfo, pBufferInfo, or pTexelBufferView, as described below. It must be the same type as the descriptorType specified in VkDescriptorsetLayout for dstSet at dstBinding. The type of the descriptor also controls which array the descriptors are taken from.

pImageInfo is a pointer to an array of VkDescriptorImageInfo structures or is ignored, as described below.

pBufferInfo is a pointer to an array of VkDescriptorBufferInfo structures or is ignored, as described below.

pTexelBufferView is a pointer to an array of VkBufferView handles as described in the Buffer Views section or is ignored, as described below.

Only one of pImageInfo, pBufferInfo, or pTexelBufferView members is used according to the descriptor type specified in the descriptorType member of the containing VkWriteDescriptorSet structure, or none of them in case descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, in which case the source data for the descriptor writes is taken from the VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet, or if descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, in which case the source data for the descriptor writes is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet, as specified below.

If the dstBinding has fewer than descriptorCount array elements remaining starting from dstArrayElement, then the remainder will be used to update the subsequent binding - dstBinding+1.
starting at array element zero. If a binding has a `descriptorCount` of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all `descriptorCount` descriptors. Consecutive bindings **must** have identical `VkDescriptorType`, `VkShaderStageFlags`, `VkDescriptorBindingFlagBits`, and immutable samplers references.

**Note**
The same behavior applies to bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` where `descriptorCount` specifies the number of bytes to update while `dstArrayElement` specifies the starting byte offset, thus in this case if the `dstBinding` has a smaller byte size than the sum of `dstArrayElement` and `descriptorCount`, then the remainder will be used to update the subsequent binding - `dstBinding`+1 starting at offset zero. This falls out as a special case of the above rule.

### Valid Usage

- **VUID-VkWriteDescriptorSet-dstBinding-00315**
  `dstBinding` **must** be less than or equal to the maximum value of `binding` of all `VkDescriptorSetLayoutBinding` structures specified when `dstSet`'s descriptor set layout was created

- **VUID-VkWriteDescriptorSet-dstBinding-00316**
  `dstBinding` **must** be a binding with a non-zero `descriptorCount`

- **VUID-VkWriteDescriptorSet-descriptorCount-00317**
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** have identical `descriptorType` and `stageFlags`

- **VUID-VkWriteDescriptorSet-descriptorCount-00318**
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, **must** all either use immutable samplers or **must** all not use immutable samplers

- **VUID-VkWriteDescriptorSet-descriptorType-00319**
  `descriptorType` **must** match the type of `dstBinding` within `dstSet`

- **VUID-VkWriteDescriptorSet-dstSet-00320**
  `dstSet` **must** be a valid `VkDescriptorSet` handle

- **VUID-VkWriteDescriptorSet-dstArrayElement-00321**
  The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by consecutive binding updates

- **VUID-VkWriteDescriptorSet-descriptorType-02219**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` **must** be an integer multiple of 4

- **VUID-VkWriteDescriptorSet-descriptorType-02220**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount` **must** be an integer multiple of 4
If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, each element of `pTexelBufferView` must be either a valid `VkBufferView` handle or `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` and the `nullDescriptor` feature is not enabled, each element of `pTexelBufferView` must not be `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, `pBufferInfo` must be a valid pointer to an array of `descriptorCount` valid `VkDescriptorBufferInfo` structures.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was not allocated with a layout that included immutable samplers for `dstBinding` with `descriptorType`, the `sampler` member of each element of `pImageInfo` must be a valid `VkSampler` object.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` must be either a valid `VkImageView` handle or `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must not be `VK_NULL_HANDLE`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, the `pNext` chain must include a `VkWriteDescriptorSetInlineUniformBlock` structure whose `dataSize` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureKHR` structure whose `accelerationStructureCount` member equals `descriptorCount`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element must have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain.
If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has a `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` must have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler must have been created with an *identically defined* `VkSamplerYcbcrConversionInfo` object.

- **VUID-VkWriteDescriptorSet-descriptorType-01948**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables **sampler Y’C_bC_r** conversion must have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an *identically defined* `VkSamplerYcbcrConversionInfo` object to the corresponding immutable sampler.

- **VUID-VkWriteDescriptorSet-descriptorType-00327**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

- **VUID-VkWriteDescriptorSet-descriptorType-00328**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-VkWriteDescriptorSet-descriptorType-00329**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkWriteDescriptorSet-descriptorType-00330**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00331**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` set.

- **VUID-VkWriteDescriptorSet-descriptorType-00332**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the **effective range** if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `VkPhysicalDeviceLimits::maxUniformBufferRange`.

- **VUID-VkWriteDescriptorSet-descriptorType-00333**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `range` member of each element of `pBufferInfo`, or the **effective range** if `range` is `VK_WHOLE_SIZE`, must be less than or equal to `904`.
VkPhysicalDeviceLimits::maxStorageBufferRange

- **VUID-VkWriteDescriptorSet-descriptorType-08765**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, the `pTexelBufferView` buffer view usage must include `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`

- **VUID-VkWriteDescriptorSet-descriptorType-08766**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`, the `pTexelBufferView` buffer view usage must include `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

- **VUID-VkWriteDescriptorSet-descriptorType-00336**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with the identity swizzle

- **VUID-VkWriteDescriptorSet-descriptorType-00337**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_SAMPLED_BIT` set

- **VUID-VkWriteDescriptorSet-descriptorType-04149**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Sampled Image

- **VUID-VkWriteDescriptorSet-descriptorType-04150**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Combined Image Sampler

- **VUID-VkWriteDescriptorSet-descriptorType-04151**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Input Attachment

- **VUID-VkWriteDescriptorSet-descriptorType-04152**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Storage Image

- **VUID-VkWriteDescriptorSet-descriptorType-00338**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set

- **VUID-VkWriteDescriptorSet-descriptorType-00339**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_STORAGE_BIT` set

- **VUID-VkWriteDescriptorSet-descriptorType-02752**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` must not have been allocated with a layout that included immutable samplers for `dstBinding`

---

**Valid Usage (Implicit)**

- **VUID-VkWriteDescriptorSet-sType-sType**
sType must be **VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET**

- **VUID-VkWriteDescriptorSet-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of **VkWriteDescriptorSetAccelerationStructureKHR** or **VkWriteDescriptorSetInlineUniformBlock**

- **VUID-VkWriteDescriptorSet-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkWriteDescriptorSet-descriptorType-parameter**
  descriptorType must be a valid **VkDescriptorType** value

- **VUID-VkWriteDescriptorSet-descriptorCount-arraylength**
  descriptorCount must be greater than 0

- **VUID-VkWriteDescriptorSet-commonparent**
  Both of dstSet, and the elements of pTexelBufferView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

The type of descriptors in a descriptor set is specified by **VkWriteDescriptorSet::descriptorType**, which must be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
} VkDescriptorType;
```

- **VK_DESCRIPTOR_TYPE_SAMPLER** specifies a sampler descriptor.
- **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** specifies a combined image sampler descriptor.
- **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE** specifies a sampled image descriptor.
- **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE** specifies a storage image descriptor.
- **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** specifies a uniform texel buffer descriptor.
- **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER** specifies a storage texel buffer descriptor.
• **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER** specifies a *uniform buffer descriptor*.

• **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER** specifies a *storage buffer descriptor*.

• **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC** specifies a *dynamic uniform buffer descriptor*.

• **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC** specifies a *dynamic storage buffer descriptor*.

• **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT** specifies an *input attachment descriptor*.

• **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** specifies an *inline uniform block*.

When a descriptor set is updated via elements of **VkWriteDescriptorSet**, members of **pImageInfo**, **pBufferInfo** and **pTexelBufferView** are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

• For **VK_DESCRIPTOR_TYPE_SAMPLER**, only the **sampler** member of each element of **VkWriteDescriptorSet::pImageInfo** is accessed.

• For **VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE**, **VK_DESCRIPTOR_TYPE_STORAGE_IMAGE**, or **VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT**, only the **imageView** and **imageLayout** members of each element of **VkWriteDescriptorSet::pImageInfo** are accessed.

• For **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER**, all members of each element of **VkWriteDescriptorSet::pImageInfo** are accessed.

• For **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER**, **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER**, **VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC**, or **VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC**, all members of each element of **VkWriteDescriptorSet::pBufferInfo** are accessed.

• For **VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER** or **VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER**, each element of **VkWriteDescriptorSet::pTexelBufferView** is accessed.

When updating descriptors with a **descriptorType** of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, none of the **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members are accessed, instead the source data of the descriptor update operation is taken from the **VkWriteDescriptorSetInlineUniformBlock** structure in the **pNext** chain of **VkWriteDescriptorSet**. When updating descriptors with a **descriptorType** of **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**, none of the **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members are accessed, instead the source data of the descriptor update operation is taken from the **VkWriteDescriptorSetAccelerationStructureKHR** structure in the **pNext** chain of **VkWriteDescriptorSet**.

The **VkDescriptorBufferInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer       buffer;
    VkDeviceSize   offset;
    VkDeviceSize   range;
} VkDescriptorBufferInfo;
```

• **buffer** is the buffer resource.
• `offset` is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.

• `range` is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

Note
When setting `range` to `VK_WHOLE_SIZE`, the effective range must not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is `VK_WHOLE_SIZE` the effective range is calculated at `vkUpdateDescriptorSets` is by taking the size of `buffer` minus the `offset`.

Valid Usage

• VUID-VkDescriptorBufferInfo-offset-00340
  `offset` must be less than the size of `buffer`

• VUID-VkDescriptorBufferInfo-range-00341
  If `range` is not equal to `VK_WHOLE_SIZE`, `range` must be greater than 0

• VUID-VkDescriptorBufferInfo-range-00342
  If `range` is not equal to `VK_WHOLE_SIZE`, `range` must be less than or equal to the size of `buffer` minus `offset`

• VUID-VkDescriptorBufferInfo-buffer-02998
  If the `nullDescriptor` feature is not enabled, `buffer` must not be `VK_NULL_HANDLE`

Valid Usage (Implicit)

• VUID-VkDescriptorBufferInfo-buffer-parameter
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` must be a valid `VkBuffer` handle

The `VkDescriptorImageInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler sampler;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```
• **sampler** is a sampler handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` if the binding being updated does not use immutable samplers.

• **imageView** is an image view handle, and is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.

• **imageLayout** is the layout that the image subresources accessible from **imageView** will be in at the time this descriptor is accessed. **imageLayout** is used in descriptor updates for types `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`.

Members of **VkDescriptorImageInfo** that are not used in an update (as described above) are ignored.

---

**Valid Usage**

- **VUID-VkDescriptorImageInfo-imageView-06712**
  **imageView must** not be a 2D array image view created from a 3D image

- **VUID-VkDescriptorImageInfo-descriptorType-06713**
  **imageView must** not be a 2D view created from a 3D image

- **VUID-VkDescriptorImageInfo-descriptorType-06714**
  **imageView must** not be a 2D view created from a 3D image

- **VUID-VkDescriptorImageInfo-imageView-01976**
  If **imageView** is created from a depth/stencil image, the **aspectMask** used to create the **imageView** **must** include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` but not both

- **VUID-VkDescriptorImageInfo-imageLayout-09425**
  If **imageLayout** is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, then the **aspectMask** used to create **imageView** **must** not include either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-VkDescriptorImageInfo-imageLayout-09426**
  If **imageLayout** is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, then the **aspectMask** used to create **imageView** **must** not include `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkDescriptorImageInfo-imageLayout-00344**
  **imageLayout** **must** match the actual **VkImageLayout** of each subresource accessible from **imageView** at the time this descriptor is accessed as defined by the **image layout matching rules**

- **VUID-VkDescriptorImageInfo-sampler-01564**
If `sampler` is used and the `VkFormat` of the image is a multi-planar format, the image must have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` must be a valid multi-planar aspect mask bit.

- VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers` is `VK_FALSE`, then `sampler` must have been created with `VkSamplerCreateInfo::compareEnable` set to `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkDescriptorImageInfo-commonparent
  Both of `imageView` and `sampler` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

If the `descriptorType` member of `VkWriteDescriptorSet` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlock` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
  VkStructureType sType;
  const void* pNext;
  uint32_t dataSize;
  const void* pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dataSize` is the number of bytes of inline uniform block data pointed to by `pData`.
- `pData` is a pointer to `dataSize` number of bytes of data to write to the inline uniform block.

Valid Usage

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
  `dataSize` must be an integer multiple of 4.

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK

- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes
- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  dataSize must be greater than 0

The VkWriteDescriptorSetAccelerationStructureKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructureCount is the number of elements in pAccelerationStructures.
- pAccelerationStructures is a pointer to an array of VkAccelerationStructureKHR structures specifying the acceleration structures to update.

Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
  accelerationStructureCount must be equal to descriptorCount in the extended structure
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in pAccelerationStructures must have been created with a type of VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  If the nullDescriptor feature is not enabled, each element of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureKHR handles
The `VkCopyDescriptorSet` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSet srcSet;
    uint32_t srcBinding;
    uint32_t srcArrayElement;
    VkDescriptorSet dstSet;
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
} VkCopyDescriptorSet;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcSet**, **srcBinding**, and **srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then **srcArrayElement** specifies the starting byte offset within the binding to copy from.
- **dstSet**, **dstBinding**, and **dstArrayElement** are the destination set, binding, and array element, respectively. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then **dstArrayElement** specifies the starting byte offset within the binding to copy to.
- **descriptorCount** is the number of descriptors to copy from the source to destination. If **descriptorCount** is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to `VkWriteDescriptorSet` above. If the descriptor binding identified by **srcSet** and **srcBinding** has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then **descriptorCount** specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

### Valid Usage

- **VUID-VkCopyDescriptorSet-srcBinding-00345**
  - **srcBinding** must be a valid binding within **srcSet**

- **VUID-VkCopyDescriptorSet-srcArrayElement-00346**
  - The sum of **srcArrayElement** and **descriptorCount** must be less than or equal to the number of array elements in the descriptor set binding specified by **srcBinding**, and all applicable consecutive bindings, as described by **consecutive binding updates**
• **VUID-VkCopyDescriptorSet-dstBinding-00347**  
  `dstBinding` **must** be a valid binding within `dstSet`.

• **VUID-VkCopyDescriptorSet-dstArrayElement-00348**  
  The sum of `dstArrayElement` and `descriptorCount` **must** be less than or equal to the number of array elements in the descriptor set binding specified by `dstBinding`, and all applicable consecutive bindings, as described by **consecutive binding updates**.

• **VUID-VkCopyDescriptorSet-dstBinding-02632**  
  The type of `dstBinding` within `dstSet` **must** be equal to the type of `srcBinding` within `srcSet`.

• **VUID-VkCopyDescriptorSet-srcSet-00349**  
  If `srcSet` is equal to `dstSet`, then the source and destination ranges of descriptors **must not** overlap, where the ranges **may** include array elements from consecutive bindings as described by **consecutive binding updates**.

• **VUID-VkCopyDescriptorSet-srcBinding-02223**  
  If the descriptor type of the descriptor set binding specified by `srcBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `srcArrayElement` **must** be an integer multiple of 4.

• **VUID-VkCopyDescriptorSet-dstBinding-02224**  
  If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` **must** be an integer multiple of 4.

• **VUID-VkCopyDescriptorSet-srcSet-01918**  
  If `srcSet`’s **layout was created** with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`’s layout **must also have been created** with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-04885**  
  If `srcSet`’s layout was **created without** the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`’s layout **must have been created without** the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-01920**  
  If the descriptor pool from which `srcSet` was allocated was **created with** the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must also have been created with** the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-04887**  
  If the descriptor pool from which `srcSet` was allocated was **created without** the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated **must have been created without** the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.
If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding.

**Valid Usage (Implicit)**

- VUID-VkCopyDescriptorSet-dstBinding-02753
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding.

- VUID-VkCopyDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET

- VUID-VkCopyDescriptorSet-pNext-pNext
  pNext must be NULL

- VUID-VkCopyDescriptorSet-srcSet-parameter
  srcSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-dstSet-parameter
  dstSet must be a valid VkDescriptorSet handle

- VUID-VkCopyDescriptorSet-commonparent
  Both of dstSet, and srcSet must have been created, allocated, or retrieved from the same VkDevice

### 14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by VkDescriptorUpdateTemplate handles:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

### 14.2.6. Descriptor Set Updates With Templates

Updating a large VkDescriptorSet array can be an expensive operation since an application must specify one VkWriteDescriptorSet structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same VkDescriptorsetLayout, vkUpdateDescriptorSetWithTemplate can be used as a replacement for vkUpdateDescriptorSets.
VkDescriptorUpdateTemplate allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR, can be more efficient compared to calling vkUpdateDescriptorSets or vkCmdPushDescriptorSetKHR. The descriptors themselves are not specified in the VkDescriptorUpdateTemplate, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- **device** is the logical device that creates the descriptor update template.
- **pCreateInfo** is a pointer to a VkDescriptorUpdateTemplateCreateInfo structure specifying the set of descriptors to update with a single call to vkCmdPushDescriptorSetWithTemplateKHR or vkUpdateDescriptorSetWithTemplate.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDescriptorUpdateTemplate** is a pointer to a VkDescriptorUpdateTemplate handle in which the resulting descriptor update template object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
  
  pCreateInfo must be a valid pointer to a valid VkDescriptorUpdateTemplateCreateInfo structure

- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
**VkAllocationCallbacks** structure

- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
  
  pDescriptorUpdateTemplate must be a valid pointer to a VkDescriptorUpdateTemplate handle

---

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The **VkDescriptorUpdateTemplateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void *pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **descriptorUpdateEntryCount** is the number of elements in the pDescriptorUpdateEntries array.
- **pDescriptorUpdateEntries** is a pointer to an array of VkDescriptorUpdateTemplateEntry structures describing the descriptors to be updated by the descriptor update template.
- **templateType** Specifies the type of the descriptor update template. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET it can only be used to update descriptor sets
with a fixed descriptorSetLayout. If set to
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR it can only be used to push descriptor
sets using the provided pipelineBindPoint, pipelineLayout, and set number.

- descriptorSetLayout is the descriptor set layout used to build the descriptor update template. All
descriptor sets which are going to be updated through the newly created descriptor update
template must be created with a layout that matches (is the same as, or defined identically to)
this layout. This parameter is ignored if templateType is not
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET.

- pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the
descriptors. This parameter is ignored if templateType is not
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- pipelineLayout is a VkPipelineLayout object used to program the bindings. This parameter is
ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- set is the set number of the descriptor set in the pipeline layout that will be updated. This
parameter is ignored if templateType is not
VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

Valid Usage

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout
  must be a valid VkDescriptorsetLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineBindPoint
  must be a valid VkPipelineBindPoint value

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineLayout
  must be a valid VkPipelineLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, set must be
  the unique set number in the pipeline layout that uses a descriptor set layout that was
  created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO

- VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter
  parameter 917
pDescriptorUpdateEntries must be a valid pointer to an array of descriptorUpdateEntryCount valid VkDescriptorUpdateTemplateEntry structures

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter templateType must be a valid VkDescriptorUpdateTemplateType value

- VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength descriptorUpdateEntryCount must be greater than 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent Both of descriptorSetLayout, and pipelineLayout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;

VkDescriptorUpdateTemplateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the VkDescriptorUpdateTemplateCreateInfo::templateType property, which takes the following values:

// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {
   VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
   // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
   VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
   VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
   // Provided by VK_KHR_descriptor_update_template
   VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR =
   VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
} VkDescriptorUpdateTemplateType;

or the equivalent

// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;

- VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET specifies that the descriptor update template will be used for descriptor set updates only.
• **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR** specifies that the descriptor update template will be used for push descriptor updates only.

The **VkDescriptorUpdateTemplateEntry** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;
```

• **dstBinding** is the descriptor binding to update when using this descriptor update template.

• **dstArrayElement** is the starting element in the array belonging to dstBinding. If the descriptor binding identified by dstBinding has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then dstArrayElement specifies the starting byte offset to update.

• **descriptorCount** is the number of descriptors to update. If descriptorCount is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to **VkWriteDescriptorSet** above. If the descriptor binding identified by dstBinding has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then descriptorCount specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.

• **descriptorType** is a **VkDescriptorType** specifying the type of the descriptor.

• **offset** is the offset in bytes of the first binding in the raw data structure.

• **stride** is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer ptr for each array element j of update entry i is computed using the following formula:

```c
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
```

The stride is useful in case the bindings are stored in structs along with other data. If descriptorType is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then the value of stride is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.
Valid Usage

- VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354
  *dstBinding must be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors*

- VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355
  *dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates*

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226
  *If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4*

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227
  *If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4*

Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter
  *descriptorType must be a valid VkDescriptorType value*

To destroy a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
  VkDevice device,
  VkDescriptorUpdateTemplate descriptorUpdateTemplate,
  const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
  VkDevice device,
  VkDescriptorUpdateTemplate descriptorUpdateTemplate,
  const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that has been used to create the descriptor update template.
- `descriptorUpdateTemplate` is the descriptor update template to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356
  If VkAllocationCallbacks were provided when descriptorUpdateTemplate was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no VkAllocationCallbacks were provided when descriptorUpdateTemplate was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
  device must be a valid VkDevice handle

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
  If descriptorUpdateTemplate is not VK_NULL_HANDLE, descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

• VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
  If descriptorUpdateTemplate is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to descriptorUpdateTemplate must be externally synchronized

Once a VkDescriptorUpdateTemplate has been created, descriptor sets can be updated by calling:

// Provided by VK_VERSION_1_1
void vkUpdateDescriptorSetWithTemplate(
  VkDevice device,
  VkDescriptorSet descriptorSet,
  VkDescriptorUpdateTemplate descriptorUpdateTemplate,
  const void* pData);

or the equivalent command

// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
  VkDevice device,
  VkDescriptorSet descriptorSet,
VkDescriptorUpdateTemplate descriptorUpdateTemplate,
const void* pData);

- `device` is the logical device that updates the descriptor set.
- `descriptorSet` is the descriptor set to update
- `descriptorUpdateTemplate` is a `VkDescriptorUpdateTemplate` object specifying the update mapping between `pData` and the descriptor set to update.
- `pData` is a pointer to memory containing one or more `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` structures or `VkAccelerationStructureKHR` handles used to write the descriptors.

**Valid Usage**

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995
  Host access to `descriptorSet` must be externally synchronized unless explicitly denoted otherwise for specific flags

**Valid Usage (Implicit)**

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter
  `descriptorSet` must be a valid `VkDescriptorSet` handle

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parent
  `descriptorSet` must have been created, allocated, or retrieved from `device`

- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent
  `descriptorUpdateTemplate` must have been created, allocated, or retrieved from `device`

**API example**

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t applicationRelatedInformation;
};

struct AppDataStructure {
    
};
```
VkDescriptorImageInfo imageInfo; // a single image info
VkDescriptorBufferInfo bufferInfoArray[3]; // 3 buffer infos in an array
AppBufferView bufferView[2]; // An application defined structure

// ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    {
        .binding = 0,
        .dstArrayElement = 0,
        .descriptorCount = 1,
        .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
        .offset = offsetof(AppDataStructure, imageInfo),
        .stride = 0 // stride not required if descriptorCount is 1
    },

    // binding to an array of buffer descriptors
    {
        .binding = 1,
        .dstArrayElement = 0,
        .descriptorCount = 3,
        .descriptorType = VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        .offset = offsetof(AppDataStructure, bufferInfoArray),
        .stride = sizeof(VkDescriptorBufferInfo) // descriptor buffer infos are compact
    },

    // binding to an array of buffer views
    {
        .binding = 2,
        .dstArrayElement = 0,
        .descriptorCount = 2,
        .descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
        .offset = offsetof(AppDataStructure, bufferView) +
                   offsetof(AppBufferView, bufferView),
        .stride = sizeof(AppBufferView) // bufferViews do not have to be compact
    }
};

// create a descriptor update template for descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 3,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
}
```c
.templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
.descriptorSetLayout = myLayout,
.pipelineBindPoint = 0,         // ignored by given templateType
.pipelineLayout = 0,           // ignored by given templateType
.set = 0,                      // ignored by given templateType
);

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet,
    myDescriptorUpdateTemplate, &appData);
```

### 14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t firstSet,
    uint32_t descriptorSetCount,
    const VkDescriptorSet* pDescriptorSets,
    uint32_t dynamicOffsetCount,
    const uint32_t* pDynamicOffsets);
```

- **commandBuffer** is the command buffer that the descriptor sets will be bound to.
- **pipelineBindPoint** is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
- **layout** is a VkPipelineLayout object used to program the bindings.
- **firstSet** is the set number of the first descriptor set to be bound.
- **descriptorSetCount** is the number of elements in the pDescriptorSets array.
- **pDescriptorSets** is a pointer to an array of handles to VkDescriptorSet objects describing the descriptor sets to bind to.
- **dynamicOffsetCount** is the number of dynamic offsets in the pDynamicOffsets array.
• **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets `pDescriptorSets[0..descriptorSetCount-1]` to set numbers `[firstSet..firstSet+descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in **Pipeline Layout Compatibility**.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

When consuming a descriptor, a descriptor is considered valid if the descriptor is not undefined as described by **descriptor set allocation**. A descriptor that was disturbed by **Pipeline Layout Compatibility**, or was never bound by `vkCmdBindDescriptorSets` is not considered valid. If a pipeline accesses a descriptor either statically or dynamically depending on the `VkDescriptorBindingFlagBits`, the consuming descriptor type in the pipeline **must** match the `VkDescriptorType` in `VkDescriptorSetLayoutCreateInfo` for the descriptor to be considered valid.

Note
Further validation may be carried out beyond validation for descriptor types, e.g. **Texel Input Validation**.

If any of the sets being bound include dynamic uniform or storage buffers, then **pDynamicOffsets** includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from **pDynamicOffsets** in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. **dynamicOffsetCount** **must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from **pDynamicOffsets**, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the **pDescriptorSets** **must** be compatible with the pipeline layout specified by **layout**. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the **Pipeline Layout Compatibility** section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

• For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during
shader execution of the resulting draws and dispatches, or any time in between. Otherwise,
• during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding must not be altered (overwritten by an update command, or freed) between the first point in time that it may be consumed, and when the command completes executing on the queue.

The contents of pDynamicOffsets are consumed immediately during execution of vkCmdBindDescriptorSets. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

Valid Usage

• VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358
  Each element of pDescriptorSets must have been allocated with a VkDescriptorSetLayout that matches (is the same as, or identically defined as) the VkDescriptorSetLayout at set $n$ in layout, where $n$ is the sum of firstSet and the index into pDescriptorSets

• VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359
dynamicOffsetCount must be equal to the total number of dynamic descriptors in pDescriptorSets

• VUID-vkCmdBindDescriptorSets-firstSet-00360
  The sum of firstSet and descriptorSetCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

• VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment

• VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment

• VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979
  For each dynamic uniform or storage buffer binding in pDescriptorSets, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer

• VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715
  For each dynamic uniform or storage buffer binding in pDescriptorSets, if the range was set with VK_WHOLE_SIZE then pDynamicOffsets which corresponds to the descriptor binding must be 0

• VUID-vkCmdBindDescriptorSets-pDescriptorSets-06563
  Each element of pDescriptorSets must be a valid VkDescriptorSet

• VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
  pipelineBindPoint must be supported by the commandBuffer's parent VkCommandPool's queue
Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

- VUID-vkCmdBindDescriptorSets-layout-parameter
  
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
  
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` valid or `VK_NULL_HANDLE` `VkDescriptorSet` handles

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
  
  If `dynamicOffsetCount` is not 0, `pDynamicOffsets` must be a valid pointer to an array of `dynamicOffsetCount` `uint32_t` values

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
  
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
  
  `descriptorSetCount` must be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent
  
  Each of `commandBuffer`, `layout`, and the elements of `pDescriptorSets` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Alternatively, to bind one or more descriptor sets to a command buffer, call:

```c
void vkCmdBindDescriptorSets2KHR(
    VkCommandBuffer commandBuffer,          // Provided by VK_KHR_maintenance6
    const VkBindDescriptorSetsInfoKHR* pBindDescriptorSetsInfo;
);
```

- `commandBuffer` is the command buffer that the descriptor sets will be bound to.
- `pBindDescriptorSetsInfo` is a pointer to a `VkBindDescriptorSetsInfoKHR` structure.

**Valid Usage**

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-09467
  Each bit in `pBindDescriptorSetsInfo->stageFlags` must be a stage supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

**Valid Usage (Implicit)**

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindDescriptorSets2KHR-pBindDescriptorSetsInfo-parameter
  `pBindDescriptorSetsInfo` must be a valid pointer to a valid `VkBindDescriptorSetsInfoKHR` structure

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindDescriptorSets2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets2KHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkBindDescriptorSetsInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindDescriptorSetsInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout layout;
    uint32_t firstSet;
    uint32_t descriptorSetCount;
    const VkDescriptorSet* pDescriptorSets;
    uint32_t dynamicOffsetCount;
    const uint32_t* pDynamicOffsets;
} VkBindDescriptorSetsInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages the descriptor sets will be bound to.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `firstSet` is the set number of the first descriptor set to be bound.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
- `dynamicOffsetCount` is the number of dynamic offsets in the `pDynamicOffsets` array.
- `pDynamicOffsets` is a pointer to an array of `uint32_t` values specifying dynamic offsets.

If `stageFlags` specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a `stageFlags` value of `VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT` is equivalent to calling the original
version of this command once with `VK_PIPELINE_BIND_POINT_GRAPHICS` and once with `VK_PIPELINE_BIND_POINT_COMPUTE`.

### Valid Usage

- **VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-00358**
  
  Each element of `pDescriptorSets` must have been allocated with a `VkDescriptorSetLayout` that matches (is the same as, or identically defined as) the `VkDescriptorSetLayout` at set `n` in `layout`, where `n` is the sum of `firstSet` and the index into `pDescriptorSets`.

- **VUID-VkBindDescriptorSetsInfoKHR-dynamicOffsetCount-00359**
  
  `dynamicOffsetCount` must be equal to the total number of dynamic descriptors in `pDescriptorSets`.

- **VUID-VkBindDescriptorSetsInfoKHR-firstSet-00360**
  
  The sum of `firstSet` and `descriptorSetCount` must be less than or equal to `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created.

- **VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01971**
  
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

- **VUID-VkBindDescriptorSetsInfoKHR-pDynamicOffsets-01972**
  
  Each element of `pDynamicOffsets` which corresponds to a descriptor binding with type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-01979**
  
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer.

- **VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-06715**
  
  For each dynamic uniform or storage buffer binding in `pDescriptorSets`, if the range was set with `VK_WHOLE_SIZE` then `pDynamicOffsets` which corresponds to the descriptor binding must be 0.

- **VUID-VkBindDescriptorSetsInfoKHR-pDescriptorSets-06563**
  
  Each element of `pDescriptorSets` must be a valid `VkDescriptorSet`.

- **VUID-VkBindDescriptorSetsInfoKHR-None-09495**
  
  `layout` must be a valid `VkPipelineLayout` handle.

### Valid Usage (Implicit)

- **VUID-VkBindDescriptorSetsInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_DESCRIPTOR_SETS_INFO_KHR`.

- **VUID-VkBindDescriptorSetsInfoKHR-pNext-pNext**
  
  `pNext` must be NULL or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`.
14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer       commandBuffer,
    VkPipelineBindPoint   pipelineBindPoint,
    VkPipelineLayout      layout,
    uint32_t              set,
    uint32_t              descriptorWriteCount,
    const VkWriteDescriptorSet*  pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
• *pDescriptorWrites* is a pointer to an array of *VkWriteDescriptorSet* structures describing the descriptors to be updated.

**Push descriptors** are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors *can* be updated incrementally and cause shaders to use the updated descriptors for subsequent **bound pipeline commands** with the pipeline type set by *pipelineBindPoint* until the descriptor is overwritten, or else until the set is disturbed as described in **Pipeline Layout Compatibility**. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are **statically used** by a pipeline **must** not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which **must** be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in *pDescriptorWrites*). Push descriptors that are not statically used **can** remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types **can** be used and the **offset** member of *VkDescriptorBufferInfo* **can** be changed each time the descriptor is written.

Each element of *pDescriptorWrites* is interpreted as in *VkWriteDescriptorSet*, except the **dstSet** member is ignored.

To push an immutable sampler, use a *VkWriteDescriptorSet* with **dstBinding** and **dstArrayElement** selecting the immutable sampler's binding. If the descriptor type is *VK_DESCRIPTOR_TYPE_SAMPLER*, the **pImageInfo** parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is *VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER*, the **sampler** member of the **pImageInfo** parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

---

**Valid Usage**

- **VUID-vkCmdPushDescriptorSetKHR-set-00364**
  *set* **must** be less than *VkPipelineLayoutCreateInfo::*setLayoutCount provided when **layout** was created

- **VUID-vkCmdPushDescriptorSetKHR-set-00365**
  *set* **must** be the unique set number in the pipeline layout that uses a descriptor set layout that was created with *VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR*

- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494**
  For each element *i* where *pDescriptorWrites[i].descriptorType* is *VK_DESCRIPTOR_TYPE_SAMPLER*, *VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER*, *VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE*, *VK_DESCRIPTOR_TYPE_STORAGE_IMAGE*, or *VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT*, *pDescriptorWrites[i].pImageInfo* **must** be a valid
pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363
  pipelineBindPoint must be supported by the commandBuffer’s parent VkCommandPool’s queue family

### Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdPushDescriptorSetKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter
  pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength
  descriptorWriteCount must be greater than 0

- VUID-vkCmdPushDescriptorSetKHR-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
# Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSet2KHR(
    VkCommandBuffer commandBuffer,
    const VkPushDescriptorSetInfoKHR* pPushDescriptorSetInfo);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pPushDescriptorSetInfo` is a pointer to a `VkPushDescriptorSetInfoKHR` structure.

## Valid Usage

- VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-09468
  Each bit in `pPushDescriptorSetInfo->stageFlags` must be a stage supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family.

## Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdPushDescriptorSet2KHR-pPushDescriptorSetInfo-parameter
  `pPushDescriptorSetInfo` must be a valid pointer to a valid `VkPushDescriptorSetInfoKHR` structure.

- VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdPushDescriptorSet2KHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdPushDescriptorSet2KHR-videocoding
  This command must only be called outside of a video coding scope.

## Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The VkPushDescriptorSetInfoKHR structure is defined as:

```c
typedef struct VkPushDescriptorSetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkShaderStageFlags stageFlags;
    VkPipelineLayout layout;
    uint32_t set;
    uint32_t descriptorWriteCount;
    const VkWriteDescriptorSet* pDescriptorWrites;
} VkPushDescriptorSetInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• stageFlags is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the descriptors.
• layout is a VkPipelineLayout object used to program the bindings.
• set is the set number of the descriptor set in the pipeline layout that will be updated.
• descriptorWriteCount is the number of elements in the pDescriptorWrites array.
• pDescriptorWrites is a pointer to an array of VkWriteDescriptorSet structures describing the descriptors to be updated.

If stageFlags specifies a subset of all stages corresponding to one or more pipeline bind points, the binding operation still affects all stages corresponding to the given pipeline bind point(s) as if the equivalent original version of this command had been called with the same parameters. For example, specifying a stageFlags value of VK_SHADER_STAGE_VERTEX_BIT | VK_SHADER_STAGE_FRAGMENT_BIT | VK_SHADER_STAGE_COMPUTE_BIT is equivalent to calling the original version of this command once with VK_PIPELINE_BIND_POINT_GRAPHICS and once with VK_PIPELINE_BIND_POINT_COMPUTE.
Valid Usage

- VUID-VkPushDescriptorSetInfoKHR-set-00364
  set must be less than VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-VkPushDescriptorSetInfoKHR-set-00365
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

- VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-06494
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-VkPushDescriptorSetInfoKHR-None-09495
  layout must be a valid VkPipelineLayout handle

Valid Usage (Implicit)

- VUID-VkPushDescriptorSetInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_INFO_KHR

- VUID-VkPushDescriptorSetInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkPipelineLayoutCreateInfo

- VUID-VkPushDescriptorSetInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPushDescriptorSetInfoKHR-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkPushDescriptorSetInfoKHR-stageFlags-requiredbitmask
  stageFlags must not be 0

- VUID-VkPushDescriptorSetInfoKHR-layout-parameter
  If layout is not VK_NULL_HANDLE, layout must be a valid VkPipelineLayout handle

- VUID-VkPushDescriptorSetInfoKHR-pDescriptorWrites-parameter
  pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-VkPushDescriptorSetInfoKHR-descriptorWriteCount-arraylength
  descriptorWriteCount must be greater than 0

14.2.9. Push Descriptor Updates With Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To
do so, call:

```c
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    VkPipelineLayout layout,
    uint32_t set,
    const void* pData);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `descriptorUpdateTemplate` is a descriptor update template defining how to interpret the descriptor information in `pData`.
- `layout` is a `VkPipelineLayout` object used to program the bindings. It must be compatible with the layout used to create the `descriptorUpdateTemplate` handle.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the `descriptorUpdateTemplate` handle.
- `pData` is a pointer to memory containing descriptors for the templated update.

### Valid Usage

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366**
  The pipelineBindPoint specified during the creation of the descriptor update template must be supported by the `commandBuffer`’s parent `VkCommandPool`’s queue family

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686**
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-07993**
  `layout` must be compatible with the layout used to create `descriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-07994**
  `descriptorUpdateTemplate` must have been created with a `templateType` of `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07995**
  `set` must be the same value used to create `descriptorUpdateTemplate`

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07304**
  `set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created

- **VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07305**
  `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  `layout` must be a valid `VkPipelineLayout` handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tbody>
</table>

API example

```c
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo; // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
```

938
// binding to a single image descriptor
{
    .binding = 0,
    .dstArrayElement = 0,
    .descriptorCount = 1,
    .descriptorType = VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
    .offset = offsetof(AppDataStructure, imageInfo),
    .stride = 0  // not required if descriptorCount is 1
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo =
{
    .sType = VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,
    .pNext = NULL,
    .flags = 0,
    .descriptorUpdateEntryCount = 1,
    .pDescriptorUpdateEntries = descriptorUpdateTemplateEntries,
    .templateType = VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR,
    .descriptorSetLayout = 0,  // ignored by given templateType
    .pipelineBindPoint = VK_PIPELINE_BIND_POINT_GRAPHICS,
    .pipelineLayout = myPipelineLayout,
    .set = 0,
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate, myPipelineLayout, 0,&appData);

Alternatively, to use a descriptor update template to specify the push descriptors to update, call:

// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplate2KHR(
    VkCommandBuffer commandBuffer, const VkPushDescriptorSetWithTemplateInfoKHR* pPushDescriptorSetWithTemplateInfo);

- **commandBuffer** is the command buffer that the descriptors will be recorded in.
- **pPushDescriptorSetWithTemplateInfo** is a pointer to a **VkPushDescriptorSetWithTemplateInfoKHR** structure.
Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-pPushDescriptorSetWithTemplateInfo-parameter pPushDescriptorSetWithTemplateInfo must be a valid pointer to a valid VkPushDescriptorSetWithTemplateInfoKHR structure
- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
- VUID-vkCmdPushDescriptorSetWithTemplate2KHR-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The VkPushDescriptorSetWithTemplateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance6 with VK_KHR_push_descriptor
typedef struct VkPushDescriptorSetWithTemplateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplate descriptorUpdateTemplate;
    VkPipelineLayout layout;
    uint32_t set;
    const void* pData;
} VkPushDescriptorSetWithTemplateInfoKHR;
```
• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkStructureType.html) value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **descriptorUpdateTemplate** is a descriptor update template defining how to interpret the descriptor information in `pData`.

• **layout** is a [VkPipelineLayout](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPipelineLayout.html) object used to program the bindings. It must be compatible with the layout used to create the `descriptorUpdateTemplate` handle.

• **set** is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the `descriptorUpdateTemplate` handle.

• **pData** is a pointer to memory containing descriptors for the templated update.

---

**Valid Usage**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-commandBuffer-00366**
  The `pipelineBindPoint` specified during the creation of the descriptor update template must be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-pData-01686**
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-layout-07993**
  `layout` must be compatible with the layout used to create `descriptorUpdateTemplate`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-descriptorUpdateTemplate-07994**
  `descriptorUpdateTemplate` must have been created with a `templateType` of `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07995**
  `set` must be the same value used to create `descriptorUpdateTemplate`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07304**
  `set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-set-07305**
  `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-None-09495**
  `layout` must be a valid `VkPipelineLayout` handle.

---

**Valid Usage (Implicit)**

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PUSH_DESCRIPTOR_SET_WITH_TEMPLATE_INFO_KHR`.

- **VUID-VkPushDescriptorSetWithTemplateInfoKHR-pNext-pNext**
  `pNext` must be NULL or a pointer to a valid instance of `VkPipelineLayoutCreateInfo`.
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

Note
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,
    VkPipelineLayout layout,
    VkShaderStageFlags stageFlags,
    uint32_t offset,
    uint32_t size,
    const void* pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.
Push constant values can be updated incrementally, causing shader stages in `stageFlags` to read the new data from `pValues` for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline's layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout's push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.

**Valid Usage**

- **VUID-vkCmdPushConstants-offset-01795**
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there must be a push constant range in `layout` that includes that byte and that stage.

- **VUID-vkCmdPushConstants-offset-01796**
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` must include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

- **VUID-vkCmdPushConstants-offset-00368**
  `offset` must be a multiple of 4.

- **VUID-vkCmdPushConstants-size-00369**
  `size` must be a multiple of 4.

- **VUID-vkCmdPushConstants-offset-00370**
  `offset` must be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`.

- **VUID-vkCmdPushConstants-size-00371**
  `size` must be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`.

**Valid Usage (Implicit)**

- **VUID-vkCmdPushConstants-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPushConstants-layout-parameter**
  `layout` must be a valid `VkPipelineLayout` handle.

- **VUID-vkCmdPushConstants-stageFlags-parameter**
  `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-vkCmdPushConstants-stageFlags-requiredbitmask**
  `stageFlags` must not be 0.
• VUID-vkCmdPushConstants-pValues-parameter
  pValues must be a valid pointer to an array of size bytes

• VUID-vkCmdPushConstants-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdPushConstants-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0

• VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to update push constants, call:

```c
// Provided by VK_KHR_maintenance6
void vkCmdPushConstants2KHR(
  VkCommandBuffer commandBuffer,
  const VkPushConstantsInfoKHR* pPushConstantsInfo);
```

• commandBuffer is the command buffer in which the push constant update will be recorded.

• pPushConstantsInfo is a pointer to a VkPushConstantsInfoKHR structure.

Valid Usage (Implicit)
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkPushConstantsInfoKHR` structure is defined as:

```
// Provided by VK_KHR_maintenance6
typedef struct VkPushConstantsInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayout layout;
    VkShaderStageFlags stageFlags;
    uint32_t offset;
    uint32_t size;
    const void* pValues;
} VkPushConstantsInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `layout` is the pipeline layout used to program the push constant updates.
- **stageFlags** is a bitmask of **VkShaderStageFlagBits** specifying the shader stages that will use the push constants in the updated range.

- **offset** is the start offset of the push constant range to update, in units of bytes.

- **size** is the size of the push constant range to update, in units of bytes.

- **pValues** is a pointer to an array of **size** bytes containing the new push constant values.

### Valid Usage

- **VUID-VkPushConstantsInfoKHR-offset-01795**
  For each byte in the range specified by **offset** and **size** and for each shader stage in **stageFlags**, there **must** be a push constant range in **layout** that includes that byte and that stage.

- **VUID-VkPushConstantsInfoKHR-offset-01796**
  For each byte in the range specified by **offset** and **size** and for each push constant range that overlaps that byte, **stageFlags** **must** include all stages in that push constant range's **VkPushConstantRange::stageFlags**.

- **VUID-VkPushConstantsInfoKHR-offset-00368**
  **offset** **must** be a multiple of 4.

- **VUID-VkPushConstantsInfoKHR-size-00369**
  **size** **must** be a multiple of 4.

- **VUID-VkPushConstantsInfoKHR-offset-00370**
  **offset** **must** be less than **VkPhysicalDeviceLimits::maxPushConstantsSize**.

- **VUID-VkPushConstantsInfoKHR-size-00371**
  **size** **must** be less than or equal to **VkPhysicalDeviceLimits::maxPushConstantsSize** minus **offset**.

- **VUID-VkPushConstantsInfoKHR-None-09495**
  **layout** **must** be a valid **VkPipelineLayout** handle.

### Valid Usage (Implicit)

- **VUID-VkPushConstantsInfoKHR-sType-sType**
  **sType** **must** be **VK_STRUCTURE_TYPE_PUSH_CONSTANTS_INFO_KHR**.

- **VUID-VkPushConstantsInfoKHR-pNext-pNext**
  **pNext** **must** be **NULL** or a pointer to a valid instance of **VkPipelineLayoutCreateInfo**.

- **VUID-VkPushConstantsInfoKHR-sType-unique**
  The **sType** value of each struct in the **pNext** chain **must** be unique.

- **VUID-VkPushConstantsInfoKHR-layout-parameter**
  If **layout** is not **VK_NULL_HANDLE**, **layout** **must** be a valid **VkPipelineLayout** handle.

- **VUID-VkPushConstantsInfoKHR-stageFlags-parameter**
  **stageFlags** **must** be a valid combination of **VkShaderStageFlagBits** values.
14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress`, the return value will be the same address that was returned at capture time.

The returned address must satisfy the alignment requirement specified by `VkMemoryRequirements::alignment` for the buffer in `VkBufferDeviceAddressInfo::buffer`.

If multiple `VkBuffer` objects are bound to overlapping ranges of `VkDeviceMemory`, implementations may return address ranges which overlap. In this case, it is ambiguous which
VkBuffer is associated with any given device address. For purposes of valid usage, if multiple VkBuffer objects can be attributed to a device address, a VkBuffer is selected such that valid usage passes, if it exists.

**Valid Usage**

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324
  The bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferDeviceAddressAddress-device-03325
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkGetBufferDeviceAddressAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetBufferDeviceAddressAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The VkBufferDeviceAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `buffer` specifies the buffer whose address is being queried.

**Valid Usage**

- VUID-VkBufferDeviceAddressInfo-buffer-02600
  If buffer is non-sparse and was not created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag, then it must be bound
completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  
  `buffer` must have been created with `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`

---

**Valid Usage (Implicit)**

- VUID-VkBufferDeviceAddressInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO`

- VUID-VkBufferDeviceAddressInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkBufferDeviceAddressInfo-buffer-parameter
  
  `buffer` must be a valid `VkBuffer` handle

---

To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` the return value must be the same address.

---

**Valid Usage**

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  
  The `bufferDeviceAddress` feature must be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding VkPipelineCreateInfo structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Tile Image Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: Block, BufferBlock, Offset, ArrayStride, and MatrixStride can also decorate types and type members used by variables in the Private and Function storage classes.

Note
In this chapter, there are references to SPIR-V terms such as the MeshNV execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the OpEntryPoint instruction and are declared with the Input or Output storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the Initializer operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block.
They **must**

- be explicitly declared (there are no implicit built-ins),
- be identified with a `BuiltIn` decoration,
- form object types as described in the `Built-in Variables` section, and
- be declared in a block whose top-level members are the built-ins.

There **must** be no more than one built-in interface block per shader per interface.

Built-ins **must** not have any `Location` or `Component` decorations.

### 15.1.2. User-defined Variable Interface

The non-built-in variables listed by `OpEntryPoint` with the `Input` or `Output` storage class form the **user-defined variable interface**. These **must** have numeric type or, recursively, composite types of such types. If an implementation supports `storageInputOutput16`, components **can** have a width of 16 bits. These variables **must** be identified with a `Location` decoration and **can** also be identified with a `Component` decoration.

### 15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - one is not decorated with `Component` and the other is declared with a `Component` of 0
  - Interpolation decorations
  - `RelaxedPrecision` if one is an input variable and the other an output variable
- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the output, and neither is a structure member; or
  - if the `maintenance4` feature is enabled, they are declared as `OpTypeVector` variables, and the output has a `Component Count` value higher than that of the input but the same `Component Type`; or
  - if the input is decorated with `PerVertexKHR`, and is declared in a fragment shader as an `OpTypeArray` with an `Element Type` equivalent to the `OpType*` declaration of the output, and neither the input nor the output is a structure member; or
  - if in any other case they are declared with an equivalent `OpType*` declaration.
- If both are structures and every member has an interface match.

**Note**
The word “structure” above refers to both variables that have an `OpTypeStruct` type
and interface blocks (which are also declared as `OpTypeStruct`).

All input variables and blocks must have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders can declare and write to output variables that are not declared or read by the subsequent stage.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

### 15.1.4. Location Assignment

This section describes `Location` assignments for user-defined variables and how many `Location` slots are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many `Location` slots the type consumes.

The `Location` value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The `Component` specifies word components within these vector `Location` slots. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface `Location`:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive `Location` slots.

If a declared input or output is an array of size n and each element takes m `Location` slots, it will be assigned $m \times n$ consecutive `Location` slots starting with the specified `Location`.

If the declared input or output is an $n \times m$ 16-, 32- or 64-bit matrix, it will be assigned multiple `Location` slots starting with the specified `Location`. The number of `Location` slots assigned for each matrix will be the same as for an $n$-element array of $m$-component vectors.

An `OpVariable` with a structure type that is not a block must be decorated with a `Location`.

When an `OpVariable` with a structure type (either block or non-block) is decorated with a `Location`, the members in the structure type must not be decorated with a `Location`. The `OpVariable`'s members are assigned consecutive `Location` slots in declaration order, starting from the first member, which is assigned the `Location` decoration from the `OpVariable`.

When a block-type `OpVariable` is declared without a `Location` decoration, each member in its structure type must be decorated with a `Location`. Types nested deeper than the top-level members must not have `Location` decorations.

The `Location` slots consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.
Any two inputs listed as operands on the same `OpEntryPoint` must not be assigned the same `Location` slot and `Component` word, either explicitly or implicitly. Any two outputs listed as operands on the same `OpEntryPoint` must not be assigned the same `Location` slot and `Component` word, either explicitly or implicitly.

The number of input and output `Location` slots available for a shader input or output interface is limited, and dependent on the shader stage as described in Shader Input and Output Locations. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective `Location` must have a value less than the number of `Location` slots available for the given interface, as specified in the “Locations Available” column in Shader Input and Output Locations.

### 15.1.5. Component Assignment

The `Component` decoration allows the `Location` to be more finely specified for scalars and vectors, down to the individual `Component` word within a `Location` slot that are consumed. The `Component` word within a `Location` are 0, 1, 2, and 3. A variable or block member starting at `Component` N will consume `Component` words N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of `Component` words gets larger than 3. A scalar 64-bit type will consume two of these `Component` words in sequence, and a two-component 64-bit vector type will consume all four `Component` words available within a `Location`. A three- or four-component 64-bit vector type must not specify a non-zero `Component` decoration. A three-component 64-bit vector type will consume all four `Component` words of the first `Location` and `Component` 0 and 1 of the second `Location`. This leaves `Component` 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a `Component` decoration of 1 or 3. A `Component` decoration must not be specified for any type that is not a scalar or vector.

A four-component 64-bit data type will consume all four `Component` words of the first `Location` and
15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input Location slots is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of $i$ is associated with the color attachment indicated by VkRenderingInfo::pColorAttachments[$i$]. When using render pass objects, it is associated with the color attachment indicated by VkSubpassDescription::pColorAttachments[$i$]. Values are written to those attachments after passing through the blending unit as described in Blending, if enabled. Locations are consumed as described in Location Assignment. The number of available fragment output Location slots is given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

When an active fragment shader invocation finishes, the values of all fragment shader outputs are copied out and used as blend inputs or color attachments writes. If the invocation does not set a value for them, the input values to those blending or color attachment writes are undefined.

Components of the output variables are assigned as described in Component Assignment. Output Component words identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the
blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same Location, they must have the same underlying type (floating-point or integer). Component words which do not correspond to any fragment shader output will also result in undefined values for blending or color attachment writes.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

There must be no output variable which has the same Location, Component, and Index as any other, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either OpTypeFloat or OpTypeInt, and a Width of 32. If storageInputOutput16 is supported, output values written by a fragment shader can be also declared with either OpTypeFloat or OpTypeInt and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion From Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment's format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

15.4. Fragment Tile Image Interface

When a fragment stage is present in a pipeline, the fragment shader tile image variables decorated with Location form an interface with the color attachments defined by the render pass instance. The fragment shader tile image variables are matched by Location decorations to the color attachments specified in the pColorAttachments array of the VkRenderingInfoKHR structure describing the render pass instance the fragment shader is executed in.

The fragment shader variables listed by OpEntryPoint with the TileImageEXT storage class and a decoration of Location form the fragment tile image interface. These variables must be declared with a type of OpTypeImage, and a Dim operand of TileImageDataEXT. The Component decoration is not supported for these variables.

Reading from a tile image variable with a Location decoration of i reads from the color attachment identified by the element of VkRenderingInfoKHR::pColorAttachments with a location equal to i. If the tile image variable is declared as an array of size N, it consumes N consecutive tile image locations, starting with the index specified. There must not be more than one tile image variable with the same Location whether explicitly declared or implied by an array declaration. The number of available tile image locations is the same as the number of available fragment output locations as given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

The basic data type (floating-point, integer, unsigned integer) of the tile image variable must match the basic format of the corresponding color attachment, or the values read from the tile image variables are undefined.
15.5. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by `InputAttachmentIndex` decorations to the input attachments specified in the `pInputAttachments` array of the `VkSubpassDescription` structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the `UniformConstant` storage class and a decoration of `InputAttachmentIndex` that are statically used by `OpEntryPoint` form the fragment input attachment interface. These variables must be declared with a type of `OpTypeImage`, a `Dim` operand of `SubpassData`, an `Arrayed` operand of 0, and a `Sampled` operand of 2. The `MS` operand of the `OpTypeImage` must be 0 if the `samples` field of the corresponding `VkAttachmentDescription` is `VK_SAMPLE_COUNT_1_BIT` and 1 otherwise.

A subpass input variable identified with an `InputAttachmentIndex` decoration of `i` reads from the input attachment indicated by `pInputAttachments[i]` member of `VkSubpassDescription`. If the subpass input variable is declared as an array of size N, it consumes N consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same `InputAttachmentIndex` whether explicitly declared or implied by an array declaration per image aspect. A multi-aspect image (e.g. a depth/stencil format) can use the same input variable. The number of available input attachment indices is given by the `maxPerStageDescriptorInputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Variables identified with the `InputAttachmentIndex` must only be used by a fragment stage. The numeric format of the subpass input must match the format of the corresponding input attachment, or the values of subpass loads from these variables are undefined. If the framebuffer attachment contains both depth and stencil aspects, the numeric format of the subpass input determines if depth or stencil aspect is accessed by the shader.

See Input Attachment for more details.

15.5.1. Fragment Input Attachment Compatibility

An input attachment that is statically accessed by a fragment shader must be backed by a descriptor that is equivalent to the `VkImageView` in the `VkFramebuffer`, except for `subresourceRange.aspectMask`. The `aspectMask` must be equal to the aspect accessed by the shader.

15.6. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.
Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.

- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.

- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

15.7. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage’s OpEntryPoint with a storage class of Uniform, UniformConstant, StorageBuffer, or PushConstant. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.
15.7.1. Push Constant Interface

The shader variables defined with a storage class of PushConstant that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as OpTypeStruct,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

There must be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block must be placed at an Offset such that the entire member is entirely contained within the VkPushConstantRange for each OpEntryPoint that uses it, and the stageFlags for that range must specify the appropriate VkShaderStageFlagBits for that stage. The Offset decoration for any member of a push constant block must not cause the space required for that member to extend outside the range [0, maxPushConstantsSize).

Any member of a push constant block that is declared as an array must only be accessed with dynamically uniform indices.

15.7.2. Descriptor Set Interface

The descriptor set interface is comprised of the shader variables with the storage class of StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables must have DescriptorSet and Binding decorations specified, which are assigned and matched with the VkDescriptorSetLayout objects in the pipeline layout as described in DescriptorSet and Binding Assignment.

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpImageRead, OpImageSparseRead, or OpImageWrite operations, except under the following conditions:

- For OpImageWrite, if the image format is listed in the storage without format list and if the shaderStorageImageWriteWithoutFormat feature is enabled and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageWrite, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format is listed in the storage without format list and if the shaderStorageImageReadWithoutFormat feature is enabled and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageReadWithoutFormat capability.
- For `OpImageRead`, if `Dim` is `SubpassData` (indicating a read from an input attachment).

The Image Format of an `OpTypeImage` declaration must not be `Unknown`, for variables which are used for `OpAtomic*` operations.

Variables identified with the Uniform storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a Block or BufferBlock decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

Variables identified with the StorageBuffer storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as `OpTypeStruct`, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the Uniform storage class must not cause the space required for that variable to extend outside the range `[0, maxUniformBufferRange)`. The Offset decoration for any member of a Block-decorated variable in the StorageBuffer storage class must not cause the space required for that variable to extend outside the range `[0, maxStorageBufferRange)`. Variables identified with the Uniform storage class can also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a descriptorType of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. In this case the variable must be typed as `OpTypeStruct` and cannot be aggregated into arrays of that type. Further, the Offset decoration for any member of such a variable must not cause the space required for that variable to extend outside the range `[0, maxInlineUniformBlockSize)`. Variables identified with a storage class of UniformConstant and a decoration of `InputAttachmentIndex` must be declared as described in Fragment Input Attachment Interface.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor can have a type of `OpTypeImage`, `OpTypeSampler (Sampled=1)`, or `OpTypeSampledImage`. Arrays of any of these types can be indexed with constant integral expressions. The following features must be enabled and capabilities must be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- Storage images (except storage texel buffers and input attachments):
  - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
  - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and
If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature must be enabled and the capability must be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the
corresponding dynamic or non-uniform indexing feature must be enabled and the capability must be declared.

If the combined image sampler enables sampler \( Y'C'k \) conversion, it must be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the shaderSampledImageArrayDynamicIndexing feature.

1 Where `OpTypeImage` is referenced, the `Dim` values `Buffer` and `SubpassData` are only accepted where they are specifically referenced. They do not correspond to resource types where a generic `OpTypeImage` is specified.

2 In addition to `DescriptorSet` and `Binding`.

### 15.7.3. DescriptorSet and Binding Assignment

A variable decorated with a `DescriptorSet` decoration of `s` and a `Binding` decoration of `b` indicates that this variable is associated with the `VkDescriptorSetLayoutBinding` that has a `binding` equal to `b` in `pSetLayouts[s]` that was specified in `VkPipelineLayoutCreateInfo`.

`DescriptorSet` decoration values **must** be between zero and `maxBoundDescriptorSets` minus one, inclusive. `Binding` decoration values **can** be any 32-bit unsigned integer value, as described in `Descriptor Set Layout`. Each descriptor set has its own binding name space.

If the `Binding` decoration is used with an array, the entire array is assigned that binding value. The array **must** be a single-dimensional array and size of the array **must** be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set **must** not be used. If the array is runtime-sized, the `runtimeDescriptorArray` feature **must** be enabled and the `RuntimeDescriptorArray` capability **must** be declared. The index of each element of the array is referred to as the `arrayElement`. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an `arrayElement` of zero.

There is a limit on the number of resources of each type that **can** be accessed by a pipeline stage as shown in `Shader Resource Limits`. The “Resources Per Stage” column gives the limit on the number each type of resource that **can** be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits.

The pipeline layout **may** include descriptor sets and bindings which are not referenced by any
variables statically used by the entry points for the shader stages in the binding’s stageFlags.

However, if a variable assigned to a given DescriptorSet and Binding is statically used by the entry point for a shader stage, the pipeline layout must contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s stageFlags must include the appropriate VkShaderStageFlagBits for that stage. The variable must be of a valid resource type determined by its SPIR-V type and storage class, as defined in Shader Resource and Storage Class Correspondence. The descriptor set layout binding must be of a corresponding descriptor type, as defined in Shader Resource and Descriptor Type Correspondence.

Note
There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are statically used has an impact. If any shader variable identifying a resource is statically used in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and Aliased decorations should be used to avoid data hazards (see section 2.18.2 Aliasing in the SPIR-V specification).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER that has multiple corresponding shader variables in the UniformConstant storage class, where some could be OpTypeImage (Sampled=1), some could be OpTypeSampler, and some could be OpTypeSampledImage.

Input attachments **can** only be used in the fragment shader stage

### 15.7.4. Offset and Stride Assignment

Certain objects **must** be explicitly laid out using the **Offset**, **ArrayStride**, and **MatrixStride**, as described in SPIR-V **explicit layout validation rules**. All such layouts also **must** conform to the following requirements.

**Note**

The numeric order of **Offset** decorations does not need to follow member declaration order.

#### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with C columns and R rows is equivalent to a C element array of vectors with R components.
- A row-major matrix with C columns and R rows is equivalent to an R element array of vectors with C components.

The **scalar alignment** of the type of an **OpTypeStruct** member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector type has a scalar alignment equal to that of its component type.
• An array type has a scalar alignment equal to that of its element type.
• A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
• A matrix type inherits scalar alignment from the equivalent array declaration.

The base alignment of the type of an OpTypeStruct member is defined recursively as follows:

• A scalar has a base alignment equal to its scalar alignment.
• A two-component vector has a base alignment equal to twice its scalar alignment.
• A three- or four-component vector has a base alignment equal to four times its scalar alignment.
• An array has a base alignment equal to the base alignment of its element type.
• A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the StorageBuffer storage class, StorageBuffer8BitAccess or UniformAndStorageBuffer8BitAccess must be declared in the SPIR-V module.)
• A matrix type inherits base alignment from the equivalent array declaration.

The extended alignment of the type of an OpTypeStruct member is similarly defined as follows:

• A scalar or vector type has an extended alignment equal to its base alignment.
• An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
• A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to improperly straddle if either of the following are true:

• It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at F and its last byte at L, where floor(F / 16) \neq floor(L / 16).
• It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

Standard Buffer Layout

Every member of an OpTypeStruct that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the scalarBlockLayout feature is enabled on the device and the storage class is Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant then every member must be aligned according to its scalar alignment.
2. If the workgroupMemoryExplicitLayoutScalarBlockLayout feature is enabled on the device and the storage class is Workgroup then every member must be aligned according to its scalar alignment.
3. All vectors must be aligned according to their scalar alignment.
4. If the uniformBufferStandardLayout feature is not enabled on the device, then any member of an OpTypeStruct with a storage class of Uniform and a decoration of Block must be aligned according
5. Every other member **must** be aligned according to its base alignment.

There are some conditions that apply to the memory layout:

- **The Offset** decoration of any member **must** be a multiple of its alignment.
- Any **ArrayStride** or **MatrixStride** decoration **must** be a multiple of the alignment of the array or matrix as defined above.

If one of the following conditions applies:

- The storage class is **Uniform**, **StorageBuffer**, **PhysicalStorageBuffer**, **ShaderRecordBufferKHR**, or **PushConstant**, and the **scalarBlockLayout** feature is not enabled on the device.
- The storage class is **Workgroup**, and either the struct member is not part of a **Block** or the **workgroupMemoryExplicitLayoutScalarBlockLayout** feature is not enabled on the device.
- The storage class is any other storage class.

The memory layout **must** also obey the following rules:

- Vectors **must** not improperly straddle, as defined above.
- The **Offset** decoration of a member **must** not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

The **std430 layout** in GLSL satisfies these rules for types using the base alignment. The **std140 layout** satisfies the rules for types using the extended alignment.

### 15.8. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a **BuiltIn** **SPIR-V** decoration. The meaning of each **BuiltIn** decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values **can** be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

**BaryCoordKHR**

The **BaryCoordKHR** decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that
indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

**Valid Usage**

- VUID-BaryCoordKHR-BaryCoordKHR-04154
  The `BaryCoordKHR` decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordKHR-BaryCoordKHR-04155
  The variable decorated with `BaryCoordKHR` must be declared using the Input Storage Class

- VUID-BaryCoordKHR-BaryCoordKHR-04156
  The variable decorated with `BaryCoordKHR` must be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspKHR**

The `BaryCoordNoPerspKHR` decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

**Valid Usage**

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160
  The `BaryCoordNoPerspKHR` decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161
  The variable decorated with `BaryCoordNoPerspKHR` must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04162
  The variable decorated with `BaryCoordNoPerspKHR` must be declared as a three-component vector of 32-bit floating-point values

**BaseInstance**

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the firstInstance parameter to a direct drawing command or the firstInstance member of a structure consumed by an indirect drawing command.

**Valid Usage**

- VUID-BaseInstance-BaseInstance-04181
  The `BaseInstance` decoration must be used only within the Vertex Execution Model

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with `BaseInstance` must be declared using the Input Storage Class
The variable decorated with **BaseInstance** must be declared as a scalar 32-bit integer value.

**BaseVertex**

Decorating a variable with the **BaseVertex** built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For **non-indexed drawing commands**, this variable is the **firstVertex** parameter to a direct drawing command or the **firstVertex** member of the structure consumed by an indirect drawing command. For **indexed drawing commands**, this variable is the **vertexOffset** parameter to a direct drawing command or the **vertexOffset** member of the structure consumed by an indirect drawing command.

**Valid Usage**

- **VUID-BaseVertex-BaseVertex-04184**
  The **BaseVertex** decoration must be used only within the **Vertex Execution Model**.

- **VUID-BaseVertex-BaseVertex-04185**
  The variable decorated with **BaseVertex** must be declared using the **Input Storage Class**.

- **VUID-BaseVertex-BaseVertex-04186**
  The variable decorated with **BaseVertex** must be declared as a scalar 32-bit integer value.

**ClipDistance**

Decorating a variable with the **ClipDistance** built-in decoration will make that variable contain the mechanism for controlling user clipping. **ClipDistance** is an array such that the i\textsuperscript{th} element of the array specifies the clip distance for plane i. A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

**Note**

The array variable decorated with **ClipDistance** is explicitly sized by the shader.

**Note**

In the last **pre-rasterization shader stage**, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If **ClipDistance** is then used by a fragment shader, **ClipDistance** contains these linearly interpolated values.

**Valid Usage**

- **VUID-ClipDistance-ClipDistance-04187**
  The **ClipDistance** decoration must be used only within the **MeshEXT, MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model**.
The variable decorated with `ClipDistance` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the `Output Storage Class`.

The variable decorated with `ClipDistance` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

The variable decorated with `ClipDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared in a `Storage Class` other than `Input` or `Output`.

The variable decorated with `ClipDistance` must be declared as an array of 32-bit floating-point values.

**CullDistance**

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

**Note**

In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

**Note**

If `CullDistance` decorates an input variable, that variable will contain the corresponding value from the `CullDistance` decorated output variable from the previous shader stage.

**Valid Usage**

- The `CullDistance` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `Fragment`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- The variable decorated with `CullDistance` within the `MeshEXT`, `MeshNV` or `Vertex Execution Model` must be declared using the `Output Storage Class`.

- The variable decorated with `CullDistance` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- The variable decorated with `CullDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class`.
Class other than Input or Output

- VUID-CullDistance-CullDistance-04200
  The variable decorated with **CullDistance** must be declared as an array of 32-bit floating-point values

**CullMaskKHR**

A variable decorated with the **CullMaskKHR** decoration will specify the cull mask of the ray being processed. The value is given by the **Cull Mask** parameter passed into one of the **OpTrace** instructions.

### Valid Usage

- VUID-CullMaskKHR-CullMaskKHR-06735
  The **CullMaskKHR** decoration must be used only within the **IntersectionKHR**, **AnyHitKHR**, **ClosestHitKHR**, or **MissKHR** Execution Model

- VUID-CullMaskKHR-CullMaskKHR-06736
  The variable decorated with **CullMaskKHR** must be declared using the **Input Storage Class**

- VUID-CullMaskKHR-CullMaskKHR-06737
  The variable decorated with **CullMaskKHR** must be declared as a scalar 32-bit integer value

**DeviceIndex**

The **DeviceIndex** decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \([0, \max(1, \text{physicalDeviceCount}))\), where physicalDeviceCount is the **physicalDeviceCount** member of **VkDeviceGroupDeviceCreateInfo**.

### Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with **DeviceIndex** must be declared using the **Input Storage Class**

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with **DeviceIndex** must be declared as a scalar 32-bit integer value

**DrawIndex**

Decorating a variable with the **DrawIndex** built-in will make that variable contain the integer value corresponding to the zero-based index of the draw that invoked the current vertex shader invocation. For **indirect drawing commands**, **DrawIndex** begins at zero and increments by one for each draw executed. The number of draws is given by the **drawCount** parameter. For **direct drawing commands**, **DrawIndex** is always zero. **DrawIndex** is dynamically uniform.

### Valid Usage

- VUID-DrawIndex-DrawIndex-04207
The **DrawIndex** decoration **must** be used only within the **Vertex**, **MeshEXT**, **TaskEXT**, **MeshNV**, or **TaskNV Execution Model**

- **VUID-DrawIndex-DrawIndex-04208**  
The variable decorated with **DrawIndex** **must** be declared using the **Input Storage Class**

- **VUID-DrawIndex-DrawIndex-04209**  
The variable decorated with **DrawIndex** **must** be declared as a scalar 32-bit integer value

**FragCoord**

Decorating a variable with the **FragCoord** built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the \(x\) and \(y\) components of **FragCoord** reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of **FragCoord** reflect the location of the center of the fragment.

The \(z\) component of **FragCoord** is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w}\).

The **Centroid** interpolation decoration is ignored, but allowed, on **FragCoord**.

**Valid Usage**

- **VUID-FragCoord-FragCoord-04210**  
The **FragCoord** decoration **must** be used only within the **Fragment Execution Model**

- **VUID-FragCoord-FragCoord-04211**  
The variable decorated with **FragCoord** **must** be declared using the **Input Storage Class**

- **VUID-FragCoord-FragCoord-04212**  
The variable decorated with **FragCoord** **must** be declared as a four-component vector of 32-bit floating-point values

**FragDepth**

To have a shader supply a fragment-depth value, the shader **must** declare the **DepthReplacing** execution mode. Such a shader's fragment-depth value will come from the variable decorated with the **FragDepth** built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See **fragment shader depth replacement** for details.

**Valid Usage**

- **VUID-FragDepth-FragDepth-04213**
The **FragDepth** decoration must be used only within the **Fragment Execution Model**

- VUID-FragDepth-FragDepth-04214
  The variable decorated with **FragDepth** must be declared using the **Output Storage Class**

- VUID-FragDepth-FragDepth-04215
  The variable decorated with **FragDepth** must be declared as a scalar 32-bit floating-point value

- VUID-FragDepth-FragDepth-04216
  If the shader dynamically writes to the variable decorated with **FragDepth**, the **DepthReplacing Execution Mode** must be declared

**FrontFacing**

Decorating a variable with the **FrontFacing** built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a **front-facing** polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

**Valid Usage**

- VUID-FrontFacing-FrontFacing-04229
  The **FrontFacing** decoration must be used only within the **Fragment Execution Model**

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with **FrontFacing** must be declared using the **Input Storage Class**

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with **FrontFacing** must be declared as a boolean value

**GlobalInvocationId**

Decorating a variable with the **GlobalInvocationId** built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus **LocalInvocationId**.

**Valid Usage**

- VUID-GlobalInvocationId-GlobalInvocationId-04236
  The **GlobalInvocationId** decoration must be used only within the **GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model**

- VUID-GlobalInvocationId-GlobalInvocationId-04237
  The variable decorated with **GlobalInvocationId** must be declared using the **Input Storage Class**

- VUID-GlobalInvocationId-GlobalInvocationId-04238
  The variable decorated with **GlobalInvocationId** must be declared as a three-component vector of 32-bit integer values
**HelperInvocation**

Decorating a variable with the **HelperInvocation** built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

*Note*

It is very likely that a helper invocation will have a value of **SampleMask** fragment shader input value that is zero.

**Valid Usage**

- **VUID-HelperInvocation-HelperInvocation-04239**
  
  The **HelperInvocation** decoration must be used only within the **Fragment Execution Model**

- **VUID-HelperInvocation-HelperInvocation-04240**
  
  The variable decorated with **HelperInvocation** must be declared using the **Input Storage Class**

- **VUID-HelperInvocation-HelperInvocation-04241**
  
  The variable decorated with **HelperInvocation** must be declared as a boolean value

**HitKindKHR**

A variable decorated with the **HitKindKHR** decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of **OpReportIntersectionKHR**. For triangle intersection candidates, this will be one of **HitKindFrontFacingTriangleKHR** or **HitKindBackFacingTriangleKHR**.

**Valid Usage**

- **VUID-HitKindKHR-HitKindKHR-04242**
  
  The **HitKindKHR** decoration must be used only within the **AnyHitKHR** or **ClosestHitKHR** Execution Model

- **VUID-HitKindKHR-HitKindKHR-04243**
  
  The variable decorated with **HitKindKHR** must be declared using the **Input Storage Class**

- **VUID-HitKindKHR-HitKindKHR-04244**
  
  The variable decorated with **HitKindKHR** must be declared as a scalar 32-bit integer value

**HitTriangleVertexPositionsKHR**

A variable decorated with the **HitTriangleVertexPositionsKHR** decoration will specify the object space vertices of the triangle at the current intersection in application-provided order. The positions returned are transformed by the geometry transform, which is performed at standard floating point precision, but without a specifically defined order of floating point operations to
perform the matrix multiplication.

Valid Usage

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08747
  The HitTriangleVertexPositionsKHR decoration must be used only within the AnyHitKHR or ClosestHitKHR Execution Model

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08748
  The variable decorated with HitTriangleVertexPositionsKHR must be declared using the Input Storage Class

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08749
  The variable decorated with HitTriangleVertexPositionsKHR must be declared as an array of three vectors of three 32-bit float values

- VUID-HitTriangleVertexPositionsKHR-HitTriangleVertexPositionsKHR-08750
  The variable decorated with HitTriangleVertexPositionsKHR must be used only if the value of HitKindKHR is HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR

- VUID-HitTriangleVertexPositionsKHR-None-08751
  The acceleration structure corresponding to the current intersection must have been built with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR

IncomingRayFlagsKHR

A variable with the IncomingRayFlagsKHR decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline must not cause any corresponding flags to be set in variables with this decoration.

Valid Usage

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  The IncomingRayFlagsKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  The variable decorated with IncomingRayFlagsKHR must be declared using the Input Storage Class

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  The variable decorated with IncomingRayFlagsKHR must be declared as a scalar 32-bit integer value

InstanceCustomIndexKHR

A variable decorated with the InstanceCustomIndexKHR decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in VkAccelerationStructureInstanceKHR::instanceCustomIndex for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.
Valid Usage

• VUID-InstanceId-InstanceId-04254
  The `InstanceId` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR Execution Model`

• VUID-InstanceId-InstanceId-04255
  The variable decorated with `InstanceId` **must** be declared using the `Input Storage Class`

• VUID-InstanceId-InstanceId-04256
  The variable decorated with `InstanceId` **must** be declared as a scalar 32-bit integer value

InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

Valid Usage

• VUID-InvocationId-InvocationId-04257
  The `InvocationId` decoration **must** be used only within the `TessellationControl` or `Geometry Execution Model`

• VUID-InvocationId-InvocationId-04258
  The variable decorated with `InvocationId` **must** be declared using the `Input Storage Class`

InvocationId

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of `instances` declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.
The variable decorated with **InvocationId** must be declared as a scalar 32-bit integer value.

**InstanceIndex**

Decorating a variable in a vertex shader with the **InstanceIndex** built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. **InstanceIndex** begins at the **firstInstance** parameter to `vkCmdDraw` or `vkCmdDrawIndexed` or at the **firstInstance** member of a structure consumed by `vkCmdDrawIndirect` or `vkCmdDrawIndexedIndirect`.

**Valid Usage**

- VUID-InvocationId-InvocationId-04259
  The variable decorated with **InvocationId** must be declared as a scalar 32-bit integer value

**LaunchIdKHR**

A variable decorated with the **LaunchIdKHR** decoration will specify the index of the work item being processed. One work item is generated for each of the `width × height × depth` items dispatched by a `vkCmdTraceRaysKHR` command. All shader invocations inherit the same value for variables decorated with **LaunchIdKHR**.

**Valid Usage**

- VUID-LaunchIdKHR-LaunchIdKHR-04266
  The **LaunchIdKHR** decoration must be used only within the **RayGenerationKHR**, **IntersectionKHR**, **AnyHitKHR**, **ClosestHitKHR**, **MissKHR**, or **CallableKHR** Execution Model

- VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with **LaunchIdKHR** must be declared using the **Input Storage Class**

- VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with **LaunchIdKHR** must be declared as a three-component vector of 32-bit integer values

**LaunchSizeKHR**

A variable decorated with the **LaunchSizeKHR** decoration will contain the `width`, `height`, and `depth` dimensions passed to the `vkCmdTraceRaysKHR` command that initiated this shader execution. The `width` is in the first component, the `height` is in the second component, and the `depth` is in the third component.
Valid Usage

• VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The LaunchSizeKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model

• VUID-LaunchSizeKHR-LaunchSizeKHR-04270
  The variable decorated with LaunchSizeKHR must be declared using the Input Storage Class

• VUID-LaunchSizeKHR-LaunchSizeKHR-04271
  The variable decorated with LaunchSizeKHR must be declared as a three-component vector of 32-bit integer values

Layer

Decorating a variable with the Layer built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a vertex, tessellation evaluation, or geometry shader, any variable decorated with Layer can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active pre-rasterization shader stage (in pipeline order) controls the Layer that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the Layer.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with Layer, then the first layer is used. If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with Layer, it must write the same value to Layer for all output vertices of a given primitive. If the Layer value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized, fragment shaders may be executed, and the framebuffer values for all layers are undefined.

In a fragment shader, a variable decorated with Layer contains the layer index of the primitive that the fragment invocation belongs to.

Valid Usage

• VUID-Layer-Layer-04272
  The Layer decoration must be used only within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

• VUID-Layer-Layer-04273
  If the shaderOutputLayer feature is not enabled then the Layer decoration must be used only within the Geometry or Fragment Execution Model

• VUID-Layer-Layer-04274
  The variable decorated with Layer within the MeshEXT, MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model must be declared using the Output Storage Class
The variable decorated with `Layer` within the Fragment Execution Model must be declared using the Input Storage Class.

The variable decorated with `Layer` must be declared as a scalar 32-bit integer value.

The variable decorated with `Layer` within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration.

**LocalInvocationId**

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

**Note**

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.

**Valid Usage**

The `LocalInvocationId` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model.

The variable decorated with `LocalInvocationId` must be declared using the Input Storage Class.

The variable decorated with `LocalInvocationId` must be declared as a three-component vector of 32-bit integer values.

**LocalInvocationIndex**

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```plaintext
LocalInvocationIndex = 
LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y + 
LocalInvocationId.y * WorkgroupSize.x + 
LocalInvocationId.x;
```
Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
  The `LocalInvocationIndex` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV` Execution Model

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with `LocalInvocationIndex` **must** be declared using the `Input Storage Class`

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with `LocalInvocationIndex` **must** be declared as a scalar 32-bit integer value

**NumSubgroups**

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

Valid Usage

- VUID-NumSubgroups-NumSubgroups-04293
  The `NumSubgroups` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV` Execution Model

- VUID-NumSubgroups-NumSubgroups-04294
  The variable decorated with `NumSubgroups` **must** be declared using the `Input Storage Class`

- VUID-NumSubgroups-NumSubgroups-04295
  The variable decorated with `NumSubgroups` **must** be declared as a scalar 32-bit integer value

**NumWorkgroups**

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

Valid Usage

- VUID-NumWorkgroups-NumWorkgroups-04296
  The `NumWorkgroups` decoration **must** be used only within the `GLCompute, MeshEXT, or TaskEXT` Execution Model

- VUID-NumWorkgroups-NumWorkgroups-04297
  The variable decorated with `NumWorkgroups` **must** be declared using the `Input Storage Class`

- VUID-NumWorkgroups-NumWorkgroups-04298
  The variable decorated with `NumWorkgroups` **must** be declared as a three-component vector of 32-bit integer values
ObjectRayDirectionKHR

A variable decorated with the ObjectRayDirectionKHR decoration will specify the direction of the ray being processed, in object space.

Valid Usage

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The ObjectRayDirectionKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model
- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300
  The variable decorated with ObjectRayDirectionKHR **must** be declared using the Input Storage Class
- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301
  The variable decorated with ObjectRayDirectionKHR **must** be declared as a three-component vector of 32-bit floating-point values

ObjectRayOriginKHR

A variable decorated with the ObjectRayOriginKHR decoration will specify the origin of the ray being processed, in object space.

Valid Usage

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The ObjectRayOriginKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model
- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303
  The variable decorated with ObjectRayOriginKHR **must** be declared using the Input Storage Class
- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304
  The variable decorated with ObjectRayOriginKHR **must** be declared as a three-component vector of 32-bit floating-point values

ObjectToWorldKHR

A variable decorated with the ObjectToWorldKHR decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

Valid Usage

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305
  The ObjectToWorldKHR decoration **must** be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model
- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with ObjectToWorldKHR **must** be declared using the Input Storage Class
**Class**

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with `ObjectToWorldKHR` **must** be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

**PatchVertices**

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the name:`patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`. In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

**Valid Usage**

- VUID-PatchVertices-PatchVertices-04308
  The `PatchVertices` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model.

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with `PatchVertices` **must** be declared using the `Input Storage Class`.

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` **must** be declared as a scalar 32-bit integer value.

**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

*Note*

Depending on how the point is rasterized, `PointCoord` **may** never reach (0,0) or (1,1).

**Valid Usage**

- VUID-PointCoord-PointCoord-04311
  The `PointCoord` decoration **must** be used only within the `Fragment Execution Model`.

- VUID-PointCoord-PointCoord-04312
  The variable decorated with `PointCoord` **must** be declared using the `Input Storage Class`.

- VUID-PointCoord-PointCoord-04313
The variable decorated with \textit{PointCoord} must be declared as a two-component vector of 32-bit floating-point values.

\textbf{PointSize}

Decorating a variable with the \textit{PointSize} built-in decoration will make that variable contain the size of point primitives or the final rasterization of polygons if \textit{polygon mode} is \texttt{VK_POLYGON_MODE_POINT} when \texttt{VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize} is set to \texttt{VK_TRUE}. The value written to the variable decorated with \textit{PointSize} by the last \textit{pre-rasterization shader stage} in the pipeline is used as the framebuffer-space size of points produced by rasterization. If \texttt{maintenance5} is enabled and a value is not written to a variable decorated with \textit{PointSize}, a value of 1.0 is used as the size of points.

\textit{Note}

When \textit{PointSize} decorates a variable in the \textit{Input Storage Class}, it contains the data written to the output variable decorated with \textit{PointSize} from the previous shader stage.

\textbf{Valid Usage}

- \texttt{VUID-PointSize-PointSize-04314}

  The \textit{PointSize} decoration \textbf{must} be used only within the \texttt{MeshEXT}, \texttt{MeshNV}, \texttt{Vertex}, \texttt{TessellationControl}, \texttt{TessellationEvaluation}, or \texttt{Geometry Execution Model}.

- \texttt{VUID-PointSize-PointSize-04315}

  The variable decorated with \textit{PointSize} within the \texttt{MeshEXT}, \texttt{MeshNV}, or \texttt{Vertex Execution Model} \textbf{must} be declared using the \textit{Output Storage Class}.

- \texttt{VUID-PointSize-PointSize-04316}

  The variable decorated with \textit{PointSize} within the \texttt{TessellationControl}, \texttt{TessellationEvaluation}, or \texttt{Geometry Execution Model} \textbf{must} not be declared using a \textit{Storage Class} other than \texttt{Input} or \texttt{Output}.

- \texttt{VUID-PointSize-PointSize-04317}

  The variable decorated with \textit{PointSize} \textbf{must} be declared as a scalar 32-bit floating-point value.

\textbf{Position}

Decorating a variable with the \textit{Position} built-in decoration will make that variable contain the position of the current vertex. In the last \textit{pre-rasterization shader stage}, the value of the variable decorated with \textit{Position} is used in subsequent primitive assembly, clipping, and rasterization operations.

\textit{Note}

When \textit{Position} decorates a variable in the \textit{Input Storage Class}, it contains the data written to the output variable decorated with \textit{Position} from the previous shader stage.
Valid Usage

- **VUID-Position-Position-04318**
  The `Position` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-Position-Position-04319**
  The variable decorated with `Position` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the `Output Storage Class`.

- **VUID-Position-Position-04320**
  The variable decorated with `Position` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a `Storage Class` other than `Input` or `Output`.

- **VUID-Position-Position-04321**
  The variable decorated with `Position` must be declared as a four-component vector of 32-bit floating-point values.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see `Polygon Mode`), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

**Note**

When the `PrimitiveId` decoration is applied to an output variable in the geometry shader, the resulting value is seen through the `PrimitiveId` decorated input.
variable in the fragment shader.

The fragment shader using `PrimitiveId` will need to declare either the `Geometry` or `Tessellation` capability to satisfy the requirement SPIR-V has to use `PrimitiveId`.

## Valid Usage

- **VUID-PrimitiveId-PrimitiveId-04330**
  The `PrimitiveId` decoration **must** be used only within the `MeshEXT`, `MeshNV`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `TessellationControl`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-PrimitiveId-Fragment-04331**
  If pipeline contains both the `Fragment` and `Geometry Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `Geometry` shader **must** write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  If pipeline contains both the `Fragment` and `MeshEXT` or `MeshNV` `Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `MeshEXT` or `MeshNV` shader **must** write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
  If `Fragment Execution Model` contains a variable decorated with `PrimitiveId`, then either the `MeshShadingEXT`, `MeshShadingNV`, `Geometry` or `Tessellation` capability **must** also be declared.

- **VUID-PrimitiveId-PrimitiveId-04334**
  The variable decorated with `PrimitiveId` within the `TessellationControl`, `TessellationEvaluation`, `Fragment`, `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` `Execution Model` **must** be declared using the `Input Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04335**
  The variable decorated with `PrimitiveId` within the `Geometry Execution Model` **must** be declared using the `Input` or `Output Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04336**
  The variable decorated with `PrimitiveId` within the `MeshEXT` or `MeshNV` `Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04337**
  The variable decorated with `PrimitiveId` **must** be declared as a scalar 32-bit integer value.

- **VUID-PrimitiveId-PrimitiveId-07040**
  The variable decorated with `PrimitiveId` **must** also be decorated with the `PerPrimitiveEXT` decoration.

### PrimitiveShadingRateKHR

Decorating a variable with the `PrimitiveShadingRateKHR` built-in decoration will make that variable contain the **primitive fragment shading rate**.

The value written to the variable decorated with `PrimitiveShadingRateKHR` by the last pre-
rasterization shader stage in the pipeline is used as the primitive fragment shading rate. Outputs in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with PrimitiveShadingRateKHR, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has PrimitiveShadingRateKHR in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

Valid Usage

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484
  The PrimitiveShadingRateKHR decoration must be used only within the MeshEXT, MeshNV,Vertex, or Geometry Execution Model

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485
  The variable decorated with PrimitiveShadingRateKHR must be declared using the Output Storage Class

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486
  The variable decorated with PrimitiveShadingRateKHR must be declared as a scalar 32-bit integer value

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487
  The value written to PrimitiveShadingRateKHR must include no more than one of Vertical2Pixels and Vertical4Pixels

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488
  The value written to PrimitiveShadingRateKHR must include no more than one of Horizontal2Pixels and Horizontal4Pixels

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489
  The value written to PrimitiveShadingRateKHR must not have any bits set other than those defined by Fragment Shading Rate Flags enumerants in the SPIR-V specification

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-07059
  The variable decorated with PrimitiveShadingRateKHR within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration

RayGeometryIndexKHR

A variable decorated with the RayGeometryIndexKHR decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

Valid Usage

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345
  The RayGeometryIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model
The variable decorated with `RayGeometryIndexKHR` must be declared using the Input Storage Class.

The variable decorated with `RayGeometryIndexKHR` must be declared as a scalar 32-bit integer value.

**RayTmaxKHR**

A variable decorated with the `RayTmaxKHR` decoration will contain the parametric $t_{\text{max}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into the pipeline trace ray instruction.

The $t_{\text{max}}$ value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling `OpReportIntersectionKHR` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into the pipeline trace ray instruction.

**Valid Usage**

- VUID-RayTmaxKHR-RayTmaxKHR-04348
  The `RayTmaxKHR` decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- VUID-RayTmaxKHR-RayTmaxKHR-04349
  The variable decorated with `RayTmaxKHR` must be declared using the Input Storage Class.

- VUID-RayTmaxKHR-RayTmaxKHR-04350
  The variable decorated with `RayTmaxKHR` must be declared as a scalar 32-bit floating-point value.

**RayTminKHR**

A variable decorated with the `RayTminKHR` decoration will contain the parametric $t_{\text{min}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into the pipeline trace ray instruction.

The $t_{\text{min}}$ value remains constant for the duration of the ray query.

**Valid Usage**

- VUID-RayTminKHR-RayTminKHR-04351
  The `RayTminKHR` decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- VUID-RayTminKHR-RayTminKHR-04352
  The variable decorated with `RayTminKHR` must be declared as a scalar 32-bit floating-point value.
The variable decorated with `RayTminKHR` must be declared using the `Input Storage Class`.

- VUID-RayTminKHR-RayTminKHR-04353
  The variable decorated with `RayTminKHR` must be declared as a scalar 32-bit floating-point value.

**SampleId**

Decorating a variable with the `SampleId` built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. `SampleId` ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with `SampleId`, Sample Shading is considered enabled with a `minSampleShading` value of 1.0.

**Valid Usage**

- VUID-SampleId-SampleId-04354
  The `SampleId` decoration must be used only within the Fragment Execution Model.

- VUID-SampleId-SampleId-04355
  The variable decorated with `SampleId` must be declared using the `Input Storage Class`.

- VUID-SampleId-SampleId-04356
  The variable decorated with `SampleId` must be declared as a scalar 32-bit integer value.

**SampleMask**

Decorating a variable with the `SampleMask` built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the `Input` storage class decorated with `SampleMask` will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. `SampleMask[]` is an array of integers. Bits are mapped to samples in a manner where `bit B of mask M (SampleMask[M]) corresponds to sample 32 × M + B`.

A variable in the `Output` storage class decorated with `SampleMask` is an array of integers forming a bit array in a manner similar to an input variable decorated with `SampleMask`, but where each bit represents coverage as computed by the shader. This computed `SampleMask` is combined with the generated coverage mask in the multisample coverage operation.

Variables decorated with `SampleMask` must be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with `SampleMask`, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with `SampleMask`, the sample mask has no effect on the processing of a fragment.
Valid Usage

- VUID-SampleMask-SampleMask-04357
  The SampleMask decoration must be used only within the Fragment Execution Model

- VUID-SampleMask-SampleMask-04358
  The variable decorated with SampleMask must be declared using the Input or Output Storage Class

- VUID-SampleMask-SampleMask-04359
  The variable decorated with SampleMask must be declared as an array of 32-bit integer values

SamplePosition

Decorating a variable with the SamplePosition built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If a fragment shader entry point’s interface includes an input variable decorated with SamplePosition, Sample Shading is considered enabled with a minSampleShading value of 1.0.

Valid Usage

- VUID-SamplePosition-SamplePosition-04360
  The SamplePosition decoration must be used only within the Fragment Execution Model

- VUID-SamplePosition-SamplePosition-04361
  The variable decorated with SamplePosition must be declared using the Input Storage Class

- VUID-SamplePosition-SamplePosition-04362
  The variable decorated with SamplePosition must be declared as a two-component vector of 32-bit floating-point values

ShadingRateKHR

Decorating a variable with the ShadingRateKHR built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.

Valid Usage

- VUID-ShadingRateKHR-ShadingRateKHR-04490
  The ShadingRateKHR decoration must be used only within the Fragment Execution Model

- VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with ShadingRateKHR must be declared using the Input Storage Class

- VUID-ShadingRateKHR-ShadingRateKHR-04492
  The variable decorated with ShadingRateKHR must be declared as a scalar 32-bit integer
**SubgroupId**

Decorating a variable with the `SubgroupId` built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range \([0, \text{NumSubgroups}-1]\).

### Valid Usage

- **VUID-SubgroupId-SubgroupId-04367**
  The `SubgroupId` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- **VUID-SubgroupId-SubgroupId-04368**
  The variable decorated with `SubgroupId` must be declared using the Input Storage Class

- **VUID-SubgroupId-SubgroupId-04369**
  The variable decorated with `SubgroupId` must be declared as a scalar 32-bit integer value

**SubgroupEqMask**

Decorating a variable with the `SubgroupEqMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the `SubgroupLocalInvocationId` is set in the variable decorated with `SubgroupEqMask`. All other bits are set to zero.

`SubgroupEqMaskKHR` is an alias of `SubgroupEqMask`.

### Valid Usage

- **VUID-SubgroupEqMask-SubgroupEqMask-04370**
  The variable decorated with `SubgroupEqMask` must be declared using the Input Storage Class

- **VUID-SubgroupEqMask-SubgroupEqMask-04371**
  The variable decorated with `SubgroupEqMask` must be declared as a four-component vector of 32-bit integer values

**SubgroupGeMask**

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

### Valid Usage

- **VUID-SubgroupGeMask-SubgroupGeMask-04372**
The variable decorated with **SubgroupGeMask** must be declared using the **Input Storage Class**

- VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with **SubgroupGeMask** must be declared as a four-component vector of 32-bit integer values

**SubgroupGtMask**

Decorating a variable with the **SubgroupGtMask** builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than **SubgroupLocalInvocationId** through **SubgroupSize-1** are set in the variable decorated with **SubgroupGtMask**. All other bits are set to zero.

**SubgroupGtMaskKHR** is an alias of **SubgroupGtMask**.

---

**Valid Usage**

- VUID-SubgroupGtMask-SubgroupGtMask-04374
  The variable decorated with **SubgroupGtMask** must be declared using the **Input Storage Class**

- VUID-SubgroupGtMask-SubgroupGtMask-04375
  The variable decorated with **SubgroupGtMask** must be declared as a four-component vector of 32-bit integer values

**SubgroupLeMask**

Decorating a variable with the **SubgroupLeMask** builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to **SubgroupLocalInvocationId** are set in the variable decorated with **SubgroupLeMask**. All other bits are set to zero.

**SubgroupLeMaskKHR** is an alias of **SubgroupLeMask**.

---

**Valid Usage**

- VUID-SubgroupLeMask-SubgroupLeMask-04376
  The variable decorated with **SubgroupLeMask** must be declared using the **Input Storage Class**

- VUID-SubgroupLeMask-SubgroupLeMask-04377
  The variable decorated with **SubgroupLeMask** must be declared as a four-component vector of 32-bit integer values

**SubgroupLtMask**

Decorating a variable with the **SubgroupLtMask** builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than **SubgroupLocalInvocationId** are set in the variable decorated with
SubgroupLtMask. All other bits are set to zero.

SubgroupLtMaskKHR is an alias of SubgroupLtMask.

Valid Usage

• VUID-SubgroupLtMask-SubgroupLtMask-04378
  The variable decorated with SubgroupLtMask must be declared using the Input Storage Class

• VUID-SubgroupLtMask-SubgroupLtMask-04379
  The variable decorated with SubgroupLtMask must be declared as a four-component vector of 32-bit integer values

SubgroupLocalInvocationId

Decorating a variable with the SubgroupLocalInvocationId builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range [0,SubgroupSize-1].

If VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT is specified, or if module declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the stage is a multiple of SubgroupSize, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups must be launched with all invocations active, i.e., there is an active invocation with SubgroupLocalInvocationId for each value in range [0,SubgroupSize-1].

Note

There is no direct relationship between SubgroupLocalInvocationId and LocalInvocationId or LocalInvocationIndex. If the pipeline or shader object was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

index = SubgroupLocalInvocationId + SubgroupId × SubgroupSize

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

Note

VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT and VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT are effectively deprecated when compiling SPIR-V 1.6 shaders, as this behavior is the default for Vulkan with SPIR-V 1.6. This is more aligned with developer expectations, and avoids applications unexpectedly breaking in the future.

Valid Usage

• VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380
The variable decorated with `SubgroupLocalInvocationId` must be declared using the Input Storage Class.

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  The variable decorated with `SubgroupLocalInvocationId` must be declared as a scalar 32-bit integer value.

### SubgroupSize

Decorating a variable with the `SubgroupSize` builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, or the shader object was created with the `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set, or the SPIR-V module is at least version 1.6, the `SubgroupSize` decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between `minSubgroupSize` and `maxSubgroupSize` and must be uniform with `subgroup scope`. The value may vary across a single draw call, and for fragment shaders may vary across a single primitive. In compute dispatches, `SubgroupSize` must be uniform with `command scope`.

If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure, or the shader object was created with a chained `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If SPIR-V module is less than version 1.6 and the pipeline was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure was chained, and the shader was not created with the `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` flag set and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**

The old behavior for `SubgroupSize` is considered deprecated as certain compute algorithms cannot be easily implemented without the guarantees of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`.

### Valid Usage

- **VUID-SubgroupSize-SubgroupSize-04382**
  The variable decorated with `SubgroupSize` must be declared using the Input Storage Class.

- **VUID-SubgroupSize-SubgroupSize-04383**
  The variable decorated with `SubgroupSize` must be declared as a scalar 32-bit integer.
**TessCoord**

Decorating a variable with the `TessCoord` built-in decoration will make that variable contain the three-dimensional \((u,v,w)\) barycentric coordinate of the tessellated vertex within the patch. \(u\), \(v\), and \(w\) are in the range \([0,1]\) and vary linearly across the primitive being subdivided. For the tessellation modes of `Quads` or `IsoLines`, the third component is always zero.

---

### Valid Usage

- **VUID-TessCoord-TessCoord-04387**
  The `TessCoord` decoration **must** be used only within the `TessellationEvaluation Execution Model`

- **VUID-TessCoord-TessCoord-04388**
  The variable decorated with `TessCoord` **must** be declared using the `Input Storage Class`

- **VUID-TessCoord-TessCoord-04389**
  The variable decorated with `TessCoord` **must** be declared as a three-component vector of 32-bit floating-point values

---

**TessLevelOuter**

Decorating a variable with the `TessLevelOuter` built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelOuter` **can** be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` **can** read the values written by the tessellation control shader.

---

### Valid Usage

- **VUID-TessLevelOuter-TessLevelOuter-04390**
  The `TessLevelOuter` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`

- **VUID-TessLevelOuter-TessLevelOuter-04391**
  The variable decorated with `TessLevelOuter` within the `TessellationControl Execution Model` **must** be declared using the `Output Storage Class`

- **VUID-TessLevelOuter-TessLevelOuter-04392**
  The variable decorated with `TessLevelOuter` within the `TessellationEvaluation Execution Model` **must** be declared using the `Input Storage Class`

- **VUID-TessLevelOuter-TessLevelOuter-04393**
  The variable decorated with `TessLevelOuter` **must** be declared as an array of size four, containing 32-bit floating-point values
**TessLevelInner**

Decorating a variable with the **TessLevelInner** built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelInner** can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with **TessLevelInner** can read the values written by the tessellation control shader.

### Valid Usage

- **VUID-TessLevelInner-TessLevelInner-04394**
  The **TessLevelInner** decoration must be used only within the **TessellationControl** or **TessellationEvaluation** Execution Model.

- **VUID-TessLevelInner-TessLevelInner-04395**
  The variable decorated with **TessLevelInner** within the **TessellationControl** Execution Model must be declared using the **Output Storage Class**.

- **VUID-TessLevelInner-TessLevelInner-04396**
  The variable decorated with **TessLevelInner** within the **TessellationEvaluation** Execution Model must be declared using the **Input Storage Class**.

- **VUID-TessLevelInner-TessLevelInner-04397**
  The variable decorated with **TessLevelInner** must be declared as an array of size two, containing 32-bit floating-point values.

**VertexIndex**

Decorating a variable with the **VertexIndex** built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the **firstVertex** parameter to **vkCmdDraw** or the **firstVertex** member of a structure consumed by **vkCmdDrawIndirect** and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the **vertexOffset** parameter to **vkCmdDrawIndexed** or the **vertexOffset** member of the structure consumed by **vkCmdDrawIndexedIndirect**.

**Note**

**VertexIndex** starts at the same starting value for each instance.

### Valid Usage

- **VUID-VertexIndex-VertexIndex-04398**
  The **VertexIndex** decoration must be used only within the **Vertex** Execution Model.

- **VUID-VertexIndex-VertexIndex-04399**
  The variable decorated with **VertexIndex** must be declared using the **Input Storage Class**.
The variable decorated with **VertexIndex** must be declared as a scalar 32-bit integer value.

**ViewIndex**

The **ViewIndex** decoration can be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

**Valid Usage**

- VUID-ViewIndex-ViewIndex-04401
  The **ViewIndex** decoration must be used only within the **MeshEXT, Vertex, Geometry, TessellationControl, TessellationEvaluation** or **Fragment Execution Model**.

- VUID-ViewIndex-ViewIndex-04402
  The variable decorated with **ViewIndex** must be declared using the **Input Storage Class**.

- VUID-ViewIndex-ViewIndex-04403
  The variable decorated with **ViewIndex** must be declared as a scalar 32-bit integer value.

**ViewportIndex**

Decorating a variable with the **ViewportIndex** built-in decoration will make that variable contain the index of the viewport.

In a vertex, tessellation evaluation, or geometry shader, the variable decorated with **ViewportIndex** can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform and scissor rectangle.

The last active **pre-rasterization shader stage** (in pipeline order) controls the **ViewportIndex** that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the **ViewportIndex**.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with **ViewportIndex** then the first viewport is used. If a **pre-rasterization shader stage** shader entry point's interface includes a variable decorated with **ViewportIndex**, it must write the same value to **ViewportIndex** for all output vertices of a given primitive.

In a fragment shader, the variable decorated with **ViewportIndex** contains the viewport index of the primitive that the fragment invocation belongs to.

**Valid Usage**

- VUID-ViewportIndex-ViewportIndex-04404
The `ViewportIndex` decoration **must** be used only within the `MeshEXT, MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model`

- **VUID-ViewportIndex-ViewportIndex-04405**
  If the `shaderOutputViewportIndex` feature is not enabled then the `ViewportIndex` decoration **must** be used only within the `Geometry or Fragment Execution Model`

- **VUID-ViewportIndex-ViewportIndex-04406**
  The variable decorated with `ViewportIndex` within the `MeshEXT, MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model` **must** be declared using the `Output Storage Class`

- **VUID-ViewportIndex-ViewportIndex-04407**
  The variable decorated with `ViewportIndex` within the `Fragment Execution Model` **must** be declared using the `Input Storage Class`

- **VUID-ViewportIndex-ViewportIndex-04408**
  The variable decorated with `ViewportIndex` **must** be declared as a scalar 32-bit integer value

- **VUID-ViewportIndex-ViewportIndex-07060**
  The variable decorated with `ViewportIndex` within the `MeshEXT Execution Model` **must** also be decorated with the `PerPrimitiveEXT` decoration

---

**WorkgroupId**

Decorating a variable with the `WorkgroupId` built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

---

**Valid Usage**

- **VUID-WorkgroupId-WorkgroupId-04422**
  The `WorkgroupId` decoration **must** be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model`

- **VUID-WorkgroupId-WorkgroupId-04423**
  The variable decorated with `WorkgroupId` **must** be declared using the `Input Storage Class`

- **VUID-WorkgroupId-WorkgroupId-04424**
  The variable decorated with `WorkgroupId` **must** be declared as a three-component vector of 32-bit integer values

---

**WorkgroupSize**

**Note**

SPIR-V 1.6 deprecated `WorkgroupSize` in favor of using the `LocalSizeId` Execution Mode instead. Support for `LocalSizeId` was added with `VK_KHR_maintenance4` and promoted to core in Version 1.3.
Decorating an object with the `WorkgroupSize` built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the `WorkgroupSize` decoration, this takes precedence over any `LocalSize` or `LocalSizeId` execution mode.

### Valid Usage

- **VUID-WorkgroupSize-WorkgroupSize-04425**
  The `WorkgroupSize` decoration must be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model

- **VUID-WorkgroupSize-WorkgroupSize-04426**
  The variable decorated with `WorkgroupSize` must be a specialization constant or a constant

- **VUID-WorkgroupSize-WorkgroupSize-04427**
  The variable decorated with `WorkgroupSize` must be declared as a three-component vector of 32-bit integer values

### WorldRayDirectionKHR

A variable decorated with the `WorldRayDirectionKHR` decoration will specify the direction of the ray being processed, in world space. The value is the parameter passed into the pipeline trace ray instruction.

### Valid Usage

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428**
  The `WorldRayDirectionKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429**
  The variable decorated with `WorldRayDirectionKHR` must be declared using the Input Storage Class

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430**
  The variable decorated with `WorldRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values

### WorldRayOriginKHR

A variable decorated with the `WorldRayOriginKHR` decoration will specify the origin of the ray being processed, in world space. The value is the parameter passed into the pipeline trace ray instruction.

### Valid Usage

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431**
  The `WorldRayOriginKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432**
  The variable decorated with `WorldRayOriginKHR` must be declared as a three-component vector of 32-bit integer values
The variable decorated with `WorldRayOriginKHR` must be declared using the Input Storage Class.

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433**
  The variable decorated with `WorldRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values.

---

**WorldToObjectKHR**

A variable decorated with the `WorldToObjectKHR` decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

---

**Valid Usage**

- **VUID-WorldToObjectKHR-WorldToObjectKHR-04434**
  The `WorldToObjectKHR` decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model.

- **VUID-WorldToObjectKHR-WorldToObjectKHR-04435**
  The variable decorated with `WorldToObjectKHR` must be declared using the Input Storage Class.

- **VUID-WorldToObjectKHR-WorldToObjectKHR-04436**
  The variable decorated with `WorldToObjectKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an `OpTypeImage` (representing a `VkImageView`) or `OpTypeSampledImage` (representing a `VkImageView`, `VkSampler`) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of `OpTypeImage` is ignored.

Note
Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- `OpImageSample*` and `OpImageSparseSample*` read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.
  - Instructions with `ImplicitLod` in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with `ExplicitLod` in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with `Proj` in the name apply homogeneous projection to the coordinates.
- `OpImageFetch` and `OpImageSparseFetch` return a single texel of the image. No sampler is used.
- `OpImage*Gather` and `OpImageSparse*Gather` read neighboring texels and return a single component of each.
- `OpImageRead` (and `OpImageSparseRead`) and `OpImageWrite` read and write, respectively, a texel in the image. No sampler is used.
- `OpImage*Dref*` instructions apply depth comparison on the texel values.
- `OpImageSparse*` instructions additionally return a sparse residency code.
- `OpImageQueryLod` returns the LOD parameters that would be used in a sample operation. The actual operation is not performed.

16.1.1. Texel Coordinate Systems

Images are addressed by texel coordinates. There are three texel coordinate systems:
- normalized texel coordinates [0.0, 1.0]
- unnormalized texel coordinates [0.0, width / height / depth]
- integer texel coordinates [0, width / height / depth]

Other image instructions can use either normalized or unnormalized texel coordinates (selected by the `unnormalizedCoordinates` state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as (s,t,r,q,a), with the coordinates having the following meanings:

- s: Coordinate in the first dimension of an image.
- t: Coordinate in the second dimension of an image.
- r: Coordinate in the third dimension of an image.
  - (s,t,r) are interpreted as a direction vector for Cube images.
- q: Fourth coordinate, for homogeneous (projective) coordinates.
- a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order (s, [t], [r], q), with t and r being conditionally present based on the Dim of the image. For non-Proj instructions, the coordinates are (s[,t] [,r] [,a]), with t and r being conditionally present based on the Dim of the image and a being conditionally present based on the Arrayed property of the image. Projective image instructions are not supported on Arrayed images.

Unnormalized texel coordinates are referred to as (u,v,w,a), with the coordinates having the following meanings:

- u: Coordinate in the first dimension of an image.
- v: Coordinate in the second dimension of an image.
- w: Coordinate in the third dimension of an image.
- a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-Arrayed) dimensionalities support unnormalized coordinates. The components are in order (u [,v]), with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as (i,j,k,l,n), with the coordinates having the following meanings:
• \(i\): Coordinate in the first dimension of an image.
• \(j\): Coordinate in the second dimension of an image.
• \(k\): Coordinate in the third dimension of an image.
• \(l\): Coordinate for array layer.
• \(n\): Index of the sample within the texel.

They are extracted from the SPIR-V operand in order \((i, j, k, l, n)\), with \(j\) and \(k\) conditionally present based on the \text{Dim} of the image, and \(l\) conditionally present based on the \text{Arrayed} property of the image. \(n\) is conditionally present and is taken from the \text{Sample} image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

![Texel Coordinate Systems, Linear Filtering](image.png)

**Figure 3. Texel Coordinate Systems, Linear Filtering**

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

- Normalized texel coordinates:
  - The \(s\) coordinate goes from 0.0 to 1.0.
  - The \(t\) coordinate goes from 0.0 to 1.0.

- Unnormalized texel coordinates:
  - The \(u\) coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  - The \(v\) coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

- Integer texel coordinates:
  - The \(i\) coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
\* The \( j \) coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

\* Also shown for linear filtering:
  \* Given the unnormalized coordinates \((u,v)\), the four texels selected are \( i_{0j}, i_{1j}, i_{0j+1}, \) and \( i_{1j+1} \).
  \* The fractions \( \alpha \) and \( \beta \).
  \* Given the offset \( \Delta_i \) and \( \Delta_j \), the four texels selected by the offset are \( i_{0j'}, i_{1j'}, i_{0j'+1}, \) and \( i_{1j'+1} \).

\begin{itemize}
  \item Note
  
  For formats with reduced-resolution components, \( \Delta_i \) and \( \Delta_j \) are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution components.
\end{itemize}

\begin{figure}
\centering
\includegraphics[width=\textwidth]{texel_coordinate_systems.png}
\caption{Texel Coordinate Systems, Nearest Filtering}
\end{figure}

The Texel Coordinate Systems - For the example shown of an \( 8 \times 4 \) texel two dimensional image.

\* Texel coordinates as above. Also shown for nearest filtering:
  \* Given the unnormalized coordinates \((u,v)\), the texel selected is \( ij \).
  \* Given the offset \( \Delta_i \) and \( \Delta_j \), the texel selected by the offset is \( ij' \).

### 16.2. Conversion Formulas

#### 16.2.1. RGB to Shared Exponent Conversion

An RGB color \((\text{red}, \text{green}, \text{blue})\) is transformed to a shared exponent color \((\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \exp_{\text{shared}})\) as follows:
First, the components (red, green, blue) are clamped to (\(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}}\)) as:

\[
\text{red}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red}))
\]

\[
\text{green}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green}))
\]

\[
\text{blue}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))
\]

where:

\[
\begin{align*}
N &= 9 & \text{number of mantissa bits per component} \\
B &= 15 & \text{exponent bias} \\
E_{\text{max}} &= 31 & \text{maximum possible biased exponent value} \\
\text{sharedexp}_{\text{max}} &= \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)}
\end{align*}
\]

**Note**

NaN, if supported, is handled as in IEEE 754-2008 \(\text{minNum()}\) and \(\text{maxNum()}\). This results in any NaN being mapped to zero.

The largest clamped component, \(\text{max}_{\text{clamped}}\) is determined:

\[
\text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})
\]

A preliminary shared exponent \(\text{exp}'\) is computed:

\[
\text{exp}' = \begin{cases} 
\lfloor \log_2(\text{max}_{\text{clamped}}) \rfloor + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\
0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)}
\end{cases}
\]

The shared exponent \(\text{exp}_{\text{shared}}\) is computed:

\[
\text{max}_{\text{shared}} = \left\lfloor \frac{\text{max}_{\text{clamped}}}{2^{(\text{exp}' - B - N)}} + \frac{1}{2} \right\rfloor
\]

\[
\text{exp}_{\text{shared}} = \begin{cases} 
\text{exp}' & \text{for } 0 \leq \text{max}_{\text{shared}} < 2^N \\
\text{exp}' + 1 & \text{for } \text{max}_{\text{shared}} = 2^N
\end{cases}
\]

Finally, three integer values in the range 0 to \(2^N\) are computed:
A shared exponent color \( \text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \exp_{\text{shared}} \) is transformed to an RGB color (red, green, blue) as follows:

\[
\text{red}_{\text{shared}} = \left[ \frac{\text{red}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right]
\]

\[
\text{green}_{\text{shared}} = \left[ \frac{\text{green}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right]
\]

\[
\text{blue}_{\text{shared}} = \left[ \frac{\text{blue}_{\text{clamped}}}{2^{(\exp_{\text{shared}} - B - N)}} + \frac{1}{2} \right]
\]

\[\text{red} = \text{red}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}\]

\[\text{green} = \text{green}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}\]

\[\text{blue} = \text{blue}_{\text{shared}} \times 2^{(\exp_{\text{shared}} - B - N)}\]

where:

\[N = 9\] (number of mantissa bits per component)

\[B = 15\] (exponent bias)

### 16.3. Texel Input Operations

**Texel input instructions** are SPIR-V image instructions that read from an image. **Texel input operations** are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- Format conversion
- Texel replacement
- Depth comparison
• Conversion to RGBA
• Component swizzle
• Chroma reconstruction
• Y'CbCr conversion

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If Chroma Reconstruction is implicit, Texel Filtering instead takes place during chroma reconstruction, before sampler Y'CbCr conversion occurs.

16.3.1. Texel Input Validation Operations

Texel input validation operations inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction can mismatch with the sampler, the image view, or both, and a number of further cases where the sampler can mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

• The sampler borderColor is an integer type and the image view format is not one of the VkFormat integer types or a stencil component of a depth/stencil format.

• The sampler borderColor is a float type and the image view format is not one of the VkFormat float types or a depth component of a depth/stencil format.

• The sampler borderColor is one of the opaque black colors (VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK or VK_BORDER_COLOR_INT_OPAQUE_BLACK) and the image view VkComponentSwizzle for any of the VkComponentMapping components is not the identity swizzle.

• The VkImageLayout of any subresource in the image view does not match the VkDescriptorImageInfo::imageLayout used to write the image descriptor.

• The SPIR-V Image Format is not compatible with the image view’s format.

• The sampler unnormalizedCoordinates is VK_TRUE and any of the limitations of unnormalized coordinates are violated.

• The SPIR-V instruction is one of the OpImage*Dref* instructions and the sampler compareEnable is VK_FALSE

• The SPIR-V instruction is not one of the OpImage*Dref* instructions and the sampler compareEnable is VK_TRUE

• The SPIR-V instruction is one of the OpImage*Dref* instructions, the image view format is one of the depth/stencil formats, and the image view aspect is not VK_IMAGE_ASPECT_DEPTH_BIT.
• The SPIR-V instruction’s image variable’s properties are not compatible with the image view:
  ◦ Rules for viewType:
    ▪ **VK_IMAGE_VIEW_TYPE_1D** must have Dim = 1D, Arrayed = 0, MS = 0.
    ▪ **VK_IMAGE_VIEW_TYPE_2D** must have Dim = 2D, Arrayed = 0.
    ▪ **VK_IMAGE_VIEW_TYPE_3D** must have Dim = 3D, Arrayed = 0, MS = 0.
    ▪ **VK_IMAGE_VIEW_TYPE_CUBE** must have Dim = Cube, Arrayed = 0, MS = 0.
    ▪ **VK_IMAGE_VIEW_TYPE_1D_ARRAY** must have Dim = 1D, Arrayed = 1, MS = 0.
    ▪ **VK_IMAGE_VIEW_TYPE_2D_ARRAY** must have Dim = 2D, Arrayed = 1.
    ▪ **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY** must have Dim = Cube, Arrayed = 1, MS = 0.
  ◦ If the image was created with **VkImageCreateInfo::samples** equal to **VK_SAMPLE_COUNT_1_BIT**, the instruction must have MS = 0.
  ◦ If the image was created with **VkImageCreateInfo::samples** not equal to **VK_SAMPLE_COUNT_1_BIT**, the instruction must have MS = 1.
  ◦ If the Sampled Type of the OpTypeImage does not match the SPIR-V Type.
  ◦ If the signedness of any read or sample operation does not match the signedness of the image’s format.

Only **OpImageSample** and **OpImageSparseSample** can be used with a sampler or image view that enables sampler Y'CbCr conversion.

**OpImageFetch, OpImageSparseFetch, OpImage*Gather**, and **OpImageSparse*Gather** must not be used with a sampler or image view that enables sampler Y'CbCr conversion.

The **ConstOffset** and **Offset** operands must not be used with a sampler or image view that enables sampler Y'CbCr conversion.

**Integer Texel Coordinate Validation**

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[0 \leq i < w_s\]
\[0 \leq j < h_s\]
\[0 \leq k < d_s\]
\[ 0 \leq l < \text{layers} \]

\[ 0 \leq n < \text{samples} \]

where:

\[ w_s = \text{width of the image level} \]

\[ h_s = \text{height of the image level} \]

\[ d_s = \text{depth of the image level} \]

\[ \text{layers} = \text{number of layers in the image} \]

\[ \text{samples} = \text{number of samples per texel in the image} \]

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates
   - If the texel coordinates pass validation (that is, the coordinates lie within the image),
   then the texel value comes from the value in image memory.

2. Border Texel
   - If the texel coordinates fail validation, and
   - If the read is the result of an image sample instruction or image gather instruction, and
   - If the image is not a cube image,
   then the texel is a border texel and \textit{texel replacement} is performed.

3. Invalid Texel
   - If the texel coordinates fail validation, and
   - If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,
   then the texel is an invalid texel and \textit{texel replacement} is performed.

4. Cube Map Edge or Corner
Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and **Cube map edge handling** is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face (as described in the prior section), the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **Cube Map Edge Texel**
  - If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the appropriate neighboring face.

- **Cube Map Corner Texel**
  - If the texel lies beyond the selected cube map face in both i and j, then there is no unique neighboring face from which to read that texel. The texel should be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations may replace the cube map corner texel by other methods. The methods are subject to the constraint that if the three available texels have the same value, the resulting filtered texel must have that value.

**Sparse Validation**

If the texel reads from an unbound region of a sparse image, the texel is a **sparse unbound texel**, and processing continues with **texel replacement**.

**Layout Validation**

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with **sampler Y'CbCr conversion** enabled.

### 16.3.2. Format Conversion

Texels undergo a format conversion from the `VkFormat` of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- **Color formats** have one, two, three, or four components, according to the format.

- **Depth/stencil formats** are one component. The depth or stencil component is selected by the `aspectMask` of the image view.

Each component is converted based on its type and size (as defined in the **Format Definition** section for each `VkFormat`), using the appropriate equations in **16-Bit Floating-Point Numbers**, **Unsigned 11-Bit Floating-Point Numbers**, **Unsigned 10-Bit Floating-Point Numbers**, **Fixed-Point Data Conversion**, and **Shared Exponent to RGB**. Signed integer components smaller than 32 bits are sign-extended.
If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the *Khronos Data Format Specification*. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

### 16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the *borderColor* of the sampler. The border color is:

<table>
<thead>
<tr>
<th>Sampler Border Color</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1, 1, 1, 1])</td>
</tr>
</tbody>
</table>

**Note**

The names *VK_BORDER_COLOR_* _TRANSPARENT_BLACK*, *VK_BORDER_COLOR_* _OPAQUE_BLACK*, and *VK_BORDER_COLOR_* _OPAQUE_WHITE* are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of *VK_BORDER_COLOR_INT_OPAQUE_WHITE* is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format.

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>Component Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>(D = B_r)</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>(S = B_r)</td>
</tr>
<tr>
<td>One component color format</td>
<td>(\text{Color}_r = B_r)</td>
</tr>
<tr>
<td>Two component color format</td>
<td>([\text{Color}_r, \text{Color}_s] = [B_r, B_s])</td>
</tr>
</tbody>
</table>
The value returned by a read of an invalid texel is undefined, unless that read operation is from a
buffer resource and the robustBufferAccess feature is enabled. In that case, an invalid texel is
replaced as described by the robustBufferAccess feature. If the access is to an image resource and
the x, y, z, or layer coordinate validation fails and the robustImageAccess feature is enabled, then
zero must be returned for the R, G, and B components, if present. Either zero or one must be
returned for the A component, if present. If only the sample index was invalid, the values returned
are undefined.

Additionally, if the robustImageAccess feature is enabled, any invalid texels may be expanded to four
components prior to texel replacement. This means that components not present in the image
format may be replaced with 0 or may undergo conversion to RGBA as normal.

If the VkPhysicalDeviceSparseProperties::residencyNonResidentStrict property is VK_TRUE, a sparse
unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the
image format, respectively.

If residencyNonResidentStrict is VK_FALSE, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the aspectMask, and
the operation is an OpImage*Dref* instruction, a depth comparison is performed. The result is 1.0 if
the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component D.

The compare operation is selected by the VkCompareOp value set by VkSamplerCreateInfo
::compareOp. The reference value from the SPIR-V operand Dref and the texel depth value Dtex are used
as the reference and test values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then Dref is clamped to
[0,1] before the compare operation.

### 16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image
base color:

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>[Color_r,Color_g,Color_b,Color_a] = [D,0,0,one]</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>[Color_r,Color_g,Color_b,Color_a] = [S,0,0,one]</td>
</tr>
<tr>
<td>One component color format</td>
<td>[Color_r,Color_g,Color_b,Color_a] = [Color_r,0,0,one]</td>
</tr>
<tr>
<td>Texel Aspect or Format</td>
<td>RGBA Color</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Two component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b, \text{Color}_a] = [\text{Color}_r,\text{Color}_g,0,\text{one}])</td>
</tr>
<tr>
<td>Three component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b, \text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{one}])</td>
</tr>
<tr>
<td>Four component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b, \text{Color}_a] = [\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a])</td>
</tr>
<tr>
<td>One alpha component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b, \text{Color}_a] = [0,0,0,\text{Color}_a])</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.

### 16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if sampler \(Y'CbCr\) conversion is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the sampler \(Y'CbCr\) conversion if sampler \(Y'CbCr\) conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color}'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle}
\end{cases}
\]

where:

\[
\text{one} = \begin{cases} 
1.0f & \text{for floating point components} \\
1 & \text{for integer components}
\end{cases}
\]

\[
\text{identity} = \begin{cases} 
\text{Color}_r & \text{for component} = r \\
\text{Color}_g & \text{for component} = g \\
\text{Color}_b & \text{for component} = b \\
\text{Color}_a & \text{for component} = a
\end{cases}
\]

If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the identity swizzle for all components, the value of the texel after swizzle is undefined.

If the image view has a depth/stencil format and the `VkComponentSwizzle` is `VK_COMPONENT_SWIZZLE_ONE`, and

\[\text{VkPhysicalDeviceMaintenance5PropertiesKHR}\]
::depthStencilSwizzleOneSupport is not set to 
VK_TRUE, the value of the texel after swizzle is undefined.

16.3.7. Sparse Residency

OpImageSparse* instructions return a structure which includes a residency code indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the OpImageSparseTexelsResident instruction which converts the residency code to a boolean value.

16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same approach is used with additive color, since the green component dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.422” formats have downsampling in the x dimension (corresponding to u or s coordinates): they are sampled at half the resolution of luma in that dimension.
- “.420” formats have downsampling in the x dimension (corresponding to u or s coordinates) and the y dimension (corresponding to v or t coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the xChromaOffset and yChromaOffset members of the VkSamplerYcbcrConversionCreateInfo structure used to create the sampler Y’C_bC_r conversion.

The following diagrams show the relationship between unnormalized (u,v) coordinates and (i,j) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.
If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to Wrapping Operation. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for NEAREST sampling is shown as a grid.

![Diagram](image)

Figure 5. 422 downsampling, xChromaOffset=COSITED_EVEN

![Diagram](image)

Figure 6. 422 downsampling, xChromaOffset=MIDPOINT
Figure 7. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN

Figure 8. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the
VkSamplerYcbcrConversionCreateInfo's `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

**Explicit Reconstruction**

- If the `chromaFilter` member of the VkSamplerYcbcrConversionCreateInfo structure is `VK_FILTER_NEAREST`:
  - If the format's R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format), the $\tau_{ij}[l]evel]$ values accessed by texel filtering are reconstructed as follows:
    
    $$
    \tau_R'(i, j) = \tau_R([i \times 0.5], \ j)[l]evel] \\
    \tau_B'(i, j) = \tau_B([i \times 0.5], \ j)[l]evel]
    $$

  - If the format's R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), the $\tau_{ij}[l]evel]$ values accessed by texel filtering are reconstructed as follows:
    
    $$
    \tau_R'(i, j) = \tau_R([i \times 0.5], \ [j \times 0.5])[l]evel] \\
    \tau_B'(i, j) = \tau_B([i \times 0.5], \ [j \times 0.5])[l]evel]
    $$

  *Note* xChromaOffset and yChromaOffset have no effect if chromaFilter is `VK_FILTER_NEAREST` for explicit reconstruction.

- If the `chromaFilter` member of the VkSamplerYcbcrConversionCreateInfo structure is `VK_FILTER_LINEAR`:
  - If the format's R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format):
    - If xChromaOffset is `VK_CHROMA_LOCATION_COSITED_EVEN`:
      - If xChromaOffset is `VK_CHROMA_LOCATION_MIDPOINT`:
    - If xChromaOffset is `VK_CHROMA_LOCATION_MIDPOINT`:
      - If the format's R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:
In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to `chromaFilter = VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation may behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

$$u_{RB} \times (422/420) = \begin{cases} 
0.5 \times (u + 0.5) & \text{xChromaOffset=COSITED_EVEN} \\
0.5 \times u & \text{xChromaOffset=MIDPOINT}
\end{cases}$$

$$v_{RB} \times (420) = \begin{cases} 
0.5 \times (v + 0.5) & \text{yChromaOffset=COSITED_EVEN} \\
0.5 \times v & \text{yChromaOffset=MIDPOINT}
\end{cases}$$
16.3.9. Sampler Y′CBCR Conversion

Sampler Y′CBCR conversion performs the following operations, which an implementation may combine into a single mathematical operation:

- Sampler Y′CBCR Range Expansion
- Sampler Y′CBCR Model Conversion

Sampler Y′CBCR Range Expansion

Sampler Y′CBCR range expansion is applied to color component values after all texel input operations which are not specific to sampler Y′CBCR conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y′CBCR range expansion is not applied if ycbcrModel is VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY. That is, the shader receives the vector C_prime as output by the Component Swizzle stage without further modification.

For other values of ycbcrModel, range expansion is applied to the texel component values output by the Component Swizzle defined by the components member of VkSamplerYcbcrConversionCreateInfo. Range expansion applies independently to each component of the image. For the purposes of range expansion and Y′CBCR model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y′CBCR range expansion.

The range expansion to be applied is defined by the ycbcrRange member of the VkSamplerYcbcrConversionCreateInfo structure:

- If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_FULL, the following transformations are applied:

\[
Y' = C'_{rgba}[G] \\
C_B = C'_{rgba}[B] - \frac{2^{(n-1)}}{(2^n) - 1} \\
C_R = C'_{rgba}[R] - \frac{2^{(n-1)}}{(2^n) - 1}
\]

**Note**

These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW, the following transformations are applied:
Note

These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

\[
Y' = \frac{C \cdot r g b a \cdot [G] \times (2^n - 1) - 16 \times 2^n - 8}{219 \times 2^n - 8}
\]

\[
C_B = \frac{C \cdot r g b a \cdot [B] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}
\]

\[
C_R = \frac{C \cdot r g b a \cdot [R] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}
\]

- \( n \) is the bit-depth of the components in the format.

The precision of the operations performed during range expansion must be at least that of the source format.

An implementation may clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_B \) and \( C_R \) fall in the range \([-0.5,0.5]\).

**Sampler Y'\( C_B \)\( C_R \) Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY**

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; \( Y'\)\( C_B\)\( C_R \) range expansion is also ignored.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY**

The color components are not modified by the color model conversion and are assumed to be treated as though in \( Y'\)\( C_B\)\( C_R \) form both in memory and in the shader; \( Y'\)\( C_B\)\( C_R \) range expansion is applied to the components as for other \( Y'\)\( C_B\)\( C_R \) models, with the vector \((C_B,Y',C_B,A)\) provided to the shader.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709**

The color components are transformed from a \( Y'\)\( C_B\)\( C_R \) representation to an \( R'G'B' \) representation as described in the “BT.709 \( Y'\)\( C_B\)\( C_R \) conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601**

The color components are transformed from a \( Y'\)\( C_B\)\( C_R \) representation to an \( R'G'B' \) representation as described in the “BT.601 \( Y'\)\( C_B\)\( C_R \) conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020**

The color components are transformed from a \( Y'\)\( C_B\)\( C_R \) representation to an \( R'G'B' \) representation as described in the “BT.2020 \( Y'\)\( C_B\)\( C_R \) conversion” section of the Khronos Data Format Specification.
In this operation, each output component is dependent on each input component.

An implementation may clamp the R'G'B' results of these conversions to the range \([0,1]\).

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha component is not modified by these model conversions.

**Note**

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the *Khronos Data Format Specification* may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.
- For a minFilter or magFilter of VK_FILTER_NEAREST:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y'CbCr conversion at this location.
- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_0, j_0)\),\((i_1, j_1)\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler Y'CbCr conversion at each of these locations.
  4. Convert the non-linear A'R'G'B' outputs of the Y'CbCr conversions to linear ARGB values as described in the “Transfer Functions” chapter of the *Khronos Data Format Specification*.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these
operations are redundant and sampling using sampler Y'CbCr conversion at the desired sample coordinates will produce the “correct” results without further processing.

16.4. Texel Output Operations

*Texel output instructions* are SPIR-V image instructions that write to an image. *Texel output operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- **Texel output format conversion**

16.4.1. Texel Output Validation Operations

*Texel output validation operations* inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

**Texel Format Validation**

If the image format of the `OpTypeImage` is not compatible with the `VkImageView`'s format, the write causes the contents of the image's memory to become undefined.

**Texel Type Validation**

If the `Sampled Type` of the `OpTypeImage` does not match the SPIR-V `Type`, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.

16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, the sparse unbound texel write has no effect. If `residencyNonResidentStrict` is `VK_FALSE`,...
the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the VkFormat of the image view. If the number of components in the texel data is larger than the number of components in the format, additional components are discarded.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For Proj image operations, the normalized texel coordinates \((s, t, r, q, a)\) and (if present) the \(D_{ref}\) coordinate are transformed as follows:

\[
\begin{align*}
  s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\
  t &= \frac{t}{q}, & \text{for 2D or 3D image} \\
  r &= \frac{r}{q}, & \text{for 3D image} \\
  D_{ref} &= \frac{D_{ref}}{q}, & \text{if provided}
\end{align*}
\]

16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an ImplicitLod image instruction in a fragment shader) or explicit (provided explicitly by shader to the image instruction in any shader).

For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:
Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand Grad is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the optional SPIR-V operand Lod is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to $\lambda_{\text{base}}$ as described in LOD Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and quadDivergentImplicitLod is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If quadDivergentImplicitLod is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

### 16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector $(r_x, r_y, r_z)$. The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system $(s_{\text{face}}, t_{\text{face}})$. The direction vector is also used to transform the derivatives to per-face derivatives.

### 16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map's faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that $r_z$ wins over $r_y$ and $r_x$, and the second rule that $r_y$ wins over $r_x$. An implementation may choose other rules, but the rules must be deterministic and depend only on $(r_x, r_y, r_z)$.

The layer number (corresponding to a cube map face), the coordinate selections for $s_{\text{c}}, t_{\text{c}}, r_{\text{c}}$, and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

### 16.5.5. Cube Map Coordinate Transformation

$$s_{face} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}$$

$$t_{face} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}$$

### 16.5.6. Cube Map Derivative Transformation

$$\frac{\partial s_{face}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right)$$

$$\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} \right)$$

$$\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)$$
16.5.7. Scale Factor Operation, LOD Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with \texttt{mipmapPrecisionBits} of accuracy.

**Scale Factor Operation**

The magnitude of the derivatives are calculated by:

\[
\begin{align*}
\frac{\partial s_{\text{face}}}{\partial y} &= \frac{1}{2} \left( \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial x} &= \frac{1}{2} \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial y} &= \frac{1}{2} \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\end{align*}
\]

where:

\[
\begin{align*}
\partial t/\partial x &= \partial t/\partial y = 0 \text{ (for 1D images)}
\end{align*}
\]

\[
\begin{align*}
\partial r/\partial x &= \partial r/\partial y = 0 \text{ (for 1D, 2D or Cube images)}
\end{align*}
\]

and:

\[
\begin{align*}
w_{\text{base}} &= \text{image.w}
\end{align*}
\]
\[ h_{\text{base}} = \text{image.h} \]
\[ d_{\text{base}} = \text{image.d} \]

(for the baseMipLevel, from the image descriptor).

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) **should** be the minor and major axes of this ellipse.

The scale factors \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in \(x\) and \(y\), are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) **may** be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

- \(f_x\) is continuous and monotonically increasing in each of \(m_{ux}, m_{vx}, \text{ and } m_{wx}\)
- \(f_y\) is continuous and monotonically increasing in each of \(m_{uy}, m_{vy}, \text{ and } m_{wy}\)

\[
\begin{align*}
\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) &\leq f_x \leq \sqrt{2(|m_{ux}| + |m_{vx}| + |m_{wx}|)} \\
\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) &\leq f_y \leq \sqrt{2(|m_{uy}| + |m_{vy}| + |m_{wy}|)}
\end{align*}
\]

The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) are determined by:

\[
\rho_{\text{max}} = \max(\rho_x, \rho_y) \\
\rho_{\text{min}} = \min(\rho_x, \rho_y)
\]

The ratio of anisotropy is determined by:

\[
\eta = \min(\rho_{\text{max}}/\rho_{\text{min}}, \text{maxAniso})
\]

where:

\[
\text{sampler.maxAniso} = \text{maxAnisotropy} \text{ (from sampler descriptor)}
\]
\[
\text{limits.maxAniso} = \text{maxSamplerAnisotropy} \text{ (from physical device limits)}
\]
\[
\text{maxAniso} = \min(\text{sampler.maxAniso}, \text{limits.maxAniso})
\]

If \(\rho_{\text{max}} = \rho_{\text{min}} = 0\), then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and \(\eta\) **should** be treated as 1. If \(\rho_{\text{max}} \neq 0\) and \(\rho_{\text{min}} = 0\) then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and \(\eta\) **should** be treated as
maxAniso. However, anytime the footprint is small in texel space the implementation may use a smaller value of $\eta$, even when $\rho_{\min}$ is zero or close to zero. If either `VkPhysicalDeviceFeatures::samplerAnisotropy` or `VkSamplerCreateInfo::anisotropyEnable` are `VK_FALSE`, $\text{maxAniso}$ is set to 1.

If $\eta = 1$, sampling is isotropic. If $\eta > 1$, sampling is anisotropic.

The sampling rate ($N$) is derived as:

$$N = \lceil \eta \rceil$$

An implementation may round $N$ up to the nearest supported sampling rate. An implementation may use the value of $N$ as an approximation of $\eta$.

**LOD Operation**

The LOD parameter $\lambda$ is computed as follows:

$$\lambda_{\text{base}}(x, y) = \begin{cases} \text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\ \log \left( \frac{D_{\text{max}}}{\eta} \right) & \text{otherwise} \end{cases}$$

$$\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})$$

$$\lambda = \begin{cases} \text{lod}_{\text{max}}, & \lambda' > \text{lod}_{\text{max}} \\ \lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\ \text{undefined}, & \text{lod}_{\text{min}} < \lambda' \end{cases}$$

where:

- $\text{sampler.bias} = \text{mipLodBias}$ (from sampler descriptor)
- $\text{shaderOp.bias} = \begin{cases} \text{Bias} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}$
- $\text{shaderOp.lod}_{\text{min}} = \text{minLod}$ (from sampler descriptor)
- $\text{lod}_{\text{min}} = \max(\text{sampler.lod}_{\text{min}}, \text{shaderOp.lod}_{\text{min}})$ (from sampler descriptor)
- $\text{lod}_{\text{max}} = \maxLod$ (from sampler descriptor)

and maxSamplerLodBias is the value of the `VkPhysicalDeviceLimits` feature `maxSamplerLodBias`.

**Image Level(s) Selection**

The image level(s) $d$, $d_{\text{hi}}$, and $d_{\text{lo}}$, which texels are read from are determined by an image-level parameter $d_l$, which is computed based on the LOD parameter, as follows:

$$d_l = \begin{cases} \text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\ d', & \text{otherwise} \end{cases}$$

where:

$$d' = \text{level}_{\text{base}} + \text{clamp}(\lambda, 0, q)$$
\[
\text{nearest}(d') = \begin{cases} 
[d' + 0.5] - 1, & \text{preferred} \\
[d' + 0.5], & \text{alternative}
\end{cases}
\]

and:

\[
\begin{align*}
\text{level}_\text{base} &= \text{baseMipLevel} \\
q &= \text{levelCount} - 1
\end{align*}
\]

\text{baseMipLevel} \text{ and } \text{levelCount} \text{ are taken from the subresourceRange of the image view.}

If the sampler's \text{mipmapMode} is \text{VK_SAMPLER_MIPMAP_MODE_NEAREST}, then the level selected is \(d = d\).

If the sampler's \text{mipmapMode} is \text{VK_SAMPLER_MIPMAP_MODE_LINEAR}, two neighboring levels are selected:

\[
\begin{align*}
d_{hi} &= \lfloor d \rfloor \\
d_{lo} &= \min(d_{hi} + 1, \text{level}_\text{base} + q) \\
\delta &= d_l - d_{hi}
\end{align*}
\]

\(\delta\) is the fractional value, quantized to the number of \text{mipmap precision bits}, used for \text{linear filtering} between levels.

16.5.8. \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in \text{filtering} (either \(d\), or \(d_{hi}\) and \(d_{lo}\)).

\[
\begin{align*}
\begin{align*}
u(x, y) &= s(x, y) \times \text{width}_{\text{scale}} + \Delta_i & \text{for 1D images} \\
v(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\
0 & \text{otherwise}
\end{cases} \\
w(x, y) &= \begin{cases} 0 & \text{for 2D or Cube images} \\
r(x, y) \times \text{depth}_{\text{scale}} + \Delta_k & \text{otherwise}
\end{cases} \\
a(x, y) &= \begin{cases} a(x, y) & \text{for array images} \\
0 & \text{otherwise}
\end{cases}
\end{align*}
\]

where:

\[
\begin{align*}
\text{width}_{\text{scale}} &= \text{width}_{\text{level}} \\
\text{height}_{\text{scale}} &= \text{height}_{\text{level}} \\
\text{depth}_{\text{scale}} &= \text{depth}_{\text{level}}
\end{align*}
\]
and where \((\Delta_i, \Delta_j, \Delta_k)\) are taken from the image instruction if it includes a \texttt{ConstOffset} or \texttt{Offset} operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

### 16.6. Unnormalized Texel Coordinate Operations

#### 16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation and Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:

\[
l = \text{clamp}(\text{RNE}(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer}
\]

where \text{layerCount} is the number of layers in the image subresource range of the image view, \text{baseArrayLayer} is the first layer from the subresource range, and where:

\[
\text{RNE}(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
[a + 0.5] & \text{alternative}
\end{cases}
\]

The sample index \(n\) is assigned the value 0.

Nearest filtering (\texttt{VK_FILTER_NEAREST}) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + \text{shift} \rfloor \\
j = \lfloor v + \text{shift} \rfloor \\
k = \lfloor w + \text{shift} \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

Linear filtering (\texttt{VK_FILTER_LINEAR}) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \(i_0\) or \(i_1\), \(j_0\) or \(j_1\), \(k_0\) or \(k_1\), as well as weights \(\alpha\), \(\beta\), and \(\gamma\).

\[
i_0 = \lfloor u - \text{shift} \rfloor \\
i_1 = i_0 + 1 \\
j_0 = \lfloor v - \text{shift} \rfloor \\
j_1 = j_0 + 1 \\
k_0 = \lfloor w - \text{shift} \rfloor \\
k_1 = k_0 + 1
\]
\begin{align*}
\alpha &= \text{frac}(u - shift) \\
\beta &= \text{frac}(v - shift) \\
\gamma &= \text{frac}(w - shift)
\end{align*}

where:

\[ \text{shift} = 0.5 \]

and where:

\[ \text{frac}(x) = x - \lfloor x \rfloor \]

where the number of fraction bits retained is specified by \texttt{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

### 16.7. Integer Texel Coordinate Operations

The \texttt{OpImageFetch} and \texttt{OpImageFetchSparse} SPIR-V instructions \textbf{may} supply a LOD from which texels are to be fetched using the optional SPIR-V operand \texttt{Lod}. Other integer-coordinate operations \textbf{must} not. If the \texttt{Lod} is provided then it \textbf{must} be an integer.

The image level selected is:

\[ d = \text{level}_{\text{base}} + \begin{cases} 
Lod & \text{(from optional SPIR-V operand)} \\
0 & \text{otherwise}
\end{cases} \]

If \( d \) does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) then any values fetched are undefined, and any writes (if supported) are discarded.

### 16.8. Image Sample Operations

#### 16.8.1. Wrapping Operation

\textbf{Cube} images ignore the wrap modes specified in the sampler. Instead, if \texttt{VK_FILTER_NEAREST} is used within a mip level then \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE} is used, and if \texttt{VK_FILTER_LINEAR} is used within a mip level then sampling at the edges is performed as described earlier in the \textbf{Cube map edge handling} section.

The first integer texel coordinate \( i \) is transformed based on the \texttt{addressModeU} parameter of the sampler.
where:

\[
\text{mirror} (n) = \begin{cases} 
  n & \text{for } n \geq 0 \\
  -(1 + n) & \text{otherwise}
\end{cases}
\]

j (for 2D and Cube image) and k (for 3D image) are similarly transformed based on the `addressModeV` and `addressModeW` parameters of the sampler, respectively.

### 16.8.2. Texel Gathering

SPIR-V instructions with `Gather` in the name return a vector derived from 4 texels in the base level of the image view. The rules for the `VK_FILTER_LINEAR` minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then swizzled. A four-component vector is then assembled by taking the component indicated by the `Component` value in the instruction from the swizzled color value of the four texels. If the operation does not use the `ConstOffsets` image operand then the four texels form the $2 \times 2$ rectangle used for texture filtering:

\[
\begin{aligned}
\tau[R] &= \tau_{i0,j1}[\text{level}_{\text{base}},\text{comp}] \\
\tau[G] &= \tau_{i1,j1}[\text{level}_{\text{base}},\text{comp}] \\
\tau[B] &= \tau_{i1,j0}[\text{level}_{\text{base}},\text{comp}] \\
\tau[A] &= \tau_{i0,j0}[\text{level}_{\text{base}},\text{comp}]
\end{aligned}
\]

If the operation does use the `ConstOffsets` image operand then the offsets allow a custom filter to be defined:

\[
\begin{aligned}
\tau[R] &= \tau_{i0,j0} + \Delta_0[\text{level}_{\text{base}},\text{comp}] \\
\tau[G] &= \tau_{i0,j0} + \Delta_1[\text{level}_{\text{base}},\text{comp}] \\
\tau[B] &= \tau_{i0,j0} + \Delta_2[\text{level}_{\text{base}},\text{comp}] \\
\tau[A] &= \tau_{i0,j0} + \Delta_3[\text{level}_{\text{base}},\text{comp}]
\end{aligned}
\]

where:

\[
\tau[\text{level}_{\text{base}}][\text{comp}] = \begin{cases} 
  \tau[\text{level}_{\text{base}}][R], & \text{for } \text{comp} = 0 \\
  \tau[\text{level}_{\text{base}}][G], & \text{for } \text{comp} = 1 \\
  \tau[\text{level}_{\text{base}}][B], & \text{for } \text{comp} = 2 \\
  \tau[\text{level}_{\text{base}}][A], & \text{for } \text{comp} = 3
\end{cases}
\]

`comp` from SPIR-V operand `Component`
OpImage*Gather must not be used on a sampled image with sampler Y’CbCr conversion enabled.

16.8.3. Texel Filtering

Texel filtering is first performed for each level (either \( d \) or \( d_{hi} \) and \( d_{lo} \)).

If \( \lambda \) is less than or equal to zero, the texture is said to be magnified, and the filter mode within a mip level is selected by the \texttt{magFilter} in the sampler. If \( \lambda \) is greater than zero, the texture is said to be minified, and the filter mode within a mip level is selected by the \texttt{minFilter} in the sampler.

**Texel Nearest Filtering**

Within a mip level, \texttt{VK_FILTER_NEAREST} filtering selects a single value using the \((i, j, k)\) texel coordinates, with all texels taken from layer \( l \).

\[
\tau[level] = \begin{cases} 
\tau_{ijk}[level], & \text{for 3D image} \\
\tau_{ij}[level], & \text{for 2D or Cube image} \\
\tau_{i}[level], & \text{for 1D image}
\end{cases}
\]

**Texel Linear Filtering**

Within a mip level, \texttt{VK_FILTER_LINEAR} filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

\[
\begin{align*}
\tau_{i0} &= (1 - \alpha) \\
\tau_{i1} &= (\alpha) \\
\tau_{j0} &= (1 - \beta) \\
\tau_{j1} &= (\beta) \\
\tau_{k0} &= (1 - \gamma) \\
\tau_{k1} &= (\gamma)
\end{align*}
\]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The \texttt{VkSamplerReductionModeCreateInfo::reductionMode} can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the \texttt{reductionMode} is set (explicitly or implicitly) to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, a weighted average is computed:

\[
\text{weighted average} = \sum_{i=0}^{n} \tau_{i}[level] \times w_i
\]
However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level, \( \tau = \tau[d] \).

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels (\( \tau[hi] \) and \( \tau[lo] \)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
\begin{align*}
    w_{hi} &= (1 - \delta) \\
    w_{lo} &= (\delta)
\end{align*}
\]

The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent.
Implementations should consider the \texttt{magFilter}, \texttt{minFilter} and \texttt{mipmapMode} of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations should consider \texttt{minLod} and \texttt{maxLod} of the sampler.

\textbf{Note}

For historical reasons, vendor implementations of anisotropic filtering interpret these sampler parameters in different ways, particularly in corner cases such as \texttt{magFilter}, \texttt{minFilter} of \texttt{NEAREST} or \texttt{maxAnisotropy} equal to 1.0. Applications should not expect consistent behavior in such cases, and should use anisotropic filtering only with parameters which are expected to give a quality improvement relative to \texttt{LINEAR} filtering.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case; implementations may choose other methods:

Given a \texttt{magFilter}, \texttt{minFilter} of \texttt{VK_FILTER_LINEAR} and a \texttt{mipmapMode} of \texttt{VK_SAMPLER_MIPMAP_MODE_NEAREST}:

Instead of a single isotropic sample, \( N \) isotropic samples are sampled within the image footprint of the image level \( d \) to approximate an anisotropic filter. The sum \( \tau_{2D \text{aniso}} \) is defined using the single isotropic \( \tau_{2D}(u,v) \) at level \( d \).

\[
\tau_{2D \text{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u \left( x - \frac{1}{2} + \frac{i}{N+1}, y \right), v \left( x - \frac{1}{2} + \frac{i}{N+1}, y \right)). \quad \text{when } \rho_x > \rho_y
\]

\[
\tau_{2D \text{aniso}} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}(u \left( x, y - \frac{1}{2} + \frac{i}{N+1}, v \left( x, y - \frac{1}{2} + \frac{i}{N+1} \right) \right)). \quad \text{when } \rho_y \geq \rho_x
\]

When \texttt{VkSamplerReductionModeCreateInfo}::\texttt{reductionMode} is set to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, the above summation is used. However, if the reduction mode is \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX}, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except \texttt{OpImageWrite}.
- Depth Comparison: Performed by \texttt{OpImage*Dref} instructions.
- All Texel output operations: Performed by \texttt{OpImageWrite}.
- Projection: Performed by all \texttt{OpImage*Proj} instructions.
- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, LOD Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all \texttt{OpImageSample*} and \texttt{OpImageSparseSample*} instructions.
• (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all OpImageSample, OpImageSparseSample, and OpImage*Gather instructions.

• Texel Gathering: Performed by OpImage*Gather instructions.

• Texel Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.

• Sparse Residency: Performed by all OpImageSparse* instructions.

16.10. Image Query Instructions

16.10.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, then the value returned is undefined.

16.10.2. Lod Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. The steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, LOD Operation and Image Level(s) Selection. The return value is the vector (λ', d). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Feedback Queries and Timestamp Queries. Performance Queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

17.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
#define VK_QUERY_POOL_HANDLE

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice device,
    const VkQueryPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkQueryPool* pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pQueryPool` is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.

Valid Usage (Implicit)

- `VUID-vkCreateQueryPool-device-parameter` device must be a valid VkDevice handle
• VUID-vkCreateQueryPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkQueryPoolCreateInfo structure

• VUID-vkCreateQueryPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a validVkAllocationCallbacks structure

• VUID-vkCreateQueryPool-pQueryPool-parameter
  pQueryPool must be a valid pointer to a VkQueryPool handle

---

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

The VkQueryPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `queryType` is a VkQueryType value specifying the type of queries managed by the pool.
- `queryCount` is the number of queries managed by the pool.
- `pipelineStatistics` is a bitmask of VkQueryPipelineStatisticFlagBits specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

`pipelineStatistics` is ignored if `queryType` is not VK_QUERY_TYPE_PIPELINE_STATISTICS.

---

## Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
  If the pipelineStatisticsQuery feature is not enabled, `queryType` must not be
VK_QUERY_TYPE_PIPELINE_STATISTICS

- VUID-VkQueryPoolCreateInfo-queryType-00792
  If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS`, `pipelineStatistics` must be a valid combination of `VkQueryPipelineStatisticFlagBits` values

- VUID-VkQueryPoolCreateInfo-queryType-03222
  If `queryType` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `pNext` chain must include a `VkQueryPoolPerformanceCreateInfoKHR` structure

- VUID-VkQueryPoolCreateInfo-queryCount-02763
  `queryCount` must be greater than 0

- VUID-VkQueryPoolCreateInfo-queryType-07133
  If `queryType` is `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then the `pNext` chain must include a `VkVideoProfileInfoKHR` structure with `videoCodecOperation` specifying an encode operation

- VUID-VkQueryPoolCreateInfo-queryType-07906
  If `queryType` is `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then the `pNext` chain must include a `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` structure

- VUID-VkQueryPoolCreateInfo-queryType-07907
  If `queryType` is `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, and the `pNext` chain includes a `VkVideoProfileInfoKHR` structure and a `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` structure, then `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` must not contain any bits that are not set in `VkVideoEncodeCapabilitiesKHR::supportedEncodeFeedbackFlags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile described by `VkVideoProfileInfoKHR` and its `pNext` chain

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO`

- VUID-VkQueryPoolCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueryPoolPerformanceCreateInfoKHR`, `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR`, `VkVideoDecodeH264ProfileInfoKHR`, `VkVideoDecodeH265ProfileInfoKHR`, `VkVideoDecodeUsageInfoKHR`, `VkVideoEncodeH264ProfileInfoKHR`, `VkVideoEncodeH265ProfileInfoKHR`, `VkVideoEncodeUsageInfoKHR`, or `VkVideoProfileInfoKHR`

- VUID-VkQueryPoolCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  `flags` must be 0

- VUID-VkQueryPoolCreateInfo-queryType-parameter
  `queryType` must be a valid `VkQueryType` value
typedef VkFlags VkQueryPoolCreateFlags;

VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family index to create this performance query pool for.
- **counterIndexCount** is the length of the pCounterIndices array.
- **pCounterIndices** is a pointer to an array of indices into the vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters to enable in this performance query pool.

**Valid Usage**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  queueFamilyIndex must be a valid queue family index of the device

- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  The performanceCounterQueryPools feature must be enabled

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
  Each element of pCounterIndices must be in the range of counters reported by vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR for the queue family specified in queueFamilyIndex

**Valid Usage (Implicit)**

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
  pCounterIndices must be a valid pointer to an array of counterIndexCount uint32_t values

- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
To query the number of passes required to query a performance query pool on a physical device, call:

```c
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
    uint32_t* pNumPasses);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `pPerformanceQueryCreateInfo` is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.
- `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` must be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter `pPerformanceQueryCreateInfo` must be a valid pointer to a valid `VkQueryPoolPerformanceCreateInfoKHR` structure
- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter `pNumPasses` must be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    const VkAllocationCallbacks* pAllocator);
```
• device is the logical device that destroys the query pool.
• queryPool is the query pool to destroy.
• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to queryPool must have completed execution

• VUID-vkDestroyQueryPool-queryPool-00794
  If VkAllocationCallbacks were provided when queryPool was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyQueryPool-queryPool-00795
  If no VkAllocationCallbacks were provided when queryPool was created, pAllocator must be NULL

Note
Applications can verify that queryPool can be destroyed by checking that vkGetQueryPoolResults() without the VK_QUERY_RESULT_PARTIAL_BIT flag returns VK_SUCCESS for all queries that are used in command buffers submitted for execution.

Valid Usage (Implicit)

• VUID-vkDestroyQueryPool-device-parameter
  device must be a valid VkDevice handle

• VUID-vkDestroyQueryPool-queryPool-parameter
  If queryPool is not VK_NULL_HANDLE, queryPool must be a valid VkQueryPool handle

• VUID-vkDestroyQueryPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyQueryPool-queryPool-parent
  If queryPool is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to queryPool must be externally synchronized

Possible values of VkQueryPoolCreateInfo::queryType, specifying the type of queries managed by the pool, are:
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    // Provided by VK_KHR_video_queue
    VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,
    // Provided by VK_KHR_performance_query
    VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR = 1000116000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR = 1000150000,
    // Provided by VK_KHR_acceleration_structure
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR = 1000150001,
    // Provided by VK_KHR_video_encode_queue
    VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR = 1000299000,
    // Provided by VK_KHR_ray_tracing_maintenance1
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR = 1000386000,
    // Provided by VK_KHR_ray_tracing_maintenance1
    VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR = 1000386001,
    // Provided by VK_EXT_opacity_micromap
    VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT = 1000396000,
    // Provided by VK_EXT_opacity_micromap
    VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT = 1000396001,
} VkQueryType;

- VK_QUERY_TYPE_OCCLUSION specifies an occlusion query.
- VK_QUERY_TYPE_PIPELINE_STATISTICS specifies a pipeline statistics query.
- VK_QUERY_TYPE_TIMESTAMP specifies a timestamp query.
- VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR specifies a performance query.
- VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR specifies an acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.
- VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR specifies a serialization acceleration structure size query.
- VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR specifies an acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.
- VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR specifies a serialization acceleration structure pointer count query.
- VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR specifies a result status query.
- VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR specifies a video encode feedback query.
17.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either *unavailable* or *available*, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPool` sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of `vkCmdEndQuery`, `vkCmdWriteTimestamp2`, or `vkCmdWriteTimestamp`. Both the availability status and numerical results can be retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

After query pool creation, each query is in an uninitialized state and must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to `vkCmdBeginQuery` must execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur earlier in submission order.
The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable for each pass of `queryPool`, as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Valid Usage**

- **VUID-vkCmdResetQueryPool-firstQuery-09436**
  
  `firstQuery` must be less than the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-firstQuery-09437**
  
  The sum of `firstQuery` and `queryCount` must be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-None-02841**
  
  All queries used by the command must not be active

- **VUID-vkCmdResetQueryPool-firstQuery-02862**
  
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries \([firstQuery, firstQuery + queryCount - 1]\)

**Valid Usage (Implicit)**

- **VUID-vkCmdResetQueryPool-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdResetQueryPool-queryPool-parameter**
  
  `queryPool` must be a valid `VkQueryPool` handle

- **VUID-vkCmdResetQueryPool-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdResetQueryPool-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute,
decode, or encode operations

- VUID-vkCmdResetQueryPool-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdResetQueryPool-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

To reset a range of queries in a query pool on the host, call:

```c
// Provided by VK_VERSION_1_2
void vkResetQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the handle of the query pool managing the queries being reset.
- `firstQuery` is the initial query index to reset.
- `queryCount` is the number of queries to reset.

This command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.
If queryPool is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR this command sets the status of query indices [firstQuery, firstQuery + queryCount - 1] to unavailable for each pass.

**Valid Usage**

- **VUID-vkResetQueryPool-firstQuery-09436**
  firstQuery **must** be less than the number of queries in queryPool

- **VUID-vkResetQueryPool-firstQuery-09437**
  The sum of firstQuery and queryCount **must** be less than or equal to the number of queries in queryPool

- **VUID-vkResetQueryPool-None-02665**
  The hostQueryReset feature **must** be enabled

- **VUID-vkResetQueryPool-firstQuery-02741**
  Submitted commands that refer to the range specified by firstQuery and queryCount in queryPool **must** have completed execution

- **VUID-vkResetQueryPool-firstQuery-02742**
  The range of queries specified by firstQuery and queryCount in queryPool **must** not be in use by calls to vkGetQueryPoolResults or vkResetQueryPool in other threads

**Valid Usage (Implicit)**

- **VUID-vkResetQueryPool-device-parameter**
  device **must** be a valid VkDevice handle

- **VUID-vkResetQueryPool-queryPool-parameter**
  queryPool **must** be a valid VkQueryPool handle

- **VUID-vkResetQueryPool-queryPool-parent**
  queryPool **must** have been created, allocated, or retrieved from device

Once queries are reset and ready for use, query commands **can** be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a vkCmdBeginQuery command and a vkCmdEndQuery command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query **must** begin and end in the same command buffer, although if it is a primary command buffer, and the inheritedQueries feature is enabled, it **can** execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it **must** set the occlusionQueryEnable, queryFlags, and/or pipelineStatistics members of VkCommandBufferInheritanceInfo to conservative values, as described in the Command Buffer Recording section. A query **must** either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).
If queries are used while executing a render pass instance that has multiview enabled, the query uses \(N\) consecutive query indices in the query pool (starting at \(\text{query}\)) where \(N\) is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view’s results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries must accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering must not span subpasses, i.e. they must begin and end in the same subpass.

A query must either begin and end inside the same video coding scope, or must both begin and end outside of a video coding scope and must not contain entire video coding scopes.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer commandBuffer,   // Provided by VK_VERSION_1_0
    VkQueryPool queryPool,          // Provided by VK_VERSION_1_0
    uint32_t query,                 // Provided by VK_VERSION_1_0
    VkQueryControlFlags flags);    // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation must return a result that matches the actual number of samples passed. This is described in more detail in Occlusion Queries.

After beginning a query, that query is considered active within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

Furthermore, if the query is started within a video coding scope, the following command buffer states are initialized for the query type:

- The `active_query_index` is set to the value specified by `query`.
- The `last activatable query index` is also set to the value specified by `query`.

Each video coding operation stores a result to the query corresponding to the current active query index, followed by incrementing the active query index. If the active query index gets incremented past the last activatable query index, issuing any further video coding operations results in
undefined behavior.

**Note**

In practice, this means that currently no more than a single video coding operation **must** be issued between a begin and end query pair.

This command defines an execution dependency between other query commands that reference the same query.

The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in **submission order**.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in **submission order**.

The operation of this command happens after the first scope and happens before the second scope.

**Valid Usage**

- VUID-vkCmdBeginQuery-None-00807
  
  All queries used by the command **must** be **unavailable**

- VUID-vkCmdBeginQuery-queryType-02804
  
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- VUID-vkCmdBeginQuery-queryType-04728
  
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- VUID-vkCmdBeginQuery-queryType-06741
  
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`

- VUID-vkCmdBeginQuery-queryType-00800
  
  If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- VUID-vkCmdBeginQuery-queryType-00802
  
  `query` **must** be less than the number of queries in `queryPool`

- VUID-vkCmdBeginQuery-queryType-00803
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdBeginQuery-queryType-00804
  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdBeginQuery-queryType-00805
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

• VUID-vkCmdBeginQuery-commandBuffer-01885
  `commandBuffer` must not be a protected command buffer

• VUID-vkCmdBeginQuery-query-00808
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in `queryPool`

• VUID-vkCmdBeginQuery-queryType-07126
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then the `VkCommandPool` that `commandBuffer` was allocated from must have been created with a queue family index that supports result status queries, as indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport`

• VUID-vkCmdBeginQuery-None-07127
  If there is a bound video session, then there must be no active queries

• VUID-vkCmdBeginQuery-None-08370
  If there is a bound video session, then it must not have been created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`

• VUID-vkCmdBeginQuery-queryType-07128
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS ONLY_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with

• VUID-vkCmdBeginQuery-queryType-07129
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be a bound video session

• VUID-vkCmdBeginQuery-queryType-07130
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR` and there is a bound video session, then `queryPool` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with

• VUID-vkCmdBeginQuery-queryType-07131
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_RESULT_STATUS ONLY_KHR` or `VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR`, then there must be no bound video session

• VUID-vkCmdBeginQuery-queryPool-01922
  `queryPool` must have been created with a `queryType` that differs from that of any queries that are active within `commandBuffer`

• VUID-vkCmdBeginQuery-queryPool-07289
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` `queryPool` was created with
**must** equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from

- **VUID-vkCmdBeginQuery-queryPool-03223**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`

- **VUID-vkCmdBeginQuery-queryPool-03224**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`

- **VUID-vkCmdBeginQuery-queryPool-03225**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the begin command **must** not be recorded within a render pass instance

- **VUID-vkCmdBeginQuery-queryPool-03226**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature **must** be enabled

- **VUID-vkCmdBeginQuery-None-02863**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginQuery-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBeginQuery-queryPool-parameter**
  `queryPool` **must** be a valid `VkQueryPool` handle

- **VUID-vkCmdBeginQuery-flags-parameter**
  `flags` **must** be a valid combination of `VkQueryControlFlagBits` values

- **VUID-vkCmdBeginQuery-commandBuffer-recording**
  `commandBuffer` **must** be in the `recording` state

- **VUID-vkCmdBeginQuery-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, compute, decode, or encode operations

- **VUID-vkCmdBeginQuery-commonparent**
  Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

<td></td>
<td>Decode</td>
<td></td>
</tr>
<tr>
<td>Both</td>
<td></td>
<td></td>
<td>Encode</td>
<td></td>
</tr>
</tbody>
</table>

Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

- `VK_QUERY_CONTROL_PRECISE_BIT` specifies the precision of occlusion queries.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;
```

`VkQueryControlFlags` is a bitmask type for setting a mask of zero or more `VkQueryControlFlagBits`.

To end a query after the set of desired drawing or dispatching commands is executed, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
• `query` is the query index within the query pool where the result is stored.

The command completes the query in `queryPool` identified by `query`, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

### Valid Usage

- **VUID-vkCmdEndQuery-None-01923**
  All queries used by the command **must** be active

- **VUID-vkCmdEndQuery-query-00810**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdEndQuery-commandBuffer-01886**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdEndQuery-query-00812**
  If `vkCmdEndQuery` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdEndQuery-queryPool-03227**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the `vkCmdEndQuery` **must** be the last recorded command in `commandBuffer`

- **VUID-vkCmdEndQuery-queryPool-03228**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the `vkCmdEndQuery` **must** not be recorded within a render pass instance

- **VUID-vkCmdEndQuery-None-07007**
  If called within a subpass of a render pass instance, the corresponding `vkCmdBeginQuery`* command **must** have been called previously within the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndQuery-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndQuery-queryPool-parameter**
  `queryPool` **must** be a valid `VkQueryPool` handle
VUID-vkCmdEndQuery-commandBuffer-recording
commandBuffer must be in the recording state

VUID-vkCmdEndQuery-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

VUID-vkCmdEndQuery-commonparent
Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a VkBuffer. In either case, the layout in memory is defined as follows:

• The first query’s result is written starting at the first byte requested by the command, and each subsequent query’s result begins stride bytes later.

• Occlusion queries, pipeline statistics queries, video encode feedback queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

• Performance queries store results in a tightly packed array whose type is determined by the unit member of the corresponding VkPerformanceCounterKHR.

• If VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is used, the final element of each query’s result is an integer indicating whether the query’s result is available, with any non-zero value indicating that it is available.

• If VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is used, the final element of each query’s result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes
are encoded in the `VkQueryResultStatusKHR` enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one `VkPerformanceCounterResultKHR` value for each `VkPerformanceCounterKHR` in the query. Video encode feedback queries write one or more integer values for each bit that is enabled in `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` when the pool is created, and the feedback values are written in bit order starting from the least significant bit, as described here.

- If more than one query is retrieved and `stride` is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
```

- `device` is the logical device that owns the query pool.
- `queryPool` is the query pool managing the queries containing the desired results.
- `firstQuery` is the initial query index.
- `queryCount` is the number of queries to read.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written
- `stride` is the stride in bytes between results for individual queries within `pData`.
- `flags` is a bitmask of `VkQueryResultFlagBits` specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

If no bits are set in `flags`, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. Behavior when not all queries are available is described below.

If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `pData`, along with an extra availability or status value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are
available. The size of the availability or status values is 64 bits if \( \text{VK_QUERY_RESULT_64_BIT} \) is set in \( \text{flags} \). Otherwise, it is 32 bits.

If \( \text{VK_QUERY_RESULT_WITH_STATUS_BIT_KHR} \) is set, results for all queries in \( \text{queryPool} \) identified by \( \text{firstQuery} \) and \( \text{queryCount} \) are copied to \( \text{pData} \), along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

\( \text{VkQueryResultStatusKHR} \) defines specific meaning for values returned here, though implementations are free to return other values.

If the status value written is negative, indicating that the operations within the query completed unsuccessfully, then all other results written by this command are undefined unless otherwise specified for any of the results of the used query type.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>If ( \text{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} ) or ( \text{VK_QUERY_RESULT_WITH_STATUS_BIT_KHR} ) is set, the layout of data in the buffer is a ((\text{result,availability})) or ((\text{result, status})) pair for each query returned, and ( \text{stride} ) is the stride between each pair.</td>
</tr>
</tbody>
</table>

Results for any available query written by this command are final and represent the final result of the query. If \( \text{VK_QUERY_RESULT_PARTIAL_BIT} \) is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If \( \text{VK_QUERY_RESULT_64_BIT} \) is set, results and, if returned, availability or status values for all queries are written as an array of 64-bit values. If the \( \text{queryPool} \) was created with \( \text{VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR} \), results for each query are written as an array of the type indicated by \( \text{VkPerformanceCounterKHR}::\text{storage} \) for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value may either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating point query's value is not representable as the result type, the value is undefined.

If \( \text{VK_QUERY_RESULT_WAIT_BIT} \) is set, this command defines an execution dependency with any earlier commands that writes one of the identified queries. The first \( \text{synchronization scope} \) includes all instances of \( \text{vkCmdEndQuery}, \text{vkCmdWriteTimestamp2}, \) and \( \text{vkCmdWriteTimestamp} \) that reference any query in \( \text{queryPool} \) indicated by \( \text{firstQuery} \) and \( \text{queryCount} \). The second \( \text{synchronization scope} \) includes the host operations of this command.

If \( \text{VK_QUERY_RESULT_WAIT_BIT} \) is not set, \( \text{vkGetQueryPoolResults} \) may return \( \text{VK_NOT_READY} \) if there are queries in the unavailable state.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>Applications ( \textbf{must} ) take care to ensure that use of the ( \text{VK_QUERY_RESULT_WAIT_BIT} ) bit has the desired effect.</td>
</tr>
</tbody>
</table>
For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications can use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status may reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Note

Applications can double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

---

Valid Usage

- VUID-vkGetQueryPoolResults-firstQuery-09436
  firstQuery must be less than the number of queries in queryPool

- VUID-vkGetQueryPoolResults-firstQuery-09437
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkGetQueryPoolResults-queryCount-09438
  If queryCount is greater than 1, stride must not be zero

- VUID-vkGetQueryPoolResults-queryType-09439
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- VUID-vkGetQueryPoolResults-queryType-09440
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, VK_QUERY_RESULT_PARTIAL_BIT, or VK_QUERY_RESULT_64_BIT

- VUID-vkGetQueryPoolResults-queryType-09441
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkGetQueryPoolResults-queryType-09442
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR
• **VUID-vkGetQueryPoolResults-flags-09443**  
  If `flags` includes `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`, then it **must** not include `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`.

• **VUID-vkGetQueryPoolResults-None-09401**  
  All queries used by the command **must** not be uninitialized.

• **VUID-vkGetQueryPoolResults-flags-02828**  
  If `VK_QUERY_RESULT_64_BIT` is not set in `flags` and the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` **must** be multiples of 4.

• **VUID-vkGetQueryPoolResults-flags-00815**  
  If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `pData` and `stride` **must** be multiples of 8.

• **VUID-vkGetQueryPoolResults-stride-08993**  
  If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, `stride` **must** be large enough to contain the unsigned integer representing availability or status in addition to the query result.

• **VUID-vkGetQueryPoolResults-queryType-03229**  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` **must** be multiples of the size of `VkPerformanceCounterResultKHR`.

• **VUID-vkGetQueryPoolResults-queryType-04519**  
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `stride` **must** be large enough to contain the `VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount` used to create `queryPool` times the size of `VkPerformanceCounterResultKHR`.

• **VUID-vkGetQueryPoolResults-dataSize-00817**  
  `dataSize` **must** be large enough to contain the result of each query, as described [here](#).

---

**Valid Usage (Implicit)**

• **VUID-vkGetQueryPoolResults-device-parameter**  
  `device` **must** be a valid `VkDevice` handle.

• **VUID-vkGetQueryPoolResults-queryPool-parameter**  
  `queryPool` **must** be a valid `VkQueryPool` handle.

• **VUID-vkGetQueryPoolResults-pData-parameter**  
  `pData` **must** be a valid pointer to an array of `dataSize` bytes.

• **VUID-vkGetQueryPoolResults-flags-parameter**  
  `flags` **must** be a valid combination of `VkQueryResultFlagBits` values.

• **VUID-vkGetQueryPoolResults-dataSize-arraylength**  
  `dataSize` **must** be greater than 0.

• **VUID-vkGetQueryPoolResults-queryPool-parent**  
  `queryPool` **must** have been created, allocated, or retrieved from `device`.
Return Codes

Success

• VK_SUCCESS
• VK_NOT_READY

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST

Bits which can be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    // Provided by VK_KHR_video_queue
    VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
} VkQueryResultFlagBits;
```

• **VK_QUERY_RESULT_64_BIT** specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.

• **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query’s status to become available before retrieving its results.

• **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.

• **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.

• **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a `VkQueryResultStatusKHR` value. See `result status query` for information on how an application can determine whether the use of this flag bit is supported.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

`VkQueryResultFlags` is a bitmask type for setting a mask of zero or more `VkQueryResultFlagBits`.

Specific status codes that can be returned from a query are:
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
    // Provided by VK_KHR_video_encode_queue
    VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR = -1000299000,
} VkQueryResultStatusKHR;

• VK_QUERY_RESULT_STATUS_NOT_READY_KHR indicates that the query result is not yet available.
• VK_QUERY_RESULT_STATUS_ERROR_KHR indicates that operations did not complete successfully.
• VK_QUERY_RESULT_STATUS_COMPLETE_KHR indicates that operations completed successfully and the query result is available.
• VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR indicates that a video encode operation did not complete successfully due to the destination video bitstream buffer range not being sufficiently large to fit the encoded bitstream data.

To copy query statuses and numerical results directly to buffer memory, call:

// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer,            commandBuffer,
    VkQueryPool queryPool,                     queryPool,
    uint32_t firstQuery,                       firstQuery,
    uint32_t queryCount,                       queryCount,
    VkBuffer dstBuffer,                       dstBuffer,
    VkDeviceSize dstOffset,                    dstOffset,
    VkDeviceSize stride,                      stride,
    VkQueryResultFlags flags);               flags);

• commandBuffer is the command buffer into which this command will be recorded.
• queryPool is the query pool managing the queries containing the desired results.
• firstQuery is the initial query index.
• queryCount is the number of queries. firstQuery and queryCount together define a range of queries.
• dstBuffer is a VkBuffer object that will receive the results of the copy command.
• dstOffset is an offset into dstBuffer.
• stride is the stride in bytes between results for individual queries within dstBuffer. The required size of the backing memory for dstBuffer is determined as described above for vkGetQueryPoolResults.
• flags is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.
Results for any query in \texttt{queryPool} identified by \texttt{firstQuery} and \texttt{queryCount} that is available are copied to \texttt{dstBuffer}.

If \texttt{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} is set, results for all queries in \texttt{queryPool} identified by \texttt{firstQuery} and \texttt{queryCount} are copied to \texttt{dstBuffer}, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If \texttt{VK_QUERY_RESULT_WITH_STATUS_BIT_KHR} is set, results for all queries in \texttt{queryPool} identified by \texttt{firstQuery} and \texttt{queryCount} are copied to \texttt{dstBuffer}, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

\texttt{VkQueryResultStatusKHR} defines specific meaning for values returned here, though implementations are free to return other values.

If the status value written is negative, indicating that the operations within the query completed unsuccessfully, then all other results written by this command are undefined unless otherwise specified for any of the results of the used query type.

Results for any available query written by this command are final and represent the final result of the query. If \texttt{VK_QUERY_RESULT_PARTIAL_BIT} is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If \texttt{VK_QUERY_RESULT_64_BIT} is set, results and availability or status values for all queries are written as an array of 64-bit values. If the \texttt{queryPool} was created with \texttt{VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR}, results for each query are written as an array of the type indicated by \texttt{VkPerformanceCounterKHR::storage} for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query's value overflows the result type, the value \texttt{may} either wrap or saturate. If a signed integer query's value overflows the result type, the value is undefined. If a floating point query's value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in \texttt{queryPool} indicated by \texttt{query} that occur earlier in submission order. If \texttt{flags} does not include \texttt{VK_QUERY_RESULT_WAIT_BIT}, \texttt{vkCmdWriteTimestamp2}, \texttt{vkCmdEndQuery}, and \texttt{vkCmdWriteTimestamp} are excluded from this scope.

The second synchronization scope includes all commands which reference the queries in \texttt{queryPool} indicated by \texttt{query} that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.
vkCmdCopyQueryPoolResults is considered to be a transfer operation, and its writes to buffer memory must be synchronized using VK_PIPELINE_STAGE_TRANSFER_BIT and VK_ACCESS_TRANSFER_WRITE_BIT before using the results.

### Valid Usage

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-09436**
  
  firstQuery must be less than the number of queries in queryPool

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-09437**
  
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- **VUID-vkCmdCopyQueryPoolResults-queryCount-09438**
  
  If queryCount is greater than 1, stride must not be zero

- **VUID-vkCmdCopyQueryPoolResults-queryType-09439**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- **VUID-vkCmdCopyQueryPoolResults-queryType-09440**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT_KHR, VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, VK_QUERY_RESULT_PARTIAL_BIT, or VK_QUERY_RESULT_64_BIT

- **VUID-vkCmdCopyQueryPoolResults-queryType-09441**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- **VUID-vkCmdCopyQueryPoolResults-queryType-09442**
  
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, then flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

- **VUID-vkCmdCopyQueryPoolResults-flags-09443**
  
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, then it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

- **VUID-vkCmdCopyQueryPoolResults-None-09402**
  
  All queries used by the command must not be uninitialized when the command is executed

- **VUID-vkCmdCopyQueryPoolResults-dstOffset-00819**
  
  dstOffset must be less than the size of dstBuffer

- **VUID-vkCmdCopyQueryPoolResults-flags-00822**
  
  If VK_QUERY_RESULT_64_BIT is not set in flags then dstOffset and stride must be multiples of 4

- **VUID-vkCmdCopyQueryPoolResults-flags-00823**
  
  If VK_QUERY_RESULT_64_BIT is set in flags then dstOffset and stride must be multiples of 8

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824**
  
  1062
dstBuffer must have enough storage, from dstOffset, to contain the result of each query, as described here

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyQueryPoolResults-queryType-03232
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies must be VK_TRUE

- VUID-vkCmdCopyQueryPoolResults-None-07429
All queries used by the command must not be active

- VUID-vkCmdCopyQueryPoolResults-None-08752
All queries used by the command must have been made available by prior executed commands

Valid Usage (Implicit)

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
queryPool must be a valid VkQueryPool handle

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

- VUID-vkCmdCopyQueryPoolResults-flags-parameter
flags must be a valid combination of VkQueryResultFlagBits values

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdCopyQueryPoolResults-renderpass
This command must only be called outside of a render pass instance

- VUID-vkCmdCopyQueryPoolResults-videocoding
This command must only be called outside of a video coding scope

- VUID-vkCmdCopyQueryPoolResults-commonparent
Each of commandBuffer, dstBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which may include vertices and some not.

17.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

**Note**

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

Setting `VK_QUERY_CONTROL_PRECISE_BIT` does not guarantee that different implementations return the same number of samples in an occlusion query. Some implementations may kill fragments in the pre-rasterization shader stage, and these killed fragments do not contribute to the final result of the query. It is possible that some implementations generate a zero result value for the query, while others generate a non-zero value.

When an occlusion query finishes, the result for that query is marked as available. The application
can then either copy the result to a buffer (via vkCmdCopyQueryPoolResults) or request it be put into host memory (via vkGetQueryPoolResults).

**Note**

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

### 17.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of VkPipeline counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the pipelineStatisticsQuery member of the VkPhysicalDeviceFeatures object (see vkGetPhysicalDeviceFeatures and vkCreateDevice for detecting and requesting this query type on a VkDevice).

A pipeline statistics query is begun and ended by calling vkCmdBeginQuery and vkCmdEndQuery, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set in VkQueryPoolCreateInfo::pipelineStatistics for query pools and in VkCommandBufferInheritanceInfo::pipelineStatistics for secondary command buffers, individually enabling pipeline statistics counters, are:

```c
typedef enum Vk_VERSION_1_0
    VkQueryPipelineStatisticFlagBits {
        VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
        VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
        VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
        VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
        VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
        VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
        VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
        VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
        VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
        VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
        VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
    } VkQueryPipelineStatisticFlagBits;
```

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices...
corresponding to incomplete primitives may contribute to the count.

- **VK_QUERY_PIPELINE_STATISTIC_INPUT.Assembly.PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter’s value is incremented each time a vertex shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter’s value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter’s value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions OpEndPrimitive or OpEndStreamPrimitive has no effect on the geometry shader output primitives count.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:
  - If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
  - Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter’s value is incremented each time the fragment shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of compute shader invocations. The counter’s value is
incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters may be affected by the issues described in Query Operation.

For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has rasterizerDiscardEnable enabled, implementations may discard primitives after the final pre-rasterization shader stage. As a result, if rasterizerDiscardEnable is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via vkCmdCopyQueryPoolResults), or request it be put into host memory (via vkGetQueryPoolResults).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

VkQueryPipelineStatisticFlags is a bitmask type for setting a mask of zero or more VkQueryPipelineStatisticFlagBits.

### 17.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.
To request a timestamp and write the value to memory, call:

```
// Provided by VK_VERSION_1_3
void vkCmdWriteTimestamp2(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **stage** specifies a stage of the pipeline.
- **queryPool** is the query pool that will manage the timestamp.
- **query** is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `stage`.

The second synchronization scope includes only the timestamp write operation.

**Note**

Implementations may write the timestamp at any stage that is logically later than `stage`.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the `VK_TIME_DOMAIN_DEVICE_KHR` time domain. If an overflow occurs, the timestamp value must wrap back to zero.

**Note**

Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp
from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and \( VK_{KHR}\_calibrated\_timestamps \) is enabled.

If \( \text{vkCmdWriteTimestamp2} \) is called while executing a render pass instance that has multiview enabled, the timestamp uses \( N \) consecutive query indices in the query pool (starting at \( \text{query} \)) where \( N \) is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All \( N \) queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all \( N \) queries to determine the total execution time.

### Valid Usage

- VUID-vkCmdWriteTimestamp2-stage-03929
  If the \( \text{geometryShader} \) feature is not enabled, stage must not contain \( \text{VK\_PIPELINE\_STAGE\_2\_GEOMETRY\_SHADER\_BIT} \)

- VUID-vkCmdWriteTimestamp2-stage-03930
  If the \( \text{tessellationShader} \) feature is not enabled, stage must not contain \( \text{VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_CONTROL\_SHADER\_BIT} \) or \( \text{VK\_PIPELINE\_STAGE\_2\_TESSELLATION\_EVALUATION\_SHADER\_BIT} \)

- VUID-vkCmdWriteTimestamp2-stage-07317
  If the \( \text{attachmentFragmentShadingRate} \) feature is not enabled, stage must not contain \( \text{VK\_PIPELINE\_STAGE\_2\_FRAGMENT\_SHADING\_RATE\_ATTACHMENT\_BIT\_KHR} \)

- VUID-vkCmdWriteTimestamp2-stage-07947
  If the \( \text{rayTracingPipeline} \) feature is not enabled, stage must not contain \( \text{VK\_PIPELINE\_STAGE\_2\_RAY\_TRACING\_SHADER\_BIT\_KHR} \)

- VUID-vkCmdWriteTimestamp2-synchronization2-03858
  The \( \text{synchronization2} \) feature must be enabled

- VUID-vkCmdWriteTimestamp2-stage-03859
  stage must only include a single pipeline stage

- VUID-vkCmdWriteTimestamp2-stage-03860
  stage must only include stages valid for the queue family that was used to create the command pool that \( \text{commandBuffer} \) was allocated from

- VUID-vkCmdWriteTimestamp2-queryPool-03861
queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

- VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
  The command pool's queue family must support a non-zero timestampValidBits

- VUID-vkCmdWriteTimestamp2-query-04903
  query must be less than the number of queries in queryPool

- VUID-vkCmdWriteTimestamp2-None-03864
  All queries used by the command must be unavailable

- VUID-vkCmdWriteTimestamp2-query-03865
  If vkCmdWriteTimestamp2 is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

Valid Usage (Implicit)

- VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteTimestamp2-stage-parameter
  stage must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-vkCmdWriteTimestamp2-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteTimestamp2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

- VUID-vkCmdWriteTimestamp2-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `pipelineStage`.

The second synchronization scope includes only the timestamp write operation.

**Note**

Implementations may write the timestamp at any stage that is logically later than stage.

Any timestamp write that happens-after another timestamp write in the same submission must not have a lower value unless its value overflows the maximum supported integer bit width of the query. If `VK_KHR_calibrated_timestamps` is enabled, this extends to timestamp writes across all submissions on the same logical device: any timestamp write that happens-after another must not have a lower value unless its value overflows the maximum supported integer bit width of the query. Timestamps written by this command must be in the `VK_TIME_DOMAIN_DEVICE_KHR` time domain. If an overflow occurs, the timestamp value must wrap back to zero.

**Note**
Comparisons between timestamps should be done between timestamps where they are guaranteed to not decrease. For example, subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands is only a reliable measurement if the two timestamp writes were performed in the same submission, or if the writes were performed on the same logical device and `VK_KHR_calibrated_timestamps` is enabled.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.
- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

### Valid Usage

- **VUID-vkCmdWriteTimestamp-pipelineStage-04074**
  
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- **VUID-vkCmdWriteTimestamp-pipelineStage-04075**
  
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be
  
  `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04076**
  
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be
  
  `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
  
  `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-fragmentShadingRate-07315**
  
  If the `attachmentFragmentShadingRate` feature is not enabled, `pipelineStage` must not be
  
  `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdWriteTimestamp-synchronization2-06489**
  
  If the `synchronization2` feature is not enabled, `pipelineStage` must not be
  
  `VK_PIPELINE_STAGE_NONE`

- **VUID-vkCmdWriteTimestamp-rayTracingPipeline-07944**
  
  If the `rayTracingPipeline` feature is not enabled, `pipelineStage` must not be
  
  `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`
• VUID-vkCmdWriteTimestamp-queryPool-01416
queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

• VUID-vkCmdWriteTimestamp-timestampValidBits-00829
The command pool's queue family must support a non-zero timestampValidBits

• VUID-vkCmdWriteTimestamp-query-04904
query must be less than the number of queries in queryPool

• VUID-vkCmdWriteTimestamp-None-00830
All queries used by the command must be unavailable

• VUID-vkCmdWriteTimestamp-query-00831
If vkCmdWriteTimestamp is called within a render pass instance, the sum of query and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in queryPool

Valid Usage (Implicit)
• VUID-vkCmdWriteTimestamp-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdWriteTimestamp-pipelineStage-parameter
pipelineStage must be a valid VkPipelineStageFlagBits value

• VUID-vkCmdWriteTimestamp-queryPool-parameter
queryPool must be a valid VkQueryPool handle

• VUID-vkCmdWriteTimestamp-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

• VUID-vkCmdWriteTimestamp-commonparent
Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization
• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
17.6. Performance Queries

Performance queries provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR`. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

Note
This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing `vkCmdBeginQuery` and `vkCmdEndQuery` to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

Note
Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`. 
The `VkPerformanceCounterResultKHR` union is defined as:

```cpp
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t int32;
    int64_t int64;
    uint32_t uint32;
    uint64_t uint64;
    float float32;
    double float64;
} VkPerformanceCounterResultKHR;
```

• `int32` is a 32-bit signed integer value.
• `int64` is a 64-bit signed integer value.
• `uint32` is a 32-bit unsigned integer value.
• `uint64` is a 64-bit unsigned integer value.
• `float32` is a 32-bit floating-point value.
• `float64` is a 64-bit floating-point value.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. `VkPerformanceCounterKHR::storage` specifies how to parse the counter data.

### 17.6.1. Profiling Lock

To record and submit a command buffer containing a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock must be held while any command buffer containing a performance query pool is in the recording, executable, or pending state. To acquire the profiling lock, call:

```cpp
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);
```

• `device` is the logical device to profile.
• `pInfo` is a pointer to a `VkAcquireProfilingLockInfoKHR` structure containing information about how the profiling is to be acquired.

Implementations may allow multiple actors to hold the profiling lock concurrently.
**Valid Usage (Implicit)**

- VUID-vkAcquireProfilingLockKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
  
  pInfo must be a valid pointer to a valid VkAcquireProfilingLockInfoKHR structure

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_TIMEOUT

The VkAcquireProfilingLockInfoKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **timeout** indicates how long the function waits, in nanoseconds, if the profiling lock is not available.

**Valid Usage (Implicit)**

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR

- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
  
  pNext must be NULL

- VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask
  
  flags must be 0

If **timeout** is 0, vkAcquireProfilingLockKHR will not block while attempting to acquire the profiling
lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(VkDevice device);
```

- `device` is the logical device to cease profiling on.

**Valid Usage**

- VUID-vkReleaseProfilingLockKHR-device-03235
  The profiling lock of `device` **must** have been held via a previous successful call to `vkAcquireProfilingLockKHR`

**Valid Usage (Implicit)**

- VUID-vkReleaseProfilingLockKHR-device-parameter
  `device` must be a valid `VkDevice` handle

### 17.7. Result Status Queries

Result status queries serve a single purpose: allowing the application to determine whether a set of operations have completed successfully or not, as indicated by the `VkQueryResultStatusKHR` value written when retrieving the result of a query using the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Unlike other query types, result status queries do not track or maintain any other data beyond the completion status, thus no other data is written when retrieving their results.

Support for result status queries is indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` for the queue family in question.
17.8. Video Encode Feedback Queries

Video encode feedback queries allow the application to capture feedback values generated by video encode operations. As such, video encode feedback queries are available on queue families supporting video encode operations. The availability of individual video encode feedback values is indicated by the bits of `VkVideoEncodeCapabilitiesKHR::supportedEncodeFeedbackFlags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the queries are intended to be used with.

The set of enabled video encode feedback values must be configured on the query pool when it is created using the `encodeFeedbackFlags` member of the `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` included in the `pNext` chain of `VkQueryPoolCreateInfo`.

The `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkQueryPoolVideoEncodeFeedbackCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFeedbackFlagsKHR encodeFeedbackFlags;
} VkQueryPoolVideoEncodeFeedbackCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `encodeFeedbackFlags` is a bitmask of `VkVideoEncodeFeedbackFlagBitsKHR` values specifying the set of enabled video encode feedback values captured by queries of the new pool.

**Valid Usage (Implicit)**

- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_VIDEO_ENCODE_FEEDBACK_CREATE_INFO_KHR`

- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-parameter
  `encodeFeedbackFlags` must be a valid combination of `VkVideoEncodeFeedbackFlagBitsKHR` values

- VUID-VkQueryPoolVideoEncodeFeedbackCreateInfoKHR-encodeFeedbackFlags-requiredbitmask
  `encodeFeedbackFlags` must not be 0

Bits which can be set in `VkQueryPoolVideoEncodeFeedbackCreateInfoKHR::encodeFeedbackFlags` for video encode feedback query pools are:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeFeedbackFlagBitsKHR {
    VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR = 0x00000001,
} VkVideoEncodeFeedbackFlagBitsKHR;
```
VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR = 0x00000002,
VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR = 0x00000004,
} VkVideoEncodeFeedbackFlagBitsKHR;

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR** specifies that queries managed by the pool will capture the byte offset of the bitstream data written by the video encode operation to the bitstream buffer specified in VkVideoEncodeInfoKHR::dstBuffer relative to the offset specified in VkVideoEncodeInfoKHR::dstBufferOffset. For the first video encode operation issued by any video encode command, this value will always be zero, meaning that bitstream data is always written to the buffer specified in VkVideoEncodeInfoKHR::dstBuffer starting from the offset specified in VkVideoEncodeInfoKHR::dstBufferOffset.

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR** specifies that queries managed by the pool will capture the number of bytes written by the video encode operation to the bitstream buffer specified in VkVideoEncodeInfoKHR::dstBuffer.

- **VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR** specifies that queries managed by the pool will capture a boolean value indicating that the data written to the bitstream buffer specified in VkVideoEncodeInfoKHR::dstBuffer contains overridden parameters.

When retrieving the results of video encode feedback queries, the values corresponding to each enabled video encode feedback are written in the order of the bits defined above, followed by an optional value indicating availability or result status if VK_QUERY_RESULT_WITH_AVAILABILITY_BIT or VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is specified, respectively.

If the result status of a video encode feedback query is negative, then the results of all enabled video encode feedback values will be undefined.

**Note**

Thus it is recommended that applications always specify VK_QUERY_RESULT_WITH_STATUS_BIT_KHR when retrieving the results of video encode feedback queries and ignore such undefined video encode feedback values for any unsuccessfully completed video encode operations.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFeedbackFlagsKHR;
```

VkVideoEncodeFeedbackFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeFeedbackFlagBitsKHR.
Chapter 18. Clear Commands

18.1. Clearing Images Outside a Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pColor,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-vkCmdClearColorImage-image-00002
  `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdClearColorImage-image-01545
  `image` must not use any of the formats that require a sampler Y'CbCr conversion

- VUID-vkCmdClearColorImage-image-00003
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice.

imageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

The VkImageSubresourceRange::aspectMask members of the elements of the pRanges array must each only include VK_IMAGE_ASPECT_COLOR_BIT.

The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the levelCount member is not VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created.

The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created.

image must not have a compressed or depth/stencil format.

color must be a valid pointer to a VkClearColorValue union.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, image must not be a protected image.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, must not be an unprotected image.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

image must be a valid VkImage handle.
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(vkCommandBuffer, VkImage image, VkImageLayout imageLayout, const VkClearColorValue* pClearValue, uint32_t faceCount = 1);```

To clear one or more subranges of a depth/stencil image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearDepthStencilImage(vkCommandBuffer, VkImage image, VkImageLayout imageLayout, const VkClearDepthStencilValue* pDepthStencil, uint32_t faceCount = 1);```
• commandBuffer is the command buffer into which the command will be recorded.

• image is the image to be cleared.

• imageLayout specifies the current layout of the image subresource ranges to be cleared, and must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL.

• pDepthStencil is a pointer to a VkClearDepthStencilValue structure containing the values that the depth and stencil image subresource ranges will be cleared to (see Clear Values below).

• rangeCount is the number of image subresource range structures in pRanges.

• pRanges is a pointer to an array of VkImageSubresourceRange structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Valid Usage

• VUID-vkCmdClearDepthStencilImage-image-01994
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-vkCmdClearDepthStencilImage-pRanges-02658
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencelUsageCreateInfo::stencilUsage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02659
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02660
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_DEPTH_BIT, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-image-00010
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdClearDepthStencilImage-imageLayout-00011
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

• VUID-vkCmdClearDepthStencilImage-imageLayout-00012
  imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdClearDepthStencilImage-aspectMask-02824
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
If the image's format does not have a stencil component, then the \( \text{VkImageSubresourceRange}::\text{aspectMask} \) member of each element of the \( \text{pRanges} \) array must not include the \text{VK_IMAGE_ASPECT_STENCIL_BIT} bit.

If the image's format does not have a depth component, then the \( \text{VkImageSubresourceRange}::\text{aspectMask} \) member of each element of the \( \text{pRanges} \) array must not include the \text{VK_IMAGE_ASPECT_DEPTH_BIT} bit.

The \( \text{VkImageSubresourceRange}::\text{baseMipLevel} \) members of the elements of the \( \text{pRanges} \) array must each be less than the \text{mipLevels} specified in \text{VkImageCreateInfo} when image was created.

For each \( \text{VkImageSubresourceRange} \) element of \( \text{pRanges} \), if the \text{levelCount} member is not \text{VK_REMAINING_MIP_LEVELS}, then \text{baseMipLevel} + \text{levelCount} must be less than or equal to the \text{mipLevels} specified in \text{VkImageCreateInfo} when image was created.

The \( \text{VkImageSubresourceRange}::\text{baseArrayLayer} \) members of the elements of the \( \text{pRanges} \) array must each be less than the \text{arrayLayers} specified in \text{VkImageCreateInfo} when image was created.

For each \( \text{VkImageSubresourceRange} \) element of \( \text{pRanges} \), if the \text{layerCount} member is not \text{VK_REMAINING_ARRAY_LAYERS}, then \text{baseArrayLayer} + \text{layerCount} must be less than or equal to the \text{arrayLayers} specified in \text{VkImageCreateInfo} when image was created.

image must have a depth/stencil format.

If \text{commandBuffer} is an unprotected command buffer and \text{protectedNoFault} is not supported, image must not be a protected image.

If \text{commandBuffer} is a protected command buffer and \text{protectedNoFault} is not supported, image must not be an unprotected image.

### Valid Usage (Implicit)

- \text{VkCommandBuffer} handle
- \text{VkImage} handle
- \text{VkImageLayout} value
- \text{VkCommandBuffer} handle
- \text{VkImage} handle
- \text{VkImageLayout} value
pDepthStencil must be a valid pointer to a valid VkClearDepthStencilValue structure

- VUID-vkCmdClearDepthStencilImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

- VUID-vkCmdClearDepthStencilImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearDepthStencilImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearDepthStencilImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength
  rangeCount must be greater than 0

- VUID-vkCmdClearDepthStencilImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

**18.2. Clearing Images Inside a Render Pass Instance**

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:
// Provided by VK_VERSION_1_0

```c
void vkCmdClearAttachments(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t rectCount,
    const VkClearRect* pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

Unlike other clear commands, `vkCmdClearAttachments` is not a transfer command. It performs its operations in rasterization order. For color attachments, the operations are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. For depth/stencil attachments, the operations are executed as depth writes and stencil writes by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

**Note**

It is generally preferable to clear attachments by using the `VK_ATTACHMENT_LOAD_OP_CLEAR` load operation at the start of rendering, as it is more efficient on some implementations.

If any attachment's `aspectMask` to be cleared is not backed by an image view, the clear has no effect on that aspect.

If an attachment being cleared refers to an image view created with an `aspectMask` equal to one of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`, it is considered to be `VK_IMAGE_ASPECT_COLOR_BIT` for purposes of this command, and must be cleared with the `VK_IMAGE_ASPECT_COLOR_BIT` aspect as specified by image view creation.

**Valid Usage**

- VUID-vkCmdClearAttachments-aspectMask-07884
  If the current render pass instance does not use dynamic rendering, and the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_DEPTH_BIT`, the current subpass instance's depth-stencil attachment must be either `VK_ATTACHMENT_UNUSED` or the attachment format must contain a depth component

- VUID-vkCmdClearAttachments-aspectMask-07885
If the current render pass instance does not use dynamic rendering, and the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_STENCIL_BIT`, the current subpass instance’s depth-stencil attachment must be either `VK_ATTACHMENT_UNUSED` or the attachment `format` must contain a stencil component.

- **VUID-vkCmdClearAttachments-aspectMask-07271**
  If the `aspectMask` member of any element of `pAttachments` contains `VK_IMAGE_ASPECT_COLOR_BIT`, the color attachment must be a valid color attachment index in the current render pass instance.

- **VUID-vkCmdClearAttachments-rect-02682**
  The `rect` member of each element of `pRects` must have an `extent.width` greater than 0.

- **VUID-vkCmdClearAttachments-rect-02683**
  The `rect` member of each element of `pRects` must have an `extent.height` greater than 0.

- **VUID-vkCmdClearAttachments-pRects-00016**
  The rectangular region specified by each element of `pRects` must be contained within the render area of the current render pass instance.

- **VUID-vkCmdClearAttachments-pRects-06937**
  The layers specified by each element of `pRects` must be contained within every attachment that `pAttachments` refers to, i.e. for each element of `pRects`, `VkClearRect::baseArrayLayer + VkClearRect::layerCount` must be less than or equal to the number of layers rendered to in the current render pass instance.

- **VUID-vkCmdClearAttachments-layerCount-01934**
  The `layerCount` member of each element of `pRects` must not be 0.

- **VUID-vkCmdClearAttachments-commandBuffer-02504**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each attachment to be cleared must not be a protected image.

- **VUID-vkCmdClearAttachments-commandBuffer-02505**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each attachment to be cleared must not be an unprotected image.

- **VUID-vkCmdClearAttachments-baseArrayLayer-00018**
  If the render pass instance this is recorded in uses multiview, then `baseArrayLayer` must be zero and `layerCount` must be one.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdClearAttachments-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdClearAttachments-pAttachments-parameter**
  `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkClearAttachment` structures.

- **VUID-vkCmdClearAttachments-pRects-parameter**
  `pRects` must be a valid pointer to an array of `rectCount` `VkClearRect` structures.

- **VUID-vkCmdClearAttachments-commandBuffer-recording**
commandBuffer must be in the recording state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearAttachments-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdClearAttachments-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  attachmentCount must be greater than 0

- VUID-vkCmdClearAttachments-rectCount-arraylength
  rectCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkClearRect structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D rect;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkClearRect;
```

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.
- `layerCount` is the number of layers to clear.

The layers \([\text{baseArrayLayer}, \text{baseArrayLayer} + \text{layerCount}]\) counting from the base layer of the attachment image view are cleared.
The `VkClearAttachment` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags aspectMask;
    uint32_t colorAttachment;
    VkClearColorValue clearValue;
} VkClearAttachment;
```

- `aspectMask` is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.
- `colorAttachment` is only meaningful if `VK_IMAGE_ASPECT_COLOR_BIT` is set in `aspectMask`, in which case it is an index into the currently bound color attachments.
- `clearValue` is the color or depth/stencil value to clear the attachment to, as described in `Clear Values` below.

**Valid Usage**

- VUID-VkClearAttachment-aspectMask-00019
  If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not include `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkClearAttachment-aspectMask-00020
  `aspectMask` **must** not include `VK_IMAGE_ASPECT_METADATA_BIT`

**Valid Usage (Implicit)**

- VUID-VkClearAttachment-aspectMask-parameter
  `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkClearAttachment-aspectMask-requiredbitmask
  `aspectMask` **must** not be 0

### 18.3. Clear Values

The `VkClearColorValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- `float32` are the color clear values when the format of the image or attachment is one of the
numeric formats with a numeric type that is floating-point. Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- **int32** are the color clear values when the format of the image or attachment has a numeric type that is signed integer (**SINT**). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- **uint32** are the color clear values when the format of the image or attachment has a numeric type that is unsigned integer (**UINT**). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The `VkClearDepthStencilValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```

- **depth** is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment’s format.

- **stencil** is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment’s format by taking the appropriate number of LSBs.

**Valid Usage**

- VUID-VkClearDepthStencilValue-depth-00022
  
  `depth` must be between 0.0 and 1.0, inclusive

The `VkClearValue` union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;
```
- **color** specifies the color image clear values to use when clearing a color image or attachment.
- **depthStencil** specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the `VkRenderPassBeginInfo` structure.

### 18.4. Filling Buffers

To clear buffer data, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **dstBuffer** is the buffer to be filled.
- **dstOffset** is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.
- **size** is the number of bytes to fill, and **must** be either a multiple of 4, or `VK_WHOLE_SIZE` to fill the range from `offset` to the end of the buffer. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
- **data** is the 4-byte word written repeatedly to the buffer to fill `size` bytes of data. The data word is written to memory according to the host endianness.

`vkCmdFillBuffer` is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` **must** be specified in usage of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdFillBuffer`.

### Valid Usage

- **VUID-vkCmdFillBuffer-dstOffset-00024**
  - `dstOffset` **must** be less than the size of `dstBuffer`

- **VUID-vkCmdFillBuffer-dstOffset-00025**
  - `dstOffset` **must** be a multiple of 4

- **VUID-vkCmdFillBuffer-size-00026**
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be greater than 0

- **VUID-vkCmdFillBuffer-size-00027**
  - If `size` is not equal to `VK_WHOLE_SIZE`, `size` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`
• VUID-vkCmdFillBuffer-size-00028
If size is not equal to VK_WHOLE_SIZE, size must be a multiple of 4

• VUID-vkCmdFillBuffer-dstBuffer-00029
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdFillBuffer-apiVersion-07894
If the VK_KHR_maintenance1 extension is not enabled and VkPhysicalDeviceProperties ::apiVersion is less than Vulkan 1.1, the VkCommandPool that commandBuffer was allocated from must support graphics or compute operations

• VUID-vkCmdFillBuffer-dstBuffer-00031
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdFillBuffer-commandBuffer-01811
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer

• VUID-vkCmdFillBuffer-commandBuffer-01812
If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstBuffer must not be an unprotected buffer

Valid Usage (Implicit)

• VUID-vkCmdFillBuffer-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdFillBuffer-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-vkCmdFillBuffer-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdFillBuffer-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics or compute operations

• VUID-vkCmdFillBuffer-renderpass
This command must only be called outside of a render pass instance

• VUID-vkCmdFillBuffer-videncoding
This command must only be called outside of a video coding scope

• VUID-vkCmdFillBuffer-commonparent
Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
18.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,       // Handle to the buffer to be updated.
    VkDeviceSize dstOffset,   // Byte offset into the buffer to start updating, and must be a multiple of 4.
    VkDeviceSize dataSize,    // Number of bytes to update, and must be a multiple of 4.
    const void* pData)        // Pointer to the source data for the buffer update, and must be at least dataSize bytes in size.
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and must be a multiple of 4.
- `dataSize` is the number of bytes to update, and must be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and must be at least `dataSize` bytes in size.

`dataSize` must be less than or equal to 65536 bytes. For larger updates, applications can use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.
Applications can work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they should not.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in usage of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

**Valid Usage**

- **VUID-vkCmdUpdateBuffer-dstOffset-00032**
  
  `dstOffset` must be less than the size of `dstBuffer`

- **VUID-vkCmdUpdateBuffer-dataSize-00033**
  
  `dataSize` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- **VUID-vkCmdUpdateBuffer-dstBuffer-00034**
  
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdUpdateBuffer-dstBuffer-00035**
  
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdUpdateBuffer-dstOffset-00036**
  
  `dstOffset` must be a multiple of 4

- **VUID-vkCmdUpdateBuffer-dataSize-00037**
  
  `dataSize` must be less than or equal to 65536

- **VUID-vkCmdUpdateBuffer-dataSize-00038**
  
  `dataSize` must be a multiple of 4

- **VUID-vkCmdUpdateBuffer-commandBuffer-01813**
  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- **VUID-vkCmdUpdateBuffer-commandBuffer-01814**
  
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

**Valid Usage (Implicit)**

- **VUID-vkCmdUpdateBuffer-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdUpdateBuffer-dstBuffer-parameter**
  
  `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdUpdateBuffer-pData-parameter**
  
  1094
**pData** must be a valid pointer to an array of \( \text{dataSize} \) bytes

- VUID-vkCmdUpdateBuffer-commandBuffer-recording
  
  \( \text{commandBuffer} \) must be in the **recording state**

- VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
  
  The **VkCommandPool** that \( \text{commandBuffer} \) was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdUpdateBuffer-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdUpdateBuffer-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdUpdateBuffer-dataSize-arraylength
  
  \( \text{dataSize} \) must be greater than 0

- VUID-vkCmdUpdateBuffer-commonparent
  
  Both of \( \text{commandBuffer} \), and \( \text{dstBuffer} \) must have been created, allocated, or retrieved from the same **VkDevice**

---

**Host Synchronization**

- Host access to \( \text{commandBuffer} \) must be externally synchronized

- Host access to the **VkCommandPool** that \( \text{commandBuffer} \) was allocated from must be externally synchronized

---

**Command Properties**

---

**Note**

The **pData** parameter was of type `uint32_t*` instead of `void*` prior to version 1.0.19 of the Specification and \( \text{VK\_HEADER\_VERSION} \) 19 of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 19. Copy Commands

An application can copy buffer and image data using several methods described in this chapter, depending on the type of data transfer.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

19.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `srcBuffer` overlaps in memory with any of the specified regions in `dstBuffer`, values read from those overlapping regions are undefined.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01824
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- **VUID-vkCmdCopyBuffer-srcOffset-00113**
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- **VUID-vkCmdCopyBuffer-dstOffset-00114**
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- **VUID-vkCmdCopyBuffer-size-00115**
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- **VUID-vkCmdCopyBuffer-size-00116**
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- **VUID-vkCmdCopyBuffer-pRegions-00117**
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-vkCmdCopyBuffer-srcBuffer-00118**
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-vkCmdCopyBuffer-srcBuffer-00119**
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyBuffer-dstBuffer-00120**
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdCopyBuffer-dstBuffer-00121**
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

---

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyBuffer-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBuffer-srcBuffer-parameter**
  `srcBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdCopyBuffer-dstBuffer-parameter**
  `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdCopyBuffer-pRegions-parameter**
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- **VUID-vkCmdCopyBuffer-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdCopyBuffer-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
• VUID-vkCmdCopyBuffer-renderpass
  This command **must** only be called outside of a render pass instance

• VUID-vkCmdCopyBuffer-videocoding
  This command **must** only be called outside of a video coding scope

• VUID-vkCmdCopyBuffer-regionCount-arraylength
  `regionCount` **must** be greater than 0

• VUID-vkCmdCopyBuffer-commonparent
  Each of `commandBuffer`, `dstBuffer`, and `srcBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

---

### Host Synchronization

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

</tbody>
</table>

The `VkBufferCopy` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;
```

- `srcOffset` is the starting offset in bytes from the start of `srcBuffer`.
- `dstOffset` is the starting offset in bytes from the start of `dstBuffer`.
- `size` is the number of bytes to copy.

---

### Valid Usage

• VUID-VkBufferCopy-size-01988
  The `size` **must** be greater than 0
A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferInfo` is a pointer to a `VkCopyBufferInfo2` structure describing the copy parameters.

Each source region specified by `pCopyBufferInfo->pRegions` is copied from the source buffer to the destination region of the destination buffer. If any of the specified regions in `pCopyBufferInfo->srcBuffer` overlaps in memory with any of the specified regions in `pCopyBufferInfo->dstBuffer`, values read from those overlapping regions are undefined.

### Valid Usage

- VUID-vkCmdCopyBuffer2-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` **must** not be a protected buffer
- VUID-vkCmdCopyBuffer2-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be a protected buffer
- VUID-vkCmdCopyBuffer2-commandBuffer-01824
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer

### Valid Usage (Implicit)

- VUID-vkCmdCopyBuffer2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter
  `pCopyBufferInfo` **must** be a valid pointer to a valid `VkCopyBufferInfo2` structure
**commandBuffer** must be in the recording state

- VUID-vkCmdCopyBuffer2-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBuffer2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBuffer2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **VkCopyBufferInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferCopy2* pRegions;
} VkCopyBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcBuffer is the source buffer.
• dstBuffer is the destination buffer.
• regionCount is the number of regions to copy.
• pRegions is a pointer to an array of VkBufferCopy2 structures specifying the regions to copy.

Valid Usage

• VUID-VkCopyBufferInfo2-srcOffset-00113
  The srcOffset member of each element of pRegions must be less than the size of srcBuffer

• VUID-VkCopyBufferInfo2-dstOffset-00114
  The dstOffset member of each element of pRegions must be less than the size of dstBuffer

• VUID-VkCopyBufferInfo2-size-00115
  The size member of each element of pRegions must be less than or equal to the size of srcBuffer minus srcOffset

• VUID-VkCopyBufferInfo2-size-00116
  The size member of each element of pRegions must be less than or equal to the size of dstBuffer minus dstOffset

• VUID-VkCopyBufferInfo2-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of pRegions, must not overlap in memory

• VUID-VkCopyBufferInfo2-srcBuffer-00118
  srcBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_SRC_BIT usage flag

• VUID-VkCopyBufferInfo2-srcBuffer-00119
  If srcBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyBufferInfo2-dstBuffer-00120
  dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-VkCopyBufferInfo2-dstBuffer-00121
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

Valid Usage (Implicit)

• VUID-VkCopyBufferInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2

• VUID-VkCopyBufferInfo2-pNext-pNext
  pNext must be NULL

• VUID-VkCopyBufferInfo2-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle
• VUID-VkCopyBufferInfo2-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-VkCopyBufferInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferCopy2 structures

• VUID-VkCopyBufferInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkCopyBufferInfo2-commonparent
Both of dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

The VkBufferCopy2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

### Valid Usage

• VUID-VkBufferCopy2-size-01988
  The size must be greater than 0

### Valid Usage (Implicit)

• VUID-VkBufferCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COPY_2
19.2. Copying Data Between Images

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source image to the destination region of the destination image. If any of the specified regions in `srcImage` overlaps in memory with any of the specified regions in `dstImage`, values read from those overlapping regions are undefined.

**Multi-planar images** can only be copied on a per-plane basis, and the subresources used in each region when copying to or from such images must specify only one plane, though different regions can specify different planes. When copying planes of multi-planar images, the format considered is the compatible format for that plane, rather than the format of the multi-planar image.

If the format of the destination image has a different block extent than the source image (e.g. one is a compressed format), the offset and extent for each of the regions specified is scaled according to the block extents of each format to match in size. Copy regions for each image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

Image data can be copied between images with different image types. If one image is `VK_IMAGE_TYPE_3D` and the other image is `VK_IMAGE_TYPE_2D` with multiple layers, then each slice is copied to or from a different layer; depth slices in the 3D image correspond to `layerCount` layers in the 2D image, with an effective depth of 1 used for the 2D image. If `maintenance5` is enabled, all other combinations are allowed and function as if 1D images are 2D images with a height of 1. Otherwise,
other combinations of image types are disallowed.

**Valid Usage**

- **VUID-vkCmdCopyImage-commandBuffer-01825**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdCopyImage-commandBuffer-01826**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyImage-commandBuffer-01827**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdCopyImage-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-vkCmdCopyImage-srcImage-01995**
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-vkCmdCopyImage-srcImageLayout-00128**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImage-srcImageLayout-01917**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-vkCmdCopyImage-srcImage-09460**
  If `srcImage` and `dstImage` are the same, and any elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-vkCmdCopyImage-dstImage-01996**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-vkCmdCopyImage-dstImageLayout-00133**
  `dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImage-dstImageLayout-01395**
  `dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-vkCmdCopyImage-None-01548**
  If the `VkFormat` of each of `srcImage` and `dstImage` is not a multi-planar format, the `VkFormat` of each of `srcImage` and `dstImage` must be size-compatible

- **VUID-vkCmdCopyImage-None-01549**
  In a copy to or from a plane of a multi-planar image, the `VkFormat` of the image and plane
must be compatible according to the description of compatible planes for the plane being copied

- VUID-vkCmdCopyImage-srcImage-09247
  If the VkFormat of each of srcImage and dstImage is a compressed image format, the formats must have the same texel block extent

- VUID-vkCmdCopyImage-srcImage-00136
  The sample count of srcImage and dstImage must match

- VUID-vkCmdCopyImage-srcOffset-01783
  The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-dstOffset-01784
  The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

- VUID-vkCmdCopyImage-srcImage-01551
  If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

- VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdCopyImage-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkCmdCopyImage-apiVersion-07932
  If the VK_KHR_maintenance1 extension is not enabled, or VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must both be 0, and srcSubresource.layerCount and dstSubresource.layerCount must both be 1

- VUID-vkCmdCopyImage-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

- VUID-vkCmdCopyImage-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions,
dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

- VUID-vkCmdCopyImage-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-vkCmdCopyImage-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-vkCmdCopyImage-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcImage-00146
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

- VUID-vkCmdCopyImage-srcOffset-00147
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-vkCmdCopyImage-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

- VUID-vkCmdCopyImage-dstImage-01786
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

- VUID-vkCmdCopyImage-srcImage-01787
  If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0

- VUID-vkCmdCopyImage-dstImage-01788
  If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0

- VUID-vkCmdCopyImage-apiVersion-07933
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage and dstImage must have the same VkImageType

- VUID-vkCmdCopyImage-apiVersion-08969
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage or dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-vkCmdCopyImage-srcImage-07743
If `srcImage` and `dstImage` have a different `VkImageType`, and maintenance5 is not enabled, one must be `VK_IMAGE_TYPE_3D` and the other must be `VK_IMAGE_TYPE_2D`.

- VUID-vkCmdCopyImage-srcImage-08793
  If `srcImage` and `dstImage` have the same `VkImageType`, for each element of `pRegions`, if neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` must match.

- VUID-vkCmdCopyImage-srcImage-08794
  If `srcImage` and `dstImage` have the same `VkImageType`, and one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`.

- VUID-vkCmdCopyImage-srcImage-01790
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be 1.

- VUID-vkCmdCopyImage-srcImage-01791
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, and `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `srcSubresource.layerCount`.

- VUID-vkCmdCopyImage-dstImage-01792
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`.

- VUID-vkCmdCopyImage-dstOffset-00150
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

- VUID-vkCmdCopyImage-dstOffset-00151
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

- VUID-vkCmdCopyImage-dstOffset-00152
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.

- VUID-vkCmdCopyImage-dstOffset-00153
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

- VUID-vkCmdCopyImage-pRegions-07278
  For each element of `pRegions`, `srcOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

- VUID-vkCmdCopyImage-pRegions-07279
  For each element of `pRegions`, `srcOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

- VUID-vkCmdCopyImage-pRegions-07280
For each element of \( p\text{Regions} \), \( \text{srcOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-pRegions-07281
  For each element of \( p\text{Regions} \), \( \text{dstOffset.x} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-pRegions-07282
  For each element of \( p\text{Regions} \), \( \text{dstOffset.y} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-pRegions-07283
  For each element of \( p\text{Regions} \), \( \text{dstOffset.z} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-srcImage-01728
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-srcImage-01729
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.height} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-srcImage-01730
  For each element of \( p\text{Regions} \), if the sum of \( \text{srcOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{srcSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{srcImage} \)

- VUID-vkCmdCopyImage-dstImage-01732
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.x} \) and \( \text{extent.width} \) does not equal the width of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.width} \) must be a multiple of the texel block extent width of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-dstImage-01733
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.y} \) and \( \text{extent.height} \) does not equal the height of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.height} \) must be a multiple of the texel block extent height of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-dstImage-01734
  For each element of \( p\text{Regions} \), if the sum of \( \text{dstOffset.z} \) and \( \text{extent.depth} \) does not equal the depth of the subresource specified by \( \text{dstSubresource} \), \( \text{extent.depth} \) must be a multiple of the texel block extent depth of the \( \text{VkFormat} \) of \( \text{dstImage} \)

- VUID-vkCmdCopyImage-aspect-06662
  If the aspect member of any element of \( p\text{Regions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{srcImage} \) was not created with separate stencil usage, \( \text{VK_IMAGE_USAGE_TRANSFER_SRC_BIT} \) must have been included in the \( \text{VkImageCreateInfo} \) ::usage used to create \( \text{srcImage} \)

- VUID-vkCmdCopyImage-aspect-06663
  If the aspect member of any element of \( p\text{Regions} \) includes any flag other than \( \text{VK_IMAGE_ASPECT_STENCIL_BIT} \) or \( \text{dstImage} \) was not created with separate stencil usage,
VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create dstImage

- VUID-vkCmdCopyImage-aspect-06664
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- VUID-vkCmdCopyImage-aspect-06665
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

- VUID-vkCmdCopyImage-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-srcSubresource-07967
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdCopyImage-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdCopyImage-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

Valid Usage (Implicit)

- VUID-vkCmdCopyImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdCopyImage-srcImageLayout-parameter
The **VkImageCopy** structure is defined as:

```c
typedef struct VkImageCopy {
    // Provided by VK_VERSION_1_0

    // Additional fields defined here...
}
```
The `VkImageSubresourceLayers` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
} VkImageSubresourceLayers;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in width, height and depth.

**Valid Usage**

- **VUID-VkImageCopy-apiVersion-07940**
  If the `VK_KHR_sampler_ycbcr_conversion` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageCopy-apiVersion-07941**
  If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `layerCount` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageCopy-extent-06668**
  `extent.width` must not be 0

- **VUID-VkImageCopy-extent-06669**
  `extent.height` must not be 0

- **VUID-VkImageCopy-extent-06670**
  `extent.depth` must not be 0

**Valid Usage (Implicit)**

- **VUID-VkImageCopy-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageCopy-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure
- `aspectMask` is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- `mipLevel` is the mipmap level to copy
- `baseArrayLayer` and `layerCount` are the starting layer and number of layers to copy.

### Valid Usage

- VUID-VkImageSubresourceLayers-aspectMask-00167
  If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it **must** not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkImageSubresourceLayers-aspectMask-00168
  `aspectMask` **must not** contain `VK_IMAGE_ASPECT_METADATA_BIT`

- VUID-VkImageSubresourceLayers-layerCount-09243
  If the `maintenance5` feature is not enabled, `layerCount` **must** not be `VK_REMAINING_ARRAY_LAYERS`

- VUID-VkImageSubresourceLayers-layerCount-01700
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it **must** be greater than 0

### Valid Usage (Implicit)

- VUID-VkImageSubresourceLayers-aspectMask-parameter
  `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
  `aspectMask` **must** not be 0

A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
```
The command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyImage2-commandBuffer-01825**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage must` not be a protected image.

- **VUID-vkCmdCopyImage2-commandBuffer-01826**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage must` not be a protected image.

- **VUID-vkCmdCopyImage2-commandBuffer-01827**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage must` not be an unprotected image.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImage2-commandBuffer-parameter**
  `commandBuffer must` be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyImage2-pCopyImageInfo-parameter**
  `pCopyImageInfo must` be a valid pointer to a valid `VkCopyImageInfo2` structure.

- **VUID-vkCmdCopyImage2-commandBuffer-recording**
  `commandBuffer must` be in the `recording state`.

- **VUID-vkCmdCopyImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support transfer, graphics, or compute operations.

- **VUID-vkCmdCopyImage2-renderpass**
  This command `must` only be called outside of a render pass instance.

- **VUID-vkCmdCopyImage2-videocoding**
  This command `must` only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized.
The `VkCopyImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.

## Valid Usage

- **VUID-VkCopyImageInfo2-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

`sclideanLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

`sclideanLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

If `srcImage` and `dstImage` are the same, and any elements of `pRegions` contains the `srcSubresource` and `dstSubresource` with matching `mipLevel` and overlapping array layers, then the `srcImageLayout` and `dstImageLayout` must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

`dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

`dstImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_GENERAL`.

If the `VkFormat` of each of `srcImage` and `dstImage` is not a multi-planar format, the `VkFormat` of each of `srcImage` and `dstImage` must be size-compatible.

In a copy to or from a plane of a multi-planar image, the `VkFormat` of the image and plane must be compatible according to the description of compatible planes for the plane being copied.

If the `VkFormat` of each of `srcImage` and `dstImage` is a compressed image format, the formats must have the same texel block extent.

The sample count of `srcImage` and `dstImage` must match.

The `srcOffset` and `extent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

The `dstOffset` and `extent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

If neither `srcImage` nor `dstImage` has a multi-planar image format then for each element of...
pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match

- VUID-VkCopyImageInfo2-srcImage-08713
  If srcImage has a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- VUID-VkCopyImageInfo2-dstImage-08714
  If dstImage has a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- VUID-VkCopyImageInfo2-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkCopyImageInfo2-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkCopyImageInfo2-apiVersion-07932
  If the VK_KHR_maintenance1 extension is not enabled, or VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, and either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must both be 0, and srcSubresource.layerCount and dstSubresource.layerCount must both be 1

- VUID-VkCopyImageInfo2-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

- VUID-VkCopyImageInfo2-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

- VUID-VkCopyImageInfo2-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkCopyImageInfo2-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-VkCopyImageInfo2-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcImage-00146
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y
must be 0 and extent.height must be 1

- VUID-VkCopyImageInfo2-srcOffset-00147
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

- VUID-VkCopyImageInfo2-dstImage-01786
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

- VUID-VkCopyImageInfo2-apiVersion-07933
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage and dstImage must have the same VkImageType

- VUID-VkCopyImageInfo2-apiVersion-08969
  If the VK_KHR_maintenance1 extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, srcImage or dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-VkCopyImageInfo2-srcImage-07743
  If srcImage and dstImage have a different VkImageType, and maintenance5 is not enabled, one must be VK_IMAGE_TYPE_3D and the other must be VK_IMAGE_TYPE_2D

- VUID-VkCopyImageInfo2-srcImage-08793
  If srcImage and dstImage have the same VkImageType, for each element of pRegions, if neither of the layerCount members of srcSubresource or dstSubresource are VK_REMAINING_ARRAY LAYERS, the layerCount members of srcSubresource or dstSubresource must match

- VUID-VkCopyImageInfo2-srcImage-08794
  If srcImage and dstImage have the same VkImageType, and one of the layerCount members of srcSubresource or dstSubresource is VK_REMAINING_ARRAY LAYERS, the other member must be either VK_REMAINING_ARRAY LAYERS or equal to the arrayLayers member of the VkImageCreateInfo used to create the image minus baseArrayLayer

- VUID-VkCopyImageInfo2-srcImage-01790
  If srcImage and dstImage are both of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-VkCopyImageInfo2-srcImage-01791
  If srcImage is of type VK_IMAGE_TYPE_2D, and dstImage is of type VK_IMAGE_TYPE_3D, then for
each element of `pRegions.extent.depth` must equal `srcSubresource.layerCount`

- **VUID-VkCopyImageInfo2-dstImage-01792**
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions.extent.depth` must equal `dstSubresource.layerCount`

- **VUID-VkCopyImageInfo2-dstOffset-00150**
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- **VUID-VkCopyImageInfo2-dstOffset-00151**
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- **VUID-VkCopyImageInfo2-dstOffset-00152**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1

- **VUID-VkCopyImageInfo2-dstOffset-00153**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- **VUID-VkCopyImageInfo2-pRegions-07278**
  For each element of `pRegions`, `srcOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageInfo2-pRegions-07279**
  For each element of `pRegions`, `srcOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageInfo2-pRegions-07280**
  For each element of `pRegions`, `srcOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageInfo2-pRegions-07281**
  For each element of `pRegions`, `dstOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`

- **VUID-VkCopyImageInfo2-pRegions-07282**
  For each element of `pRegions`, `dstOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`

- **VUID-VkCopyImageInfo2-pRegions-07283**
  For each element of `pRegions`, `dstOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`

- **VUID-VkCopyImageInfo2-srcImage-01728**
  For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageInfo2-srcImage-01729**
  For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal
the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- **VUID-VkCopyImageInfo2-srcImage-01730**
  For each element of pRegions, if the sum of srcOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- **VUID-VkCopyImageInfo2-dstImage-01732**
  For each element of pRegions, if the sum of dstOffset.x and extent.width does not equal the width of the subresource specified by dstSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- **VUID-VkCopyImageInfo2-dstImage-01733**
  For each element of pRegions, if the sum of dstOffset.y and extent.height does not equal the height of the subresource specified by dstSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- **VUID-VkCopyImageInfo2-aspect-06662**
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or srcImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageCreateInfo::usage used to create srcImage

- **VUID-VkCopyImageInfo2-aspect-06663**
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or dstImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create dstImage

- **VUID-VkCopyImageInfo2-aspect-06664**
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- **VUID-VkCopyImageInfo2-aspect-06665**
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

- **VUID-VkCopyImageInfo2-srcImage-07966**
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-VkCopyImageInfo2-srcSubresource-07967**
  The srcSubresource.mipLevel member of each element of pRegions must be less than the
mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageInfo2-dstImage-07966
  If dstImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageInfo2-dstSubresource-07967
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkCopyImageInfo2-dstSubresource-07968
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

**Valid Usage (Implicit)**

- VUID-VkCopyImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2

- VUID-VkCopyImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkCopyImageInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-VkCopyImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkCopyImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-VkCopyImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-VkCopyImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageCopy2 structures

- VUID-VkCopyImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkCopyImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice
The `VkImageCopy2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageCopy2 {  
  VkStructureType sType;  
  const void* pNext;  
  VkImageSubresourceLayers srcSubresource;  
  VkOffset3D srcOffset;  
  VkImageSubresourceLayers dstSubresource;  
  VkOffset3D dstOffset;  
  VkExtent3D extent;  
} VkImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageCopy2 VkImageCopy2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in `width`, `height` and `depth`.

### Valid Usage

- **VUID-VkImageCopy2-apiVersion-07940**  
  If the `VK_KHR_sampler_ycbcr_conversion` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageCopy2-apiVersion-07941**  
  If the `VK_KHR_maintenance1` extension is not enabled, and `VkPhysicalDeviceProperties::apiVersion` is less than Vulkan 1.1, the `layerCount` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageCopy2-extent-06668**  
  `extent.width` must not be 0

- **VUID-VkImageCopy2-extent-06669**  
  `extent.height` must not be 0

- **VUID-VkImageCopy2-extent-06670**  
  `extent.depth` must not be 0
Valid Usage (Implicit)

- **VUID-VkImageCopy2-sType-sType**
  - sType must be `VK_STRUCTURE_TYPE_IMAGE_COPY_2`

- **VUID-VkImageCopy2-pNext-pNext**
  - pNext must be `NULL`

- **VUID-VkImageCopy2-srcSubresource-parameter**
  - srcSubresource must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageCopy2-dstSubresource-parameter**
  - dstSubresource must be a valid `VkImageSubresourceLayers` structure

### 19.3. Copying Data Between Buffers and Images

Data can be copied between buffers and images, enabling applications to load and store data between images and user defined offsets in buffer memory.

When copying between a buffer and an image, whole texel blocks are always copied; each texel block in the specified extent in the image to be copied will be written to a region in the buffer, specified according to the position of the texel block, and the texel block extent and size of the format being copied.

For a set of coordinates \((x,y,z,\text{layer})\), where:

- \(x\) is in the range \([\frac{\text{imageOffset.x}}{\text{blockWidth}}, \lceil\frac{(\text{imageOffset.x} + \text{imageExtent.width})}{\text{blockWidth}}\rceil]\),

- \(y\) is in the range \([\frac{\text{imageOffset.y}}{\text{blockHeight}}, \lceil\frac{(\text{imageOffset.y} + \text{imageExtent.height})}{\text{blockHeight}}\rceil]\),

- \(z\) is in the range \([\frac{\text{imageOffset.z}}{\text{blockDepth}}, \lceil\frac{(\text{imageOffset.z} + \text{imageExtent.depth})}{\text{blockDepth}}\rceil]\),

- \(\text{layer}\) is in the range \([\text{imageSubresource.baseArrayLayer}, \text{imageSubresource.baseArrayLayer} + \text{imageSubresource.layerCount})\),

and where blockWidth, blockHeight, and blockDepth are the dimensions of the texel block extent of the image’s format.

For each \((x,y,z,\text{layer})\) coordinate, texels in the image layer selected by layer are accessed in the following ranges:

\([x \times \text{blockWidth}, \max((x \times \text{blockWidth}) + \text{blockWidth}, \text{imageWidth})]\)
\[
[y \times \text{blockHeight}, \max((y \times \text{blockHeight}) + \text{blockHeight}, \text{imageHeight})]
\]

\[
[z \times \text{blockDepth}, \max((z \times \text{blockDepth}) + \text{blockDepth}, \text{imageDepth})]
\]

where \text{imageWidth}, \text{imageHeight}, and \text{imageDepth} are the dimensions of the image subresource.

For each \((x, y, z, \text{layer})\) coordinate, bytes in the buffer are accessed at offsets in the range \([\text{texelOffset}, \text{texelOffset} + \text{blockSize}]\), where:

\[
\text{texelOffset} = \text{bufferOffset} + (x \times \text{blockSize}) + (y \times \text{rowExtent}) + (z \times \text{sliceExtent}) + (\text{layer} \times \text{layerExtent})
\]

\(\text{blockSize}\) is the size of the block in bytes for the format

\[
\text{rowExtent} = \max(\text{bufferRowLength}, \lceil \frac{\text{imageExtent.width}}{\text{blockWidth}} \rceil \times \text{blockSize})
\]

\[
\text{sliceExtent} = \max(\text{bufferImageHeight}, \text{imageExtent.height} \times \text{rowExtent})
\]

\[
\text{layerExtent} = \text{imageExtent.depth} \times \text{sliceExtent}
\]

When copying between a buffer and the depth or stencil aspect of an image, data in the buffer is assumed to be laid out as separate planes rather than interleaved. Addressing calculations are thus performed for a different format than the base image, according to the aspect, as described in the following table:

<table>
<thead>
<tr>
<th>Base Format</th>
<th>Depth Aspect Format</th>
<th>Stencil Aspect Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_FORMAT_D16_UNORM</td>
<td>VK_FORMAT_D16_UNORM</td>
<td>-</td>
</tr>
<tr>
<td>VK_FORMAT_X8_D24_UNORM_PACK32</td>
<td>VK_FORMAT_X8_D24_UNORM_PACK32</td>
<td>-</td>
</tr>
<tr>
<td>VK_FORMAT_D32_SFLOAT</td>
<td>VK_FORMAT_D32_SFLOAT</td>
<td>-</td>
</tr>
<tr>
<td>VK_FORMAT_S8_UINT</td>
<td>-</td>
<td>VK_FORMAT_S8_UINT</td>
</tr>
<tr>
<td>VK_FORMAT_D16_UNORM_S8_UINT</td>
<td>VK_FORMAT_D16_UNORM</td>
<td>VK_FORMAT_S8_UINT</td>
</tr>
<tr>
<td>VK_FORMAT_D24_UNORM_S8_UINT</td>
<td>VK_FORMAT_X8_D24_UNORM_PACK32</td>
<td>VK_FORMAT_S8_UINT</td>
</tr>
<tr>
<td>VK_FORMAT_D32_SFLOAT_S8_UINT</td>
<td>VK_FORMAT_D32_SFLOAT</td>
<td>VK_FORMAT_S8_UINT</td>
</tr>
</tbody>
</table>

When copying between a buffer and any plane of a multi-planar image, addressing calculations are performed using the compatible format for that plane, rather than the format of the multi-planar image.
Each texel block is copied from one resource to the other according to the above addressing equations.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkBuffer srcBuffer,             // Provided by VK_VERSION_1_0
    VkImage dstImage,               // Provided by VK_VERSION_1_0
    VkImageLayout dstImageLayout,   // Provided by VK_VERSION_1_0
    uint32_t regionCount,           // Provided by VK_VERSION_1_0
    const VkBufferImageCopy* pRegions);  // Provided by VK_VERSION_1_0
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each source region specified by `pRegions` is copied from the source buffer to the destination region of the destination image according to the addressing calculations for each resource. If any of the specified regions in `srcBuffer` overlaps in memory with any of the specified regions in `dstImage`, values read from those overlapping regions are undefined. If any region accesses a depth aspect in `dstImage` values copied from `srcBuffer` outside of the range [0,1] will be written as undefined values to the destination image.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- VUID-vkCmdCopyBufferToImage-dstImage-07966
  If `dstImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBufferToImage-imageSubresource-07967
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-vkCmdCopyBufferToImage-imageSubresource-07968
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
The image region specified by each element of \( pRegions \) must be contained within the specified \( imageSubresource \) of \( dstImage \).

For each element of \( pRegions \), \( imageOffset.x \) and \((imageExtent.width + imageOffset.x)\) must both be greater than or equal to 0 and less than or equal to the width of the specified \( imageSubresource \) of \( dstImage \).

For each element of \( pRegions \), \( imageOffset.y \) and \((imageExtent.height + imageOffset.y)\) must both be greater than or equal to 0 and less than or equal to the height of the specified \( imageSubresource \) of \( dstImage \).

dstImage must have a sample count equal to \( VK_SAMPLE_COUNT_1_BIT \).

If \( commandBuffer \) is an unprotected command buffer and \( protectedNoFault \) is not supported, \( srcBuffer \) must not be a protected buffer.

If \( commandBuffer \) is an unprotected command buffer and \( protectedNoFault \) is not supported, \( dstImage \) must not be a protected image.

If \( commandBuffer \) is a protected command buffer and \( protectedNoFault \) is not supported, \( dstImage \) must not be an unprotected image.

If the queue family used to create the \( VkCommandPool \) which \( commandBuffer \) was allocated from does not support \( VK_QUEUE_GRAPHICS_BIT \) or \( VK_QUEUE_COMPUTE_BIT \), the \( bufferOffset \) member of any element of \( pRegions \) must be a multiple of 4.

The \( imageOffset \) and \( imageExtent \) members of each element of \( pRegions \) must respect the image transfer granularity requirements of \( commandBuffer \)'s command pool's queue family, as described in \( VkQueueFamilyProperties \).

If the queue family used to create the \( VkCommandPool \) which \( commandBuffer \) was allocated from does not support \( VK_QUEUE_GRAPHICS_BIT \), for each element of \( pRegions \), the \( aspectMask \) member of \( imageSubresource \) must not be \( VK_IMAGE_ASPECT_DEPTH_BIT \) or \( VK_IMAGE_ASPECT_STENCIL_BIT \).

\( srcBuffer \) must be large enough to contain all buffer locations that are accessed according to \( Buffer and Image Addressing \), for each element of \( pRegions \).

The union of all source regions, and the union of all destination regions, specified by the elements of \( pRegions \), must not overlap in memory.
*srcBuffer* must have been created with *VK_BUFFER_USAGE_TRANSFER_SRC_BIT* usage flag.

- **VUID-vkCmdCopyBufferToImage-dstImage-01997**  
The format features of *dstImage* must contain *VK_FORMAT_FEATURE_TRANSFER_DST_BIT*.

- **VUID-vkCmdCopyBufferToImage-srcBuffer-00176**  
If *srcBuffer* is non-sparse then it must be bound completely and contiguously to a single *VkDeviceMemory* object.

- **VUID-vkCmdCopyBufferToImage-dstImage-00177**  
*dstImage* must have been created with *VK_IMAGE_USAGE_TRANSFER_DST_BIT* usage flag.

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-00180**  
*dstImageLayout* must specify the layout of the image subresources of *dstImage* specified in *pRegions* at the time this command is executed on a *VkDevice*.

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-01396**  
*dstImageLayout* must be *VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR*, *VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL*, or *VK_IMAGE_LAYOUT_GENERAL*.

- **VUID-vkCmdCopyBufferToImage-pRegions-07931**  
For each element of *pRegions* whose *imageSubresource* contains a depth aspect, the data in *srcBuffer* must be in the range [0,1].

- **VUID-vkCmdCopyBufferToImage-dstImage-07979**  
If *dstImage* is of type *VK_IMAGE_TYPE_1D*, then for each element of *pRegions*, *imageOffset.y* must be 0 and *imageExtent.height* must be 1.

- **VUID-vkCmdCopyBufferToImage-imageOffset-09104**  
For each element of *pRegions*, *imageOffset.z* and (*imageExtent.depth + imageOffset.z*) must both be greater than or equal to 0 and less than or equal to the depth of the specified *imageSubresource* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-dstImage-07980**  
If *dstImage* is of type *VK_IMAGE_TYPE_1D* or *VK_IMAGE_TYPE_2D*, then for each element of *pRegions*, *imageOffset.z* must be 0 and *imageExtent.depth* must be 1.

- **VUID-vkCmdCopyBufferToImage-dstImage-07274**  
For each element of *pRegions*, *imageOffset.x* must be a multiple of the texel block extent width of the *VkFormat* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-dstImage-07275**  
For each element of *pRegions*, *imageOffset.y* must be a multiple of the texel block extent height of the *VkFormat* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-dstImage-07276**  
For each element of *pRegions*, *imageOffset.z* must be a multiple of the texel block extent depth of the *VkFormat* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-dstImage-00207**  
For each element of *pRegions*, if the sum of *imageOffset.x* and *extent.width* does not equal the width of the subresource specified by *srcSubresource*, *extent.width* must be a multiple of the texel block extent width of the *VkFormat* of *dstImage*.

- **VUID-vkCmdCopyBufferToImage-dstImage-00208**  
For each element of *pRegions*, if the sum of *imageOffset.y* and *extent.height* does not equal
the height of the subresource specified by \texttt{srcSubresource}, \texttt{extent.height} \textbf{must} be a multiple of the \texttt{texel block extent height} of the \texttt{VkFormat} of \texttt{dstImage}

- VUID-vkCmdCopyBufferToImage-dstImage-00209
  For each element of \texttt{pRegions}, if the sum of \texttt{imageOffset.z} and \texttt{extent.depth} does not equal the depth of the subresource specified by \texttt{srcSubresource}, \texttt{extent.depth} \textbf{must} be a multiple of the \texttt{texel block extent depth} of the \texttt{VkFormat} of \texttt{dstImage}

- VUID-vkCmdCopyBufferToImage-imageSubresource-09105
  For each element of \texttt{pRegions}, \texttt{imageSubresource.aspectMask} \textbf{must} specify aspects present in \texttt{dstImage}

- VUID-vkCmdCopyBufferToImage-dstImage-07981
  If \texttt{dstImage} has a \texttt{multi-planar image format}, then for each element of \texttt{pRegions}, \texttt{imageSubresource.aspectMask} \textbf{must} be a single valid \texttt{multi-planar aspect mask} bit

- VUID-vkCmdCopyBufferToImage-dstImage-07983
  If \texttt{dstImage} is of type \texttt{VK_IMAGE_TYPE_3D}, for each element of \texttt{pRegions}, \texttt{imageSubresource.baseArrayLayer} \textbf{must} be 0 and \texttt{imageSubresource.layerCount} \textbf{must} be 1

- VUID-vkCmdCopyBufferToImage-bufferRowLength-09106
  For each element of \texttt{pRegions}, \texttt{bufferRowLength} \textbf{must} be a multiple of the \texttt{texel block extent width} of the \texttt{VkFormat} of \texttt{dstImage}

- VUID-vkCmdCopyBufferToImage-bufferImageHeight-09107
  For each element of \texttt{pRegions}, \texttt{bufferImageHeight} \textbf{must} be a multiple of the \texttt{texel block extent height} of the \texttt{VkFormat} of \texttt{dstImage}

- VUID-vkCmdCopyBufferToImage-bufferRowLength-09108
  For each element of \texttt{pRegions}, \texttt{bufferRowLength} divided by the \texttt{texel block extent width} and then multiplied by the \texttt{texel block size} of \texttt{dstImage} \textbf{must} be less than or equal to 2\(^{31}-1\)

- VUID-vkCmdCopyBufferToImage-dstImage-07975
  If \texttt{dstImage} does not have either a depth/stencil format or a \texttt{multi-planar format}, then for each element of \texttt{pRegions}, \texttt{bufferOffset} \textbf{must} be a multiple of the \texttt{texel block size}

- VUID-vkCmdCopyBufferToImage-dstImage-07976
  If \texttt{dstImage} has a \texttt{multi-planar format}, then for each element of \texttt{pRegions}, \texttt{bufferOffset} \textbf{must} be a multiple of the element size of the compatible format for the format and the \texttt{aspectMask} of the \texttt{imageSubresource} as defined in \texttt{Compatible Formats of Planes of Multi-Planar Formats}

- VUID-vkCmdCopyBufferToImage-dstImage-07978
  If \texttt{dstImage} has a depth/stencil format, the \texttt{bufferOffset} member of any element of \texttt{pRegions} \textbf{must} be a multiple of 4

\section*{Valid Usage (Implicit)}

- VUID-vkCmdCopyBufferToImage-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdCopyBufferToImage-srcBuffer-parameter
  \texttt{srcBuffer} \textbf{must} be a valid \texttt{VkBuffer} handle
• VUID-vkCmdCopyBufferToImage-dstImage-parameter
  dstImage must be a valid VkImage handle

• VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

• VUID-vkCmdCopyBufferToImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy structures

• VUID-vkCmdCopyBufferToImage-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdCopyBufferToImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyBufferToImage-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdCopyBufferToImage-regionCount-arraylength
  regionCount must be greater than 0

• VUID-vkCmdCopyBufferToImage-commonparent
  Each of commandBuffer, dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
```
VkCommandBuffer commandBuffer,
VkImage srcImage,
VkImageLayout srcImageLayout,
VkBuffer dstBuffer,
uint32_t regionCount,
const VkBufferImageCopy* pRegions);

• commandBuffer is the command buffer into which the command will be recorded.
• srcImage is the source image.
• srcImageLayout is the layout of the source image subresources for the copy.
• dstBuffer is the destination buffer.
• regionCount is the number of regions to copy.
• pRegions is a pointer to an array of VkBufferImageCopy structures specifying the regions to copy.

Each source region specified by pRegions is copied from the source image to the destination region of the destination buffer according to the addressing calculations for each resource. If any of the specified regions in srcImage overlaps in memory with any of the specified regions in dstBuffer, values read from those overlapping regions are undefined.

Copy regions for the image must be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents must match the edge of the image.

Valid Usage

• VUID-vkCmdCopyImageToBuffer-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdCopyImageToBuffer-imageSubresource-07967
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImageToBuffer-imageSubresource-07968
  If imageSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImageToBuffer-imageSubresource-07970
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of srcImage

• VUID-vkCmdCopyImageToBuffer-imageSubresource-07971
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage
For each element of pRegions, 
imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage.

srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstBuffer must not be an unprotected buffer.

If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset member of any element of pRegions must be a multiple of 4.

The imageOffset and imageExtent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer's command pool's queue family, as described in VkQueueFamilyProperties.

dstBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of pRegions.

The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory.

srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag.

The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT.

dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag.

If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice.
• VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdCopyImageToBuffer-srcImage-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-vkCmdCopyImageToBuffer-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

• VUID-vkCmdCopyImageToBuffer-srcImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-00210
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

• VUID-vkCmdCopyImageToBuffer-srcImage-07981
  If srcImage has a multi-planar image format, then for each element of pRegions, imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit

• VUID-vkCmdCopyImageToBuffer-srcImage-07983
  If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1
For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31}-1$.

If `srcImage` does not have either a depth/stencil format or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the texel block size.

If `srcImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible Formats of Planes of Multi-Planar Formats.

If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4.

---

**Valid Usage ( Implicit )**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `srcImage` must be a valid `VkImage` handle.
- `srcImageLayout` must be a valid `VkImageLayout` value.
- `dstBuffer` must be a valid `VkBuffer` handle.
- `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.
- This command must only be called outside of a render pass instance.
• VUID-vkCmdCopyImageToBuffer-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdCopyImageToBuffer-regionCount-arraylength
  regionCount must be greater than 0

• VUID-vkCmdCopyImageToBuffer-commonparent
  Each of commandBuffer, dstBuffer, and srcImage must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Graphics</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

For both vkCmdCopyBufferToImage and vkCmdCopyImageToBuffer, each element of pRegions is a structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

• bufferOffset is the offset in bytes from the start of the buffer object where the image data is copied from or to.

• bufferRowLength and bufferImageHeight specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the imageExtent.

• imageSubresource is a VkImageSubresourceLayers used to specify the specific image...
subresources of the image used for the source or destination image data.

- **imageOffset** selects the initial \( x \), \( y \), \( z \) offsets in texels of the sub-region of the source or destination image data.
- **imageExtent** is the size in texels of the image to copy in \( \text{width} \), \( \text{height} \) and \( \text{depth} \).

### Valid Usage

- **VUID-VkBufferImageCopy-bufferRowLength-09101**
  
  \( \text{bufferRowLength} \) must be 0, or greater than or equal to the \( \text{width} \) member of \( \text{imageExtent} \)

- **VUID-VkBufferImageCopy-bufferImageHeight-09102**
  
  \( \text{bufferImageHeight} \) must be 0, or greater than or equal to the \( \text{height} \) member of \( \text{imageExtent} \)

- **VUID-VkBufferImageCopy-aspectMask-09103**
  
  The \( \text{aspectMask} \) member of \( \text{imageSubresource} \) must only have a single bit set

- **VUID-VkBufferImageCopy-imageExtent-06659**
  
  \( \text{imageExtent.width} \) must not be 0

- **VUID-VkBufferImageCopy-imageExtent-06660**
  
  \( \text{imageExtent.height} \) must not be 0

- **VUID-VkBufferImageCopy-imageExtent-06661**
  
  \( \text{imageExtent.depth} \) must not be 0

### Valid Usage (Implicit)

- **VUID-VkBufferImageCopy-imageSubresource-parameter**
  
  \( \text{imageSubresource} \) must be a valid \( \text{VkImageSubresourceLayers} \) structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBufferToImage2(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
  VkCommandBuffer commandBuffer,
  const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
• `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01828**  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01829**  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01830**  
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07737**  
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyBufferToImageInfo->pRegions` must be a multiple of 4

- **VUID-vkCmdCopyBufferToImage2-imageOffset-07738**  
  The `imageOffset` and `imageExtent` members of each element of `pCopyBufferToImageInfo->pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-07739**  
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pCopyBufferToImageInfo->pRegions`, the `aspectMask` member of `imageSubresource` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

### Valid Usage (Implicit)

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter**  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter**  
  `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2` structure

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-recording**  
  `commandBuffer` must be in the `recording state`

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool**  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
- **VUID-vkCmdCopyBufferToImage2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyBufferToImage2-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

The `VkCopyBufferToImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferToImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyBufferToImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the copy.

• **regionCount** is the number of regions to copy.

• **pRegions** is a pointer to an array of **VkBufferImageCopy2** structures specifying the regions to copy.

---

**Valid Usage**

- **VUID-VkCopyBufferToImageInfo2-pRegions-04565**
  The image region specified by each element of **pRegions** must be contained within the specified **imageSubresource** of **dstImage**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00171**
  **srcBuffer** must be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00174**
  **srcBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkCopyBufferToImageInfo2-dstImage-01997**
  The **format features** of **dstImage** must contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00175**
  If **srcBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyBufferToImageInfo2-dstImage-00177**
  **dstImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-VkCopyBufferToImageInfo2-dstImageLayout-00180**
  **dstImageLayout** must specify the layout of the image subresources of **dstImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyBufferToImageInfo2-dstImageLayout-01396**
  **dstImageLayout** must be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-07967**
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-07968**
  If **dstImage** is non-sparse then the image or the specified **disjoint** plane must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-07967**
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-07968**
  If **dstImage** is non-sparse then the image or the specified **disjoint** plane must be bound completely and contiguously to a single **VkDeviceMemory** object
If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-VkCopyBufferToImageInfo2-dstImage-07973
  `dstImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07979
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1.

- VUID-VkCopyBufferToImageInfo2-imageOffset-09104
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07980
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

- VUID-VkCopyBufferToImageInfo2-dstImage-07274
  For each element of `pRegions`, `imageOffset.x` must be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07275
  For each element of `pRegions`, `imageOffset.y` must be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07276
  For each element of `pRegions`, `imageOffset.z` must be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-00207
  For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the `texel block extent width` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-00208
  For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the `texel block extent height` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-00209
  For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`.

- VUID-VkCopyBufferToImageInfo2-imageSubresource-09105
  For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `dstImage`.

- VUID-VkCopyBufferToImageInfo2-dstImage-07981
  If `dstImage` has a multi-planar image format, then for each element of `pRegions`,...
imageSubresource.aspectMask must be a single valid multi-planar aspect mask bit

- VUID-VkCopyBufferToImageInfo2-dstImage-07983
  If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-VkCopyBufferToImageInfo2-bufferRowLength-09106
  For each element of pRegions, bufferRowLength must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyBufferToImageInfo2-bufferImageHeight-09107
  For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyBufferToImageInfo2-bufferRowLength-09108
  For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of dstImage must be less than or equal to 2^{31}-1

- VUID-VkCopyBufferToImageInfo2-dstImage-07975
  If dstImage does not have either a depth/stencil format or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the texel block size

- VUID-VkCopyBufferToImageInfo2-dstImage-07976
  If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible Formats of Planes of Multi-Planar Formats

- VUID-VkCopyBufferToImageInfo2-dstImage-07978
  If dstImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4

- VUID-VkCopyBufferToImageInfo2-pRegions-06223
  For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage

- VUID-VkCopyBufferToImageInfo2-pRegions-06224
  For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage

Valid Usage (Implicit)

- VUID-VkCopyBufferToImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2

- VUID-VkCopyBufferToImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkCopyBufferToImageInfo2-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle
• VUID-VkCopyBufferToImageInfo2-dstImage-parameter
dstImage must be a valid VkImage handle

• VUID-VkCopyBufferToImageInfo2-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

• VUID-VkCopyBufferToImageInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy2 structures

• VUID-VkCopyBufferToImageInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkCopyBufferToImageInfo2-commonparent
Both of dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

To copy data from an image object to a buffer object, call:

```
// Provided by VK_VERSION_1_3
void vkCmdCopyImageToBuffer2(
   VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

or the equivalent command

```
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
   VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pCopyImageToBufferInfo is a pointer to a VkCopyImageToBufferInfo2 structure describing the copy parameters.

This command is functionally identical to vkCmdCopyImageToBuffer, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

**Valid Usage**

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-07746**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pCopyImageToBufferInfo->pRegions` must be a multiple of 4

- **VUID-vkCmdCopyImageToBuffer2-imageOffset-07747**
  The `imageOffset` and `imageExtent` members of each element of `pCopyImageToBufferInfo->pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter**
  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImageToBuffer2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyImageToBuffer2-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkCopyImageToBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

### Valid Usage

- VUID-VkCopyImageToBufferInfo2-pRegions-04566
  The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `srcImage`

- VUID-VkCopyImageToBufferInfo2-pRegions-00183
**dstBuffer** must be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- **VUID-VkCopyImageToBufferInfo2-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkCopyImageToBufferInfo2-srcImage-00186**
  **srcImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkCopyImageToBufferInfo2-srcImage-01998**
  The **format features** of **srcImage** must contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00191**
  **dstBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-00192**
  If **dstBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397**
  **srcImageLayout** must be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, or **VK_IMAGE_LAYOUT_GENERAL**

- **VUID-VkCopyImageToBufferInfo2-srcImage-07966**
  If **srcImage** is non-sparse then the image or the specified **disjoint** plane must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07967**
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-07968**
  If **imageSubresource.layerCount** is not **VK_REMAINING_ARRAY_LAYERS**, **imageSubresource.baseArrayLayer + imageSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **srcImage** was created

- **VUID-VkCopyImageToBufferInfo2-srcImage-07973**
  **srcImage** must have a sample count equal to **VK_SAMPLE_COUNT_1_BIT**

- **VUID-VkCopyImageToBufferInfo2-srcImage-07979**
  If **srcImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **imageOffset.y** must be 0 and **imageExtent.height** must be 1

- **VUID-VkCopyImageToBufferInfo2-imageOffset-09104**
  For each element of **pRegions**, **imageOffset.z** and (**imageExtent.depth + imageOffset.z**) must both be greater than or equal to 0 and less than or equal to the depth of the specified **imageSubresource** of **srcImage**

- **VUID-VkCopyImageToBufferInfo2-srcImage-07980**
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1

- **VUID-VkCopyImageToBufferInfo2-srcImage-07274**
  For each element of `pRegions`, `imageOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-07275**
  For each element of `pRegions`, `imageOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-07276**
  For each element of `pRegions`, `imageOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-00207**
  For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-00208**
  For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-00209**
  For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-imageSubresource-09105**
  For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-07981**
  If `srcImage` has a multi-planar image format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be a single valid multi-planar aspect mask bit

- **VUID-VkCopyImageToBufferInfo2-srcImage-07983**
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1

- **VUID-VkCopyImageToBufferInfo2-bufferRowLength-09106**
  For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-bufferImageHeight-09107**
  For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-bufferRowLength-09108**
  For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31}-1$

- **VUID-VkCopyImageToBufferInfo2-srcImage-07975**
If *srcImage* does not have either a depth/stencil format or a multi-planar format, then for each element of *pRegions*, *bufferOffset* must be a multiple of the texel block size

- **VUID-VkCopyImageToBufferInfo2-srcImage-07976**
  If *srcImage* has a multi-planar format, then for each element of *pRegions*, *bufferOffset* must be a multiple of the element size of the compatible format for the format and the aspectMask of the *imageSubresource* as defined in Compatible Formats of Planes of Multi-Planar Formats

- **VUID-VkCopyImageToBufferInfo2-srcImage-07978**
  If *srcImage* has a depth/stencil format, the *bufferOffset* member of any element of *pRegions* must be a multiple of 4

- **VUID-VkCopyImageToBufferInfo2-imageOffset-00197**
  For each element of *pRegions* not containing *VkCopyCommandTransformInfoQCOM* in its *pNext* chain, *imageOffset.x* and (*imageExtent.width* + *imageOffset.x*) must both be greater than or equal to 0 and less than or equal to the width of the specified *imageSubresource* of *srcImage*

- **VUID-VkCopyImageToBufferInfo2-imageOffset-00198**
  For each element of *pRegions* not containing *VkCopyCommandTransformInfoQCOM* in its *pNext* chain, *imageOffset.y* and (*imageExtent.height* + *imageOffset.y*) must both be greater than or equal to 0 and less than or equal to the height of the specified *imageSubresource* of *srcImage*

---

**Valid Usage (Implicit)**

- **VUID-VkCopyImageToBufferInfo2-sType-sType**
  *sType* must be *VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2*

- **VUID-VkCopyImageToBufferInfo2-pNext-pNext**
  *pNext* must be *NULL*

- **VUID-VkCopyImageToBufferInfo2-srcImage-parameter**
  *srcImage* must be a valid *VkImage* handle

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-parameter**
  *srcImageLayout* must be a valid *VkImageLayout* value

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter**
  *dstBuffer* must be a valid *VkBuffer* handle

- **VUID-VkCopyImageToBufferInfo2-pRegions-parameter**
  *pRegions* must be a valid pointer to an array of *regionCount* valid *VkBufferImageCopy2* structures

- **VUID-VkCopyImageToBufferInfo2-regionCount-arraylength**
  *regionCount* must be greater than 0

- **VUID-VkCopyImageToBufferInfo2-commonparent**
  Both of *dstBuffer*, and *srcImage* must have been created, allocated, or retrieved from the same *VkDevice*

---

For both *vkCmdCopyBufferToImage2* and *vkCmdCopyImageToBuffer2*, each element of *pRegions* is
a structure defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.
- **imageSubresource** is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- **imageOffset** selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.
- **imageExtent** is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to `VkBufferImageCopy`, but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

### Valid Usage

- VUID-VkBufferImageCopy2-bufferRowLength-09101
  bufferRowLength must be 0, or greater than or equal to the width member of imageExtent

- VUID-VkBufferImageCopy2-bufferImageHeight-09102
  bufferImageHeight must be 0, or greater than or equal to the height member of imageExtent

- VUID-VkBufferImageCopy2-aspectMask-09103
The `aspectMask` member of `imageSubresource` must only have a single bit set

- VUID-VkBufferImageCopy2-imageExtent-06659
  `imageExtent.width` must not be 0
- VUID-VkBufferImageCopy2-imageExtent-06660
  `imageExtent.height` must not be 0
- VUID-VkBufferImageCopy2-imageExtent-06661
  `imageExtent.depth` must not be 0

Valid Usage (Implicit)

- VUID-VkBufferImageCopy2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2`
- VUID-VkBufferImageCopy2-pNext-pNext
  `pNext` must be NULL
- VUID-VkBufferImageCopy2-imageSubresource-parameter
  `imageSubresource` must be a valid `VkImageSubresourceLayers` structure

The following commands can be used to copy between host memory and images.

To copy data from host memory to an image object, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkCopyMemoryToImageEXT(
    VkDevice device,
    const VkCopyMemoryToImageInfoEXT* pCopyMemoryToImageInfo);
```

- `device` is the device which owns `pCopyMemoryToImageInfo->dstImage`.
- `pCopyMemoryToImageInfo` is a pointer to a `VkCopyMemoryToImageInfoEXT` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyBufferToImage2`, except it is executed on the host and reads from host memory instead of a buffer.

Valid Usage

- VUID-vkCopyMemoryToImageEXT-hostImageCopy-09058
  The `hostImageCopy` feature must be enabled

Valid Usage (Implicit)

- VUID-vkCopyMemoryToImageEXT-device-parameter
  `device` must be a valid `VkDevice` handle
pCopyMemoryToImageInfo must be a valid pointer to a valid VkCopyMemoryToImageInfoEXT structure

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The VkCopyMemoryToImageInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyMemoryToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkMemoryToImageCopyEXT* pRegions;
} VkCopyMemoryToImageInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkHostImageCopyFlagBitsEXT values describing additional copy parameters.
- dstImage is the destination image.
- dstImageLayout is the layout of the destination image subresources for the copy.
- regionCount is the number of regions to copy.
- pRegions is a pointer to an array of VkMemoryToImageCopyEXT structures specifying the regions to copy.

vkCopyMemoryToImageEXT does not check whether the device memory associated with dstImage is currently in use before performing the copy. The application must guarantee that any previously submitted command that reads from or writes to the copy regions has completed before the host performs the copy.
Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09109**
  If `dstImage` is sparse then all memory ranges accessed by the copy command **must** be bound as described in **Binding Resource Memory**

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09111**
  If the stencil aspect of `dstImage` is accessed, and `dstImage` was not created with separate stencil usage, `dstImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09112**
  If the stencil aspect of `dstImage` is accessed, and `dstImage` was created with separate stencil usage, `dstImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageStencilUsageCreateInfo::stencilUsage`

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09113**
  If non-stencil aspects of `dstImage` are accessed, `dstImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`

- **VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09114**
  If `flags` contains `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, the `x`, `y`, and `z` members of the `imageOffset` member of each element of `pRegions` **must** be 0

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-09115**
  If `flags` contains `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, the `imageExtent` member of each element of `pRegions` **must** equal the extents of `dstImage` identified by `imageSubresource`

- **VUID-VkCopyMemoryToImageInfoEXT-dstImage-07966**
  If `dstImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07967**
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07968**
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07970**
  The image region specified by each element of `pRegions` **must** be contained within the specified `imageSubresource` of `dstImage`

- **VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07971**
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` **must** both be greater than or equal to 0 and less than or equal to the width of the specified...
imageSubresource of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-imageSubresource-07972
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07973
dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07979
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

- VUID-VkCopyMemoryToImageInfoEXT-imageOffset-09104
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07980
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07277
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00207
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00208
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07277
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00207
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00208
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07277
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00207
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-00208
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage
If \textit{dstImage} has a \textit{multi-planar image format}, then for each element of \textit{pRegions}, \textit{imageSubresource.aspectMask} must be a single valid \textit{multi-planar aspect mask} bit.

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-07983
  If \textit{dstImage} is of type \textit{VK_IMAGE_TYPE_3D}, for each element of \textit{pRegions}, \textit{imageSubresource.baseArrayLayer} must be 0 and \textit{imageSubresource.layerCount} must be 1.

- VUID-VkCopyMemoryToImageInfoEXT-memoryRowLength-09106
  For each element of \textit{pRegions}, \textit{memoryRowLength} must be a multiple of the texel block extent width of the \textit{VkFormat} of \textit{dstImage}.

- VUID-VkCopyMemoryToImageInfoEXT-memoryImageHeight-09107
  For each element of \textit{pRegions}, \textit{memoryImageHeight} must be a multiple of the texel block extent height of the \textit{VkFormat} of \textit{dstImage}.

- VUID-VkCopyMemoryToImageInfoEXT-memoryRowLength-09108
  For each element of \textit{pRegions}, \textit{memoryRowLength} divided by the texel block extent width and then multiplied by the texel block size of \textit{dstImage} must be less than or equal to $2^{31}-1$.

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-09059
  \textit{dstImageLayout} must specify the current layout of the image subresources of \textit{dstImage} specified in \textit{pRegions}.

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-09060
  \textit{dstImageLayout} must be one of the image layouts returned in \textit{VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts}.

- VUID-VkCopyMemoryToImageInfoEXT-flags-09393
  If \textit{flags} includes \textit{VK_HOST_IMAGE_COPY_MEMCPY_EXT}, for each region in \textit{pRegions}, \textit{memoryRowLength} and \textit{memoryImageHeight} must both be 0.

---

**Valid Usage (Implicit)**

- VUID-VkCopyMemoryToImageInfoEXT-sType-sType
  \textit{sType} must be \textit{VK_STRUCTURE_TYPE_COPY_MEMORY_TO_IMAGE_INFO_EXT}.

- VUID-VkCopyMemoryToImageInfoEXT-pNext-pNext
  \textit{pNext} must be \textit{NULL}.

- VUID-VkCopyMemoryToImageInfoEXT-flags-parameter
  \textit{flags} must be a valid combination of \textit{VkHostImageCopyFlagBitsEXT} values.

- VUID-VkCopyMemoryToImageInfoEXT-dstImage-parameter
  \textit{dstImage} must be a valid \textit{ VkImage} handle.

- VUID-VkCopyMemoryToImageInfoEXT-dstImageLayout-parameter
  \textit{dstImageLayout} must be a valid \textit{ VkImageLayout} value.

- VUID-VkCopyMemoryToImageInfoEXT-pRegions-parameter
  \textit{pRegions} must be a valid pointer to an array of \textit{regionCount} valid \textit{VkMemoryToImageCopyEXT} structures.

- VUID-VkCopyMemoryToImageInfoEXT-regionCount-arraylength
  \textit{regionCount} must be greater than 0.
Each element of `VkCopyMemoryToImageInfoEXT::pRegions` is a structure defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkMemoryToImageCopyEXT {
    VkStructureType sType;
    const void* pNext;
    const void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkMemoryToImageCopyEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pHostPointer` is the host memory address which is the source of the copy.
- `memoryRowLength` and `memoryImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial x, y, z offsets in texels of the sub-region of the destination image data.
- `imageExtent` is the size in texels of the image to copy in width, height and depth.

This structure is functionally similar to `VkBufferImageCopy2`, except it defines host memory as the source of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

### Valid Usage

- **VUID-VkMemoryToImageCopyEXT-pHostPointer-09061**
  `pHostPointer` must point to memory that is large enough to contain all memory locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- **VUID-VkMemoryToImageCopyEXT-pRegions-09062**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- **VUID-VkMemoryToImageCopyEXT-memoryRowLength-09101**
  `memoryRowLength` must be 0, or greater than or equal to the `width` member of `imageExtent`.

- **VUID-VkMemoryToImageCopyEXT-memoryImageHeight-09102**
  `memoryImageHeight` must be 0, or greater than or equal to the `height` member of `imageExtent`. 
The aspectMask member of imageSubresource must only have a single bit set.

imageExtent.width must not be 0

imageExtent.height must not be 0

imageExtent.depth must not be 0

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_MEMORY_TO_IMAGE_COPY_EXT

pNext must be NULL

pHostPointer must be a pointer value

imageSubresource must be a valid VkImageSubresourceLayers structure

To copy data from an image object to host memory, call:

```
// Provided by VK_EXT_host_image_copy
VkResult vkCopyImageToMemoryEXT(
    VkDevice device,
    const VkCopyImageToMemoryInfoEXT* pCopyImageToMemoryInfo);
```

device is the device which owns pCopyImageToMemoryInfo->srcImage.

pCopyImageToMemoryInfo is a pointer to a VkCopyImageToMemoryInfoEXT structure describing the copy parameters.

This command is functionally similar to vkCmdCopyImageToBuffer2, except it is executed on the host and writes to host memory instead of a buffer.

Valid Usage

The hostImageCopy feature must be enabled

Valid Usage (Implicit)
• VUID-vkCopyImageToMemoryEXT-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyImageToMemoryEXT-pCopyImageToMemoryInfo-parameter
  pCopyImageToMemoryInfo must be a valid pointer to a valid
  VkCopyImageToMemoryInfoEXT structure

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_INITIALIZATION_FAILED
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_MEMORY_MAP_FAILED

The VkCopyImageToMemoryInfoEXT structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkCopyImageToMemoryInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkHostImageCopyFlagsEXT flags;
  VkImage srcImage;
  VkImageLayout srcImageLayout;
  uint32_t regionCount;
  const VkImageToMemoryCopyEXT* pRegions;
} VkCopyImageToMemoryInfoEXT;
```

• `sType` is a VkStructureType value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `flags` is a bitmask of VkHostImageCopyFlagBitsEXT values describing additional copy parameters.

• `srcImage` is the source image.

• `srcImageLayout` is the layout of the source image subresources for the copy.

• `regionCount` is the number of regions to copy.

• `pRegions` is a pointer to an array of VkImageToMemoryCopyEXT structures specifying the regions to copy.

vkCopyImageToMemoryEXT does not check whether the device memory associated with `srcImage` is currently in use before performing the copy. The application must guarantee that any previously
submitted command that writes to the copy regions has completed before the host performs the copy.

Copy regions for the image **must** be aligned to a multiple of the texel block extent in each dimension, except at the edges of the image, where region extents **must** match the edge of the image.

### Valid Usage

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09109**
  If `srcImage` is sparse then all memory ranges accessed by the copy command **must** be bound as described in **Binding Resource Memory**.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09111**
  If the stencil aspect of `srcImage` is accessed, and `srcImage` was not created with separate stencil usage, `srcImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09112**
  If the stencil aspect of `srcImage` is accessed, and `srcImage` was created with separate stencil usage, `srcImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageStencilUsageCreateInfo::stencilUsage`.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09113**
  If non-stencil aspects of `srcImage` are accessed, `srcImage` **must** have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

- **VUID-VkCopyImageToMemoryInfoEXT-imageOffset-09114**
  If `flags` contains `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, the `x`, `y`, and `z` members of the `imageOffset` member of each element of `pRegions` **must** be 0.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-09115**
  If `flags` contains `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, the `imageExtent` member of each element of `pRegions` **must** equal the extents of `srcImage` identified by `imageSubresource`.

- **VUID-VkCopyImageToMemoryInfoEXT-srcImage-07966**
  If `srcImage` is non-sparse then the image or the specified disjoint plane **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07967**
  The `imageSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07968**
  If `imageSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- **VUID-VkCopyImageToMemoryInfoEXT-imageSubresource-07970**
  The image region specified by each element of `pRegions` **must** be contained within the specified `imageSubresource` of `srcImage`. 
For each element of \( pRegions \), imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage.

For each element of \( pRegions \), imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage.

srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of \( pRegions \), imageOffset.y must be 0 and imageExtent.height must be 1.

If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of \( pRegions \), imageOffset.z must be 0 and imageExtent.depth must be 1.

For each element of \( pRegions \), imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage.

For each element of \( pRegions \), imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage.

For each element of \( pRegions \), imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage.

For each element of \( pRegions \), if the sum of imageOffset.x and extent.width does not equal the width of the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage.

For each element of \( pRegions \), if the sum of imageOffset.y and extent.height does not equal the height of the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage.

For each element of \( pRegions \), if the sum of imageOffset.z and extent.depth does not equal the depth of the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage.
For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`.

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07981
  If `srcImage` has a multi-planar image format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-07983
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1.

- VUID-VkCopyImageToMemoryInfoEXT-memoryRowLength-09106
  For each element of `pRegions`, `memoryRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

- VUID-VkCopyImageToMemoryInfoEXT-memoryImageHeight-09107
  For each element of `pRegions`, `memoryImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

- VUID-VkCopyImageToMemoryInfoEXT-memoryRowLength-09108
  For each element of `pRegions`, `memoryRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31} - 1$.

- VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-09064
  `srcImageLayout` must specify the current layout of the image subresources of `srcImage` specified in `pRegions`.

- VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-09065
  `srcImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`.

- VUID-VkCopyImageToMemoryInfoEXT-flags-09394
  If `flags` includes `VK_HOST_IMAGE_COPY_MEMCPY_EXT`, for each region in `pRegions`, `memoryRowLength` and `memoryImageHeight` must both be 0.

**Valid Usage (Implicit)**

- VUID-VkCopyImageToMemoryInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_MEMORY_INFO_EXT`.

- VUID-VkCopyImageToMemoryInfoEXT-pNext-pNext
  `pNext` must be NULL.

- VUID-VkCopyImageToMemoryInfoEXT-flags-parameter
  `flags` must be a valid combination of `VkHostImageCopyFlagBitsEXT` values.

- VUID-VkCopyImageToMemoryInfoEXT-srcImage-parameter
  `srcImage` must be a valid `VkImage` handle.

- VUID-VkCopyImageToMemoryInfoEXT-srcImageLayout-parameter
  `srcImageLayout` must be a valid `VkImageLayout` value.

- VUID-VkCopyImageToMemoryInfoEXT-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid
**VkImageToMemoryCopyEXT** structures

- VUID-VkCopyImageToMemoryInfoEXT-regionCount-arraylength
  
  `regionCount` must be greater than 0

Each element of **VkCopyImageToMemoryInfoEXT::pRegions** is a structure defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkImageToMemoryCopyEXT {
    VkStructureType sType;
    const void* pNext;
    void* pHostPointer;
    uint32_t memoryRowLength;
    uint32_t memoryImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkImageToMemoryCopyEXT;
```

- `sType` is a **VkStructureType** value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pHostPointer` is the host memory address which is the destination of the copy.
- `memoryRowLength` and `memoryImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in host memory, and control the addressing calculations. If either of these values is zero, that aspect of the host memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a **VkImageSubresourceLayers** used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial x, y, z offsets in texels of the sub-region of the source image data.
- `imageExtent` is the size in texels of the image to copy in width, height and depth.

This structure is functionally similar to **VkBufferImageCopy2**, except it defines host memory as the target of copy instead of a buffer. In particular, the same data packing rules and restrictions as that structure apply here as well.

### Valid Usage

- VUID-VkImageToMemoryCopyEXT-pHostPointer-09066
  
  `pHostPointer` must point to memory that is large enough to contain all memory locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`

- VUID-VkImageToMemoryCopyEXT-pRegions-09067
  
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- VUID-VkImageToMemoryCopyEXT-memoryRowLength-09101
memoryRowLength must be 0, or greater than or equal to the width member of imageExtent

- VUID-VkImageToMemoryCopyEXT-memoryImageHeight-09102
  memoryImageHeight must be 0, or greater than or equal to the height member of imageExtent

- VUID-VkImageToMemoryCopyEXT-aspectMask-09103
  The aspectMask member of imageSubresource must only have a single bit set

- VUID-VkImageToMemoryCopyEXT-imageExtent-06659
  imageExtent.width must not be 0

- VUID-VkImageToMemoryCopyEXT-imageExtent-06660
  imageExtent.height must not be 0

- VUID-VkImageToMemoryCopyEXT-imageExtent-06661
  imageExtent.depth must not be 0

---

Valid Usage (Implicit)

- VUID-VkImageToMemoryCopyEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_TO_MEMORY_COPY_EXT

- VUID-VkImageToMemoryCopyEXT-pNext-pNext
  pNext must be NULL

- VUID-VkImageToMemoryCopyEXT-pHostPointer-parameter
  pHostPointer must be a pointer value

- VUID-VkImageToMemoryCopyEXT-imageExtent-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

Bits which can be set in VkCopyMemoryToImageInfoEXT::flags, VkCopyImageToMemoryInfoEXT::flags, and VkCopyImageToImageInfoEXT::flags, specifying additional copy parameters are:

```c
// Provided by VK_EXT_host_image_copy
typedef enum VkHostImageCopyFlagBitsEXT {
    VK_HOST_IMAGE_COPY_MEMCPY_EXT = 0x00000001,
} VkHostImageCopyFlagBitsEXT;
```

- **VK_HOST_IMAGE_COPY_MEMCPY_EXT** specifies that no memory layout swizzling is to be applied during data copy. For copies between memory and images, this flag indicates that image data in host memory is swizzled in exactly the same way as the image data on the device. Using this flag indicates that the implementations may use a simple memory copy to transfer the data between the host memory and the device memory. The format of the swizzled data in host memory is platform dependent and is not defined in this specification.

```c
// Provided by VK_EXT_host_image_copy
typedef VkFlags VkHostImageCopyFlagsEXT;
```
VkHostImageCopyFlagsEXT is a bitmask type for setting a mask of zero or more VkHostImageCopyFlagBitsEXT.

To copy data from an image object to another image object using the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkCopyImageToImageEXT(
    VkDevice device,
    const VkCopyImageToImageInfoEXT* pCopyImageToImageInfo);
```

- `device` is the device which owns `pCopyImageToMemoryInfo->srcImage`.
- `pCopyImageToImageInfo` is a pointer to a `VkCopyImageToImageInfoEXT` structure describing the copy parameters.

This command is functionally similar to `vkCmdCopyImage2`, except it is executed on the host.

### Valid Usage

- VUID-vkCopyImageToImageEXT-hostImageCopy-09068
  The hostImageCopy feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCopyImageToImageEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkCopyImageToImageEXT-pCopyImageToImageInfo-parameter
  `pCopyImageToImageInfo` **must** be a valid pointer to a valid `VkCopyImageToImageInfoEXT` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_MEMORY_MAP_FAILED`

The `VkCopyImageToImageInfoEXT` structure is defined as:
// Provided by VK_EXT_host_image_copy

typedef struct VkCopyImageToImageInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHostImageCopyFlagsEXT flags;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageToImageInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkHostImageCopyFlagBitsEXT` values describing additional copy parameters.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.

`vkCopyImageToImageEXT` does not check whether the device memory associated with `srcImage` or `dstImage` is currently in use before performing the copy. The application must guarantee that any previously submitted command that writes to the copy regions has completed before the host performs the copy.

### Valid Usage

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09069**
  `srcImage` and `dstImage` must have been created with identical image creation parameters.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09109**
  If `srcImage` is sparse then all memory ranges accessed by the copy command must be bound as described in [Binding Resource Memory](#).

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09111**
  If the stencil aspect of `srcImage` is accessed, and `srcImage` was not created with separate stencil usage, `srcImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

- **VUID-VkCopyImageToImageInfoEXT-srcImage-09112**
  If the stencil aspect of `srcImage` is accessed, and `srcImage` was created with separate stencil usage, `srcImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in...
VkImageStencilUsageCreateInfo::stencilUsage

- VUID-VkCopyImageToImageInfoEXT-srcImage-09113
  If non-stencil aspects of srcImage are accessed, srcImage must have been created with VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT set in VkImageCreateInfo::usage

- VUID-VkCopyImageToImageInfoEXT-srcOffset-09114
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the x, y, and z members of the srcOffset member of each element of pRegions must be 0

- VUID-VkCopyImageToImageInfoEXT-srcImage-09115
  If flags contains VK_HOST_IMAGE_COPY_MEMCPY_EXT, the extent member of each element of pRegions must equal the extents of srcImage identified by srcSubresource

- VUID-VkCopyImageToImageInfoEXT-srcImage-07966
  If srcImage is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07967
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07968
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07970
  The image region specified by each element of pRegions must be contained within the specified srcSubresource of srcImage

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07971
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07972
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkCopyImageToImageInfoEXT-srcSubresource-07979
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

- VUID-VkCopyImageToImageInfoEXT-srcOffset-09104
  For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkCopyImageToImageInfoEXT-srcImage-07980
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1
For each element of `pRegions`, `srcOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `srcOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `srcOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `srcOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `srcOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `srcOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

If `srcImage` has a multi-planar image format, then for each element of `pRegions`, `srcSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1.

If `dstImage` is sparse then all memory ranges accessed by the copy command must be bound as described in `Binding Resource Memory`.

If the stencil aspect of `dstImage` is accessed, and `dstImage` was not created with separate stencil usage, `dstImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageCreateInfo::usage`.

If the stencil aspect of `dstImage` is accessed, and `dstImage` was created with separate stencil usage, `dstImage` must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` set in `VkImageStencilUsageCreateInfo::stencilUsage`.

If non-stencil aspects of `dstImage` are accessed, `dstImage` must have been created with...
**VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** set in **VkImageCreateInfo::usage**

- **VUID-VkCopyImageToImageInfoEXT-dstOffset-09114**
  If **flags** contains **VK_HOST_IMAGE_COPY_MEMCPY_EXT**, the x, y, and z members of the **dstOffset** member of each element of **pRegions** must be 0

- **VUID-VkCopyImageToImageInfoEXT-dstImage-09115**
  If **flags** contains **VK_HOST_IMAGE_COPY_MEMCPY_EXT**, the **extent** member of each element of **pRegions** must equal the extents of **dstImage** identified by **dstSubresource**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07966**
  If **dstImage** is non-sparse then the image or the specified disjoint plane must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07967**
  The **dstSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07968**
  If **dstSubresource.layerCount** is not **VK_REMAINING_ARRAY_LAYERS**, **dstSubresource.baseArrayLayer + dstSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07970**
  The image region specified by each element of **pRegions** must be contained within the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07971**
  For each element of **pRegions**, **dstOffset.x** and (**extent.width + dstOffset.x**) must both be greater than or equal to 0 and less than or equal to the width of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstSubresource-07972**
  For each element of **pRegions**, **dstOffset.y** and (**extent.height + dstOffset.y**) must both be greater than or equal to 0 and less than or equal to the height of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07979**
  If **dstImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **dstOffset.y** must be 0 and **extent.height** must be 1

- **VUID-VkCopyImageToImageInfoEXT-dstOffset-09104**
  For each element of **pRegions**, **dstOffset.z** and (**extent.depth + dstOffset.z**) must both be greater than or equal to 0 and less than or equal to the depth of the specified **dstSubresource** of **dstImage**

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07980**
  If **dstImage** is of type **VK_IMAGE_TYPE_1D** or **VK_IMAGE_TYPE_2D**, then for each element of **pRegions**, **dst Offset.z** must be 0 and **extent.depth** must be 1

- **VUID-VkCopyImageToImageInfoEXT-dstImage-07274**
  For each element of **pRegions**, **dstOffset.x** must be a multiple of the **texel block extent width** of the **VkFormat** of **dstImage**
For each element of `pRegions`, `dstOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `dstOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `dstOffset.x` and `extent.width` does not equal the width of the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `dstOffset.y` and `extent.height` does not equal the height of the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `dstOffset.z` and `extent.depth` does not equal the depth of the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

If `dstImage` has a multi-planar image format, then for each element of `pRegions`, `dstSubresource.aspectMask` must be a single valid multi-planar aspect mask bit.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

`srcImageLayout` must specify the current layout of the image subresources of `srcImage` specified in `pRegions`.

`dstImageLayout` must specify the current layout of the image subresources of `dstImage` specified in `pRegions`.

`srcImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`.

`dstImageLayout` must be one of the image layouts returned in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`.
Valid Usage (Implicit)

- **VUID-VkCopyImageToImageInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_COPY_IMAGE_TO_IMAGE_INFO_EXT`

- **VUID-VkCopyImageToImageInfoEXT-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkCopyImageToImageInfoEXT-flags-parameter**
  - `flags` must be a valid combination of `VkHostImageCopyFlagBitsEXT` values

- **VUID-VkCopyImageToImageInfoEXT-srcImage-parameter**
  - `srcImage` must be a valid `VkImage` handle

- **VUID-VkCopyImageToImageInfoEXT-srcImageLayout-parameter**
  - `srcImageLayout` must be a valid `VkImageLayout` value

- **VUID-VkCopyImageToImageInfoEXT-dstImage-parameter**
  - `dstImage` must be a valid `VkImage` handle

- **VUID-VkCopyImageToImageInfoEXT-dstImageLayout-parameter**
  - `dstImageLayout` must be a valid `VkImageLayout` value

- **VUID-VkCopyImageToImageInfoEXT-pRegions-parameter**
  - `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageCopy2` structures

- **VUID-VkCopyImageToImageInfoEXT-regionCount-arraylength**
  - `regionCount` must be greater than `0`

- **VUID-VkCopyImageToImageInfoEXT-commonparent**
  - Both of `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

### 19.4. Image Copies With Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
• *srcImage* is the source image.

• *srcImageLayout* is the layout of the source image subresources for the blit.

• *dstImage* is the destination image.

• *dstImageLayout* is the layout of the destination image subresources for the blit.

• *regionCount* is the number of regions to blit.

• *pRegions* is a pointer to an array of *VkImageBlit* structures specifying the regions to blit.

• *filter* is a *VkFilter* specifying the filter to apply if the blits require scaling.

*vkCmdBlitImage* must not be used for multisampled source or destination images. Use *vkCmdResolveImage* for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in [unnormalized to integer conversion](#):

\[
\begin{align*}
  u_{\text{base}} &= i + \frac{1}{2} \\
  v_{\text{base}} &= j + \frac{1}{2} \\
  w_{\text{base}} &= k + \frac{1}{2}
\end{align*}
\]

• These base coordinates are then offset by the first destination offset:

\[
\begin{align*}
  u_{\text{offset}} &= u_{\text{base}} - x_{\text{dst}0} \\
  v_{\text{offset}} &= v_{\text{base}} - y_{\text{dst}0} \\
  w_{\text{offset}} &= w_{\text{base}} - z_{\text{dst}0}
\end{align*}
\]

\[
\begin{align*}
  a_{\text{offset}} &= a - \text{baseArrayCount}_{\text{dst}}
\end{align*}
\]

• The scale is determined from the source and destination regions, and applied to the offset coordinates:

\[
\begin{align*}
  \text{scale}_u &= (x_{\text{src}1} - x_{\text{src}0}) / (x_{\text{dst}1} - x_{\text{dst}0})
\end{align*}
\]
\[
\text{scale}_v = \frac{(y_{\text{src1}} - y_{\text{src0}})}{(y_{\text{dst1}} - y_{\text{dst0}})}
\]

\[
\text{scale}_w = \frac{(z_{\text{src1}} - z_{\text{src0}})}{(z_{\text{dst1}} - z_{\text{dst0}})}
\]

\[
u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u
\]

\[
v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v
\]

\[
w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w
\]

* Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \text{srcImage}:

\[
u = u_{\text{scaled}} + x_{\text{src0}}
\]

\[
v = v_{\text{scaled}} + y_{\text{src0}}
\]

\[
w = w_{\text{scaled}} + z_{\text{src0}}
\]

\[
q = \text{mipLevel}
\]

\[
a = a_{\text{offset}} + \text{baseArrayCount}_\text{src}
\]

These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of \text{filter}, a mipmap mode of \text{VK_SAMPLER_MIPMAP_MODE_NEAREST} and an address mode of \text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

\[\text{Note}\]

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the \text{baseArrayLayer} member of \text{srcSubresource} for the source and \text{dstSubresource} for the destination. \text{layerCount} layers are blitted to the destination image.
When blitting 3D textures, slices in the destination region bounded by $\text{dstOffsets}[0].z$ and $\text{dstOffsets}[1].z$ are sampled from slices in the source region bounded by $\text{srcOffsets}[0].z$ and $\text{srcOffsets}[1].z$. If the filter parameter is $\text{VK_FILTER_LINEAR}$ then the value sampled from the source image is taken by doing linear filtering using the interpolated $z$ coordinate represented by $w$ in the previous equations. If the filter parameter is $\text{VK_FILTER_NEAREST}$ then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats can only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats must match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

**Valid Usage**

- **VUID-vkCmdBlitImage-commandBuffer-01834**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdBlitImage-commandBuffer-01835**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdBlitImage-commandBuffer-01836**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdBlitImage-pRegions-00215**
  The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`

- **VUID-vkCmdBlitImage-pRegions-00216**
  The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`

- **VUID-vkCmdBlitImage-pRegions-00217**
  The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation

- **VUID-vkCmdBlitImage-srcImage-01999**

1169
The format features of srcImage must contain VK_FORMAT_FEATURE_BLIT_SRC_BIT

- VUID-vkCmdBlitImage-srcImage-06421
  srcImage must not use a format that requires a sampler YCbCr conversion

- VUID-vkCmdBlitImage-srcImage-00219
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-vkCmdBlitImage-srcImage-00220
  If srcImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBlitImage-srcImageLayout-00221
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdBlitImage-srcImageLayout-01398
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdBlitImage-srcImage-09459
  If srcImage and dstImage are the same, and an elements of pRegions contains the srcSubresource and dstSubresource with matching mipmap and overlapping array layers, then the srcImageLayout and dstImageLayout must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- VUID-vkCmdBlitImage-dstImage-02000
  The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT

- VUID-vkCmdBlitImage-dstImage-06422
  dstImage must not use a format that requires a sampler YCbCr conversion

- VUID-vkCmdBlitImage-dstImage-00224
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdBlitImage-dstImage-00225
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBlitImage-dstImageLayout-00226
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdBlitImage-dstImageLayout-01399
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdBlitImage-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

- VUID-vkCmdBlitImage-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

- VUID-vkCmdBlitImage-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must
have exactly the same format

- **VUID-vkCmdBlitImage-srcImage-00232**
  If `srcImage` was created with a depth/stencil format, `filter` must be `VK_FILTER_NEAREST`

- **VUID-vkCmdBlitImage-srcImage-00233**
  `srcImage` must have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

- **VUID-vkCmdBlitImage-dstImage-00234**
  `dstImage` must have been created with a `samples` value of `VK_SAMPLE_COUNT_1_BIT`

- **VUID-vkCmdBlitImage-filter-02001**
  If `filter` is `VK_FILTER_LINEAR`, then the `format features` of `srcImage` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdBlitImage-srcSubresource-01705**
  The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created

- **VUID-vkCmdBlitImage-dstSubresource-01706**
  The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

- **VUID-vkCmdBlitImage-srcSubresource-01707**
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created

- **VUID-vkCmdBlitImage-dstSubresource-01708**
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

- **VUID-vkCmdBlitImage-srcImage-00240**
  If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1

- **VUID-vkCmdBlitImage-aspectMask-00241**
  For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`

- **VUID-vkCmdBlitImage-aspectMask-00242**
  For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`

- **VUID-vkCmdBlitImage-srcOffset-00243**
  For each element of `pRegions`, `srcSubresource` and `dstSubresource` of `srcOffset` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource`

- **VUID-vkCmdBlitImage-srcOffset-00244**
  For each element of `pRegions`, `srcSubresource` and `dstSubresource` of `srcOffset` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource`
srcImage

- **VUID-vkCmdBlitImage-srcImage-00245**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1

- **VUID-vkCmdBlitImage-srcOffset-00246**
  For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- **VUID-vkCmdBlitImage-srcImage-00247**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1

- **VUID-vkCmdBlitImage-dstOffset-00248**
  For each element of `pRegions`, `dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- **VUID-vkCmdBlitImage-dstOffset-00249**
  For each element of `pRegions`, `dstOffsets[0].y` and `dstOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- **VUID-vkCmdBlitImage-dstImage-00250**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffsets[0].y` must be 0 and `dstOffsets[1].y` must be 1

- **VUID-vkCmdBlitImage-dstOffset-00251**
  For each element of `pRegions`, `dstOffsets[0].z` and `dstOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- **VUID-vkCmdBlitImage-dstImage-00252**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffsets[0].z` must be 0 and `dstOffsets[1].z` must be 1

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBlitImage-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBlitImage-srcImage-parameter**
  `srcImage` must be a valid `VkImage` handle

- **VUID-vkCmdBlitImage-srcImageLayout-parameter**
  `srcImageLayout` must be a valid `VkImageLayout` value

- **VUID-vkCmdBlitImage-dstImage-parameter**
  `dstImage` must be a valid `VkImage` handle

- **VUID-vkCmdBlitImage-dstImageLayout-parameter**
  `dstImageLayout` must be a valid `VkImageLayout` value
pRegions must be a valid pointer to an array of regionCount valid VkImageBlit structures

filter must be a valid VkFilter value

commandBuffer must be in the recording state

The VkCommandPool that commandBuffer was allocated from must support graphics operations

This command must only be called outside of a render pass instance

This command must only be called outside of a video coding scope

regionCount must be greater than 0

Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

Host access to commandBuffer must be externally synchronized

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</table>

The VkImageBlit structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
};
```
 VkImageBlit;

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- **VUID-VkImageBlit-aspectMask-00238**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageBlit-layerCount-08800**
  If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` must match

- **VUID-VkImageBlit-layerCount-08801**
  If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

### Valid Usage (Implicit)

- **VUID-VkImageBlit-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageBlit-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_3
define vcCmdBlitImage2(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- VUID-vkCmdBlitImage2-commandBuffer-01834
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image
- VUID-vkCmdBlitImage2-commandBuffer-01835
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image
- VUID-vkCmdBlitImage2-commandBuffer-01836
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- VUID-vkCmdBlitImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBlitImage2-pBlitImageInfo-parameter
  `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2` structure
- VUID-vkCmdBlitImage2-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdBlitImage2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdBlitImage2-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdBlitImage2-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkBlitImageInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBlitImageInfo2 {
    VkStructureType         sType;
    const void*              pNext;
    VkImage                  srcImage;
    VkImageLayout            srcImageLayout;
    VkImage                  dstImage;
    VkImageLayout            dstImageLayout;
    uint32_t                 regionCount;
    const VkImageBlit2*      pRegions;
    VkFilter                 filter;
} VkBlitImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of VkImageBlit2 structures specifying the regions to blit.
- **filter** is a **VkFilter** specifying the filter to apply if the blits require scaling.

---

### Valid Usage

- **VUID-VkBlitImageInfo2-pRegions-00215**
  The source region specified by each element of **pRegions** must be a region that is contained within **srcImage**

- **VUID-VkBlitImageInfo2-pRegions-00216**
  The destination region specified by each element of **pRegions** must be a region that is contained within **dstImage**

- **VUID-VkBlitImageInfo2-pRegions-00217**
  The union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory with any texel that **may** be sampled during the blit operation

- **VUID-VkBlitImageInfo2-srcImage-01999**
  The **format features** of **srcImage** must contain **VK_FORMAT_FEATURE_BLIT_SRC_BIT**

- **VUID-VkBlitImageInfo2-srcImage-06421**
  **srcImage** must not use a format that requires a sampler \( Y' C_b C_r \) conversion

- **VUID-VkBlitImageInfo2-srcImage-00219**
  **srcImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkBlitImageInfo2-srcImage-00220**
  If **srcImage** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkBlitImageInfo2-srcImageLayout-00221**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkBlitImageInfo2-srcImageLayout-01398**
  **srcImageLayout** must be **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**, **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** or **VK_IMAGE_LAYOUT_GENERAL**

- **VUID-VkBlitImageInfo2-srcImage-09459**
  If **srcImage** and **dstImage** are the same, and an elements of **pRegions** contains the srcSubresource and dstSubresource with matching mipLevel and overlapping array layers, then the **srcImageLayout** and **dstImageLayout** must be **VK_IMAGE_LAYOUT_GENERAL** or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkBlitImageInfo2-dstImage-02000**
  The **format features** of **dstImage** must contain **VK_FORMAT_FEATURE_BLIT_DST_BIT**

- **VUID-VkBlitImageInfo2-dstImage-06422**
  **dstImage** must not use a format that requires a sampler \( Y' C_b C_r \) conversion

- **VUID-VkBlitImageInfo2-dstImage-00224**
  **dstImage** must have been created with **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage flag

- **VUID-VkBlitImageInfo2-dstImage-00225**
  If **dstImage** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object
• VUID-VkBlitImageInfo2-dstImageLayout-00226
dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkBlitImageInfo2-dstImageLayout-01399
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkBlitImageInfo2-srcImage-00229
If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00230
If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00231
If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format

• VUID-VkBlitImageInfo2-srcImage-00232
If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

• VUID-VkBlitImageInfo2-srcImage-00233
srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-VkBlitImageInfo2-dstImage-00234
dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-VkBlitImageInfo2-filter-02001
If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-VkBlitImageInfo2-srcSubresource-01705
The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-VkBlitImageInfo2-dstSubresource-01706
The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-VkBlitImageInfo2-srcSubresource-01707
If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkBlitImageInfo2-dstSubresource-01708
If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-VkBlitImageInfo2-srcImage-00240
If either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be
0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1

- VUID-VkBlitImageInfo2-aspectMask-00241
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkBlitImageInfo2-aspectMask-00242
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-VkBlitImageInfo2-srcOffset-00243
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkBlitImageInfo2-srcOffset-00244
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkBlitImageInfo2-srcImage-00245
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y must be 0 and srcOffsets[1].y must be 1

- VUID-VkBlitImageInfo2-srcImage-00246
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y must be 0 and dstOffsets[1].y must be 1

- VUID-VkBlitImageInfo2-dstImage-00251
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkBlitImageInfo2-dstImage-00252
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffsets[0].z must be 0 and dstOffsets[1].z must be 1
Valid Usage (Implicit)

- **VUID-VkBlitImageInfo2-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2`

- **VUID-VkBlitImageInfo2-pNext-pNext**
  - `pNext` **must** be `NULL`

- **VUID-VkBlitImageInfo2-srcImage-parameter**
  - `srcImage` **must** be a valid `VkImage` handle

- **VUID-VkBlitImageInfo2-srcImageLayout-parameter**
  - `srcImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkBlitImageInfo2-dstImage-parameter**
  - `dstImage` **must** be a valid `VkImage` handle

- **VUID-VkBlitImageInfo2-dstImageLayout-parameter**
  - `dstImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-VkBlitImageInfo2-pRegions-parameter**
  - `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkImageBlit2` structures

- **VUID-VkBlitImageInfo2-filter-parameter**
  - `filter` **must** be a valid `VkFilter` value

- **VUID-VkBlitImageInfo2-regionCount-arraylength**
  - `regionCount` **must** be greater than `0`

- **VUID-VkBlitImageInfo2-commonparent**
  - Both of `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkImageBlit2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageBlit2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageBlit2 VkImageBlit2KHR;
```

- **`sType`** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `srcSubresource` is the subresource to blit from.
• `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
• `dstSubresource` is the subresource to blit into.
• `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- **VUID-VkImageBlit2-aspectMask-00238**
The `aspectMask` member of `srcSubresource` and `dstSubresource` must match

- **VUID-VkImageBlit2-layerCount-08800**
If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` members of `srcSubresource` or `dstSubresource` must match

- **VUID-VkImageBlit2-layerCount-08801**
If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is `VK_REMAINING_ARRAY_LAYERS`, the other member must be either `VK_REMAINING_ARRAY_LAYERS` or equal to the `arrayLayers` member of the `VkImageCreateInfo` used to create the image minus `baseArrayLayer`

### Valid Usage (Implicit)

- **VUID-VkImageBlit2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_BLIT_2`

- **VUID-VkImageBlit2-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkImageBlit2-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageBlit2-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

### 19.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResolveImage;
```
VkCommandBuffer commandBuffer, VkImage srcImage, VkImageLayout srcImageLayout, VkImage dstImage, VkImageLayout dstImageLayout, uint32_t regionCount, const VkImageResolve* pRegions);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of VkImageResolve structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample’s value is selected for each pixel.

**srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. **extent** is the size in texels of the source image to resolve in width, height, and depth. Each element of **pRegions** must be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with **baseArrayLayer** member of **srcSubresource** for the source and **dstSubresource** for the destination. **layerCount** layers are resolved to the destination image.

### Valid Usage

- **VUID-vkCmdResolveImage-commandBuffer-01837**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcImage** must not be a protected image.

- **VUID-vkCmdResolveImage-commandBuffer-01838**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstImage** must not be a protected image.

- **VUID-vkCmdResolveImage-commandBuffer-01839**
  If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstImage** must not be an unprotected image.

- **VUID-vkCmdResolveImage-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory.
• VUID-vkCmdResolveImage-srcImage-00256
If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

• VUID-vkCmdResolveImage-srcImage-00257
  `srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`

• VUID-vkCmdResolveImage-dstImage-00258
If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

• VUID-vkCmdResolveImage-dstImage-00259
  `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

• VUID-vkCmdResolveImage-srcImageLayout-00260
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

• VUID-vkCmdResolveImage-srcImageLayout-01400
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

• VUID-vkCmdResolveImage-dstImageLayout-00262
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

• VUID-vkCmdResolveImage-dstImageLayout-01401
  `dstImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

• VUID-vkCmdResolveImage-dstImage-02003
  The **format features** of `dstImage` **must** contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`

• VUID-vkCmdResolveImage-srcImage-01386
  `srcImage` and `dstImage` **must** have been created with the same image format

• VUID-vkCmdResolveImage-srcSubresource-01709
  The `srcSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created

• VUID-vkCmdResolveImage-dstSubresource-01710
  The `dstSubresource.mipLevel` member of each element of `pRegions` **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created

• VUID-vkCmdResolveImage-srcSubresource-01711
  If `srcSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created

• VUID-vkCmdResolveImage-dstSubresource-01712
  If `dstSubresource.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` **must** be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created
• VUID-vkCmdResolveImage-srcImage-04446
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.layerCount must be 1

• VUID-vkCmdResolveImage-srcImage-04447
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

• VUID-vkCmdResolveImage-srcOffset-00269
  For each element of pRegions, srcSubresource.layerCount must be 1
  dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

• VUID-vkCmdResolveImage-srcImage-00271
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

• VUID-vkCmdResolveImage-srcOffset-00272
  For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

• VUID-vkCmdResolveImage-srcImage-00273
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

• VUID-vkCmdResolveImage-dstOffset-00274
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

• VUID-vkCmdResolveImage-dstOffset-00275
  For each element of pRegions, dstSubresource.layerCount must be 1

• VUID-vkCmdResolveImage-dstImage-00276
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

• VUID-vkCmdResolveImage-dstOffset-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

• VUID-vkCmdResolveImage-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

• VUID-vkCmdResolveImage-srcImage-06762

1184
srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-vkCmdResolveImage-srcImage-06763
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

- VUID-vkCmdResolveImage-dstImage-06764
dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdResolveImage-dstImage-06765
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

Valid Usage (Implicit)

- VUID-vkCmdResolveImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdResolveImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdResolveImage-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdResolveImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdResolveImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdResolveImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve structures

- VUID-vkCmdResolveImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdResolveImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdResolveImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResolveImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdResolveImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdResolveImage-commonparent
  Each of commandBuffer, dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in width, height and depth.

Valid Usage

- VUID-VkImageResolve-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`.

- VUID-VkImageResolve-layerCount-08803
  If neither of the `layerCount` members of `srcSubresource` or `dstSubresource` are `VK_REMAINING_ARRAY_LAYERS`, the `layerCount` member of `srcSubresource` and `dstSubresource` must match.

- VUID-VkImageResolve-layerCount-08804
  If one of the `layerCount` members of `srcSubresource` or `dstSubresource` is
VK_REMAINING_ARRAY_LAYERS, the other member must be either VK_REMAINING_ARRAY_LAYERS or equal to the arrayLayers member of the VkImageCreateInfo used to create the image minus baseArrayLayer.

Valid Usage (Implicit)

- VUID-VkImageResolve-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure
- VUID-VkImageResolve-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pResolveImageInfo` is a pointer to a VkResolveImageInfo2 structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdResolveImage2-commandBuffer-01837
  If `commandBuffer` is an unprotected command buffer and protectedNoFault is not supported, `srcImage` must not be a protected image
- VUID-vkCmdResolveImage2-commandBuffer-01838
  If `commandBuffer` is an unprotected command buffer and protectedNoFault is not supported, `dstImage` must not be a protected image
- VUID-vkCmdResolveImage2-commandBuffer-01839
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

**Valid Usage (Implicit)**

- VUID-vkCmdResolveImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdResolveImage2-pResolveImageInfo-parameter
  `pResolveImageInfo` must be a valid pointer to a valid `VkResolveImageInfo2` structure

- VUID-vkCmdResolveImage2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdResolveImage2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdResolveImage2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResolveImage2-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>

</tbody>
</table>

The `VkResolveImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImage srcImageLayout;
    VkImage dstImage;
} VkResolveImageInfo2;
```
VkImageLayout
uint32_t
const VkImageResolve2*
} VkResolveImageInfo2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of `VkImageResolve2` structures specifying the regions to resolve.

### Valid Usage

- **VUID-VkResolveImageInfo2-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkResolveImageInfo2-srcImage-00256**
  If **srcImage** is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-srcImage-00257**
  **srcImage** must have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-dstImage-00258**
  If **dstImage** is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-dstImage-00259**
  **dstImage** must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-srcImageLayout-00260**
  **srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2-srcImageLayout-01400**
  **srcImageLayout** must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, 1189
• VUID-VkResolveImageInfo2-dstImageLayout-00262
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkResolveImageInfo2-dstImageLayout-01401
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkResolveImageInfo2-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkResolveImageInfo2-srcImage-01386
  srcImage and dstImage must have been created with the same image format

• VUID-VkResolveImageInfo2-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-VkResolveImageInfo2-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-VkResolveImageInfo2-srcSubresource-01711
  If srcSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkResolveImageInfo2-dstSubresource-01712
  If dstSubresource.layerCount is not VK_REMAINING_ARRAY_LAYERS, dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-VkResolveImageInfo2-srcImage-00271
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcSubresource.layerCount must be 1

• VUID-VkResolveImageInfo2-srcImage-00272
  If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, srcSubresource.layerCount must be 1

• VUID-VkResolveImageInfo2-srcOffset-00269
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

• VUID-VkResolveImageInfo2-srcOffset-00270
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

• VUID-VkResolveImageInfo2-srcImage-00271
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.y

1190
must be 0 and extent.height must be 1

- VUID-VkResolveImageInfo2-srcOffset-00272
  For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkResolveImageInfo2-srcImage-00273
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

- VUID-VkResolveImageInfo2-dstOffset-00274
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00275
  For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00276
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

- VUID-VkResolveImageInfo2-dstImage-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

- VUID-VkResolveImageInfo2-srcImage-06762
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-VkResolveImageInfo2-srcImage-06763
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

- VUID-VkResolveImageInfo2-dstImage-06764
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-VkResolveImageInfo2-dstImage-06765
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

### Valid Usage (Implicit)

- VUID-VkResolveImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2

- VUID-VkResolveImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkResolveImageInfo2-srcImage-parameter
srcImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-dstImage-parameter
dstImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve2 structures

- VUID-VkResolveImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkResolveImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageResolve2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSubresource** and **dstSubresource** are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
- **srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- **extent** is the size in texels of the source image to resolve in width, height and depth.
Valid Usage

- VUID-VkImageResolve2-aspectMask-00266
  The aspectMask member of srcSubresource and dstSubresource must only contain VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageResolve2-layerCount-08803
  If neither of the layerCount members of srcSubresource or dstSubresource are VK_REMAINING_ARRAY_LAYERS, the layerCount member of srcSubresource and dstSubresource must match

- VUID-VkImageResolve2-layerCount-08804
  If one of the layerCount members of srcSubresource or dstSubresource is VK_REMAINING_ARRAY_LAYERS, the other member must be either VK_REMAINING_ARRAY_LAYERS or equal to the arrayLayers member of the VkImageCreateInfo used to create the image minus baseArrayLayer

Valid Usage (Implicit)

- VUID-VkImageResolve2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2

- VUID-VkImageResolve2-pNext-pNext
  pNext must be NULL

- VUID-VkImageResolve2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageResolve2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure
Chapter 20. Drawing Commands

*Drawing commands* (commands with *Draw* in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline, or if the *shaderObject* feature is enabled, any *shader objects* bound to graphics stages. A graphics pipeline or a combination of one or more graphics shader objects must be bound to a command buffer before any drawing commands are recorded in that command buffer.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the *pInputAssemblyState* member of the *VkGraphicsPipelineCreateInfo* structure, which is of type *VkPipelineInputAssemblyStateCreateInfo*:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *flags* is reserved for future use.
- *topology* is a *VkPrimitiveTopology* defining the primitive topology, as described below.
- *primitiveRestartEnable* controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (*vkCmdDrawIndexed*, and *vkCmdDrawIndexedIndirect*), and the special index value is either 0xFFFFFFFF when the *indexType* parameter of *vkCmdBindIndexBuffer2KHR* or *vkCmdBindIndexBuffer* is equal to *VK_INDEX_TYPE_UINT32*, or 0xFFFF when *indexType* is equal to *VK_INDEX_TYPE_UINT16*. Primitive restart is not allowed for “list” topologies.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the *vertexOffset* value to the index value.

### Valid Usage

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252
  
  If *topology* is *VK_PRIMITIVE_TOPOLOGY_POINT_LIST*, *VK_PRIMITIVE_TOPOLOGY_LINE_LIST*, *
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST*, *VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY*, or
VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, primitiveRestartEnable must be VK_FALSE

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253
  If topology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, primitiveRestartEnable must be VK_FALSE

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
  If the geometryShader feature is not enabled, topology must not be any of
  VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY,
  VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY,
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY
  or
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430
  If the tessellationShader feature is not enabled, topology must not be
  VK_PRIMITIVE_TOPOLOGY_PATCH_LIST

- VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, topology must not be
  VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN

Valid Usage (Implicit)

- VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO

- VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zero bitmask
  flags must be 0

- VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
  topology must be a valid VkPrimitiveTopology value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;

VkPipelineInputAssemblyStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives, call:

// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`.

This command sets the primitive restart enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveRestartEnable-None-08970
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetPrimitiveRestartEnable-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
20.1. Primitive Topologies

Primitive topology determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders.

The primitive topologies defined by VkPrimitiveTopology are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of separate point primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of separate line primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of connected line primitives with consecutive lines sharing a vertex.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all triangles sharing a common vertex. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is VK_FALSE, then triangle fans are
not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

- `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` specifies a series of separate line primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY` specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` specifies a series of separate triangle primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY` specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.
- `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th></th>
<th>Vertex</th>
<th>A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>Vertex Number</td>
<td>Sequence position of a vertex within the provided vertex data.</td>
</tr>
<tr>
<td>![Diagram]</td>
<td>Provoking Vertex</td>
<td>Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.</td>
</tr>
<tr>
<td>![Diagram]</td>
<td>Primitive Edge</td>
<td>An edge connecting the points of a main primitive.</td>
</tr>
<tr>
<td>![Diagram]</td>
<td>Adjacency Edge</td>
<td>Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.</td>
</tr>
<tr>
<td>![Diagram]</td>
<td>Winding Order</td>
<td>The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.</td>
</tr>
</tbody>
</table>

The diagrams are supported with mathematical definitions where the vertices \( v \) and primitives \( p \) are numbered starting from 0; \( v_0 \) is the first vertex in the provided data and \( p_0 \) is the first primitive in the set of primitives defined by the vertices and topology.

To dynamically set primitive topology, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveTopology(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,
    /* other parameters */)
```

1198
• `commandBuffer` is the command buffer into which the command will be recorded.
• `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetPrimitiveTopology-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter
  `primitiveTopology` **must** be a valid `VkPrimitiveTopology` value
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetPrimitiveTopology-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
### 20.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

**Table 25. Topology classes**

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</td>
</tr>
<tr>
<td>Line</td>
<td>VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Triangle</td>
<td>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Patch</td>
<td>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</td>
</tr>
</tbody>
</table>

### 20.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to `vertexCount`.  

20.1.3. Line Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/2 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{2i} \).

20.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

The provoking vertex for \( p_i \) is \( v_i \).

20.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:
\[ p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{3i} \).

20.1.6. Triangle Strips

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP}, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

The provoking vertex for \( p_i \) is \( v_i \).

\[ \text{Note} \]

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

20.1.7. Triangle Fans

When the primitive topology is \texttt{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN}, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{v_{i+1}, v_{i+2}, v_0\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

The provoking vertex for \( p_i \) is \( v_{i+1} \).
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

20.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[ p_i = \{ v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3} \} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/4 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{4i+1} \).

20.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{ v_i, v_{i+1}, v_{i+2}, v_{i+3} \} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.
The number of primitives generated is equal to \( \text{max}(0, \text{vertexCount}-3) \).

The provoking vertex for \( p_i \) is \( v_{i+1} \).

### 20.1.10. Triangle Lists With Adjacency

When the primitive topology is \( \text{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY} \), each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[
p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}
\]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/6 \rfloor \).

The provoking vertex for \( p_i \) is \( v_{6i} \).

### 20.1.11. Triangle Strips With Adjacency

When the primitive topology is \( \text{VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY} \), one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, \( n \), is equal to \( \lfloor \text{max}(0, \text{vertexCount} - 4)/2 \rfloor \).

If \( n=1 \), the primitive is defined as:

\[
p = \{v_0, v_1, v_2, v_5, v_4, v_3\}
\]

If \( n>1 \), the total primitive consists of different vertices according to where it is in the strip:

\[
p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0
\]
\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \] when \( i > 0, i < n - 1, \) and \( i \% 2 = 1 \)

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+3}, v_{2i+1}, v_{2i+6}, v_{2i+4}\} \] when \( i > 0, i < n - 1, \) and \( i \% 2 = 0 \)

\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+5}, v_{2i+2}, v_{2i+1}\} \] when \( i = n - 1 \) and \( i \% 2 = 1 \)

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+3}, v_{2i+1}, v_{2i+6}, v_{2i+4}\} \] when \( i = n - 1 \) and \( i \% 2 = 0 \)

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**
The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

The provoking vertex for \( p_i \) is always \( v_{2i} \).
20.1.12. Patch Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of \( m \) vertices defines a single patch primitive, according to the equation:

\[ p_i = \{v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)}\} \]

where \( m \) is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \text{vertexCount}/m \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

20.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the `VkDrawIndirectCommand` are stored in buffer, from lower indirect buffer addresses to higher addresses.
3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.
4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered `vertexIndex` to a higher numbered `vertexIndex`.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.
6. If geometry shading is active, by the order new primitives are generated by geometry shading.
7. If the polygon mode is not `VK_POLYGON_MODE_FILL`, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.
20.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
  - vkCmdDrawIndirectCount
  - vkCmdDrawIndirectCountKHR

- Indexed drawing commands read index values from an index buffer and use this to compute the vertexIndex value for the vertex shader. These commands are:
  - vkCmdDrawIndexed
  - vkCmdDrawIndexedIndirect
  - vkCmdDrawIndexedIndirectCount
  - vkCmdDrawIndexedIndirectCountKHR

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkIndexType indexType);
```

- commandBuffer is the command buffer into which the command is recorded.
- buffer is the buffer being bound.
- offset is the starting offset in bytes within buffer used in index buffer address calculations.
- indexType is a VkIndexType value specifying the size of the indices.
If the `maintenance6` feature is enabled, `buffer` can be `VK_NULL_HANDLE`.

### Valid Usage

- **VUID-vkCmdBindIndexBuffer-offset-08782**
  `offset must` be less than the size of `buffer`

- **VUID-vkCmdBindIndexBuffer-offset-08783**
  `offset` and the base address of the range of `VkDeviceMemory` object that is backing `buffer`, **must** be a multiple of the size of the type indicated by `indexType`

- **VUID-vkCmdBindIndexBuffer-buffer-08784**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag

- **VUID-vkCmdBindIndexBuffer-buffer-08785**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBindIndexBuffer-indexType-08786**
  `indexType must` not be `VK_INDEX_TYPE_NONE_KHR`

- **VUID-vkCmdBindIndexBuffer-None-09493**
  `buffer` **must** not be `VK_NULL_HANDLE`

- **VUID-vkCmdBindIndexBuffer-buffer-09494**
  If `buffer` is `VK_NULL_HANDLE`, `offset` **must** be zero

### Valid Usage (Implicit)

- **VUID-vkCmdBindIndexBuffer-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindIndexBuffer-buffer-parameter**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle

- **VUID-vkCmdBindIndexBuffer-indexType-parameter**
  `indexType` **must** be a valid `VkIndexType` value

- **VUID-vkCmdBindIndexBuffer-commandBuffer-recording**
  `commandBuffer` **must** be in the `recording state`

- **VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBindIndexBuffer-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdBindIndexBuffer-commonparent**
  Both of `buffer`, and `commandBuffer` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

<td></td>
</tr>
</tbody>
</table>

To bind an index buffer, along with its size, to a command buffer, call:

```c
// Provided by VK_KHR_maintenance5
void vkCmdBindIndexBuffer2KHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_maintenance5
    VkBuffer buffer,               // Provided by VK_KHR_maintenance5
    VkDeviceSize offset,           // Provided by VK_KHR_maintenance5
    VkDeviceSize size,             // Provided by VK_KHR_maintenance5
    VkIndexType indexType);        // Provided by VK_KHR_maintenance5
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `size` is the size in bytes of index data bound from `buffer`.
- `indexType` is a `VkIndexType` value specifying the size of the indices.

`size` specifies the bound size of the index buffer starting from `offset`. If `size` is `VK_WHOLE_SIZE` then the bound size is from `offset` to the end of the `buffer`.

If the `maintenance6` feature is enabled, `buffer` can be `VK_NULL_HANDLE`.

Valid Usage

- VUID-vkCmdBindIndexBuffer2KHR-offset-08782
  `offset` must be less than the size of `buffer`.
- VUID-vkCmdBindIndexBuffer2KHR-offset-08783
  The sum of `offset` and the base address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the size of the type indicated by `indexType`.
- VUID-vkCmdBindIndexBuffer2KHR-buffer-08784
buffer must have been created with the VK_BUFFER_USAGE_INDEX_BUFFER_BIT flag

- VUID-vkCmdBindIndexBuffer2KHR-buffer-08785
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindIndexBuffer2KHR-indexType-08786
  indexType must not be VK_INDEX_TYPE_NONE_KHR

- VUID-vkCmdBindIndexBuffer2KHR-None-09493
  buffer must not be VK_NULL_HANDLE

- VUID-vkCmdBindIndexBuffer2KHR-buffer-09494
  If buffer is VK_NULL_HANDLE, offset must be zero

- VUID-vkCmdBindIndexBuffer2KHR-size-08767
  If size is not VK_WHOLE_SIZE, size must be a multiple of the size of the type indicated by indexType

- VUID-vkCmdBindIndexBuffer2KHR-size-08768
  If size is not VK_WHOLE_SIZE, the sum of offset and size must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindIndexBuffer2KHR-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

- VUID-vkCmdBindIndexBuffer2KHR-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindIndexBuffer2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindIndexBuffer2KHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindIndexBuffer2KHR-commonparent
  Both of buffer, and commandBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
Possible values of `vkCmdBindIndexBuffer2KHR::indexType` and `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
    VK_INDEX_TYPE_UINT32 = 1,
    // Provided by VK_KHR_acceleration_structure
    VK_INDEX_TYPE_NONE_KHR = 1000165000,
} VkIndexType;
```

- `VK_INDEX_TYPE_UINT16` specifies that indices are 16-bit unsigned integer values.
- `VK_INDEX_TYPE_UINT32` specifies that indices are 32-bit unsigned integer values.
- `VK_INDEX_TYPE_NONE_KHR` specifies that no indices are provided.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as *indirect* drawing commands.

All drawing commands interact with the `robustBufferAccess` feature.

To record a non-indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDraw(
    VkCommandBuffer commandBuffer,
    uint32_t vertexCount,
    uint32_t instanceCount,
    uint32_t firstVertex,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
• `firstVertex` is the index of the first vertex to draw.

• `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

---

### Valid Usage

- **VUID-vkCmdDraw-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDraw-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDraw-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDraw-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDraw-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDraw-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

---

1212
• VUID-vkCmdDraw-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDraw-None-08600
  For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a VkPipelineLayout that is compatible for set \( n \), with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDraw-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDraw-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdDraw-None-08614
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

• VUID-vkCmdDraw-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdDraw-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDraw-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDraw-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler
must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDraw-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDraw-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDraw-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDraw-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` must not be a protected resource

- **VUID-vkCmdDraw-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C_b` conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDraw-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C_b` conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDraw-viewType-07752**

1214
If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDraw-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` must match

- **VUID-vkCmdDraw-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format

- **VUID-vkCmdDraw-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components

- **VUID-vkCmdDraw-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format

- **VUID-vkCmdDraw-None-07288**
  Any shader invocation executed by this command must terminate

- **VUID-vkCmdDraw-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDraw-subpass-02685**
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDraw-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

- **VUID-vkCmdDraw-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass

- **VUID-vkCmdDraw-None-07469**
  Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility

- **VUID-vkCmdDraw-None-06537**
  Memory backing image subresources used as attachments in the current render pass
**must** not be written in any way other than as an attachment by this command

- **VUID-vkCmdDraw-None-09000**
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDraw-None-09001**
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDraw-None-09002**
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command

- **VUID-vkCmdDraw-None-09003**
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command
• VUID-vkCmdDraw-None-06539
If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment.

• VUID-vkCmdDraw-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

• VUID-vkCmdDraw-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

• VUID-vkCmdDraw-None-07831
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07832
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07833
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08617
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08618
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-08619
If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDraw-None-07834
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08620**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08621**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetStencilTestEnable in the current command buffer set 
stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command 
buffer prior to this drawing command

• VUID-vkCmdDraw-None-07838 
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current 
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been 
called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08624 
If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to 
VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command 
buffer prior to this drawing command

• VUID-vkCmdDraw-None-07839 
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current 
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been 
called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08625 
If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to 
VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer 
 prior to this drawing command

• VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688 
If the draw is recorded in a render pass instance with multiview enabled, the maximum 
instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties ::maxMultiviewInstanceIndex

• VUID-vkCmdDraw-None-07840 
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE 
dynamic state enabled then vkCmdSetCullMode must have been called in the current 
command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08627 
If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called in 
the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07841 
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE 
dynamic state enabled then vkCmdSetFrontFace must have been called in the current
command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07843**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07844**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07845**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTHCOMPARE_Op` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08632**
If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetDepthBoundsTestEnable must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07847**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07848**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

- **VUID-vkCmdDraw-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

- **VUID-vkCmdDraw-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command.
and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDraw-None-08635**
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDraw-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDraw-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.
• VUID-vkCmdDraw-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

• VUID-vkCmdDraw-imageView-06177
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

• VUID-vkCmdDraw-viewMask-06178
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

• VUID-vkCmdDraw-colorAttachmentCount-06179
If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

• VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08910
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline.

• VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08912
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

• VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08911
If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

• VUID-vkCmdDraw-None-07751
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

- **VUID-vkCmdDraw-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07881**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08917
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDraw-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDraw-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView
• VUID-vkCmdDraw-multisampledRenderToSingleSampled-07287
If \( \text{VkRenderingInfo}::\text{pStencilAttachment->imageView} \) was not \( \text{VK_NULL_HANDLE} \), the value of \( \text{rasterizationSamples} \) for the currently bound graphics pipeline must be equal to the sample count used to create \( \text{VkRenderingInfo}::\text{pStencilAttachment->imageView} \)

• VUID-vkCmdDraw-renderPass-06198
If the current render pass instance was begun with \( \text{vkCmdBeginRendering} \), the currently bound pipeline must have been created with a \( \text{VkGraphicsPipelineCreateInfo}::\text{renderPass} \) equal to \( \text{VK_NULL_HANDLE} \)

• VUID-vkCmdDraw-pColorAttachments-08963
If the current render pass instance was begun with \( \text{vkCmdBeginRendering} \), there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the \( \text{VkRenderingInfo}::\text{pColorAttachments->imageView} \) was not \( \text{VK_NULL_HANDLE} \), then the corresponding element of \( \text{VkPipelineRenderingCreateInfo}::\text{pColorAttachmentFormats} \) used to create the pipeline must not be \( \text{VK_FORMAT_UNDEFINED} \)

• VUID-vkCmdDraw-pDepthAttachment-08964
If the current render pass instance was begun with \( \text{vkCmdBeginRendering} \), there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the \( \text{VkRenderingInfo}::\text{pDepthAttachment->imageView} \) was not \( \text{VK_NULL_HANDLE} \), then the \( \text{VkPipelineRenderingCreateInfo}::\text{depthAttachmentFormat} \) used to create the pipeline must not be \( \text{VK_FORMAT_UNDEFINED} \)

• VUID-vkCmdDraw-pStencilAttachment-08965
If the current render pass instance was begun with \( \text{vkCmdBeginRendering} \), there is a graphics pipeline bound, stencil test is enabled and the \( \text{VkRenderingInfo}::\text{pStencilAttachment->imageView} \) was not \( \text{VK_NULL_HANDLE} \), then the \( \text{VkPipelineRenderingCreateInfo}::\text{stencilAttachmentFormat} \) used to create the pipeline must not be \( \text{VK_FORMAT_UNDEFINED} \)

• VUID-vkCmdDraw-None-07619
If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT} \) dynamic state enabled then \( \text{vkCmdSetTessellationDomainOriginEXT} \) must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-07620
If the bound graphics pipeline state was created with the \( \text{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} \) dynamic state enabled then \( \text{vkCmdSetDepthClampEnableEXT} \) must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-09237
If a shader object is bound to the \( \text{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT} \) stage, then \( \text{vkCmdSetTessellationDomainOriginEXT} \) must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08650
If the \( \text{depthClamp} \) feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \( \text{vkCmdSetRasterizerDiscardEnable} \) in the current command buffer set \( \text{rasterizerDiscardEnable} \) to \( \text{VK_FALSE} \), then \( \text{vkCmdSetDepthClampEnableEXT} \)
must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDraw-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- **VUID-vkCmdDraw-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then \texttt{vkCmdSetAlphaToCoverageEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-alphaToCoverageEnable-08920**
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetAlphaToCoverageEnableEXT} in the current command buffer set alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

- **VUID-vkCmdDraw-None-07625**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08655**
  If the \texttt{alphaToOne} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07626**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08656**
  If the \texttt{logicOp} feature is enabled, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then \texttt{vkCmdSetLogicOpEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07627**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08657**
  If the \texttt{logicOp} feature is enabled, and a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07628**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08658**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command.
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-08659**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDraw-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDraw-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDraw-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDraw-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are
enabled, then the \textit{rasterizationSamples} in the last call to \texttt{vkCmdSetRasterizationSamplesEXT} must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDraw-firstAttachment-07476**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09417**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \textit{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorBlendEnableEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEnableEXT} calls must specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDraw-firstAttachment-07477**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT} dynamic state enabled then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEquationEXT} calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09418**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \textit{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorBlendEquationEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorBlendEquationEXT} calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDraw-firstAttachment-07478**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteMaskEXT} must have been called in the current command buffer prior to this drawing command, and the attachments specified by the \texttt{firstAttachment} and \texttt{attachmentCount} parameters of \texttt{vkCmdSetColorWriteMaskEXT} calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDraw-rasterizerDiscardEnable-09419**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \textit{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetColorWriteMaskEXT} must have been
called in the current command buffer prior to this drawing command, and the
attachments specified by the firstAttachment and attachmentCount parameters of
vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color
attachments in the current subpass

• VUID-vkCmdDraw-None-08877
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state
  vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDraw-None-08684
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
  current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

• VUID-vkCmdDraw-None-08685
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT

• VUID-vkCmdDraw-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-vkCmdDraw-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with
  pStages with an element of VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-vkCmdDraw-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
  current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-vkCmdDraw-None-08698
  If any graphics shader is bound which was created with the
  VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the
  VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also
  be bound

• VUID-vkCmdDraw-None-08699
  If any graphics shader is bound which was created with the
  VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders
  which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of
  the same vkCreateShadersEXT call must not have any VkShaderEXT bound

• VUID-vkCmdDraw-None-08878
  All bound graphics shader objects must have been created with identical or identically
  defined push constant ranges

• VUID-vkCmdDraw-None-08879
  All bound graphics shader objects must have been created with identical or identically
  defined arrays of descriptor set layouts
If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or **VK_NULL_HANDLE** buffers bound

- VUID-vkCmdDraw-None-04008
  If the *nullDescriptor* feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be **VK_NULL_HANDLE**

- VUID-vkCmdDraw-None-02721
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- VUID-vkCmdDraw-None-07842
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then **vkCmdSetPrimitiveTopology** **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** dynamic state enabled and the **dynamicPrimitiveTopologyUnrestricted** is **VK_FALSE**, then the **primitiveTopology** parameter of **vkCmdSetPrimitiveTopology** **must** be of the same **topology class** as the pipeline **VkPipelineInputAssemblyStateCreateInfo::topology** state

- VUID-vkCmdDraw-pStrides-04913
  If the bound graphics pipeline was created with the **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT** dynamic state enabled, then **vkCmdBindVertexBuffers2EXT** **must** have been called in the current command buffer prior to this draw command, and the **pStrides** parameter of **vkCmdBindVertexBuffers2EXT** **must** not be **NULL**

- VUID-vkCmdDraw-None-04914
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then **vkCmdSetVertexInputEXT** **must** have been called in the current command buffer prior to this draw command

- VUID-vkCmdDraw-Input-07939
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then all variables with the **Input** storage class decorated with **Location** in the **Vertex Execution Model OpEntryPoint** **must** contain a location in **VkVertexInputAttributeDescription2EXT::location**

- VUID-vkCmdDraw-Input-08734
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage then the numeric type associated with all **Input** variables of the corresponding **Location** in the **Vertex Execution Model OpEntryPoint** **must** be the same as **VkVertexInputAttributeDescription2EXT::format**

- VUID-vkCmdDraw-format-08936
  If there is a shader object bound to the **VK_SHADER_STAGE_VERTEX_BIT** stage and **VkVertexInputAttributeDescription2EXT::format** has a 64-bit component, then the scalar width associated with all **Input** variables of the corresponding **Location** in the **Vertex Execution Model OpEntryPoint** **must** be 64-bit
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with VkPipelineVertexInputDivisorStateCreateInfoKHR in the pNext chain of VkGraphicsPipelineCreateInfo::pVertexInputState, any member of VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0.

If shader objects are used for drawing or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, any member of the pVertexBindingDescriptions parameter to the vkCmdSetVertexInputEXT call that sets this dynamic state has a value other than 1 in divisor, and VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance is VK_FALSE, then firstInstance must be 0.

Valid Usage (Implicit)

- commandBuffer must be a valid VkCommandBuffer handle
- commandBuffer must be in the recording state
- The VkCommandPool that commandBuffer was allocated from must support graphics operations
- This command must only be called inside of a render pass instance
- This command must only be called outside of a video coding scope
**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

**Command Properties**

<table>

To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,  
    uint32_t indexCount,  
    uint32_t instanceCount,  
    uint32_t firstIndex,  
    int32_t vertexOffset,  
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer2KHR::indexType` or the `vkCmdBindIndexBuffer::indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` or `vkCmdBindIndexBuffer2KHR`, and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.
The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndexed-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDrawIndexed-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-None-08600**
For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-None-08601
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-maintenance4-08602
If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexed-None-08114
Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader

- VUID-vkCmdDrawIndexed-None-08606
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexed-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndexed-None-08609
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndexed-None-08610
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawIndexed-None-08611
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this
command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndexed-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndexed-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndexed-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDrawIndexed-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y′C′B′C conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDrawIndexed-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y′C′B′C conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDrawIndexed-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDrawIndexed-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the
image view’s format and the Sampled Type operand of the OpTypeImage must match

- VUID-vkCmdDrawIndexed-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawIndexed-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

- VUID-vkCmdDrawIndexed-OpImageWrite-04469
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawIndexed-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDrawIndexed-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexed-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndexed-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndexed-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndexed-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass’ pInputAttachments[InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility

- VUID-vkCmdDrawIndexed-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexed-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
• the **VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** is set on the currently bound pipeline or

• the last call to **vkCmdSetAttachmentFeedbackLoopEnableEXT** included **VK_IMAGE_ASPECT_COLOR_BIT** and

  ▪ there is no currently bound graphics pipeline or

  ▪ the currently bound graphics pipeline was created with **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexed-None-09001

  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** image layout, and either:

  • the **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** is set on the currently bound pipeline or

  • the last call to **vkCmdSetAttachmentFeedbackLoopEnableEXT** included **VK_IMAGE_ASPECT_DEPTH_BIT** and

    ▪ there is no currently bound graphics pipeline or

    ▪ the currently bound graphics pipeline was created with **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexed-None-09002

  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** image layout, and either:

  • the **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** is set on the currently bound pipeline or

  • the last call to **vkCmdSetAttachmentFeedbackLoopEnableEXT** included **VK_IMAGE_ASPECT_STENCIL_BIT** and

    ▪ there is no currently bound graphics pipeline or

    ▪ the currently bound graphics pipeline was created with **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** it **must** not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexed-None-09003

  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it **must** not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawIndexed-None-06539

  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexed-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**

- VUID-vkCmdDrawIndexed-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndexed-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then **vkCmdSetViewport must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL dynamic state enabled then **vkCmdSetScissor must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then **vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, **vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, **vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, **vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then **vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command**

- VUID-vkCmdDrawIndexed-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to...
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08622
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-07837
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexed-None-08623
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current 
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been 
called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to 
VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command 
buffer prior to this drawing command.

If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current 
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called 
in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then 
vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command.

If the draw is recorded in a render pass instance with multiview enabled, the maximum 
instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex.

If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then 
vkCmdSetCullMode must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then 
vkCmdSetCullMode must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then 
vkCmdSetFrontFace must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then 
vkCmdSetFrontFace must have been called in
the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07843**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07844**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07845**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08631**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-07847**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexed-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexed-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawIndexed-None-08635**
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer.
prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawIndexed-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawIndexed-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawIndexed-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndexed-None-08643**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view's `format features` do not contain...
VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE

• VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07284
If rasterization is not disabled in the bound graphics pipeline,

then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndexed-None-08644
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE,

then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndexed-None-08876
If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering

• VUID-vkCmdDrawIndexed-imageView-06172
If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

• VUID-vkCmdDrawIndexed-imageView-06173
If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawIndexed-imageView-06174
If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawIndexed-imageView-06175
If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

• VUID-vkCmdDrawIndexed-imageView-06176
If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE.Layout_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT`::`discardRectangleCount`.

1249
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command buffer prior to this drawing command.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the
The `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndexed-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is enabled, `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, and the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline was not equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`, the value of the format **must** be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexed-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07285**
  If the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07286**
  If `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07287**
  If `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndexed-renderPass-06198**
If the current render pass instance was begun with\texttt{vkCmdBeginRendering}, the currently bound pipeline \textbf{must} have been created with a \texttt{VkGraphicsPipelineCreateInfo::renderPass} equal to \texttt{VK_NULL_HANDLE}

- VUID-vkCmdDrawIndexed-pColorAttachments-08963
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the \texttt{VkRenderingInfo::pColorAttachments->imageView} was not \texttt{VK_NULL_HANDLE}, then the corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats} used to create the pipeline \textbf{must} not be \texttt{VK_FORMAT_UNDEFINED}

- VUID-vkCmdDrawIndexed-pDepthAttachment-08964
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the \texttt{VkRenderingInfo::pDepthAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, then the \texttt{VkPipelineRenderingCreateInfo::depthAttachmentFormat} used to create the pipeline \textbf{must} not be \texttt{VK_FORMAT_UNDEFINED}

- VUID-vkCmdDrawIndexed-pStencilAttachment-08965
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound, stencil test is enabled and the \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, then the \texttt{VkPipelineRenderingCreateInfo::stencilAttachmentFormat} used to create the pipeline \textbf{must} not be \texttt{VK_FORMAT_UNDEFINED}

- VUID-vkCmdDrawIndexed-None-07619
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT} dynamic state enabled then \texttt{vkCmdSetTessellationDomainOriginEXT} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07620
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetDepthClampEnableEXT} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-09237
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT} stage, then \texttt{vkCmdSetTessellationDomainOriginEXT} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08650
  If the \texttt{depthClamp} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthClampEnableEXT} \textbf{must} have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07621
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_POLYGON_MODE_EXT} dynamic state enabled then \texttt{vkCmdSetPolygonModeEXT} \textbf{must} have been called in the current command buffer prior
to this drawing command

- VUID-vkCmdDrawIndexed-None-08651
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07622
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08652
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07623
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08653
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexed-None-08654
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set
alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexed-None-07625
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08655
  If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07626
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08656
  If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07627
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-07628
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08658
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to VK_FALSE, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment's value in `pColorBlendEnables` to VK_TRUE, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then...
vkCmdSetColorBlendEnableEXT **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls **must** specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls **must** specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexed-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexed-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls **must** specify the color write mask for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexed-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls **must** specify the color write mask for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexed-None-08877**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT  

dynamic state

vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexed-None-08684
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

- VUID-vkCmdDrawIndexed-None-08685
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSellation_CONTROL_BIT

- VUID-vkCmdDrawIndexed-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSellation_EVALUATION_BIT

- VUID-vkCmdDrawIndexed-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdDrawIndexed-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-vkCmdDrawIndexed-None-08698
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also be bound

- VUID-vkCmdDrawIndexed-None-08699
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of the same vkCreateShadersEXT call must not have any VkShaderEXT bound

- VUID-vkCmdDrawIndexed-None-08878
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

- VUID-vkCmdDrawIndexed-None-08879
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

- VUID-vkCmdDrawIndexed-None-08880
  If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of `Location` for any output attachment statically used in the Fragment Execution Model executed by this command must be less than `maxFragmentDualSrcAttachments`.

If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or `VK_NULL_HANDLE` buffers bound.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit.

If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component.
If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

- **VUID-vkCmdDrawIndexed-None-04879**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then `vkCmdSetPrimitiveRestartEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexed-None-07312**
  Valid index buffer must be bound.

- **VUID-vkCmdDrawIndexed-robustBufferAccess2-07825**
  If `robustBufferAccess2` is not enabled, `(indexSize \times (firstIndex + indexCount) + offset)` must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`.

- **VUID-vkCmdDrawIndexed-pNext-09461**
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.

- **VUID-vkCmdDrawIndexed-None-09462**
  If shader objects are used for drawing or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.

- **VUID-vkCmdDrawIndexed-robustBufferAccess2-08798**
  If `robustBufferAccess2` is not enabled, `(indexSize \times (firstIndex + indexCount) + offset)` must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer` or `vkCmdBindIndexBuffer2KHR`. If `vkCmdBindIndexBuffer2KHR` is used to bind the index buffer, the size of the bound index buffer is `vkCmdBindIndexBuffer2KHR::size`.

### Valid Usage (Implicit)

- **VUID-vkCmdDrawIndexed-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawIndexed-commandBuffer-recording**
  `commandBuffer` must be in the recording state.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirect` behaves similarly to `vkCmdDraw` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndirectCommand`
structures. If \texttt{drawCount} is less than or equal to one, \texttt{stride} is ignored.

**Valid Usage**

- **VUID-vkCmdDrawIndirect-magFilter-04553**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndirect-mipmapMode-04770**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDrawIndirect-None-06479**
  If a \texttt{VkImageView} is sampled with \texttt{depth comparison}, the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}

- **VUID-vkCmdDrawIndirect-None-02691**
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- **VUID-vkCmdDrawIndirect-None-07888**
  If a \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT}

- **VUID-vkCmdDrawIndirect-OpTypeImage-07027**
  For any \texttt{VkImageView} being written as a storage image where the image format field of the \texttt{OpTypeImage} is \texttt{Unknown}, the view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT}

- **VUID-vkCmdDrawIndirect-OpTypeImage-07028**
  For any \texttt{VkImageView} being read as a storage image where the image format field of the \texttt{OpTypeImage} is \texttt{Unknown}, the view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT}

- **VUID-vkCmdDrawIndirect-OpTypeImage-07029**
  For any \texttt{VkBufferView} being written as a storage texel buffer where the image format field of the \texttt{OpTypeImage} is \texttt{Unknown}, the view's buffer features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT}

- **VUID-vkCmdDrawIndirect-OpTypeImage-07030**
  Any \texttt{VkBufferView} being read as a storage texel buffer where the image format field of the \texttt{OpTypeImage} is \texttt{Unknown} then the view's buffer features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT}

- **VUID-vkCmdDrawIndirect-None-08600**
  For each set \texttt{n} that is statically used by a bound shader, a descriptor set \textbf{must} have been bound to \texttt{n} at the same pipeline bind point, with a \texttt{VkPipelineLayout} that is compatible for
set \( n \), with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) array used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndirect-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for push constants, with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) array used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndirect-maintenance4-08602**
  If the **maintenance4** feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for push constants, with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) and \( \text{VkPushConstantRange} \) arrays used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndirect-None-08114**
  Descriptors in each bound descriptor set, specified via \( \text{vkCmdBindDescriptorSets} \), **must** be valid as described by descriptor validity if they are statically used by a bound shader

- **VUID-vkCmdDrawIndirect-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirect-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndirect-None-08609**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command or any \( \text{VkShaderEXT} \) bound to a stage corresponding to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used to sample from any \( \text{VkImage} \) with a \( \text{VkImageView} \) of the type \( \text{VK_IMAGE_VIEW_TYPE_3D} \), \( \text{VK_IMAGE_VIEW_TYPE_CUBE} \), \( \text{VK_IMAGE_VIEW_TYPE_1D_ARRAY} \), \( \text{VK_IMAGE_VIEW_TYPE_2D_ARRAY} \) or \( \text{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY} \), in any shader stage

- **VUID-vkCmdDrawIndirect-None-08610**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command or any \( \text{VkShaderEXT} \) bound to a stage corresponding to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V \( \text{OpImageSample*} \) or \( \text{OpImageSparseSample*} \) instructions with \( \text{ImplicitLod} \), \( \text{Dref} \) or \( \text{Proj} \) in their name, in any shader stage

- **VUID-vkCmdDrawIndirect-None-08611**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command or any \( \text{VkShaderEXT} \) bound to a stage corresponding to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V \( \text{OpImageSample*} \) or \( \text{OpImageSparseSample*} \)
instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndirect-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirect-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDrawIndirect-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_aC_b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDrawIndirect-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_aC_b conversion, that object must not use the ConstOffset and Offset operands

- **VUID-vkCmdDrawIndirect-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDrawIndirect-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match
If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently
bound pipeline or

- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:
  - the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
  - the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirect-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- VUID-vkCmdDrawIndirect-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the depth aspect, **depth writes must be disabled**

- VUID-vkCmdDrawIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back *writeMask* are not zero, and stencil test is enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**

- VUID-vkCmdDrawIndirect-None-07831
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then *vkCmdSetViewport* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07832
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then *vkCmdSetScissor* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then *vkCmdSetLineWidth* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, and the most recent call to *vkCmdSetPolygonModeEXT* in the current command buffer set *polygonMode* to *VK_POLYGON_MODE_LINE*, *vkCmdSetLineWidth* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, and the most recent call to *vkCmdSetPrimitiveTopology* in the current command buffer set *primitiveTopology* to any line topology, *vkCmdSetLineWidth* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08619
  If a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set *rasterizerDiscardEnable* to *VK_FALSE*, *vkCmdSetLineWidth* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-07834
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then *vkCmdSetDepthBias* or *vkCmdSetDepthBias2EXT* must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07835
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08622
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07837
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08623
If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07838
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-07839**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawIndirect-None-07840**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-07841**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command
• VUID-vkCmdDrawIndirect-None-07843
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08629
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07844
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08630
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07845
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08631
If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07846
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-08632
If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirect-None-07847
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then...
vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08633
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07848
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08634
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

• VUID-vkCmdDrawIndirect-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndirect-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdDrawIndirect-None-08635
  If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of
vkCmdSetScissorWithCount

- VUID-vkCmdDrawIndirect-None-04876
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08639
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-04877
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08640
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-08642
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- VUID-vkCmdDrawIndirect-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- VUID-vkCmdDrawIndirect-None-08643
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current
command buffer that affected that attachment index must have been VK_FALSE

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,
  then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirect-None-08644
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE,
  then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirect-None-08876
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdDrawIndirect-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirect-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirect-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndirect-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

- **VUID-vkCmdDrawIndirect-colorAttachmentCount-06179**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

- **VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08910**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08912**
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08911**
  If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirect-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT`::`discardRectangleCount`

- **VUID-vkCmdDrawIndirect-None-07880**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT  
dynamic state enabled then 
vkCmdSetDiscardRectangleEnableEXT  

must have been called in the current command 
buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-rasterizerDiscardEnable-09236 
  If the VK_EXT_discard_rectangles extension is enabled, 
  and a shader object is bound to any 
  graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the 
current command buffer set rasterizerDiscardEnable to VK_FALSE, 
and the most recent call to 
vkCmdSetDiscardRectangleEnableEXT in the current command buffer set 
discardRectangleEnable to VK_TRUE, 
then vkCmdSetDiscardRectangleEXT  
must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08648 
  If the VK_EXT_discard_rectangles extension is enabled, 
  and a shader object is bound to any 
  graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the 
current command buffer set rasterizerDiscardEnable to VK_FALSE, 
then 
vkCmdSetDiscardRectangleEnableEXT  
must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07881 
  If the bound graphics pipeline state was created with the 
  VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled 
  then 
vkCmdSetDiscardRectangleModeEXT  
must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08649 
  If the VK_EXT_discard_rectangles extension is enabled, 
  and a shader object is bound to any 
  graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the 
current command buffer set rasterizerDiscardEnable to VK_FALSE, 
and the most recent call to 
vkCmdSetDiscardRectangleEnableEXT in the current command buffer set 
discardRectangleEnable to VK_TRUE, 
then 
vkCmdSetDiscardRectangleModeEXT  
must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08913 
  If the current render pass instance was begun with 
vkCmdBeginRendering, the 
dynamicRenderingUnusedAttachments feature is not enabled, and 
VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of 
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound 
graphics pipeline  

must be equal to VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08914 
  If current render pass instance was begun with 
vkCmdBeginRendering, the 
dynamicRenderingUnusedAttachments feature is not enabled, and 
VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of 
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound 
graphics pipeline  

must be equal to the VkFormat used to create 
VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08915 
  If the current render pass instance was begun with 
vkCmdBeginRendering, the 
dynamicRenderingUnusedAttachments feature is enabled, 
VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of
vkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08917
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirect-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirect-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirect-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass
equal to **VK_NULL_HANDLE**

- **VUID-vkCmdDrawIndirect-pColorAttachments-08963**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirect-pDepthAttachment-08964**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirect-pStencilAttachment-08965**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirect-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.
• VUID-vkCmdDrawIndirect-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08655
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08656
If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07627
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08657
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07628
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-08658
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-None-07629
If the bound graphics pipeline state was created with the...
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then 
vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-08659
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view’s format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

- VUID-vkCmdDrawIndirect-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-attachment subpass

- VUID-vkCmdDrawIndirect-samples-07472
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create the bound graphics pipeline

- VUID-vkCmdDrawIndirect-samples-07473
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the rasterizationSamples parameter in the last call to vkCmdSetRasterizationSamplesEXT

- VUID-vkCmdDrawIndirect-rasterizationSamples-07474
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirect-firstAttachment-07476
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and
attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls **must** specify an enable for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndirect-rasterizerDiscardEnable-09417**
  If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to **VK_FALSE**, then **vkCmdSetColorBlendEnableEXT** **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of **vkCmdSetColorBlendEnableEXT** calls **must** specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirect-firstAttachment-07477**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT** dynamic state enabled then **vkCmdSetColorBlendEquationEXT** **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of **vkCmdSetColorBlendEquationEXT** calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndirect-rasterizerDiscardEnable-09418**
  If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to **VK_FALSE**, then **vkCmdSetColorBlendEquationEXT** **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of **vkCmdSetColorBlendEquationEXT** calls **must** specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndirect-firstAttachment-07478**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic state enabled then **vkCmdSetColorWriteMaskEXT** **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of **vkCmdSetColorWriteMaskEXT** calls **must** specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirect-rasterizerDiscardEnable-09419**
  If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to **VK_FALSE**, then **vkCmdSetColorWriteMaskEXT** **must** have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of **vkCmdSetColorWriteMaskEXT** calls **must** specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndirect-None-08877**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** dynamic state **vkCmdSetAttachmentFeedbackLoopEnableEXT** **must** have been called in the current
command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- **VUID-vkCmdDrawIndirect-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- **VUID-vkCmdDrawIndirect-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-vkCmdDrawIndirect-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDrawIndirect-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`

- **VUID-vkCmdDrawIndirect-None-08698**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound

- **VUID-vkCmdDrawIndirect-None-08699**
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders which did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound

- **VUID-vkCmdDrawIndirect-None-08878**
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

- **VUID-vkCmdDrawIndirect-None-08879**
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

- **VUID-vkCmdDrawIndirect-None-08880**
  If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirect-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE

• VUID-vkCmdDrawIndirect-pDynamicStates-08716
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0

• VUID-vkCmdDrawIndirect-None-09116
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

• VUID-vkCmdDrawIndirect-maxFragmentDualSrcAttachments-09239
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

• VUID-vkCmdDrawIndirect-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

• VUID-vkCmdDrawIndirect-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE

• VUID-vkCmdDrawIndirect-None-02721
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

• VUID-vkCmdDrawIndirect-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

• VUID-vkCmdDrawIndirect-pStrides-04913
If the bound graphics pipeline was created with the 
\texttt{VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT} dynamic state enabled, then \texttt{vkCmdBindVertexBuffers2EXT} must have been called in the current command buffer prior to this draw command, and the \texttt{pStrides} parameter of \texttt{vkCmdBindVertexBuffers2EXT} must not be \texttt{NULL}

• VUID-vkCmdDrawIndirect-None-04914
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage then \texttt{vkCmdSetVertexInputEXT} must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndirect-Input-07939
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage then all variables with the \texttt{Input} storage class decorated with \texttt{Location} in the \texttt{Vertex Execution Model OpEntryPoint} must contain a location in \texttt{VkVertexInputAttributeDescription2EXT::location}

• VUID-vkCmdDrawIndirect-Input-08734
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage then the numeric type associated with all \texttt{Input} variables of the corresponding \texttt{Location} in the \texttt{Vertex Execution Model OpEntryPoint} must be the same as \texttt{VkVertexInputAttributeDescription2EXT::format}

• VUID-vkCmdDrawIndirect-format-08936
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage and \texttt{VkVertexInputAttributeDescription2EXT::format} has a 64-bit component, then the scalar width associated with all \texttt{Input} variables of the corresponding \texttt{Location} in the \texttt{Vertex Execution Model OpEntryPoint} must be 64-bit

• VUID-vkCmdDrawIndirect-format-08937
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage and the scalar width associated with a \texttt{Location} decorated \texttt{Input} variable in the \texttt{Vertex Execution Model OpEntryPoint} is 64-bit, then the corresponding \texttt{VkVertexInputAttributeDescription2EXT::format} must have a 64-bit component

• VUID-vkCmdDrawIndirect-None-09203
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage and \texttt{VkVertexInputAttributeDescription2EXT::format} has a 64-bit component, then all \texttt{Input} variables at the corresponding \texttt{Location} in the \texttt{Vertex Execution Model OpEntryPoint} must not use components that are not present in the format

• VUID-vkCmdDrawIndirect-None-04879
If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage then \texttt{vkCmdSetPrimitiveRestartEnable} must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-buffer-02708
If \texttt{buffer} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

• VUID-vkCmdDrawIndirect-buffer-02709
\texttt{buffer} must have been created with the \texttt{VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT} bit set

• VUID-vkCmdDrawIndirect-offset-02710
offset must be a multiple of 4

- VUID-vkCmdDrawIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawIndirect-drawCount-02718
  If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1

- VUID-vkCmdDrawIndirect-drawCount-02719
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndirect-drawCount-00476
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

- VUID-vkCmdDrawIndirect-drawCount-00487
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirect-drawCount-00488
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDrawIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawIndirect-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirect-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
The `VkDrawIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t   vertexCount;
    uint32_t   instanceCount;
    uint32_t   firstVertex;
    uint32_t   firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

### Valid Usage

- **VUID-VkDrawIndirectCommand-pNext-09461**
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.

- **VUID-VkDrawIndirectCommand-None-09462**
  If shader objects are used for drawing or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` must be 0.
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the drawIndirectFirstInstance feature is not enabled, firstInstance must be 0.

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer containing draw parameters.
- **offset** is the byte offset into **buffer** where parameters begin.
- **countBuffer** is the buffer containing the draw count.
- **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.
- **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.
- **stride** is the byte stride between successive sets of draw parameters.

vkCmdDrawIndirectCount behaves similarly to vkCmdDrawIndirect except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.
Valid Usage

- VUID-vkCmdDrawIndirectCount-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndirectCount-mipmapMode-04770
  If a VkSampler created with.mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndirectCount-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawIndirectCount-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawIndirectCount-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndirectCount-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in
Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirectCount-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDrawIndirectCount-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDrawIndirectCount-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader.

- VUID-vkCmdDrawIndirectCount-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndirectCount-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawIndirectCount-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- VUID-vkCmdDrawIndirectCount-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- VUID-vkCmdDrawIndirectCount-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.
• VUID-vkCmdDrawIndirectCount-None-08607
If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

• VUID-vkCmdDrawIndirectCount-uniformBuffers-06935
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndirectCount-None-08612
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndirectCount-storageBuffers-06936
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndirectCount-None-08613
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

• VUID-vkCmdDrawIndirectCount-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

• VUID-vkCmdDrawIndirectCount-ConstOffset-06551
If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

• VUID-vkCmdDrawIndirectCount-viewType-07752
If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

• VUID-vkCmdDrawIndirectCount-format-07753
If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

• VUID-vkCmdDrawIndirectCount-OpImageWrite-08795
If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed.
using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the image view’s format

- VUID-vkCmdDrawIndirectCount-OpImageWrite-08796
  If a \texttt{VkImageView} created with the format \texttt{VK\_FORMAT\_AB\_UNORM\_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have four components

- VUID-vkCmdDrawIndirectCount-OpImageWrite-04469
  If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the buffer view’s format

- VUID-vkCmdDrawIndirectCount-None-07288
  Any shader invocation executed by this command \textbf{must} terminate

- VUID-vkCmdDrawIndirectCount-renderPass-02684
  The current render pass \textbf{must} be compatible with the \texttt{renderPass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK\_PIPELINE\_BIND\_POINT\_GRAPHICS}

- VUID-vkCmdDrawIndirectCount-subpass-02685
  The subpass index of the current render pass \textbf{must} be equal to the \texttt{subpass} member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to \texttt{VK\_PIPELINE\_BIND\_POINT\_GRAPHICS}

- VUID-vkCmdDrawIndirectCount-None-07748
  If any shader statically accesses an input attachment, a valid descriptor \textbf{must} be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirectCount-OpTypeImage-07468
  If any shader executed by this pipeline accesses an \texttt{OpTypeImage} variable with a \texttt{Dim} operand of \texttt{SubpassData}, it \textbf{must} be decorated with an \texttt{InputAttachmentIndex} that corresponds to a valid input attachment in the current subpass

- VUID-vkCmdDrawIndirectCount-None-07469
  Input attachment views accessed in a subpass \textbf{must} be created with the same \texttt{VkFormat} as the corresponding subpass definition, and be created with a \texttt{VkImageView} that is compatible with the attachment referenced by the subpass’ \texttt{pInputAttachments [InputAttachmentIndex]} in the currently bound \texttt{VkFramebuffer} as specified by Fragment Input Attachment Compatibility

- VUID-vkCmdDrawIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass \textbf{must} not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the \texttt{VK\_IMAGE\_LAYOUT\_ATTACHMENT\_FEEDBACK\_LOOP\_OPTIMAL\_EXT} image layout, and either:
  
  - the \texttt{VK\_PIPELINE\_CREATE\_COLOR\_ATTACHMENT\_FEEDBACK\_LOOP\_OPTIMAL\_EXT} is set on the currently bound pipeline or
  
  - the last call to \texttt{vkCmdSetAttachmentFeedbackLoopEnableEXT} included
VK_IMAGE_ASPECT_COLOR_BIT and

▪ there is no currently bound graphics pipeline or

▪ the currently bound graphics pipeline was created with
  VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectCount-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  ◦ the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or

  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included
    VK_IMAGE_ASPECT_DEPTH_BIT and

  ▪ there is no currently bound graphics pipeline or

  ▪ the currently bound graphics pipeline was created with
    VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectCount-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

  ◦ the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or

  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included
    VK_IMAGE_ASPECT_STENCIL_BIT and

  ▪ there is no currently bound graphics pipeline or

  ▪ the currently bound graphics pipeline was created with
    VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirectCount-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdDrawIndirectCount-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndirectCount-None-06887

1292
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawIndirectCount-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command
command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08621**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-None-07838**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilWriteMask` must have been called in the current command buffer prior to this drawing command.
called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07839
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_REFERENCE` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilReference` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilReference` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- VUID-vkCmdDrawIndirectCount-None-07840
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08627
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07841
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-08628
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` **must** have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-07843
  If the bound graphics pipeline state was created with the
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdDrawIndirectCount-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawIndirectCount-None-08643**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current
command buffer that affected that attachment index must have been VK_FALSE

• VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline,
  then rasterizationSamples for the currently bound graphics pipeline must be the same as
  the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndirectCount-None-08644
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE,
  then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command
  buffer must have set rasterizationSamples to be the same as the number of samples for
  the current render pass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndirectCount-None-08876
  If a shader object is bound to any graphics stage, the current render pass instance must
  have been begun with vkCmdBeginRendering

• VUID-vkCmdDrawIndirectCount-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
  not write any values to the depth attachment

• VUID-vkCmdDrawIndirectCount-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
  pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
  not write any values to the stencil attachment

• VUID-vkCmdDrawIndirectCount-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this
  command must not write any values to the stencil attachment

• VUID-vkCmdDrawIndirectCount-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must
  not write any values to the depth attachment

• VUID-vkCmdDrawIndirectCount-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not
  write any values to the depth attachment

• VUID-vkCmdDrawIndirectCount-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this
  command must not write any values to the stencil attachment
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- **VUID-vkCmdDrawIndirectCount-viewMask-06178**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- **VUID-vkCmdDrawIndirectCount-colorAttachmentCount-06179**
  If the dynamicRenderingUnusedAttachments feature is not enabled and the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08910**
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08912**
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView equal to VK_NULL_HANDLE must have the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound pipeline equal to VK_FORMAT_UNDEFINED

- **VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08911**
  If the dynamicRenderingUnusedAttachments feature is enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline, or the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats, if it exists, must be VK_FORMAT_UNDEFINED

- **VUID-vkCmdDrawIndirectCount-None-07751**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT dynamic state enabled then vkCmdSetDiscardRectangleEXT must have been called in the current command buffer prior to this drawing command for each discard rectangle in VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount

- **VUID-vkCmdDrawIndirectCount-None-07880**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT  

dynamic state enabled then 

vkCmdSetDiscardRectangleEnableEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09236

If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleEnableEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-None-08648

If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDiscardRectangleEnableEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-None-07881

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT dynamic state enabled then vkCmdSetDiscardRectangleModeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-None-08649

If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleModeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08913

If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingContextCreateInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

• VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08914

If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingContextCreateInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingContextCreateInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08915

If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingContextCreateInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of
VKPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VKPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VKPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirectCount-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VKPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndirectCount-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirectCount-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass
equal to `VK_NULL_HANDLE`

- **VUID-vkCmdDrawIndirectCount-pColorAttachments-08963**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::pColorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectCount-pDepthAttachment-08964**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectCount-pStencilAttachment-08965**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`

- **VUID-vkCmdDrawIndirectCount-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command
• VUID-vkCmdDrawIndirectCount-None-08651
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07622
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08652
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07623
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08653
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdDrawIndirectCount-None-08654
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.
• VUID-vkCmdDrawIndirectCount-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08655
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08656
If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07627
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08657
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07628
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-08658
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectCount-None-07629
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT  dynamic state enabled then
vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-None-08659
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-pColorBlendEnables-07470
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view’s format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

• VUID-vkCmdDrawIndirectCount-rasterizationSamples-07471
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-attachment subpass

• VUID-vkCmdDrawIndirectCount-samples-07472
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create the bound graphics pipeline

• VUID-vkCmdDrawIndirectCount-samples-07473
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT must be greater or equal to the rasterizationSamples parameter in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawIndirectCount-rasterizationSamples-07474
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawIndirectCount-firstAttachment-07476
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and
attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

• VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09417
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass

• VUID-vkCmdDrawIndirectCount-firstAttachment-07477
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

• VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09418
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

• VUID-vkCmdDrawIndirectCount-firstAttachment-07478
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color attachments in the current subpass

• VUID-vkCmdDrawIndirectCount-rasterizerDiscardEnable-09419
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color attachments in the current subpass

• VUID-vkCmdDrawIndirectCount-None-08877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current
• VUID-vkCmdDrawIndirectCount-None-08684
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

• VUID-vkCmdDrawIndirectCount-None-08685
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

• VUID-vkCmdDrawIndirectCount-None-08686
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

• VUID-vkCmdDrawIndirectCount-None-08687
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

• VUID-vkCmdDrawIndirectCount-None-08688
  If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound

• VUID-vkCmdDrawIndirectCount-None-08878
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

• VUID-vkCmdDrawIndirectCount-None-08879
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

• VUID-vkCmdDrawIndirectCount-None-08880
  If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-pDynamicStates-08715
  If the bound graphics pipeline state includes a fragment shader stage, was created with
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE

• VUID-vkCmdDrawIndirectCount-pDynamicStates-08716
If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0

• VUID-vkCmdDrawIndirectCount-None-09116
If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

• VUID-vkCmdDrawIndirectCount-maxFragmentDualSrcAttachments-09239
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

• VUID-vkCmdDrawIndirectCount-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

• VUID-vkCmdDrawIndirectCount-None-04008
If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

• VUID-vkCmdDrawIndirectCount-None-02721
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

• VUID-vkCmdDrawIndirectCount-None-07842
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

• VUID-vkCmdDrawIndirectCount-pStrides-04913
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

- **VUID-vkCmdDrawIndirectCount-None-04914**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndirectCount-Input-07939**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`.

- **VUID-vkCmdDrawIndirectCount-Input-08734**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then all variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`.

- **VUID-vkCmdDrawIndirectCount-format-08936**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be 64-bit.

- **VUID-vkCmdDrawIndirectCount-format-08937**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT ::format` must have a 64-bit component.

- **VUID-vkCmdDrawIndirectCount-None-09203**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input` variables at the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must not use components that are not present in the format.

- **VUID-vkCmdDrawIndirectCount-None-04879**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then `vkCmdSetPrimitiveRestartEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawIndirectCount-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawIndirectCount-offset-02710**
offset must be a multiple of 4

- VUID-vkCmdDrawIndirectCount-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndirectCount-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirectCount-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

- VUID-vkCmdDrawIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

- VUID-vkCmdDrawIndirectCount-None-04445
  If drawIndirectCount is not enabled this function must not be used

- VUID-vkCmdDrawIndirectCount-stride-03110
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

- VUID-vkCmdDrawIndirectCount-maxDrawCount-03111
  If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-03121
  If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirectCount-countBuffer-03122
  If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectCount-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawIndirectCount-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirectCount-countBuffer-parameter
  countBuffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirectCount-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
  TheVkCommandPoolthatcommandBufferwasallocatedfrommustsupportgraphics
  operations

• VUID-vkCmdDrawIndirectCount-renderpass
  Thiscommandmustonlybecalledinsideofarenderpassinstance

• VUID-vkCmdDrawIndirectCount-videocoding
  Thiscommandmustonlybecalledoutsideofavideocodingscope

• VUID-vkCmdDrawIndirectCount-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or
  retrieved from the sameVkDevice

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

### Command Properties

To record an indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

• commandBuffer is the command buffer into which the command is recorded.

• buffer is the buffer containing draw parameters.

• offset is the byte offset into buffer where parameters begin.

• drawCount is the number of draws to execute, and can be zero.

• stride is the byte stride between successive sets of draw parameters.

vkCmdDrawIndexedIndirect behaves similarly to vkCmdDrawIndexed except that the parameters are
read by the device from a buffer during execution. **drawCount** draws are executed by the command, with parameters taken from **buffer** starting at **offset** and increasing by **stride** bytes for each successive draw. The parameters of each draw are encoded in an array of **VkDrawIndexedIndirectCommand** structures. If **drawCount** is less than or equal to one, **stride** is ignored.

**Valid Usage**

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirect-None-0479**
  If a **VkImageView** is sampled with depth comparison, the image view's format features **must** contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's format features **must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07027**
  For any **VkImageView** being written as a storage image where the image format field of the **OpTypeImage** is *Unknown*, the view's format features **must** contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07028**
  For any **VkImageView** being read as a storage image where the image format field of the **OpTypeImage** is *Unknown*, the view's format features **must** contain **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07029**
  For any **VkBufferView** being written as a storage texel buffer where the image format field of the **OpTypeImage** is *Unknown*, the view's buffer features **must** contain **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT**

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07030**
  Any **VkBufferView** being read as a storage texel buffer where the image format field of the **OpTypeImage** is *Unknown* then the view's buffer features **must** contain
For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC < conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC < conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image.
View Validation

- **VUID-vkCmdDrawIndexedIndirect-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

- **VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have four components.

- **VUID-vkCmdDrawIndexedIndirect-OpImageWrite-08797**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawIndexedIndirect-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDrawIndexedIndirect-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawIndexedIndirect-subpass-02685**
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawIndexedIndirect-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a Dim operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-None-07469**
  Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass’ `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

- **VUID-vkCmdDrawIndexedIndirect-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndexedIndirect-None-09000**
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- **VID-vkCmdDrawIndexedIndirect-None-09001**

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- **VID-vkCmdDrawIndexedIndirect-None-09002**

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- **VID-vkCmdDrawIndexedIndirect-None-09003**

If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- **VID-vkCmdDrawIndexedIndirect-None-06539**

If any previously recorded command in the current subpass accessed an image
subresource used as an attachment in this subpass in any way other than as an
attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexedIndirect-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndexedIndirect-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is
enabled, all stencil ops must be VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawIndexedIndirect-None-07831
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT
dynamic state enabled then vkCmdSetViewport must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07832
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR
dynamic state enabled then vkCmdSetScissor must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07833
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH
dynamic state enabled then vkCmdSetLineWidth must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08617
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to
VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08618
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any
line topology, vkCmdSetLineWidth must have been called in the current command buffer
prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08619
If a shader object that outputs line primitives is bound to the
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and
the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the
current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07834
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS
dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have
been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08620
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE,
vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07835
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants
must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08621
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetColorBlendEnableEXT in the current command buffer set any element of
pColorBlendEnables to VK_TRUE, and the most recent call to
vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of
pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor
member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR,
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07836
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS
dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then
vkCmdSetDepthBounds must have been called in the current command buffer prior to
this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08622
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetDepthBoundsTestEnable in the current command buffer set
depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in
the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07837
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current
stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08623
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
**vkCmdSetStencilTestEnable** in the current command buffer set **stencilTestEnable** to **VK_TRUE**, **vkCmdSetStencilCompareMask** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07838**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** dynamic state enabled, and if the current **stencilTestEnable** state is **VK_TRUE**, then **vkCmdSetStencilWriteMask** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetStencilTestEnable** in the current command buffer set **stencilTestEnable** to **VK_TRUE**, **vkCmdSetStencilWriteMask** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07839**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_STENCIL_REFERENCE** dynamic state enabled, and if the current **stencilTestEnable** state is **VK_TRUE**, then **vkCmdSetStencilReference** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetStencilTestEnable** in the current command buffer set **stencilTestEnable** to **VK_TRUE**, **vkCmdSetStencilReference** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**.

- **VUID-vkCmdDrawIndexedIndirect-None-07840**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_CULL_MODE** dynamic state enabled then **vkCmdSetCullMode** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, then **vkCmdSetCullMode** **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07841**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_FRONT_FACE** dynamic state enabled then **vkCmdSetFrontFace** **must** have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdDrawIndexedIndirect-None-08628
  If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called in 
the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07843
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then 
vkCmdSetDepthTestEnable must have been called in the current command buffer prior to 
this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08629
  If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthTestEnable must have been 
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07844
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then 
vkCmdSetDepthWriteEnable must have been called in the current command buffer prior to 
this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08630
  If a shader object is bound to any graphics stage, and the most recent call to 
vkCmdSetRasterizerDiscardEnable in the current command buffer set 
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthWriteEnable must have been 
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07845
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then 
vkCmdSetDepthCompareOp must have been called in the current command buffer prior to 
this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08631
  If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, 
and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command 
buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
vkCmdSetDepthTestEnable in the current command buffer set depthTestEnable to VK_TRUE, 
then vkCmdSetDepthCompareOp must have been called in the current command buffer 
prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-07846
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE dynamic state enabled then 
vkCmdSetDepthBoundsTestEnable must have been called in the current command buffer 
prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08632
  If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, 
and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command 
buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthBoundsTestEnable must 
have been called in the current command buffer prior to this drawing command
buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable must` have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable must` have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable must` have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp must` have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp must` have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount must` have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount must` match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-sciissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount must` have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount must` match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount must` have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount must` match the `scissorCount` parameter of `vkCmdSetScissorWithCount`
If a shader object is bound to any graphics stage, then both *vkCmdSetViewportWithCount* and *vkCmdSetScissorWithCount* must have been called in the current command buffer prior to this drawing command, and the *viewportCount* parameter of *vkCmdSetViewportWithCount* must match the *scissorCount* parameter of *vkCmdSetScissorWithCount*.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then *vkCmdSetRasterizerDiscardEnable* must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, then *vkCmdSetRasterizerDiscardEnable* must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then *vkCmdSetDepthBiasEnable* must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to *vkCmdSetRasterizerDiscardEnable* in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then *vkCmdSetDepthBiasEnable* must have been called in the current command buffer prior to this drawing command.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then *vkCmdSetViewportWithCount* must have been called in the current command buffer prior to this drawing command, and the *viewportCount* parameter of *vkCmdSetViewportWithCount* must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then for each color attachment in the render pass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the corresponding member of pColorBlendEnables in the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer that affected that attachment index must have been VK_FALSE.

If rasterization is not disabled in the bound graphics pipeline, then rasterizationSamples for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

- **VUID-vkCmdDrawIndexedIndirect-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-dynamicRenderingUnusedAttachments-08918
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirect-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView
If \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, the value of \texttt{rasterizationSamples} for the currently bound graphics pipeline \texttt{must} be equal to the sample count used to create \texttt{VkRenderingInfo::pStencilAttachment->imageView}.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound pipeline \texttt{must} have been created with a \texttt{VkGraphicsPipelineCreateInfo::renderPass} equal to \texttt{VK_NULL_HANDLE}.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the \texttt{VkRenderingInfo::pColorAttachments->imageView} was not \texttt{VK_NULL_HANDLE}, then the corresponding element of \texttt{ VkPipelineRenderingCreateInfo::pColorAttachmentFormats} used to create the pipeline \texttt{must} not be \texttt{VK_FORMAT_UNDEFINED}.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the \texttt{VkRenderingInfo::pDepthAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, then the \texttt{VkPipelineRenderingCreateInfo::depthAttachmentFormat} used to create the pipeline \texttt{must} not be \texttt{VK_FORMAT_UNDEFINED}.

If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is a graphics pipeline bound, stencil test is enabled and the \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE}, then the \texttt{VkPipelineRenderingCreateInfo::stencilAttachmentFormat} used to create the pipeline \texttt{must} not be \texttt{VK_FORMAT_UNDEFINED}.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT} dynamic state enabled then \texttt{vkCmdSetTessellationDomainOriginEXT} \texttt{must} have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetDepthClampEnableEXT} \texttt{must} have been called in the current command buffer prior to this drawing command.

If a shader object is bound to the \texttt{VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT} stage, then \texttt{vkCmdSetTessellationDomainOriginEXT} \texttt{must} have been called in the current command buffer prior to this drawing command.

If the \texttt{depthClamp} feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthClampEnableEXT}
must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-08653**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- **VUID-vkCmdDrawIndexedIndirect-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToCoverageEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetAlphaToCoverageEnableEXT in the current command buffer set alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexedIndirect-None-07625
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08655
  If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07626
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08656
  If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-07627
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirect-None-08658
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command

1330
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-None-08659**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view’s format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`.

- **VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-07471**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawIndexedIndirect-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawIndexedIndirect-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are
enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexedIndirect-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09418**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawIndexedIndirect-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawIndexedIndirect-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

1332
called in the current command buffer prior to this drawing command, and the
attachments specified by the firstAttachment and attachmentCount parameters of
vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color
attachments in the current subpass

• VUID-vkCmdDrawIndexedIndirect-None-08877
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state
vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current
command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-08684
If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

• VUID-vkCmdDrawIndexedIndirect-None-08685
If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
vkCmdBindShadersEXT must have been called in the current command buffer with pStages
with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT

• VUID-vkCmdDrawIndexedIndirect-None-08686
If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
vkCmdBindShadersEXT must have been called in the current command buffer with pStages
with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-vkCmdDrawIndexedIndirect-None-08687
If there is no bound graphics pipeline, and the geometryShader feature is enabled,
vkCmdBindShadersEXT must have been called in the current command buffer with pStages
with an element of VK_SHADER_STAGE_GEOMETRY_BIT

• VUID-vkCmdDrawIndexedIndirect-None-08688
If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-vkCmdDrawIndexedIndirect-None-08698
If any graphics shader is bound which was created with the
VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the
VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also
be bound

• VUID-vkCmdDrawIndexedIndirect-None-08699
If any graphics shader is bound which was created with the
VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders
which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of
the same vkCreateShadersEXT call must not have any VkShaderEXT bound

• VUID-vkCmdDrawIndexedIndirect-None-08878
All bound graphics shader objects must have been created with identical or identically
defined push constant ranges

• VUID-vkCmdDrawIndexedIndirect-None-08879
All bound graphics shader objects must have been created with identical or identically
defined arrays of descriptor set layouts
• VUID-vkCmdDrawIndexedIndirect-None-08880
If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndexedIndirect-pDynamicStates-08715
If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE.

• VUID-vkCmdDrawIndexedIndirect-pDynamicStates-08716
If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0.

• VUID-vkCmdDrawIndexedIndirect-None-09116
If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them.

• VUID-vkCmdDrawIndexedIndirect-maxFragmentDualSrcAttachments-09239
If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of Location for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments.

• VUID-vkCmdDrawIndexedIndirect-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound.

• VUID-vkCmdDrawIndexedIndirect-None-04008
If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE.

• VUID-vkCmdDrawIndexedIndirect-None-02721
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

• VUID-vkCmdDrawIndexedIndirect-None-07842
If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior.
to this drawing command

• VUID-vkCmdDrawIndexedIndirect-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled and the
  `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then the `primitiveTopology` parameter
  of `vkCmdSetPrimitiveTopology` **must** be of the same topology class as the pipeline
  `VkPipelineInputAssemblyStateCreateInfo::topology` state.

• VUID-vkCmdDrawIndexedIndirect-pStrides-04913
  If the bound graphics pipeline was created with the
  `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, then
  `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer
  prior to this draw command, and the `pStrides` parameter of
  `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`.

• VUID-vkCmdDrawIndexedIndirect-None-04914
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then
  `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to
  this draw command.

• VUID-vkCmdDrawIndexedIndirect-Input-07939
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then all variables
  with the `Input` storage class decorated with `Location` in the Vertex Execution Model
  `OpEntryPoint` **must** contain a location in `VkVertexInputAttributeDescription2EXT::location`

• VUID-vkCmdDrawIndexedIndirect-Input-08734
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then the numeric
  type associated with all `Input` variables of the corresponding `Location` in the Vertex
  Execution Model `OpEntryPoint` **must** be the same as
  `VkVertexInputAttributeDescription2EXT::format`

• VUID-vkCmdDrawIndexedIndirect-format-08936
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and
  `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar
  width associated with all `Input` variables of the corresponding `Location` in the Vertex
  Execution Model `OpEntryPoint` **must** be 64-bit.

• VUID-vkCmdDrawIndexedIndirect-format-08937
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and the scalar
  width associated with a `Location` decorated `Input` variable in the Vertex Execution Model
  `OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT`
  `::format` **must** have a 64-bit component.

• VUID-vkCmdDrawIndexedIndirect-None-09203
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and
  `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then all `Input`
  variables at the corresponding `Location` in the Vertex Execution Model `OpEntryPoint` **must**
  not use components that are not present in the format.

• VUID-vkCmdDrawIndexedIndirect-None-04879
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage then
  `vkCmdSetPrimitiveRestartEnable` **must** have been called in the current command buffer.
prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawIndexedIndirect-buffer-02709**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawIndexedIndirect-offset-02710**
  `offset` **must** be a multiple of 4

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-02711**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDrawIndexedIndirect-drawCount-02718**
  If the `multiDrawIndirect` feature is not enabled, `drawCount` **must** be 0 or 1

- **VUID-vkCmdDrawIndexedIndirect-drawCount-02719**
  `drawCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`

- **VUID-vkCmdDrawIndexedIndirect-None-07312**
  valid index buffer **must** be bound

- **VUID-vkCmdDrawIndexedIndirect-robustBufferAccess2-07825**
  If `robustBufferAccess2` is not enabled, `(indexSize \times (firstIndex + indexCount) + offset)` **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00528**
  If `drawCount` is greater than 1, `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00539**
  If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

- **VUID-vkCmdDrawIndexedIndirect-drawCount-00540**
  If `drawCount` is greater than 1, `(stride \times (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawIndexedIndirect-buffer-parameter**
  `buffer` **must** be a valid `VkBuffer` handle

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool**
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDrawIndexedIndirect-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndexedIndirect-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdDrawIndexedIndirect-commonparent**
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

The `VkDrawIndexedIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named
parameters of `vkCmdDrawIndexed`.

### Valid Usage

- **VUID-VkDrawIndexedIndirectCommand-pNext-09461**
  
  If the bound graphics pipeline state was created with `VkPipelineVertexInputDivisorStateCreateInfoKHR` in the `pNext` chain of `VkGraphicsPipelineCreateInfo::pVertexInputState`, any member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must be** 0.

- **VUID-VkDrawIndexedIndirectCommand-None-09462**
  
  If shader objects are used for drawing or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, any member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call that sets this dynamic state has a value other than 1 in `divisor`, and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::supportsNonZeroFirstInstance` is `VK_FALSE`, then `firstInstance` **must be** 0.

- **VUID-VkDrawIndexedIndirectCommand-robustBufferAccess2-08798**
  
  If `robustBufferAccess2` is not enabled, `(indexSize × (firstIndex + indexCount) + offset)` **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer` or `vkCmdBindIndexBuffer2KHR`. If `vkCmdBindIndexBuffer2KHR` is used to bind the index buffer, the size of the bound index buffer is `vkCmdBindIndexBuffer2KHR::size`.

- **VUID-VkDrawIndexedIndirectCommand-None-00552**
  
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**.

- **VUID-VkDrawIndexedIndirectCommand-firstInstance-00554**
  
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must be** 0.

To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);

• commandBuffer is the command buffer into which the command is recorded.
• buffer is the buffer containing draw parameters.
• offset is the byte offset into buffer where parameters begin.
• countBuffer is the buffer containing the draw count.
• countBufferOffset is the byte offset into countBuffer where the draw count begins.
• maxDrawCount specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in countBuffer and maxDrawCount.
• stride is the byte stride between successive sets of draw parameters.

vkCmdDrawIndexedIndirectCount behaves similarly to vkCmdDrawIndexedIndirect except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from countBuffer located at countBufferOffset and use this as the draw count.

Valid Usage

• VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawIndexedIndirectCount-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdDrawIndexedIndirectCount-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current ` VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline.
bind point used by this command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawIndexedIndirectCount-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexedIndirectCount-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If the *robustBufferAccess* feature is not enabled, and any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If *commandBuffer* is an unprotected command buffer and *protectedNoFault* is not supported, any resource accessed by bound shaders **must** not be a protected resource.

If a bound shader accesses a *VkSampler* or *VkImageView* object that enables *sampler YC B C R* conversion, that object **must** only be used with *OpImageSample* or *OpImageSparseSample* instructions.

If a *VkImageView* is accessed as a result of this command, then the image view's *viewType* **must** match the *Dim* operand of the *OpTypeImage* as described in Instruction/Sampler/Image View Validation.

If a *VkImageView* is accessed as a result of this command, then the numeric type of the image view's *format* and the *Sampled Type* operand of the *OpTypeImage* **must** match.

If a *VkImageView* created with a format other than *VK_FORMAT_A8_UNORM_KHR* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the Texel operand of that instruction **must** have at least as many components as the image view's format.

If a *VkImageView* created with the format *VK_FORMAT_A8_UNORM_KHR* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the Texel operand of that instruction **must** have four components.

If a *VkBufferView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the Texel operand of that instruction **must** have at least as many components as the buffer view's format.

Any shader invocation executed by this command **must** terminate.

The current render pass **must** be compatible with the *renderPass* member of the *VkGraphicsPipelineCreateInfo* structure specified when creating the *VkPipeline* bound to *VK_PIPELINE_BIND_POINT_GRAPHICS*.

The subpass index of the current render pass **must** be equal to the *subpass* member of the *VkGraphicsPipelineCreateInfo* structure specified when creating the *VkPipeline* bound to
VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndexedIndirectCount-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set

• VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07468
  If any shader executed by this pipeline accesses an OpTypeImage variable with a Dim operand of SubpassData, it must be decorated with an InputAttachmentIndex that corresponds to a valid input attachment in the current subpass

• VUID-vkCmdDrawIndexedIndirectCount-None-07469
  Input attachment views accessed in a subpass must be created with the same VkFormat as the corresponding subpass definition, and be created with a VkImageView that is compatible with the attachment referenced by the subpass’ pInputAttachments [InputAttachmentIndex] in the currently bound VkFramebuffer as specified by Fragment Input Attachment Compatibility

• VUID-vkCmdDrawIndexedIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACKLOOP_OPTIMAL_EXT image layout, and either:
  ◦ the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACKLOOP_BIT_EXT is set on the currently bound pipeline or
  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_COLOR_BIT and
    ▪ there is no currently bound graphics pipeline or
    ▪ the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACKLOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACKLOOP_OPTIMAL_EXT image layout, and either:
  ◦ the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACKLOOP_BIT_EXT is set on the currently bound pipeline or
  ◦ the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_DEPTH_BIT and
    ▪ there is no currently bound graphics pipeline or
    ▪ the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACKLOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-09002
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the 
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:

- the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
- the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included 
  VK_IMAGE_ASPECT_STENCIL_BIT and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with 
    VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- VUID-vkCmdDrawIndexedIndirectCount-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexedIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawIndexedIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawIndexedIndirectCount-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to 
  vkCmdSetRasterizerDiscardEnable in the current command buffer set 
  rasterizerDiscardEnable to VK_FALSE, and the most recent call to 
  vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to
• **VUID-vkCmdDrawIndexedIndirectCount-None-08618**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, `vkCmdSetLineWidth` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-08619**
  If a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetLineWidth` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-07834**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-08620**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-08621**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` **must** have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndexedIndirectCount-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then
vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07837**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07838**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07839**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command.
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_DEPTH_COMPARE_OP dynamic state enabled then
vkCmdSetDepthCompareOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08631
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set
rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetDepthTestEnable in the current command buffer set depthTestEnable to VK_TRUE, then
vkCmdSetDepthCompareOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07846
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATEDEPTH_BOUNDS_TEST_ENABLE dynamic state enabled then
vkCmdSetDepthBoundsTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08632
If a shader object is bound to any graphics stage, and the depthBounds feature is enabled, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetDepthBoundsTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07847
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE dynamic state enabled then
vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08633
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then the vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07848
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then
vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08634
If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to
vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then
vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then
**vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of **vkCmdSetViewportWithCount** must match the `VkPipelineViewportStateCreateInfo`::scissorCount of the pipeline.

- **VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of **vkCmdSetScissorWithCount** must match the `VkPipelineViewportStateCreateInfo`::viewportCount of the pipeline.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of **vkCmdSetViewportWithCount** must match the `scissorCount` parameter of **vkCmdSetScissorWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08635**
  If a shader object is bound to any graphics stage, then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of **vkCmdSetViewportWithCount** must match the `scissorCount` parameter of **vkCmdSetScissorWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then **vkCmdSetRasterizerDiscardEnable** must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08639**
  If a shader object is bound to any graphics stage, then **vkCmdSetRasterizerDiscardEnable** must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then **vkCmdSetDepthBiasEnable** must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set rasterizerDiscardEnable to `VK_FALSE`, then **vkCmdSetDepthBiasEnable** must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the
bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`

- **VUID-vkCmdDrawIndexedIndirectCount-None-08643**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the corresponding member of `pColorBlendEnables` in the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer that affected that attachment index must have been `VK_FALSE`

- **VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07284**
  If rasterization is not disabled in the bound graphics pipeline, then `rasterizationSamples` for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirectCount-None-08644**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer must have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexedIndirectCount-None-08876**
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with `vkCmdBeginRendering`

- **VUID-vkCmdDrawIndexedIndirectCount-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06179
  If the dynamicRenderingUnusedAttachments feature is not enabled and the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08910
  If the dynamicRenderingUnusedAttachments feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline
If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command.
buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08649**
  If the VK_EXT_discard_rectangles extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDiscardRectangleEnableEXT in the current command buffer set discardRectangleEnable to VK_TRUE, then vkCmdSetDiscardRectangleModeEXT must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08914**
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08915**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08916**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08917**
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- **VUID-vkCmdDrawIndexedIndirectCount-dynamicRenderingUnusedAttachments-08918**
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of
VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07285
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of rasterizationSamples for the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07286
  If VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07287
  If VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexedIndirectCount-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndexedIndirectCount-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED
- **VUID-vkCmdDrawIndexedIndirectCount-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-07623**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-08653**
If a shader object is bound to any graphics stage, and the most recent call to
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
to \texttt{VK_FALSE}, then \texttt{vkCmdSetSampleMaskEXT} must have been
called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07624
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic state enabled then
  \texttt{vkCmdSetAlphaToCoverageEnableEXT} must have been called in the current command
  buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT} dynamic state enabled, and
  \texttt{alphaToCoverageEnable} was \texttt{VK_TRUE} in the last call to
  \texttt{vkCmdSetAlphaToCoverageEnableEXT}, then the Fragment Output Interface must contain
  a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexedIndirectCount-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to
  \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  to \texttt{VK_FALSE}, then \texttt{vkCmdSetAlphaToCoverageEnableEXT} must have been called in the current command
  buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to
  \texttt{vkCmdSetAlphaToCoverageEnableEXT} in the current command buffer set
  to \texttt{VK_TRUE}, then the Fragment Output Interface must contain a
  variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdDrawIndexedIndirectCount-None-07625
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT} dynamic state enabled then
  \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-08655
  If the \alphaTooOne feature is enabled, and a shader object is bound to any graphics stage,
  and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command
  buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetAlphaToOneEnableEXT} must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-None-07626
  If the \logicOp feature is enabled, and a shader object is bound to the
  \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to
  \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
  \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetLogicOpEnableEXT} must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07627
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then
  vkCmdSetColorBlendEnableEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
  call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have
  been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07628
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then
  vkCmdSetColorBlendEquationEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08658
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
  call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, and the most recent call to
  vkCmdSetColorBlendEnableEXT for any attachment set that attachment's value in
  pColorBlendEnables to VK_TRUE, then vkCmdSetColorBlendEquationEXT must have been
  called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-07629
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then
  vkCmdSetColorWriteMaskEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-None-08659
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
  call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been
  called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to
  vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE,
  then for those attachments in the subpass the corresponding image view's format features
  must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

• VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does
  not use any color and/or depth/stencil attachments, then the rasterizationSamples in the
  last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-
  attachment subpass
• VUID-vkCmdDrawIndexedIndirectCount-samples-07472
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in
  the last call to vkCmdSetSampleMaskEXT must be greater or equal to the
  VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create
  the bound graphics pipeline

• VUID-vkCmdDrawIndexedIndirectCount-samples-07473
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to
  vkCmdSetSampleMaskEXT must be greater or equal to the
  rasterizationSamples parameter in the last call to
  vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-07474
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and neither the
  VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are
  enabled, then the rasterizationSamples in the last call to
  vkCmdSetRasterizationSamplesEXT must be the same as the current subpass color and/or
  depth/stencil attachments

• VUID-vkCmdDrawIndexedIndirectCount-firstAttachment-07476
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then
  vkCmdSetColorBlendEnableEXT must have been called in the current command buffer
  prior to this drawing command, and the attachments specified by the firstAttachment and
  attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable
  for all active color attachments in the current subpass

• VUID-vkCmdDrawIndexedIndirectCount-rasterizerDiscardEnable-09417
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
  call to vkCmdSetRasterizerDiscardEnable in the current command buffer set
  rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer
  prior to this drawing command, and the attachments specified by the firstAttachment and
  attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable
  for all active color attachments in the current subpass

• VUID-vkCmdDrawIndexedIndirectCount-firstAttachment-07477
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then
  vkCmdSetColorBlendEquationEXT must have been called in the current command buffer
  prior to this drawing command, and the attachments specified by the firstAttachment and
  attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend
  equations for all active color attachments in the current subpass where blending is
  enabled

• VUID-vkCmdDrawIndexedIndirectCount-rasterizerDiscardEnable-09418
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent
call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled

- **VUID-vkCmdDrawIndexedIndirectCount-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexedIndirectCount-rasterizerDiscardEnable-09419**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass

- **VUID-vkCmdDrawIndexedIndirectCount-None-08877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state enabled `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`

- **VUID-vkCmdDrawIndexedIndirectCount-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`

- **VUID-vkCmdDrawIndexedIndirectCount-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- **VUID-vkCmdDrawIndexedIndirectCount-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDrawIndexedIndirectCount-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`
If any graphics shader is bound which was created with the `VkShaderCreateLinkStageBitEXT` flag, then all shaders created with the `VkShaderCreateLinkStageBitEXT` flag in the same `vkCreateShadersEXT` call must also be bound.

If any graphics shader is bound which was created with the `VkShaderCreateLinkStageBitEXT` flag, any stages in between stages whose shaders which did not create a shader with the `VkShaderCreateLinkStageBitEXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of `Location` for any output attachment statically used in the Fragment Execution Model executed by this
command must be less than maxFragmentDualSrcAttachments

• VUID-vkCmdDrawIndexedIndirectCount-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

• VUID-vkCmdDrawIndexedIndirectCount-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

• VUID-vkCmdDrawIndexedIndirectCount-None-04009
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

• VUID-vkCmdDrawIndexedIndirectCount-None-07842
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveTopology must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-dynamicPrimitiveTopologyUnrestricted-07500
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state enabled and the dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then the primitiveTopology parameter of vkCmdSetPrimitiveTopology must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

• VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING.Stride_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

• VUID-vkCmdDrawIndexedIndirectCount-None-04914
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

• VUID-vkCmdDrawIndexedIndirectCount-Input-07939
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription2EXT::location

• VUID-vkCmdDrawIndexedIndirectCount-Input-08734
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription2EXT::format

• VUID-vkCmdDrawIndexedIndirectCount-format-08936
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and
VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit

• VUID-vkCmdDrawIndexedIndirectCount-format-08937
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription2EXT::format must have a 64-bit component

• VUID-vkCmdDrawIndexedIndirectCount-None-09203
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage and VkVertexInputAttributeDescription2EXT::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format

• VUID-vkCmdDrawIndexedIndirectCount-None-04879
  If there is a shader object bound to the VK_SHADER_STAGE_VERTEX_BIT stage then vkCmdSetPrimitiveRestartEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirectCount-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndexedIndirectCount-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndexedIndirectCount-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714
  If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715
  countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716
  countBufferOffset must be a multiple of 4

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717
  The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129
  (countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

• VUID-vkCmdDrawIndexedIndirectCount-None-04445
  If drawIndirectCount is not enabled this function must not be used

• VUID-vkCmdDrawIndexedIndirectCount-None-07312

valid index buffer **must** be bound

- VUID-vkCmdDrawIndexedIndirectCount-robustBufferAccess2-07825
  If `robustBufferAccess2` is not enabled, \( (indexSize \times (firstIndex + indexCount) + offset) \) **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

- VUID-vkCmdDrawIndexedIndirectCount-stride-03142
  `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`

- VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
  If `maxDrawCount` is greater than or equal to 1, \( (stride \times (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) \) **must** be less than or equal to the size of `buffer`

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03153
  If count stored in `countBuffer` is equal to 1, \( (offset + sizeof(VkDrawIndexedIndirectCommand)) \) **must** be less than or equal to the size of `buffer`

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03154
  If count stored in `countBuffer` is greater than 1, \( (stride \times (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) \) **must** be less than or equal to the size of `buffer`

**Valid Usage (Implicit)**

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter
  `buffer` **must** be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter
  `countBuffer` **must** be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdDrawIndexedIndirectCount-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdDrawIndexedIndirectCount-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdDrawIndexedIndirectCount-commonparent
  Each of `buffer`, `commandBuffer`, and `countBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Chapter 21. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

21.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The Component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

GLSL example

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

SPIR-V example

```spir-v
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```
21.1.1. Attribute Location and Component Assignment

The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a Location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single Location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

If an implementation supports storageInputOutput16, vertex shader input variables can have a width of 16 bits.

Table 26. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>1</td>
<td>(o, y, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>2</td>
<td>(o, o, z, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>3</td>
<td>(o, o, o, w)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, o, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>1</td>
<td>(o, y, z, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>2</td>
<td>(o, o, z, w)</td>
</tr>
</tbody>
</table>
16-bit or 32-bit data type | Component decoration | Components consumed
--- | --- | ---
three-component vector | 0 or unspecified | (x, y, z, o)
three-component vector | 1 | (o, y, z, w)
four-component vector | 0 or unspecified | (x, y, z, w)

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The Component decoration must not be used with matrix types.

Table 27. Input attributes accessed by 32-bit input matrix variables

<table>
<thead>
<tr>
<th>Data type</th>
<th>Column vector type</th>
<th>Locations consumed</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>

<td>i, i+1, i+2</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat3x4</td>
<td>four-component vector</td>
<td>i, i+1, i+2</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
<tr>
<td>mat4x2</td>
<td>two-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)</td>
</tr>
<tr>
<td>mat4x3</td>
<td>three-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding...
VkVertexInputAttributeDescription::location. The Location slots and Component words used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute.

Table 28. Input attribute locations and components accessed by 64-bit input variables

</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a Location \( i \), its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the Location immediately following the last Location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same Location slot only if their Component words do not overlap. If multiple variables share the same Location slot, they must all have the same SPIR-V floating-point component type or all have the same width scalar type components.

### 21.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- \( sType \) is a VkStructureType value identifying this structure.
- \( pNext \) is NULL or a pointer to a structure extending this structure.
- \( flags \) is reserved for future use.
• **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.

• **pVertexBindingDescriptions** is a pointer to an array of `VkVertexInputBindingDescription` structures.

• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.

• **pVertexAttributeDescriptions** is a pointer to an array of `VkVertexInputAttributeDescription` structures.

---

**Valid Usage**

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613**
  
  `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`.

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614**
  
  `vertexAttributeDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`.

- **VUID-VkPipelineVertexInputStateCreateInfo-binding-00615**
  
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` must exist in `pVertexBindingDescriptions` with the same value of binding.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616**
  
  All elements of `pVertexBindingDescriptions` must describe distinct binding numbers.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617**
  
  All elements of `pVertexAttributeDescriptions` must describe distinct attribute locations.

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO`.

- **VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineVertexInputDivisorStateCreateInfoKHR`.

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask**
  
  `flags` must be `0`.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter**
  
  If `vertexBindingDescriptionCount` is not `0`, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription` structures.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter**
  
  This is a placeholder for a specific condition related to vertex attribute descriptions, indicating that if `vertexAttributeDescriptionCount` is not `0`, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures.
If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription` structures.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

**Valid Usage**

- `VUID-VkVertexInputBindingDescription-binding-00618` binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- `VUID-VkVertexInputBindingDescription-stride-00619` stride must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- `VUID-VkVertexInputBindingDescription-stride-04456` If the `VK_KHR_portability_subset` extension is enabled, stride must be a multiple of, and at least as large as, `VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment`

**Valid Usage (Implicit)**

- `VUID-VkVertexInputBindingDescription-inputRate-parameter` inputRate must be a valid `VkVertexInputRate` value

Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;

- **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.
- **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription-location-00620**
  - **location** must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-VkVertexInputAttributeDescription-binding-00621**
  - **binding** must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputAttributeDescription-offset-00622**
  - **offset** must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- **VUID-VkVertexInputAttributeDescription-format-00623**
  - The **format features** of **format** must contain **VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT**

- **VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457**
  - If the **VK_KHR_portability_subset** extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is **VK_FALSE**, the sum of **offset** plus the size of the vertex attribute data described by **format**...
must not be greater than stride in the VkVertexInputBindingDescription referenced in binding

Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
  format must be a valid VkFormat value

To dynamically set the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer,
    uint32_t vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
    uint32_t vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- commandBuffer is the command buffer into which the command will be recorded.
- vertexBindingDescriptionCount is the number of vertex binding descriptions provided in pVertexBindingDescriptions.
- pVertexBindingDescriptions is a pointer to an array of VkVertexInputBindingDescription2EXT structures.
- vertexAttributeDescriptionCount is the number of vertex attribute descriptions provided in pVertexAttributeDescriptions.
- pVertexAttributeDescriptions is a pointer to an array of VkVertexInputAttributeDescription2EXT structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the VkGraphicsPipelineCreateInfo::pVertexInputState values used to create the currently active pipeline.

If drawing using shader objects, or if the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE dynamic state enabled, then vkCmdBindVertexBuffers2 can be used instead of vkCmdSetVertexInputEXT to dynamically set the stride.

Valid Usage

- VUID-vkCmdSetVertexInputEXT-None-08547
  The shaderObject feature must be enabled
- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  vertexBindingDescriptionCount must be less than or equal to VkPhysicalDeviceLimits
maxVertexInputBindings

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  vertexAttributeDescriptionCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributes

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of pVertexAttributeDescriptions, a VkVertexInputBindingDescription2EXT must exist in pVertexBindingDescriptions with the same value of binding

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of pVertexBindingDescriptions must describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of pVertexAttributeDescriptions must describe distinct attribute locations

Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription2EXT structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetVertexInputEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the `vertexAttributeInstanceRateDivisor` feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

### Valid Usage

- VUID-VkVertexInputBindingDescription2EXT-binding-04796
  
  **binding** must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription2EXT-stride-04797
  
  **stride** must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-VkVertexInputBindingDescription2EXT-divisor-04798
  
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, **divisor** must not be
If the `vertexAttributeInstanceRateDivisor` feature is not enabled, `divisor` must be 1

`divisor` must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

If `divisor` is not 1 then `inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE`.

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

Valid Usage

- `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`
- `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
• VUID-VkVertexInputAttributeDescription2EXT-offset-06230
  offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

• VUID-VkVertexInputAttributeDescription2EXT-format-04805
  The format features of format must contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

• VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is
  VK_FALSE, the sum of offset plus the size of the vertex attribute data described by format
  must not be greater than stride in the VkVertexInputBindingDescription2EXT referenced
  in binding

---

### Valid Usage (Implicit)

• VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

• VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  format must be a valid VkFormat value

---

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets);
```

• `commandBuffer` is the command buffer into which the command is recorded.

• `firstBinding` is the index of the first vertex input binding whose state is updated by the command.

• `bindingCount` is the number of vertex input bindings whose state is updated by the command.

• `pBuffers` is a pointer to an array of buffer handles.

• `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for i in [0, bindingCount). The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands.
Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
  firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers-firstBinding-00625
  The sum of firstBinding and bindingCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers-pOffsets-00626
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

- VUID-vkCmdBindVertexBuffers-pBuffers-00627
  All elements of pBuffers must have been created with the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

- VUID-vkCmdBindVertexBuffers-pBuffers-00628
  Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindVertexBuffers-pBuffers-04001
  If the nullDescriptor feature is not enabled, all elements of pBuffers must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindVertexBuffers-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE VkBuffer handles

- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
  bindingCount must be greater than 0

- VUID-vkCmdBindVertexBuffers-commonparent
  Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

- commandBuffer is the command buffer into which the command is recorded.
- firstBinding is the index of the first vertex input binding whose state is updated by the command.
- bindingCount is the number of vertex input bindings whose state is updated by the command.
• `pBuffers` is a pointer to an array of buffer handles.
• `pOffsets` is a pointer to an array of buffer offsets.
• `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
• `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. If `pSizes[i]` is `VK_WHOLE_SIZE` then the bound size is from `pBuffers[i]` plus `pOffsets[i]` to the end of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands.

This command also **dynamically sets** the byte strides between consecutive elements within buffer `pBuffers[i]` to the corresponding `pStrides[i]` value when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If drawing using **shader objects** then `vkCmdSetVertexInputEXT` can be used instead of `vkCmdBindVertexBuffers2` to set the stride.

---

**Note**

Unlike the static state to set the same, `pStrides` must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.

---

**Valid Usage**

- VUID-vkCmdBindVertexBuffers2-firstBinding-03355
  `firstBinding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-firstBinding-03356
  The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers2-pOffsets-03357
  If `pSizes` is not `NULL`, all elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pSizes-03358
  If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes` , where `pSizes` is not `VK_WHOLE_SIZE`, **must** be less than or equal to the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers2-pBuffers-03359
  All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag
Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`.

If `pStrides` is not `NULL` each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`.

If `pStrides` is not `NULL` each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size.

---

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles.
- `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- If `pSizes` is not `NULL`, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- If `pStrides` is not `NULL`, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called outside of a video coding scope.
- If any of `pSizes`, or `pStrides` are not `NULL`, `bindingCount` must be greater than 0.
- Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

21.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionKHR* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionKHR` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-sType-sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_KHR`.
- `VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-pVertexBindingDivisors-parameter`
The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionKHR` structure which is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionKHR {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionKHR;
```

- **binding** is the binding number for which the divisor is specified.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- **VUID-VkVertexInputBindingDivisorDescriptionKHR-binding-01869**
  
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateZeroDivisor-02228**
  
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateDivisor-02229**
  
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDivisorDescriptionKHR-divisor-01870**
  
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR::maxVertexAttribDivisor`, inclusive

- **VUID-VkVertexInputBindingDivisorDescriptionKHR-inputRate-01871**
  
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding
21.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions` with `VkVertexInputAttributeDescription::binding` equal to `attribDesc.binding`.
- Let `vertexIndex` be the index of the vertex within the draw (a value between `firstVertex` and `firstVertex+vertexCount` for `vkCmdDraw`, or a value taken from the index buffer plus `vertexOffset` for `vkCmdDrawIndexed`), and let `instanceIndex` be the instance number of the draw (a value between `firstInstance` and `firstInstance+instanceCount`).
- Let `offset` be an array of offsets into the currently bound vertex buffers specified during `vkCmdBindVertexBuffers` or `vkCmdBindVertexBuffers2` with `pOffsets`.
- Let `divisor` be the member of `VkPipelineVertexInputDivisorStateCreateInfoKHR::pVertexBindingDivisors` with `VkVertexInputBindingDivisorDescriptionKHR::binding` equal to `attribDesc.binding`. If the vertex binding state is dynamically set, instead let `divisor` be the member of the `pVertexBindingDescriptions` parameter to the `vkCmdSetVertexInputEXT` call with `VkVertexInputBindingDescription2EXT::binding` equal to `attribDesc.binding`.

```plaintext
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * bindingDesc.stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * bindingDesc.stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

21.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at `attribAddress` and is converted from the `VkVertexInputAttributeDescription`'s `format` to either floating-point, unsigned integer, or signed integer based on the numeric type of `format`. The numeric type of `format` must match the numeric type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if `format` is a 64-bit data type. If `format` is a packed format, `attribAddress` must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, `attribAddress` must be a multiple of the size in bytes of the component type indicated by `format` (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format...
Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 22. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in (u,v) or (u,v,w) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

22.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables TessLevelOuter and TessLevelInner, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an OpExecutionMode instruction using one of the Triangles, Quads, or IsoLines execution modes. When using shader objects, this instruction must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. When using pipelines, this instruction may be specified in either the tessellation evaluation or tessellation control shader. When using shader objects, tessellation-related modes that are required must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. Other tessellation-related modes may be specified in the tessellation evaluation shader. When using pipelines, other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders must be the same.

Tessellation execution modes include:

- **Triangles, Quads, and IsoLines.** These control the type of subdivision and topology of the output primitives. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation shader stages. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines is VK_FALSE, then isoline tessellation is not supported by the implementation, and IsoLines must not be used in either tessellation shader stage.

- **VertexOrderCw and VertexOrderCcw.** These control the orientation of triangles generated by the tessellator. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation
shader stages.

- **PointMode.** Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. When using shader objects, if PointMode is set in the tessellation control stage, it must be identically set in the tessellation evaluation stage. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then point mode tessellation is not supported by the implementation, and PointMode must not be used in either tessellation shader stage.

- **SpacingEqual, SpacingFractionalEven, and SpacingFractionalOdd.** Controls the spacing of segments on the edges of tessellated primitives. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation shader stages.

- **OutputVertices.** Controls the size of the output patch of the tessellation control shader. When using shader objects, one value must be set in at least the tessellation control stage. When using pipelines, one value must be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in TessCoord are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures Domain parameterization for tessellation primitive modes (upper-left origin) and Domain parameterization for tessellation primitive modes (lower-left origin). The domain space can have either an upper-left or lower-left origin, selected by the domainOrigin member of VkPipelineTessellationDomainOriginStateCreateInfo.
Figure 11. Domain parameterization for tessellation primitive modes (upper-left origin)
In the domain parameterization diagrams, the coordinates illustrate the value of \( \text{TessCoord} \) at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 22.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For **Quads**, all four outer levels are relevant. For **Triangles** and **IsoLines**, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 22.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an **OpExecutionMode** in the tessellation control or tessellation evaluation shader using one of the identifiers **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd**.

- **SpacingEqual** is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where \(\text{maxLevel}\) is the implementation-dependent maximum tessellation level (\(\text{VkPhysicalDeviceLimits::maxTessellationGenerationLevel}\)). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in \((u,v)\) space.

- **SpacingFractionalEven** is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer \(n\). If **SpacingFractionalOdd** is used, the tessellation level is clamped to \([1, \text{maxLevel} - 1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments **must** be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but **must** be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using **point mode** with fractional odd spacing, the tessellator **may** produce **interior vertices** that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 22.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to **primitive order**.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.

- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
22.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an OpExecutionMode of VertexOrderCw or VertexOrderCcw in the tessellation control or tessellation evaluation shaders. If the order is VertexOrderCw, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is VertexOrderCcw, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

**Note**

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

22.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with (\( u,v,w \)) coordinates of (0,0,1), (1,0,0), and (0,1,0) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating $n$ segments. For the outermost inner triangle, the inner triangle is degenerate—a single point at the center of the triangle—if $n$ is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If $n$ is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into $n - 2$ segments, with the $n - 1$ vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the $n - 1$ innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Inner Triangle Tessellation](image)

**Caption**

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric $(u,v,w)$ coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in $(u,v,w)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 22.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \varepsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into $m$ segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into $n$ segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Diagram](image-url)

**Figure 14. Inner Quad Tessellation**

**Caption**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the u = 0, v = 0, u = 1, and v = 1 edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in (u,v) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
22.8. Isoline Tessellation

If the tessellation primitive mode is `IsoLines`, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called isolines, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \( u = 0 \) and \( u = 1 \) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \( u = 0 \) rectangle edge to the corresponding vertex on the \( u = 1 \) rectangle edge, except that no line is drawn between \((0,1)\) and \((1,1)\). If the number of isolines on the subdivided \( u = 0 \) and \( u = 1 \) edges is \( n \), this process will result in \( n \) equally spaced lines with constant v coordinates of 0, \( \frac{1}{n} \), \( \frac{2}{n} \), ..., \( \frac{n-1}{n} \).

Each of the \( n \) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \( m \) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation.

22.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then tessellation point mode is not supported by the implementation.
22.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

**Valid Usage**

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  `patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

**Valid Usage (Implicit)**

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`
- VUID-VkPipelineTessellationStateCreateInfo-sType-unique The `sType` value of each struct in the `pNext` chain **must** be unique
- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask `flags` **must** be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
reserved for future use.

The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType       sType;
    const void*            pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
    VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

**Valid Usage (Implicit)**

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter
  `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR =
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT` specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).
- `VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT` specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To **dynamically set** the origin of the tessellation domain space, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetTessellationDomainOriginEXT(
    VkCommandBuffer commandBuffer,
    VkTessellationDomainOrigin domainOrigin);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `domainOrigin` specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetTessellationDomainOriginEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3TessellationDomainOrigin` feature is enabled
  - The `shaderObject` feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter
  \texttt{domainOrigin} must be a valid \texttt{VkTessellationDomainOrigin} value

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording state}

- VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetTessellationDomainOriginEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Chapter 23. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

23.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline's primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
23.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

23.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

23.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
Chapter 24. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

24.1. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the provoking vertex of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as flat.

If neither geometry nor tessellation shading is active, the provoking vertex is determined by the primitive topology defined by VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

If geometry shading is active, the provoking vertex is determined by the primitive topology defined by the OutputPoints, OutputLineStrip, or OutputTriangleStrip execution mode.

If tessellation shading is active but geometry shading is not, the provoking vertex may be any of the vertices in each primitive.

24.2. Primitive Clipping

Primitives are culled against the cull volume and then clipped to the clip volume. In clip coordinates, the view volume is defined by:

\[-w_c \leq x_c \leq w_c\]
\[-w_c \leq y_c \leq w_c\]
\[-z_m \leq z_c \leq w_c\]

where \(z_m\) is equal to zero.

This view volume can be further restricted by as many as VkPhysicalDeviceLimits::maxClipDistances client-defined half-spaces.
The cull volume is the intersection of up to \( \text{VkPhysicalDeviceLimits}::\text{maxCullDistances} \) client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader **must** write a single cull distance for each enabled cull half-space to elements of the \text{CullDistance} array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to \( \text{VkPhysicalDeviceLimits}::\text{maxClipDistances} \) client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader **must** write a single clip distance for each enabled clip half-space to elements of the \text{ClipDistance} array. Clip half-space \( i \) is then given by the set of points satisfying the inequality

\[
c_i(P) \geq 0
\]

where \( c_i(P) \) is the clip distance \( i \) at point \( P \). For point primitives, \( c_i(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections *Basic Line Segment Rasterization* and *Basic Polygon Rasterization*, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays \text{ClipDistance} and \text{CullDistance}, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

Depth clamping is enabled or disabled via the \text{depthClampEnable} enable of the \text{VkPipelineRasterizationStateCreateInfo} structure. Depth clipping is disabled when \text{depthClampEnable} is \text{VK_TRUE}.

To **dynamically set** enable or disable depth clamping, call:

```c
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClampEnable);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- \text{depthClampEnable} specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with \text{VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT} set in \text{VkPipelineDynamicStateCreateInfo}::\text{pDynamicStates}. Otherwise, this state is specified by the \text{VkPipelineRasterizationStateCreateInfo}::\text{depthClampEnable} value used to create the currently active pipeline.
If the depth clamping state is changed dynamically, and the pipeline was not created with \texttt{VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT} enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

### Valid Usage

- **VUID-vkCmdSetDepthClampEnableEXT-None-09423**
  At least one of the following must be true:
  - The extendedDynamicState3DepthClampEnable feature is enabled
  - The shaderObject feature is enabled
- **VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449**
  If the depthClamp feature is not enabled, depthClampEnable must be \texttt{VK_FALSE}

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter**
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle
- **VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording**
  \texttt{commandBuffer} must be in the recording state
- **VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations
- **VUID-vkCmdSetDepthClampEnableEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

### Command Properties

<table>

</tbody>
</table>

When depth clipping is disabled, the plane equation
\[ z_m \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \( 0 \leq t \leq 1 \), for each clipped vertex. If the coordinates of a clipped vertex are \( \mathbf{P} \) and the unclipped line segment's vertex coordinates are \( \mathbf{P}_1 \) and \( \mathbf{P}_2 \), then \( t \) satisfies the following equation

\[
\mathbf{P} = t \mathbf{P}_1 + (1-t) \mathbf{P}_2.
\]

t is used to clip vertex output attributes as described in **Clipping Shader Outputs**.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume.
volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon **must** include a point on this boundary edge.

Primitives rendered with user-defined half-spaces **must** satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex $i$ has a single specified clip distance $d_i$ (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by $-d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives **must** not be missing any pixels, and pixels **must** not be drawn twice in regions where those primitives are cut by the clip planes.

### 24.3. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices $P_1$ and $P_2$ of an unclipped edge be $c_1$ and $c_2$. The value of $t$ (see **Primitive Clipping**) for a clipped point $P$ is used to obtain the output value associated with $P$ as

$$c = t c_1 + (1-t) c_2.$$  

(Multiplying an output value by a scalar means multiplying each of $x$, $y$, $z$, and $w$ by the scalar.)

Since this computation is performed in clip space before division by $w_c$, clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with **NoPerspective**, the value of $t$ used to obtain the output value associated with $P$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see **Basic Line Segment Rasterization** and **Basic Polygon Rasterization**), and no interpolation is performed. The output value $c$ is taken from either $c_1$ or $c_2$, since flat shading has already occurred and the two values are identical.
24.4. Coordinate Transformations

Clip coordinates for a vertex result from shader execution, which yields a vertex coordinate Position.

Perspective division on clip coordinates yields normalized device coordinates, followed by a viewport transformation (see Controlling the Viewport) to convert these coordinates into framebuffer coordinates.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

then the vertex’s normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \begin{pmatrix}
  \frac{x_c}{w_c} \\
  \frac{y_c}{w_c} \\
  \frac{z_c}{w_c}
\end{pmatrix}
\]

24.5. Controlling the Viewport

The viewport transformation is determined by the selected viewport’s width and height in pixels, \( p_x \) and \( p_y \), respectively, and its center \((o_x, o_y)\) (also in pixels), as well as its depth range min and max determining a depth range scale value \( p_z \) and a depth range bias value \( o_z \) (defined below). The vertex’s framebuffer coordinates \((x_f, y_f, z_f)\) are given by

\[
x_f = (p_x / 2) x_d + o_x
\]

\[
y_f = (p_y / 2) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to \( \text{VkPhysicalDeviceLimits::maxViewports} \) minus one. The number of viewports used by a pipeline is controlled by the \text{viewportCount} member of the \text{VkPipelineViewportStateCreateInfo} structure used in pipeline creation.

\( x_f \) and \( y_f \) have limited precision, where the number of fractional bits retained is specified by \( \text{VkPhysicalDeviceLimits::subPixelPrecisionBits} \).

The \text{VkPipelineViewportStateCreateInfo} structure is defined as:
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewports used by the pipeline.
- **pViewports** is a pointer to an array of VkViewport structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- **scissorCount** is the number of scissors and must match the number of viewports.
- **pScissors** is a pointer to an array of VkRect2D structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

**Valid Usage**

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the multiViewport feature is not enabled, viewportCount must not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the multiViewport feature is not enabled, scissorCount must not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  scissorCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports
- VUID-VkPipelineViewportStateCreateInfo-x-02821
  The x and y members of offset member of any element of pScissors must be greater than or equal to 0
- VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors
- VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134
  If scissorCount and viewportCount are both not dynamic, then scissorCount
viewportCount must be identical

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT set then viewportCount must be 0, otherwise viewportCount must be greater than 0

- VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136
  If the graphics pipeline is being created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set then scissorCount must be 0, otherwise scissorCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkPipelineViewportStateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO

- VUID-VkPipelineViewportStateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineViewportStateCreateInfo-flags-zerobitsetmask
  flags must be 0

To dynamically set the viewport count and viewports, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

or the equivalent command

```
// Provided by VK_EXT_shader_object
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- commandBuffer is the command buffer into which the command will be recorded.
- viewportCount specifies the viewport count.
- pViewports specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the corresponding VkPipelineViewportStateCreateInfo::viewportCount and pViewports values used to create the currently active pipeline.
**Valid Usage**

- VUID-vkCmdSetViewportWithCount-None-08971
  At least one of the following **must** be true:
    - the shaderObject feature is enabled
    - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

- VUID-vkCmdSetViewportWithCount-viewportCount-03394
  `viewportCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetViewportWithCount-viewportCount-03395
  If the multiViewport feature is not enabled, `viewportCount` **must** be 1

**Valid Usage (Implicit)**

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  `pViewports` **must** be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetViewportWithCount-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  `viewportCount` **must** be greater than 0

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To **dynamically set** the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetScissorWithCount-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
- VUID-vkCmdSetScissorWithCount-scissorCount-03397
  `scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
If the multiViewport feature is not enabled, scissorCount must be 1.

The x and y members of offset member of any element of pScissors must be greater than or equal to 0.

Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of pScissors.

Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of pScissors.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

pScissors must be a valid pointer to an array of scissorCount VkRect2D structures.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

scissorCount must be greater than 0.

Host Synchronization

Host access to commandBuffer must be externally synchronized.

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<td></td>
</tr>
</tbody>
</table>
typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A pre-rasterization shader stage can direct each primitive to one of several viewports. The destination viewport for a primitive is selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex. The viewport transform uses the viewport corresponding to the value assigned to ViewportIndex, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex is outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to ViewportIndex for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To dynamically set the viewport transformation parameters, call:

void vkCmdSetViewport(VkCommandBuffer commandBuffer, uint32_t firstViewport, uint32_t viewportCount, const VkViewport* pViewports);

- commandBuffer is the command buffer into which the command will be recorded.
- firstViewport is the index of the first viewport whose parameters are updated by the command.
- viewportCount is the number of viewports whose parameters are updated by the command.
- pViewports is a pointer to an array of VkViewport structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportStateCreateInfo::pViewports values used to create the currently active pipeline.

The viewport parameters taken from element i of pViewports replace the current state for the viewport index firstViewport + i, for i in [0, viewportCount).
Valid Usage

- VUID-vkCmdSetViewport-firstViewport-01223
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewport-firstViewport-01224
  If the `multiViewport` feature is not enabled, `firstViewport` must be 0
- VUID-vkCmdSetViewport-viewportCount-01225
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewport-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- VUID-vkCmdSetViewport-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetViewport-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewport-viewportCount-arraylength
  `viewportCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- `x` and `y` are the viewport’s upper left corner (x, y).
- `width` and `height` are the viewport’s width and height, respectively.
- `minDepth` and `maxDepth` are the depth range for the viewport.

**Note**

Despite their names, `minDepth` can be less than, equal to, or greater than `maxDepth`.

The framebuffer depth coordinate \( z_f \) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation **must** be used if the depth/stencil attachment has a floating-point depth component. If an \( m \)-bit fixed-point representation is used, we assume that it represents each value \( \frac{k}{2^{m-1}} \), where \( k \in \{ 0, 1, ..., 2^m-1 \} \), as \( k \) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
\begin{align*}
    o_x &= x + \frac{\text{width}}{2} \\
    o_y &= y + \frac{\text{height}}{2} \\
    o_z &= \text{minDepth} \\
    p_x &= \text{width} \\
    p_y &= \text{height} \\
    p_z &= \text{maxDepth} - \text{minDepth}
\end{align*}
\]
The application can specify a negative term for height, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative height, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative height allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

Valid Usage

- VUID-VkViewport-width-01770
  width must be greater than 0.0

- VUID-VkViewport-width-01771
  width must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[0]

- VUID-VkViewport-apiVersion-07917
  If the VK_KHR_maintenance1 extension is not enabled, the VK_AMD_negative_viewport_height extension is not enabled, and VkPhysicalDeviceProperties::apiVersion is less than Vulkan 1.1, height must be greater than 0.0

- VUID-VkViewport-height-01773
  The absolute value of height must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[1]

- VUID-VkViewport-x-01774
  x must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-x-01232
  (x + width) must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-y-01775
  y must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-y-01776
  y must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-y-01777
  (y + height) must be greater than or equal to viewportBoundsRange[0]

- VUID-VkViewport-y-01233
  (y + height) must be less than or equal to viewportBoundsRange[1]

- VUID-VkViewport-minDepth-01234
  minDepth must be between 0.0 and 1.0, inclusive

- VUID-VkViewport-maxDepth-01235
  maxDepth must be between 0.0 and 1.0, inclusive
Chapter 25. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType           sType;
    const void*               pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32                  depthClampEnable;
    VkBool32                  rasterizerDiscardEnable;
    VkPolygonMode             polygonMode;
    VkCullModeFlags           cullMode;
    VkFrontFace               frontFace;
    VkBool32                  depthBiasEnable;
    float                     depthBiasConstantFactor;
    float                     depthBiasClamp;
    float                     depthBiasSlopeFactor;
    float                     lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
• `depthClampEnable` controls whether to clamp the fragment’s depth values as described in Depth Test. Enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in Primitive Clipping.

• `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

• `polygonMode` is the triangle rendering mode. See `VkPolygonMode`.

• `cullMode` is the triangle facing direction used for primitive culling. See `VkCullModeFlagBits`.

• `frontFace` is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

• `depthBiasEnable` controls whether to bias fragment depth values.

• `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.

• `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.

• `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

• `lineWidth` is the width of rasterized line segments.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  - If the `depthClamp` feature is not enabled, `depthClampEnable` must be `VK_FALSE`

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  - If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL`

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  - If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons` is `VK_FALSE`, and `rasterizerDiscardEnable` is `VK_FALSE`, `polygonMode` must not be `VK_POLYGON_MODE_POINT`

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO`

- **VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask**
  - `flags` must be `0`

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter**
  - `polygonMode` must be a valid `VkPolygonMode` value

- **VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter**
**cullMode** must be a valid combination of **VkCullModeFlagBits** values.

- **VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter**

**frontFace** must be a valid **VkFrontFace** value.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;
```

**VkPipelineRasterizationStateCreateFlags** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization. This value is ignored for the purposes of setting the number of samples used in rasterization if the pipeline is created with the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** dynamic state set, but if **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** dynamic state is not set, it is still used to define the size of the **pSampleMask** array as described below.
- **sampleShadingEnable** can be used to enable **Sample Shading**.
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
- **pSampleMask** is a pointer to an array of **VkSampleMask** values used in the **sample mask test**.
- **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the **Multisample Coverage** section.
- **alphaToOneEnable** controls whether the alpha component of the fragment's first color output is replaced with one as described in **Multisample Coverage**.
Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit $b$ for mask word $w$ in the sample mask corresponds to sample index $i$, where $i = 32 \times w + b$. $p\text{SampleMask}$ has a length equal to $\lceil \text{rasterizationSamples} / 32 \rceil$ words.

If $p\text{SampleMask}$ is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sampleRateShading feature is not enabled, sampleShadingEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alphaToOne feature is not enabled, alphaToOneEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  $\text{minSampleShading}$ must be in the range [0,1]

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  pNext must be NULL

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  flags must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  rasterizationSamples must be a valid VkSampleCountFlagBits value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  If $p\text{SampleMask}$ is not NULL, $p\text{SampleMask}$ must be a valid pointer to an array of $\lceil \text{rasterizationSamples} / 32 \rceil$ VkSampleMask values

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;
```

$\text{VkPipelineMultisampleStateCreateFlags}$ is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type $\text{VkSampleMask}$, each representing 32 bits of coverage information:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;
```

Rasterization only generates fragments which cover one or more pixels inside the framebuffer.
Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

25.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the `rasterizerDiscardEnable` member of `VkPipelineRasterizationStateCreateInfo` is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically enable whether primitives are discarded before the rasterization stage, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,        
    VkBool32 rasterizerDiscardEnable);  
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,        
    VkBool32 rasterizerDiscardEnable);   
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRasterizerDiscardEnable-None-08970
  At least one of the following must be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetRasterizerDiscardEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

25.2. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. **Fragment operations**, in the order defined
2. **Blending, logic operations**, and color writes

Execution of these operations for each primitive in a subpass occurs in primitive order.

25.3. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations
apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with Sample and Input, the data associated with those variables will be assigned independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with Sample and Input need not be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments have one set of samples. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by VkPipelineMultisampleStateCreateInfo::rasterizationSamples. Each sample in a set is assigned a unique sample index i in the range [0, rasterizationSamples).

To dynamically set the rasterizationSamples, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits rasterizationSamples);
```

- commandBuffer is the command buffer into which the command will be recorded.
- rasterizationSamples specifies rasterizationSamples.

This command sets the rasterizationSamples for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineMultisampleStateCreateInfo::rasterizationSamples value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetRasterizationSamplesEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3RasterizationSamples feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>

<td></td>
<td></td>
</tr>
</tbody>
</table>

Each sample in a fragment is also assigned a unique coverage index j in the range \([0, n \times \text{rasterizationSamples})\), where n is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index.

If the fragment shading rate is set, the coverage index j is determined as a function of the pixel index p, the sample index i, and the number of rasterization samples r as:
\[ j = i + r \times ((f_w \times f_h) - 1 - p) \]

where the pixel index \( p \) is determined as a function of the pixel's framebuffer location \((x,y)\) and the fragment size \((f_w,f_h)\):

\[ p_x = x \% f_w \]

\[ p_y = y \% f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 29. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![1x1 diagram]</td>
<td>![1x2 diagram]</td>
<td>![1x4 diagram]</td>
</tr>
</tbody>
</table>

**Table 30. Pixel indices - 2 wide**
The coverage mask includes \( B \) bits packed into \( W \) words, defined as:

\[
B = n \times \text{rasterizationSamples}
\]

\[
W = \lceil B/32 \rceil
\]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

<td><img src="image5.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>
25.4. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:

- The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
- The value of `fragmentSize.width` must be greater than or equal to `1`.
- The value of `fragmentSize.width` must be a power-of-two.
- The value of `fragmentSize.height` must be less than or equal to `maxFragmentSize.height`.
- The value of `fragmentSize.height` must be greater than or equal to `1`.
- The value of `fragmentSize.height` must be a power-of-two.
- The highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th>sampleCounts</th>
<th>fragmentSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>(2,2)</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>(2,1)</td>
</tr>
<tr>
<td>~0</td>
<td>(1,1)</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts` includes `VK_SAMPLE_COUNT_2_BIT`, the required rates must also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts are supported for this rate.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  `pFragmentShadingRateCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by `pFragmentShadingRateCount` is not 0, and `pFragmentShadingRates` is not NULL, `pFragmentShadingRates` must be a valid pointer to an array of `pFragmentShadingRateCount` `VkPhysicalDeviceFragmentShadingRateKHR` structures

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
```
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **sampleCounts** is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- **fragmentSize** is a `VkExtent2D` describing the width and height of a supported shading rate.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR`.

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
  
  **pNext** must be `NULL`.

Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 25.4.1. Pipeline Fragment Shading Rate

The **pipeline fragment shading rate** can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentSize** specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by
drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

Valid Usage (Implicit)

- `VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

Valid Usage

- `VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If pipelineFragmentShadingRate is not enabled, pFragmentSize->width must be 1`
- `VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
  If pipelineFragmentShadingRate is not enabled, pFragmentSize->height must be 1`
- `VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
  One of pipelineFragmentShadingRate, primitiveFragmentShadingRate, or attachmentFragmentShadingRate must be enabled`
- `VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510`
If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width must be greater than or equal to 1`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height must be greater than or equal to 1`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width must be a power-of-two value`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  `pFragmentSize->height must be a power-of-two value`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  `pFragmentSize->width must be less than or equal to 4`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  `pFragmentSize->height must be less than or equal to 4`.

### Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  `commandBuffer must be a valid VkCommandBuffer handle`.

- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  `pFragmentSize must be a valid pointer to a valid VkExtent2D structure`.

- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of `combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value`.

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  `commandBuffer must be in the recording state`.

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command must only be called outside of a video coding scope.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</tr>
</tbody>
</table>

25.4.2. Primitive Fragment Shading Rate

The **primitive fragment shading rate** can be set via the `PrimitiveShadingRateKHR` built-in in the last active **pre-rasterization shader stage**. The rate associated with a given primitive is sourced from the value written to `PrimitiveShadingRateKHR` by that primitive's **provoking vertex**.

25.4.3. Attachment Fragment Shading Rate

The **attachment shading rate** can be set by including `VkFragmentShadingRateAttachmentInfoKHR` in a subpass to define a **fragment shading rate attachment**. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[
x' = \text{floor}(x / \text{region}_x) \\
y' = \text{floor}(y / \text{region}_y)
\]

where \(x'\) and \(y'\) are the coordinates of a texel in the fragment shading rate attachment, \(x\) and \(y\) are the coordinates of the pixel in the framebuffer, and \(\text{region}_x\) and \(\text{region}_y\) are the size of the region each texel corresponds to, as defined by the **shadingRateAttachmentTexelSize** member of `VkFragmentShadingRateAttachmentInfoKHR`.

If **multiview is enabled** and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the `ViewIndex` built-in. If **multiview is disabled**, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the **Layer** built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:
size\_w = 2^{((\text{texel} / 4) \& 3)}^\text{size} \text{h} = 2^{(\text{texel} \& 3)}$

where texel is the value in the first component of the identified texel, and size\_w and size\_h are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as size\_w = size\_h = 1. Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

### 25.4.4. Combining the Fragment Shading Rates

The final rate (C\_xy') used for fragment shading must be one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count used by rasterization.

If any of the following conditions are met, C\_xy' must be set to \{1,1\}:

- If Sample Shading is enabled.
- The fragmentShadingRateWithSampleMask limit is not supported, and VkPipelineMultisampleStateCreateInfo::pSampleMask contains a zero value in any bit used by fragment operations.
- The fragmentShadingRateWithShaderSampleMask is not supported, and the fragment shader has SampleMask in the input or output interface.
- The fragmentShadingRateWithShaderDepthStencilWrites limit is not supported, and the fragment shader declares the FragDepth built-in.
- The fragment shader declares any of the TileImageColorReadAccessEXT, TileImageDepthReadAccessEXT, or TileImageStencilReadAccessEXT capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of C\_xy'. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by VkFragmentShadingRateCombinerOpKHR:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```
• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = B_{xy} \).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy}) \).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy}) \).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy} \).

where \( \text{combine}(A_{xy}, B_{xy}) \) is the combine operation, and \( A_{xy} \) and \( B_{xy} \) are the inputs to the operation.

If \( \text{fragmentShadingRateStrictMultiplyCombiner} \) is \( \text{VK_FALSE} \), using **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** with values of 1 for both \( A \) and \( B \) in the same dimension results in the value 2 being produced for that dimension. See the definition of **fragmentShadingRateStrictMultiplyCombiner** for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy}, B_{xy})
\]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the **ShadingRateKHR** built-in.

Implementations should clamp the inputs to the combiner operations \( A_{xy} \) and \( B_{xy} \), and must do so if **VkPhysicalDeviceMaintenance6PropertiesKHR**::**fragmentShadingRateClampCombinerInputs** is set to **VK_TRUE**. All implementations must clamp the result of the second combiner operation.

A fragment shading rate \( R_{xy} \) representing any of \( A_{xy} \), \( B_{xy} \) or \( C_{xy} \) is clamped as follows. If \( R_{xy} \) is one of the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count used by rasterization, the clamped shading rate \( R'_{xy} \) is \( R_{xy} \). Otherwise, the clamped shading rate is selected from the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( R'_x \leq R_x \) and \( R'_y \leq R_y \).
   - Implementations may also keep rates where \( R'_x \leq R_y \) and \( R'_y \leq R_x \).
2. Keep only rates with the highest area \((R_x' \times R_y')\).

3. Keep only rates with the lowest aspect ratio \((R_x' + R_y')\).

4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, and combiner operations for the lifetime of the VkDevice.

### 25.5. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation must invoke the fragment shader at least \(\max(\lceil \text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \rceil, 1)\) times per fragment. If VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is set to VK_TRUE, sample shading is enabled.

If a fragment shader entry point statically uses an input variable decorated with a BuiltIn of SampleId or SamplePosition, sample shading is enabled and a value of 1.0 is used instead of minSampleShading. If a fragment shader entry point statically uses an input variable decorated with Sample, sample shading may be enabled and a value of 1.0 will be used instead of minSampleShading if it is.

**Note**

If a shader decorates an input variable with Sample and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a helper invocation covers at least one sample.

### 25.6. Barycentric Interpolation

When the fragmentShaderBarycentric feature is enabled, the PerVertexKHR interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.
When **tessellation** and **geometry shading** are not active, fragment shader inputs decorated with **PerVertexKHR** will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used for index values of 0, 1, and 2. If an input decorated with **PerVertexKHR** is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the **VkPipelineRasterizationStateCreateInfo::polygonMode** property of the currently active pipeline is not **VK_POLYGON_MODE_FILL**, an undefined value is returned.

</table>

When geometry shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry shader. In this case, the vertices used for fragment shader inputs decorated with **PerVertexKHR** are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated
with `PerVertexKHR`, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR`.

Fragment shader inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For `BaryCoordKHR`, the values are obtained using perspective interpolation. For `BaryCoordNoPerspKHR`, the values are obtained using linear interpolation. The values of `BaryCoordKHR` and `BaryCoordNoPerspKHR` are undefined while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`.

### 25.7. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range `[pointSizeRange[0], pointSizeRange[1]]`. The value written to `PointSize` must be greater than zero. If `maintenance5` is enabled, and a value is not written to `PointSize`, the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pointSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

#### 25.7.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point's \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):
where size is the point's size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

25.8. Line Segments

To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer, // Provided by VK_VERSION_1_0
    float lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineWidth-lineWidth-00788
  If the wideLines feature is not enabled, `lineWidth` must be 1.0

### Valid Usage (Implicit)

- VUID-vkCmdSetLineWidth-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineWidth-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLineWidth-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineWidth-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the `lineWidthRange` and `lineWidthGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

25.8.1. Basic Line Segment Rasterization

Rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When `rasterizationSamples` is `VK_SAMPLE_COUNT_1_BIT`, the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{\| p_b - p_a \|^2}
\]

(Note that \( t = 0 \) at \( p_a \) and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If `strictLines` is `VK_TRUE`, line segments are rasterized using perspective or linear interpolation.

*Perspective interpolation* for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip
coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{(1-t)f_a / w_a + tf_b / w_b}{(1-t) / w_a + t / w_b}
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

**Linear interpolation** for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
f = (1 - t) f_a + t f_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by *Interpolation decorations*.

The above description documents the preferred method of line rasterization, and **must** be used when the implementation advertises the *strictLines* limit in *VkPhysicalDeviceLimits* as *VK_TRUE*.

By default, when *strictLines* is *VK_FALSE*, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in *Non strict lines*, and each is *lineWidth* long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.
Only when `strictLines` is `VK_FALSE` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictSinglePixelWideLinesUseParallelogram` is `VK_TRUE`, and `strictLines` is `VK_FALSE`, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictWideLinesUseParallelogram` is `VK_TRUE`, and `strictLines` is `VK_FALSE`, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

**25.8.2. Bresenham Line Segment Rasterization**

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either *x-major* or *y-major*. *x-major* line segments have slope in the closed interval \([-1,1]\); all other line segments are *y-major* (slope is determined by the segment’s endpoints). We specify rasterization only for *x-major* segments except in cases where the modifications for *y-major* segments are not self-evident.

Ideally, Vulkan uses a *diamond-exit* rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \(f\) with center at framebuffer coordinates \(x_f\) and \(y_f\), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) | |x - x_f| + |y - y_f| < \frac{1}{2}\}
\]
Essentially, a line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment intersects \( R_f \), except if \( p_b \) is contained in \( R_f \).

**Figure 16. Visualization of Bresenham's algorithm**

To avoid difficulties when an endpoint lies on a boundary of \( R_f \) we (in principle) perturb the supplied endpoints by a tiny amount. Let \( p_a \) and \( p_b \) have framebuffer coordinates \( (x_a, y_a) \) and \( (x_b, y_b) \), respectively. Obtain the perturbed endpoints \( p_a' \) given by \( (x_a, y_a) - (\epsilon, \epsilon^2) \) and \( p_b' \) given by \( (x_b, y_b) - (\epsilon, \epsilon^2) \). Rasterizing the line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment starting at \( p_a' \) and ending on \( p_b' \) intersects \( R_f \), except if \( p_b' \) is contained in \( R_f \). \( \epsilon \) is chosen to be so small that rasterizing the line segment produces the same fragments when \( \delta \) is substituted for \( \epsilon \) for any \( 0 < \delta \leq \epsilon \).

When \( p_a \) and \( p_b \) lie on fragment centers, this characterization of fragments reduces to Bresenham's algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to \( p_b \)) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations **may** use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm **must** not deviate by more than one unit in either \( x \) or \( y \) framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.

- The total number of fragments produced by the algorithm **must** not differ from that produced by the diamond-exit rule by more than one.
• For an x-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).

• If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent \( \text{lineWidthRange} \) (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a y-major segment) is produced at each \( x \) (\( y \) for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \( \text{FragCoord} \) which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

### Note

The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).

### 25.9. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the \( \text{VkPipelineRasterizationStateCreateInfo} \) structure.
25.9.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is *back-facing* or *front-facing*. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i^f y_i^f - x_i^f y_{i+1}^f \]

where \( x_i^f \) and \( y_i^f \) are the x and y framebuffer coordinates of the \( i \)th vertex of the \( n \)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \((i + 1) \mod n\).

The interpretation of the sign of \( a \) is determined by the `VkPipelineRasterizationStateCreateInfo`::`frontFace` property of the currently active pipeline. Possible values are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;
```

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
- **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To *dynamically set* the front face orientation, call:

```cpp
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,            commandBuffer,
    VkFrontFace face) {
    VkFrontFace frontFace;                     frontFace);
}
```

or the equivalent command

```cpp
// Provided by VK_EXT_shader_object
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,            commandBuffer,
    VkFrontFace face) {
   VkFrontFace frontFace;                     frontFace);
}
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **frontFace** is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.
This command sets the front face orientation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_FRONT_FACE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::frontFace value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFrontFace-None-08971**
  At least one of the following **must** be true:
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetFrontFace-commandBuffer-parameter**
  commandBuffer **must** be a valid VkCommandBuffer handle

- **VUID-vkCmdSetFrontFace-frontFace-parameter**
  frontFace **must** be a valid VkFrontFace value

- **VUID-vkCmdSetFrontFace-commandBuffer-recording**
  commandBuffer **must** be in the recording state

- **VUID-vkCmdSetFrontFace-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations

- **VUID-vkCmdSetFrontFace-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Once the orientation of triangles is determined, they are culled according to the `VkPipelineRasterizationStateCreateInfo::cullMode` property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- `VK_CULL_MODE_NONE` specifies that no triangles are discarded
- `VK_CULL_MODE_FRONT_BIT` specifies that front-facing triangles are discarded
- `VK_CULL_MODE_BACK_BIT` specifies that back-facing triangles are discarded
- `VK_CULL_MODE_FRONT_AND_BACK` specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

`VkCullModeFlags` is a bitmask type for setting a mask of zero or more `VkCullModeFlagBits`.

To dynamically set the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `cullMode` specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_CULL_MODE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the
VkPipelineRasterizationStateCreateInfo::cullMode value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCullMode-None-08971
  At least one of the following **must** be true:
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetCullMode-cullMode-parameter
  cullMode **must** be a valid combination of VkCullModeFlagBits values
- VUID-vkCmdSetCullMode-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetCullMode-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetCullMode-vidsecoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

The rule for determining which fragments are produced by polygon rasterization is called **point sampling**. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels.
for which any sample points lie inside of this polygon. Coverage bits that correspond to sample
points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is
given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie
on either side of a common edge (with identical endpoints) on which a sample point lies, then
exactly one of the polygons must result in a covered sample for that fragment during rasterization.
As for the data associated with each fragment produced by rasterizing a polygon, we begin by
specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with a + b + c
= 1. These coordinates uniquely specify any point p within the triangle or on the triangle’s
boundary as

\[ p = a p_a + b p_b + c p_c \]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. a, b, and c are determined by:

\[ a = \frac{A(p p_b p_c)}{A(p_a p_b p_c)}, \quad b = \frac{A(p p_d p_c)}{A(p_a p_b p_c)}, \quad c = \frac{A(p p_d p_b)}{A(p_a p_b p_c)}, \]

where \( A(\text{lmn}) \) denotes the area in framebuffer coordinates of the triangle with vertices l, m, and n.

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c, \) respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when
taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates.
An interpolated value \( f \) can be determined by

\[ f = \frac{a f_a / w_a + b f_b / w_b + c f_c / w_c}{a / w_a + b / w_b + c / w_c} \]

where \( w_a, w_b, \) and \( w_c \) are the clip w coordinates of \( p_a, p_b, \) and \( p_c, \) respectively. a, b, and c are the
barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \( f \) can
be determined by

\[ f = a f_a + b f_b + c f_c \]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \)
for a sample is determined using linear interpolation. Interpolation of fragment shader input
values are determined by **Interpolation decorations**.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex
combination of the values of the datum at the polygon's vertices must be used to obtain the value
assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that
at every fragment
\[ f = \sum_{i=1}^{n} a_i f_i \]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i \). For each \( i \), \( 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1 \). The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i \), \( a_i = 1 \) and \( a_j = 0 \) for \( j \neq i \). 

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

### 25.9.2. Polygon Mode

Possible values of the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
} VkPolygonMode;
```

- `VK_POLYGON_MODE_POINT` specifies that polygon vertices are drawn as points.
- `VK_POLYGON_MODE_LINE` specifies that polygon edges are drawn as line segments.
- `VK_POLYGON_MODE_FILL` specifies that polygons are rendered using the polygon rasterization rules in this section.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_TRUE`, the point size of the final rasterization of polygons is taken from `PointSize` when polygon mode is `VK_POLYGON_MODE_POINT`.

Otherwise, if `VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize` is set to `VK_FALSE`, the point size of the final rasterization of polygons is 1.0 when polygon mode is `VK_POLYGON_MODE_POINT`.

To dynamically set the polygon mode, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
```
```c
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,
    VkPolygonMode polygonMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `polygonMode` specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::polygonMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetPolygonModeEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3PolygonMode` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424**
  If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL`

### Valid Usage (Implicit)

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter**
  `polygonMode` must be a valid `VkPolygonMode` value

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetPolygonModeEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

#### 25.9.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value that is computed for that polygon.

**Depth Bias Enable**

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment’s depth values are unchanged.

To dynamically enable whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetDepthBiasEnable-None-08970
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthBiasEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- depthBiasSlopeFactor scales the maximum depth slope $m$ of the polygon
- depthBiasConstantFactor scales the parameter $r$ of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or
maximum value specified by \texttt{depthBiasClamp}

\texttt{depthBiasSlopeFactor}, \texttt{depthBiasConstantFactor}, and \texttt{depthBiasClamp} can each be positive, negative, or zero. These parameters are set as described for \texttt{vkCmdSetDepthBias} and \texttt{vkCmdSetDepthBias2EXT} below.

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2}
\]

where \((x_0, y_0, z_0)\) is a point on the triangle. \( m \) may be approximated as

\[
m = \max\left(\left|\frac{\partial z_f}{\partial x_f}\right|, \left|\frac{\partial z_f}{\partial y_f}\right|\right).
\]

In a pipeline with a depth bias representation of \texttt{VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT}, \( r \), for the given primitive is defined as

\[
r = 1
\]

Otherwise \( r \) is the minimum resolvable difference that depends on the depth attachment representation. If \texttt{VkDepthBiasRepresentationInfoEXT::depthBiasExact} is \texttt{VK_FALSE} it is the smallest difference in framebuffer coordinate \( z \) values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z \) values that differ by \( r \), will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of \texttt{VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT}, \( r \) is constant throughout the range of the entire depth attachment. If \texttt{VkDepthBiasRepresentationInfoEXT::depthBiasExact} is \texttt{VK_TRUE}, then its value must be

\[
r = 2^n
\]

Otherwise its value is implementation-dependent but must be at most

\[
r = 2 \times 2^n
\]

where \( n \) is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as
If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times depthBiasSlopeFactor + r \times depthBiasConstantFactor)
\]

where
\[
\text{dbclamp}(x) = \begin{cases} 
  x & \text{depthBiasClamp} = 0 \text{ or } \text{NaN} \\
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
  \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 
\end{cases}
\]

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

Calling this function is equivalent to calling `vkCmdSetDepthBias2EXT` without a `VkDepthBiasRepresentationInfoEXT` in the pNext chain of `VkDepthBiasInfoEXT`.

Valid Usage

- `VUID-vkCmdSetDepthBias-depthBiasClamp-00790`
If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

Valid Usage (Implicit)

- VUID-vkCmdSetDepthBias-commandBuffer-parameter commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetDepthBias-commandBuffer-cmdpool The `VkCommandPool` that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias-videcoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkDepthBiasRepresentationInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32 depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `depthBiasRepresentation` is a `VkDepthBiasRepresentationEXT` value specifying the depth bias
• `depthBiasExact` specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

### Valid Usage

- **VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947**
  If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948**
  If the `floatRepresentation` feature is not enabled, `depthBiasRepresentation` must not be `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949**
  If the `depthBiasExact` feature is not enabled, `depthBiasExact` must be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkDepthBiasRepresentationInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter**
  `depthBiasRepresentation` must be a valid `VkDepthBiasRepresentationEXT` value

Possible values of `VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation`, specifying the depth bias representation are:

```c
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VKDEPTHBIASREPRESENTATIONLEASTREPRESENTABLEVALUEFORMATEXT = 0,
    VKDEPTHBIASREPRESENTATIONLEASTREPRESENTABLEVALUEFORCEUNORMEXT = 1,
    VKDEPTHBIASREPRESENTATIONFLOATEXT = 2,
} VkDepthBiasRepresentationEXT;
```

- `VKDEPTHBIASREPRESENTATIONLEASTREPRESENTABLEVALUEFORMATEXT` specifies that the depth bias representation is a factor of the format’s r as described in Depth Bias Computation.
- `VKDEPTHBIASREPRESENTATIONLEASTREPRESENTABLEVALUEFORCEUNORMEXT` specifies that the depth bias representation is a factor of a constant r defined by the bit-size or mantissa of the format as described in Depth Bias Computation.
- `VKDEPTHBIASREPRESENTATIONFLOATEXT` specifies that the depth bias representation is a factor of constant r equal to 1.

The `VkDepthBiasInfoEXT` structure is defined as:
```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
  VkStructureType sType;
  const void* pNext;
  float depthBiasConstantFactor;
  float depthBiasClamp;
  float depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.
- **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.
- **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

If **pNext** does not contain a `VkDepthBiasRepresentationInfoEXT` structure, then this command is equivalent to including a `VkDepthBiasRepresentationInfoEXT` with `depthBiasExact` set to `VK_FALSE` and `depthBiasRepresentation` set to `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`.

### Valid Usage

- **VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950**
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be **0.0**

### Valid Usage (Implicit)

- **VUID-VkDepthBiasInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT`

- **VUID-VkDepthBiasInfoEXT-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`

- **VUID-VkDepthBiasInfoEXT-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

To **dynamically set** the depth bias parameters, call:

```c
// Provided by VK_EXT_depth_bias_control
void vkCmdSetDepthBias2EXT(
  VkCommandBuffer commandBuffer,
  const VkDepthBiasInfoEXT* pDepthBiasInfo);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `pDepthBiasInfo` is a pointer to a `VkDepthBiasInfoEXT` structure specifying depth bias parameters.

This command is functionally identical to `vkCmdSetDepthBias`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter  
  `pDepthBiasInfo` must be a valid pointer to a valid `VkDepthBiasInfoEXT` structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording  
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias2EXT-videocoding  
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

Chapter 26. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Sample mask test
4. Certain Fragment shading operations:
   ◦ Sample Mask Accesses
   ◦ Tile Image Reads
   ◦ Depth Replacement
5. Multisample coverage
6. Depth bounds test
7. Stencil test
8. Depth test
9. Sample counting
10. Coverage reduction

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

   • OpTerminateInvocation
   • OpDemoteToHelperInvocationEXT
   • OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

If VkPhysicalDeviceMaintenance5PropertiesKHR :\text{earlyFragmentMultisampleCoverageAfterSampleCounting} is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations must be performed after sample counting.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR :\text{earlyFragmentMultisampleCoverageAfterSampleCounting} is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations must be performed after sample counting.

1460
shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting, but may be performed before sample counting.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode sample mask test operations must follow the order of fragment operations from above.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations should follow the order of fragment operations from above but may instead be performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthLess execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

the implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

### 26.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a VkRect2D. These values are either set by the VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x]\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y]\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that
are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles must enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode must be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

**Valid Usage**

- `VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582`
  
  `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`
Valid Usage (Implicit)

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType**
  
  *sType must be VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT*

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask**
  
  *flags must be 0*

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter**
  
  *discardRectangleMode must be a valid VkDiscardRectangleModeEXT value*

// Provided by VK_EXT_discard_rectangles

typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

VkDiscardRectangleModeEXT values are:

// Provided by VK_EXT_discard_rectangles

typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

- **VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT** specifies that the discard rectangle test is inclusive.
- **VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT** specifies that the discard rectangle test is exclusive.

To **dynamically set** the discard rectangles, call:

// Provided by VK_EXT_discard_rectangles

void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstDiscardRectangle** is the index of the first discard rectangle whose state is updated by the command.
- **discardRectangleCount** is the number of discard rectangles whose state are updated by the command.
- **pDiscardRectangles** is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of pDiscardRectangles replace the current state for the
discard rectangle at index firstDiscardRectangle + i, for i in [0, discardRectangleCount).

This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585
  The sum of firstDiscardRectangle and discardRectangleCount must be less than or equal to VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles

- VUID-vkCmdSetDiscardRectangleEXT-x-00587
  The x and y member of offset in each VkRect2D element of pDiscardRectangles must be greater than or equal to 0

- VUID-vkCmdSetDiscardRectangleEXT-offset-00588
  Evaluation of (offset.x + extent.width) in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

- VUID-vkCmdSetDiscardRectangleEXT-offset-00589
  Evaluation of (offset.y + extent.height) in each VkRect2D element of pDiscardRectangles must not cause a signed integer addition overflow

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter
  pDiscardRectangles must be a valid pointer to an array of discardRectangleCount VkRect2D structures

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDiscardRectangleEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength
  discardRectangleCount must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 discardRectangleEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

Valid Usage

- VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension

Valid Usage (Implicit)

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording
**commandBuffer** must be in the **recording state**

- VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations
- VUID-vkCmdSetDiscardRectangleEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the discard rectangle mode, call:

```c
// Provided by VK_EXT_discard_rectangles
define void VkCmdSetDiscardRectangleModeEXT(
  VkCommandBuffer commandBuffer,
  VkDiscardRectangleModeEXT discardRectangleMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **discardRectangleMode** specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** set in **VkPipelineDynamicStateCreateInfo**::*pDynamicStates*. Otherwise, this state is specified by the **VkPipelineDiscardRectangleStateCreateInfoEXT**: discardRectangleMode value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852
  The **VK_EXT_discard_rectangles** extension **must** be enabled, and the implementation **must**
26.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a **scissor rectangle** at the index equal to the fragment’s `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D}::\text{offset.x}, \text{VkRect2D}::\text{offset.x} + \text{VkRect2D}::\text{extent.x}]\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset.y}, \text{VkRect2D}::\text{offset.y} + \text{VkRect2D}::\text{extent.y}]\). Samples with coordinates outside the scissor rectangle at the
corresponding **ViewportIndex** will have their coverage set to 0.

To **dynamically set** the scissor rectangles, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer   commandBuffer,   
    uint32_t          firstScissor,    
    uint32_t          scissorCount,    
    const VkRect2D*   pScissors);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstScissor** is the index of the first scissor whose state is updated by the command.
- **scissorCount** is the number of scissors whose rectangles are updated by the command.
- **pScissors** is a pointer to an array of **VkRect2D** structures defining scissor rectangles.

The scissor rectangles taken from element i of **pScissors** replace the current state for the scissor index **firstScissor** + i, for i in [0, **scissorCount**).

This command sets the scissor rectangles for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_SCISSOR** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineViewportStateCreateInfo::pScissors** values used to create the currently active pipeline.

---

**Valid Usage**

- **VUID-vkCmdSetScissor-firstScissor-00592**
  The sum of **firstScissor** and **scissorCount** must be between 1 and **VkPhysicalDeviceLimits::maxViewports**, inclusive.

- **VUID-vkCmdSetScissor-firstScissor-00593**
  If the multiViewport feature is not enabled, **firstScissor** must be 0.

- **VUID-vkCmdSetScissor-scissorCount-00594**
  If the multiViewport feature is not enabled, **scissorCount** must be 1.

- **VUID-vkCmdSetScissor-x-00595**
  The x and y members of offset member of any element of **pScissors** must be greater than or equal to 0.

- **VUID-vkCmdSetScissor-offset-00596**
  Evaluation of (offset.x + extent.width) must not cause a signed integer addition overflow for any element of **pScissors**.

- **VUID-vkCmdSetScissor-offset-00597**
  Evaluation of (offset.y + extent.height) must not cause a signed integer addition overflow for any element of **pScissors**.
Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetScissor-pScissors-parameter
  `pScissors` must be a valid pointer to an array of `scissorCount` `VkRect2D` structures
- VUID-vkCmdSetScissor-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetScissor-vidcording
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetScissor-scissorCount-arraylength
  `scissorCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>

26.3. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

To dynamically set the sample mask, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,  
    VkSampleCountFlagBits samples,
```
const VkSampleMask* pSampleMask);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values, where the array size is based on the `samples` parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::pSampleMask` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetSampleMaskEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3SampleMask` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  `pSampleMask` must be a valid pointer to an array of $\frac{\text{samples}}{32}$ `VkSampleMask` values
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetSampleMaskEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in VkPipelineMultisampleStateCreateInfo::pSampleMask which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

### 26.4. Fragment Shading

**Fragment shaders** are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader **must** not be executed if a fragment operation that executes before fragment shading discards the fragment.

- A fragment shader **may** not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
  - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments **may** be shaded by one fragment shader invocation. This **may** affect VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT results, but **must** otherwise not be visible behavior to applications.

- Otherwise, at least one fragment shader **must** be executed.
  - If sample shading is enabled and multiple invocations per fragment are **required**, additional invocations **must** be executed as specified.
  - Each covered sample **must** be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values **may** be written to all color attachment outputs during this fragment operation.

**Note**

Multiple fragment shader invocations may be executed for the same fragment for
any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

### 26.4.1. Sample Mask

Reading from the `SampleMask` built-in in the `Input` storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If `sample shading` is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the `rasterization chapter`. If the bit in `SampleMask` which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the `SampleMask` built-in in the `Output` storage class will be used by the `multisample coverage` operation, with the same encoding as the input built-in.

### 26.4.2. Fragment Shader Tile Image Reads

If the `VK_EXT_shader_tile_image` extension is enabled, implementations divide the framebuffer into a grid of tiles. A `tile image` is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by `vkCmdBeginRenderingKHR`, fragment shader invocations can read the framebuffer color, depth, and stencil values at the fragment location via tile images.

**Note**

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

- Tile dimensions will be exposed in a future extension
- Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.

Enabling `shaderTileImageColorReadAccess`, `shaderTileImageDepthReadAccess`, `shaderTileImageStencilReadAccess` enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with `OpColorAttachmentReadEXT`. Tile image variables are linked to specific color attachments using `Location` decoration. See `Fragment Tile Image Interface` for more details.
Depth values are read with `OpDepthAttachmentReadEXT`.

Stencil values are read with `OpStencilAttachmentReadEXT`.

The sample to read is specified by a **sample index** value specified as the `Sample` operand to `OpColorAttachmentReadEXT`, `OpDepthAttachmentReadEXT`, or `OpStencilAttachmentReadEXT`.

If **sample shading** is disabled, a fragment invocation can read from all sample locations associated with the fragment regardless of the fragment's coverage. This functionality is supported for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1` when `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation` is `VK_TRUE`.

If **sample shading** is enabled, and `minSampleShading` is `1.0`, a fragment invocation **must** only read from the **coverage index** sample. Tile image access **must** not be used if the value of `minSampleShading` is not `1.0`.

If the **fragment shader** declares the **EarlyFragmentTests** execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation` is `VK_FALSE`, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

`OpDepthAttachmentReadEXT` returns an undefined value if no depth attachment is present. `OpStencilAttachmentReadEXT` returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without **data race** with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let `Rc` be the set of components being read from an attachment `A` in a draw call
- Let `Wc` be the set of components being written to `A` by the draw call

The samples which qualify for coherent tile image reads from an attachment `A` are:

- All samples in a pixel when `Rc` is disjoint with `Wc`.
- The samples with coverage in a fragment when `Rc` is not disjoint with `Wc`. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader can declare `NonCoherentColorAttachmentReadEXT`, `NonCoherentDepthAttachmentReadEXT`, or `NonCoherentStencilAttachmentReadEXT` execution modes to enable non-coherent tile image reads which requires **explicit tile image synchronization** for the writes to an attachment to be made visible via tile image reads.

When `VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated` is `VK_TRUE`, the implementation prefers that coherent tile image reads are used, otherwise the
implementation prefers that non-coherent tile image reads are used.

**Note**

In practice, the most common tile image reads usage patterns fall under one of the following:

- **Programmable blending** - each fragment reads from a single sample (SampleID) at its location. Per-sample shading is typically enabled when multisampled rendertargets are used.

- **G-buffer generation and shading in one render pass** - in the shading phase a fragment reads from a single sample at its location.

- **Programmable resolve** - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.

- **1:1 texturing with LOD** - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

### 26.4.3. Depth Replacement

Writing to the `FragDepth` built-in will replace the fragment's calculated depth values for each sample in the input `SampleMask`. Depth testing performed after the fragment shader for this fragment will use this new value as $z_f$.

### 26.5. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with `SampleMask`, the coverage mask is **ANDed** with the bits of the `SampleMask` built-in to generate a new coverage mask. If sample shading is enabled, bits written to `SampleMask` corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include `SampleMask` in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the `alphaToCoverageEnable` and `alphaToOneEnable` members of the `VkPipelineMultisampleStateCreateInfo` structure.

To **dynamically set** the `alphaToCoverageEnable` state, call:
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToCoverageEnable);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToCoverageEnable` specifies the `alphaToCoverageEnable` state.

This command sets the `alphaToCoverageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3AlphaToCoverageEnable` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To **dynamically set** the `alphaToOneEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToOneEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToOneEnable` specifies the `alphaToOneEnable` state.

This command sets the `alphaToOneEnable` state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetAlphaToOneEnableEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3AlphaToOneEnable` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607**
  If the `alphaToOne` feature is not enabled, `alphaToOneEnable` **must** be `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If alphaToCoverageEnable is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to \([0,1]\)), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

**Note**
Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if alphaToOneEnable is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

**26.6. Depth and Stencil Operations**

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the VkPipelineDepthStencilStateCreateInfo structure.

The VkPipelineDepthStencilStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
```
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkBool32 stencilTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **depthTestEnable** controls whether depth testing is enabled.
- **depthWriteEnable** controls whether depth writes are enabled when depthTestEnable is VK_TRUE. Depth writes are always disabled when depthTestEnable is VK_FALSE.
- **depthCompareOp** is a VkCompareOp value specifying the comparison operator to use in the Depth Comparison step of the depth test.
- **depthBoundsTestEnable** controls whether depth bounds testing is enabled.
- **stencilTestEnable** controls whether stencil testing is enabled.
- **front** and **back** are VkStencilOpState values controlling the corresponding parameters of the stencil test.
- **minDepthBounds** is the minimum depth bound used in the depth bounds test.
- **maxDepthBounds** is the maximum depth bound used in the depth bounds test.

**Valid Usage**

- VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the depthBounds feature is not enabled, depthBoundsTestEnable must be VK_FALSE.
- VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef is VK_FALSE, and the value of VkPipelineDepthStencilStateCreateInfo::stencilTestEnable is VK_TRUE, and the value of VkPipelineRasterizationStateCreateInfo::cullMode is VK_CULL_MODE_NONE, the value of reference in each of the VkStencilOpState structs in front and back must be the same.
Valid Usage (Implicit)

- `sType must be VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`
- `pNext must be NULL`
- `flags must be 0`
- `depthCompareOp must be a valid VkCompareOp value`
- `front must be a valid VkStencilOpState structure`
- `back must be a valid VkStencilOpState structure`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

26.7. Depth Bounds Test

The depth bounds test compares the depth value \( z_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum (minDepthBounds) and maximum (maxDepthBounds) depth value. These values are either set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or dynamically by `vkCmdSetDepthBoundsTestEnable` and `vkCmdSetDepthBounds`.

A given sample is considered within the depth bounds if \( z_a \) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,
    )
```
or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH.Bounds.TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo`::`pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo`::`depthBoundsTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following must be true:
    - the `shaderObject` feature is enabled
    - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
  - VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
    `commandBuffer` must be in the recording state
  - VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
    The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
  - VUID-vkCmdSetDepthBoundsTestEnable-videocoding
    This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
To **dynamically set** the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,       
    float minDepthBounds,               
    float maxDepthBounds);             
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  `minDepthBounds` must be between 0.0 and 1.0, inclusive

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  `maxDepthBounds` must be between 0.0 and 1.0, inclusive

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  `cmdpool` must be a valid `VkCommandPool` handle
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetDepthBounds-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### 26.8. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a stencil reference value.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOp::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask $s_c$ and stencil reference value $s_r$ of the front or the back stencil state set determine arguments of the comparison operation. $s_c$ is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. $s_r$ is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`.

$s_r$ and $s_a$ are each independently combined with $s_c$ using a bitwise AND operation to create masked reference and attachment values $s'_r$ and $s'_a$. $s'_r$ and $s'_a$ are used as the reference and test values, respectively, in the operation specified by the `VkCompareOp`. 

1482
If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value $s_g$ is generated according to a stencil operation defined by *VkStencilOp* parameters set by *vkCmdSetStencilOp* or *VkPipelineDepthStencilStateCreateInfo*. If the stencil test fails, *failOp* defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, *VkPipelineDepthStencilStateCreateInfo::passOp* is used, otherwise *VkPipelineDepthStencilStateCreateInfo::depthFailOp* is used.

The stencil attachment value $s_a$ is then updated with the generated stencil value $s_g$ according to the write mask $s_w$ defined by *writeMask* in *VkPipelineDepthStencilStateCreateInfo::front* and *VkPipelineDepthStencilStateCreateInfo::back* as:

$$ s_a = (s_a \& \neg s_w) \mid (s_g \& s_w) $$

To dynamically enable or disable the stencil test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *stencilTestEnable* specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with *VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE* set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the *VkPipelineDepthStencilStateCreateInfo::stencilTestEnable* value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following must be true:
  - the shaderObject feature is enabled
  - the value of *VkApplicationInfo::apiVersion* used to create the *VkInstance* parent of *commandBuffer* is greater than or equal to Version 1.3
Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetStencilTestEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer
    VkStencilFaceFlags
    VkStencilOp
    VkStencilOp
    VkStencilOp
    VkCompareOp

    commandBuffer,
    faceMask,
    failOp,
    passOp,
    depthFailOp,
    compareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetStencilOpEXT(
    VkCommandBuffer
    commandBuffer,
```
VkStencilFaceFlags faceMask, VkStencilOp failOp, VkStencilOp passOp, VkStencilOp depthFailOp, VkCompareOp compareOp);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

### Valid Usage

- VUID-vkCmdSetStencilOp-None-08971
  At least one of the following must be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilOp-faceMask-parameter
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilOp-faceMask-requiredbitmap
  `faceMask` must not be 0
- VUID-vkCmdSetStencilOp-failOp-parameter
  `failOp` must be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-passOp-parameter
passOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-depthFailOp-parameter
depthFailOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-compareOp-parameter
compareOp must be a valid VkCompareOp value

- VUID-vkCmdSetStencilOp-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilOp-videocoding
This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkStencilOpState structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- failOp is a VkStencilOp value specifying the action performed on samples that fail the stencil test.
• **passOp** is a *VkStencilOp* value specifying the action performed on samples that pass both the depth and stencil tests.

• **depthFailOp** is a *VkStencilOp* value specifying the action performed on samples that pass the stencil test and fail the depth test.

• **compareOp** is a *VkCompareOp* value specifying the comparison operator used in the stencil test.

• **compareMask** selects the bits of the unsigned integer stencil values participating in the stencil test.

• **writeMask** selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.

• **reference** is an integer stencil reference value that is used in the unsigned stencil comparison.

---

### Valid Usage (Implicit)

- **VUID-VkStencilOpState-failOp-parameter**
  - **failOp** must be a valid *VkStencilOp* value

- **VUID-VkStencilOpState-passOp-parameter**
  - **passOp** must be a valid *VkStencilOp* value

- **VUID-VkStencilOpState-depthFailOp-parameter**
  - **depthFailOp** must be a valid *VkStencilOp* value

- **VUID-VkStencilOpState-compareOp-parameter**
  - **compareOp** must be a valid *VkCompareOp* value

To **dynamically set** the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,        // commandBuffer is the command buffer into which the command will be recorded.
    VkStencilFaceFlags faceMask,         // faceMask is a bitmask of *VkStencilFaceFlagBits* specifying the set of stencil state for which to update the compare mask.
    uint32_t compareMask);               // compareMask is the new value to use as the stencil compare mask.
```

This command sets the stencil compare mask for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the *VkStencilOpState::compareMask* value used to create the currently active pipeline, for both front and back faces.
Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- VUID-vkCmdSetStencilCompareMask-faceMask-required bitmask
  `faceMask` must not be 0

- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- VUID-vkCmdSetStencilCompareMask-videocoding
  This command `must` only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` `must` be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
• **VK_STENCIL_FACE_BACK_BIT** specifies that only the back set of stencil state is updated.

• **VK_STENCIL_FACE_FRONT_AND_BACK** is the combination of **VK_STENCIL_FACE_FRONT_BIT** and **VK_STENCIL_FACE_BACK_BIT**, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

**VkStencilFaceFlags** is a bitmask type for setting a mask of zero or more **VkStencilFaceFlagBits**.

To **dynamically set** the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t writeMask);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **faceMask** is a bitmask of **VkStencilFaceFlagBits** specifying the set of stencil state for which to update the write mask, as described above for **vkCmdSetStencilCompareMask**.

• **writeMask** is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **writeMask** value used to create the currently active pipeline, for both **VkPipelineDepthStencilStateCreateInfo::front** and **VkPipelineDepthStencilStateCreateInfo::back** faces.

---

**Valid Usage (Implicit)**

• **VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

• **VUID-vkCmdSetStencilWriteMask-faceMask-parameter**
  **faceMask** must be a valid combination of **VkStencilFaceFlagBits** values

• **VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask**
  **faceMask** must not be 0

• **VUID-vkCmdSetStencilWriteMask-commandBuffer-recording**
  **commandBuffer** must be in the recording state

• **VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

• **VUID-vkCmdSetStencilWriteMask-videocoding**
This command **must** only be called outside of a video coding scope

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.

## Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilReference-faceMask-parameter
  `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask
  `faceMask` **must** not be 0
- VUID-vkCmdSetStencilReference-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilReference-vidcording
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>

<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of the failOp, passOp, and depthFailOp members of VkStencilOpState, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- **VK_STENCIL_OP_KEEP** keeps the current value.
- **VK_STENCIL_OP_ZERO** sets the value to 0.
- **VK_STENCIL_OP_REPLACE** sets the value to reference.
- **VK_STENCIL_OP_INCREMENT_AND_CLAMP** increments the current value and clamps to the maximum representable unsigned value.
VK_STENCIL_OP_DECREMENT_AND_CLAMP decrements the current value and clamps to 0.

VK_STENCIL_OP_INVERT bitwise-inverts the current value.

VK_STENCIL_OP_INCREMENT_AND_WRAP increments the current value and wraps to 0 when the maximum value would have been exceeded.

VK_STENCIL_OP_DECREMENT_AND_WRAP decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

26.9. Depth Test

The depth test compares the depth value \( z_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against the sample’s depth value \(z_f\). If there is no depth attachment then the depth test is skipped.

The depth test occurs in three stages, as detailed in the following sections.

26.9.1. Depth Clamping and Range Adjustment

If \( \text{VkPipelineRasterizationStateCreateInfo}::\text{depthClampEnable} \) is enabled, \( z_f \) is clamped to \([z_{\text{min}}, z_{\text{max}}]\), where \( z_{\text{min}} = \min(n, f) \) and \( z_{\text{max}} = \max(n, f) \), and \( n \) and \( f \) are the \text{minDepth} and \text{maxDepth} depth range values of the viewport used by this fragment, respectively.

Following depth clamping:

- If \( z_f \) is not in the range \([z_{\text{min}}, z_{\text{max}}]\), then \( z_f \) is undefined following this step.

26.9.2. Depth Comparison

If the depth test is not enabled, as specified by \( \text{vkCmdSetDepthTestEnable} \) or \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{depthTestEnable} \), then this step is skipped.

The comparison operation performed is determined by the \( \text{VkCompareOp} \) value set by \( \text{vkCmdSetDepthCompareOp} \), or by \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{depthCompareOp} \) during pipeline creation. \( z_f \) and \( z_a \) are used as the reference and test values, respectively, in the operation specified by the \( \text{VkCompareOp} \).

If the comparison evaluates to false, the coverage for the sample is set to 0.

26.9.3. Depth Attachment Writes

If depth writes are enabled, as specified by \( \text{vkCmdSetDepthWriteEnable} \) or \( \text{VkPipelineDepthStencilStateCreateInfo}::\text{depthWriteEnable} \), and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample’s depth value \( z_f \). If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:
or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following **must** be true:
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetDepthTestEnable-videoencoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To dynamically set the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthCompareOp-None-08971
  At least one of the following must be true:
  - the shaderObject feature is enabled
the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter
  `depthCompareOp` must be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthCompareOp-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthWriteEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_shader_object
```
```c
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthWriteEnable-None-08971**
  At least one of the following **must** be true:
  - the shaderObject feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetDepthWriteEnable-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
26.10. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, sample mask, alpha to coverage, stencil, and depth tests.

26.11. Coverage Reduction

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

26.11.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of \( \text{rasterizationSamples} \) unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel’s coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index \( i \).

26.11.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

The number of \( \text{rasterizationSamples} \) is identical to the number of samples in the color attachments. A color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered.
Chapter 27. The Framebuffer

27.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
• The **flags** member is reserved for future use.

• The **logicOpEnable** member controls whether to apply logical **Logical Operations**.

• The **logicOp** member selects which logical operation to apply.

• The **attachmentCount** member is the number of **VkPipelineColorBlendAttachmentState** elements in the **pAttachments** array. It is ignored if the pipeline is created with **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set, and either **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** set or the **advancedBlendCoherentOperations** member is not enabled on the device.

• The **pAttachments** member is a pointer to an array of **VkPipelineColorBlendAttachmentState** structures defining blend state for each color attachment. It is ignored if the pipeline is created with **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set, and either **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** set or the **advancedBlendCoherentOperations** member is not enabled on the device.

• The **blendConstants** member is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the **independentBlend** feature is not enabled, all elements of **pAttachments** must be identical.

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the **logicOp** feature is not enabled, **logicOpEnable** must be **VK_FALSE**.

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is **VK_TRUE**, **logicOp** must be a valid **VkLogicOp** value.

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**
  If **attachmentCount** is not 0, and any of **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, or **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** are not set, **pAttachments** must be a valid pointer to an array of **attachmentCount** valid **VkPipelineColorBlendAttachmentState** structures.

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO**.

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  **pNext** must be **NULL**.

- **VUID-VkPipelineColorBlendStateCreateInfo-flags-zerobitmask**
  **flags** must be 0.

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter**
  **1499**
If `attachmentCount` is not 0, and `pAttachments` is not NULL, `pAttachments` must be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineColorBlendAttachmentState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- `srcColorBlendFactor` selects which blend factor is used to determine the source factors \(S_r,S_g,S_b\).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors \(D_r,D_g,D_b\).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor \(S_a\).
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor \(D_a\).
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.
- `colorWriteMask` is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

**Valid Usage**

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
  If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` must not be
VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610**
  If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-00611**
  If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04454**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

- **VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

**Valid Usage (Implicit)**

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter**
  srcColorBlendFactor must be a valid VkBlendFactor value

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter**
  dstColorBlendFactor must be a valid VkBlendFactor value

- **VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter**
  colorBlendOp must be a valid VkBlendOp value

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter**
  srcAlphaBlendFactor must be a valid VkBlendFactor value

- **VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter**
  dstAlphaBlendFactor must be a valid VkBlendFactor value

- **VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter**
  alphaBlendOp must be a valid VkBlendOp value

- **VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter**
  colorWriteMask must be a valid combination of VkColorComponentFlagBits values
To **dynamically set** `blendEnable`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,  // The first color attachment the color blending enable applies.
    uint32_t attachmentCount,  // The number of color blending enables in the pColorBlendEnables array.
    const VkBool32* pColorBlendEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blending enable applies.
- `attachmentCount` the number of color blending enables in the `pColorBlendEnables` array.
- `pColorBlendEnables` an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::blendEnable` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetColorBlendEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter `pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorBlendEnableEXT-videocoding This command **must** only be called outside of a video coding scope
VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength
attachmentCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set color blend factors and operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blend factors and operations apply to.
- `attachmentCount` the number of `VkColorBlendEquationEXT` elements in the `pColorBlendEquations` array.
- `pColorBlendEquations` an array of `VkColorBlendEquationEXT` structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::srcColorBlendFactor`, `VkPipelineColorBlendAttachmentState::dstColorBlendFactor`, `VkPipelineColorBlendAttachmentState::colorBlendOp`, `VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor`, `VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor`, and `VkPipelineColorBlendAttachmentState::alphaBlendOp` values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetColorBlendEquationEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3ColorBlendEquation` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` must be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  `attachmentCount` must be greater than 0

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

The `VkColorBlendEquationEXT` structure is defined as:
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object

typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;

• *srcColorBlendFactor* selects which blend factor is used to determine the source factors \((S_r, S_g, S_b)\).

• *dstColorBlendFactor* selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).

• *colorBlendOp* selects which blend operation is used to calculate the RGB values to write to the color attachment.

• *srcAlphaBlendFactor* selects which blend factor is used to determine the source factor \(S_a\).

• *dstAlphaBlendFactor* selects which blend factor is used to determine the destination factor \(D_a\).

• *alphaBlendOp* selects which blend operation is used to calculate the alpha values to write to the color attachment.

### Valid Usage

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07357**
  If the *dualSrcBlend* feature is not enabled, *srcColorBlendFactor* must not be
  \(VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA\)

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07358**
  If the *dualSrcBlend* feature is not enabled, *dstColorBlendFactor* must not be
  \(VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA\)

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07359**
  If the *dualSrcBlend* feature is not enabled, *srcAlphaBlendFactor* must not be
  \(VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA\)

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07360**
  If the *dualSrcBlend* feature is not enabled, *dstAlphaBlendFactor* must not be
  \(VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA\)

- **VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362**
  If the *VK_KHR_portability_subset* extension is enabled, and
  *VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors* is
  \(VK_FALSE\), *srcColorBlendFactor* must not be \(VK_BLEND_FACTOR_CONSTANT_ALPHA\) or
  \(VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA\)
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

### Valid Usage (Implicit)

- **VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter**
  - `srcColorBlendFactor` must be a valid `VkBlendFactor` value.

- **VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter**
  - `dstColorBlendFactor` must be a valid `VkBlendFactor` value.

- **VUID-VkColorBlendEquationEXT-colorBlendOp-parameter**
  - `colorBlendOp` must be a valid `VkBlendOp` value.

- **VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter**
  - `srcAlphaBlendFactor` must be a valid `VkBlendFactor` value.

- **VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter**
  - `dstAlphaBlendFactor` must be a valid `VkBlendFactor` value.

- **VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter**
  - `alphaBlendOp` must be a valid `VkBlendOp` value.

To **dynamically set** the color write masks, call:

```c
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of `VkColorComponentFlags` values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of `VkColorComponentFlags` values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.
Formats with bits that are shared between components specified by VkColorComponentFlagBits, such as VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, cannot have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.

### Valid Usage

- **VUID-vkCmdSetColorWriteMaskEXT-None-09423**
  At least one of the following must be true:
  - The extendedDynamicState3ColorWriteMask feature is enabled
  - The shaderObject feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid VkCommandBuffer handle

- **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter**
  `pColorWriteMasks` must be a valid pointer to an array of `attachmentCount` valid combinations of VkColorComponentFlagBits values

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool**
  The VkCommandPool that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetColorWriteMaskEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength**
  `attachmentCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the VkCommandPool that `commandBuffer` was allocated from must be externally synchronized
27.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors ((S_{r0}, S_{g0}, S_{b0})) or ((D_{r}, D_{g}, D_{b}))</th>
<th>Alpha Blend Factor ((S_{a0}))</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_FACTOR_ZERO</td>
<td>((0,0,0))</td>
<td>0</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE</td>
<td>((1,1,1))</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_COLOR</td>
<td>((R_{s0}, G_{s0}, B_{s0}))</td>
<td>(A_{s0})</td>
</tr>

</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0},G_{s0},B_{s0}\) and \(A_{s0}\) represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.

- \(R_{s1},G_{s1},B_{s1}\) and \(A_{s1}\) represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

- \(R_{d},G_{d},B_{d}\) and \(A_{d}\) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

- \(R_{c},G_{c},B_{c}\) and \(A_{c}\) represent the blend constant R, G, B, and A components, respectively.

To **dynamically set and change** the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the R<sub>c</sub>, G<sub>c</sub>, B<sub>c</sub>, and A<sub>c</sub> components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetBlendConstants-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

### 27.1.2. Dual-Source Blending

Blend factors that use the secondary color input (R<sub>s1</sub>,G<sub>s1</sub>,B<sub>s1</sub>,A<sub>s1</sub>) (`VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the `dualSrcBlend` feature is enabled.
The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the `maxFragmentDualSrcAttachments` member of `VkPhysicalDeviceLimits`.

Color outputs can be bound to the first and second inputs of the blender using the `Index` decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.

### 27.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of `VkBlendOp`, specifying the operations, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,
} VkBlendOp;
```
The semantics of the basic blend operations are described in the table below:

### Table 34. Basic Blend Operations

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
</table>
| VK_BLEND_OP_ADD            | R = R_s0 × S_r + R_d × D_r  
                           | G = G_s0 × S_g + G_d × D_g  
                           | B = B_s0 × S_b + B_d × D_b | A = A_s0 × S_a + A_d × D_a |
| VK_BLEND_OP_SUBTRACT       | R = R_s0 × S_r - R_d × D_r  
                           | G = G_s0 × S_g - G_d × D_g  
                           | B = B_s0 × S_b - B_d × D_b | A = A_s0 × S_a - A_d × D_a |
| VK_BLEND_OP_REVERSE_SUBTRACT | R = R_d × D_r - R_s0 × S_r  
                           | G = G_d × D_g - G_s0 × S_g  
                           | B = B_d × D_b - B_s0 × S_b | A = A_d × D_a - A_s0 × S_a |
| VK_BLEND_OP_MIN            | R = min(R_s0, R_d)  
                           | G = min(G_s0, G_d)  
                           | B = min(B_s0, B_d) | A = min(A_s0, A_d) |
| VK_BLEND_OP_MAX            | R = max(R_s0, R_d)  
                           | G = max(G_s0, G_d)  
                           | B = max(B_s0, B_d) | A = max(A_s0, A_d) |

In this table, the following conventions are used:

- R_s0, G_s0, B_s0 and A_s0 represent the first source color R, G, B, and A components, respectively.
- R_d, G_d, B_d and A_d represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- S_r, S_g, S_b and S_a represent the source blend factor R, G, B, and A components, respectively.
- D_r, D_g, D_b and D_a represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned R_s0, G_s0, B_s0 and A_s0, respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to [0,1] or [-1,1] respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format Specification.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting \(c\) values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is `VK_ATTACHMENT_UNUSED`, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the `VkSubpassDescription::colorAttachmentCount` or `VkSubpassDescription2::colorAttachmentCount` value.

### 27.2. Logical Operations

The application can enable a logical operation between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp
{
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
};
```
} VkLogicOp;
The logical operations supported by Vulkan are summarized in the following table in which

- \( \neg \) is bitwise invert,
- \( \& \) is bitwise and,
- \( \lor \) is bitwise or,
- \( \oplus \) is bitwise exclusive or,
- \( s \) is the fragment's \( R_{s0}, G_{s0}, B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment's \( R, G, B \) or \( A \) component value:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_LOGIC_OP_CLEAR</td>
<td>0</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND</td>
<td>( s \land d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND_REVERSE</td>
<td>( s \land \neg d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_COPY</td>
<td>( s )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_AND_INVERTED</td>
<td>( \neg s \land d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_NO_OP</td>
<td>( d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_XOR</td>
<td>( s \land d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_OR</td>
<td>( s \land d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_NOR</td>
<td>( \neg (s \land d) )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_EQUIVALENT</td>
<td>( \neg (s \land d) )</td>

<tr>
<td>VK_LOGIC_OP_INVERT</td>
<td>( \neg d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_OR_REVERSE</td>
<td>( s \land \neg d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_COPY_INVERTED</td>
<td>( \neg s )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_OR_INVERTED</td>
<td>( \neg s \land d )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_NAND</td>
<td>( \neg (s \land d) )</td>
</tr>
<tr>
<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **logicOpEnable** specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineColorBlendStateCreateInfo::logicOpEnable** value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLogicOpEnableEXT-None-09423**
  At least one of the following must be true:
  - The **extendedDynamicState3LogicOpEnable** feature is enabled
  - The **shaderObject** feature is enabled

- **VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366**
  If the **logicOp** feature is not enabled, **logicOpEnable** must be **VK_FALSE**

### Valid Usage (Implicit)

- **VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording**
  **commandBuffer** must be in the **recording state**

- **VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool**
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations

- **VUID-vkCmdSetLogicOpEnableEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized
To **dynamically set** the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_shader_object
define void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer, 
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using shader objects. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
  At least one of the following **must** be true:
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid `VkLogicOp` value

- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdSetLogicOpEXT-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

27.3. Color Write Mask

Bits which can be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- `VK_COLOR_COMPONENT_R_BIT` specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_G_BIT` specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_B_BIT` specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- `VK_COLOR_COMPONENT_A_BIT` specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

```cpp
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

`VkColorComponentFlags` is a bitmask type for setting a mask of zero or more `VkColorComponentFlagBits`.
Chapter 28. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDispatch-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatch-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatch-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by a bound shader.

If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline.
bind point used by this command

- **VUID-vkCmdDispatch-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatch-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDispatch-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDispatch-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatch-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatch-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatch-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatch-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
If the \textit{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, any resource accessed by \textbf{bound shaders} \textbf{must} not be a protected resource.

If a \texttt{bound shader} accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables \texttt{sampler Y’C’ \_C’R conversion}, that object \textbf{must} only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions.

If a \texttt{VkImageView} is accessed as a result of this command, then the image view’s \texttt{viewType} \textbf{must} match the \texttt{Dim} operand of the \texttt{OpTypeImage} as described in \texttt{Instruction/Sampler/Image View Validation}.

If a \texttt{VkImageView} is accessed as a result of this command, then the numeric type of the image view’s \texttt{format} and the \texttt{Sampled Type} operand of the \texttt{OpTypeImage} \textbf{must} match.

If a \texttt{VkImageView} created with a format other than \texttt{VK_FORMAT_A8_UNORM_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the image view’s \texttt{format}.

If a \texttt{VkImageView} created with the format \texttt{VK_FORMAT_A8_UNORM_KHR} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have four components.

If a \texttt{VkBufferView} is accessed using \texttt{OpImageWrite} as a result of this command, then the \texttt{Type} of the \texttt{Texel} operand of that instruction \textbf{must} have at least as many components as the buffer view’s \texttt{format}.

Any shader invocation executed by this command \textbf{must} terminate.

If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, any resource written to by the \texttt{VkPipeline} object bound to the pipeline bind point used by this command \textbf{must} not be an unprotected resource.

If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, pipeline stages other than the framebuffer-space and compute stages in the \texttt{VkPipeline}.
object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDispatch-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatch-groupCountX-00386
groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatch-groupCountY-00387
groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatch-groupCountZ-00388
groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatch-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatch-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatch-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

Valid Usage

- VUID-vkCmdDispatchIndirect-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchIndirect-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchIndirect-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDispatchIndirect-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDispatchIndirect-None-07888
If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT.

- VUID-vkCmdDispatchIndirect-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDispatchIndirect-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDispatchIndirect-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDispatchIndirect-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDispatchIndirect-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatchIndirect-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatchIndirect-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDispatchIndirect-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by a bound shader.

- VUID-vkCmdDispatchIndirect-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.
If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-commandBuffer-02707**
  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders **must** not be a protected resource.

- **VUID-vkCmdDispatchIndirect-ConstOffset-06550**
  
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y'C aC conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDispatchIndirect-viewType-07752**
  
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDispatchIndirect-format-07753**
  
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08795**
  
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format.

- **VUID-vkCmdDispatchIndirect-OpImageWrite-08796**
  
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

- **VUID-vkCmdDispatchIndirect-Offset-02710**
  
  Any shader invocation executed by this command **must** terminate.

- **VUID-vkCmdDispatchIndirect-buffer-02708**
  
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDispatchIndirect-buffer-02709**
  
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDispatchIndirect-offset-02710**
  
  `offset` **must** be a multiple of 4.
• VUID-vkCmdDispatchIndirect-commandBuffer-02711
  commandBuffer **must** not be a protected command buffer

• VUID-vkCmdDispatchIndirect-offset-00407
  The sum of `offset` and the size of `VkDispatchIndirectCommand` **must** be less than or equal to the size of `buffer`

### Valid Usage (Implicit)

• VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdDispatchIndirect-buffer-parameter
  `buffer` **must** be a valid `VkBuffer` handle

• VUID-vkCmdDispatchIndirect-commandBuffer-recording
  `commandBuffer` **must** be in the `recording` state

• VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

• VUID-vkCmdDispatchIndirect-renderpass
  This command **must** only be called outside of a render pass instance

• VUID-vkCmdDispatchIndirect-videocoding
  This command **must** only be called outside of a video coding scope

• VUID-vkCmdDispatchIndirect-commonparent
  Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

The `VkDispatchIndirectCommand` structure is defined as:
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;

- x is the number of local workgroups to dispatch in the X dimension.
- y is the number of local workgroups to dispatch in the Y dimension.
- z is the number of local workgroups to dispatch in the Z dimension.

The members of VkDispatchIndirectCommand have the same meaning as the corresponding parameters of vkCmdDispatch.

Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  x must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-VkDispatchIndirectCommand-y-00418
  y must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-VkDispatchIndirectCommand-z-00419
  z must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```
uint32_t groupCountY,
uint32_t groupCountZ);

• commandBuffer is the command buffer into which the command will be recorded.
• baseGroupX is the start value for the X component of WorkgroupId.
• baseGroupY is the start value for the Y component of WorkgroupId.
• baseGroupZ is the start value for the Z component of WorkgroupId.
• groupCountX is the number of local workgroups to dispatch in the X dimension.
• groupCountY is the number of local workgroups to dispatch in the Y dimension.
• groupCountZ is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of groupCountX × groupCountY × groupCountZ local workgroups is assembled, with WorkgroupId values ranging from (baseGroup*, baseGroup* + groupCount*) in each component. vkCmdDispatch is equivalent to vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ).

**Valid Usage**

• VUID-vkCmdDispatchBase-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDispatchBase-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDispatchBase-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdDispatchBase-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDispatchBase-OpTypeImage-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

• VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

1530
• VUID-vkCmdDispatchBase-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the 
OpTypeImage is Unknown, the view’s format features must contain 
VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchBase-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format 
field of the OpTypeImage is Unknown, the view’s buffer features must contain 
VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchBase-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of 
the OpTypeImage is Unknown then the view’s buffer features must contain 
VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDispatchBase-None-08600
For each set n that is statically used by a bound shader, a descriptor set must have been 
bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for 
set n, with the VkPipelineLayout used to create the current VkPipeline or the 
VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in 
Pipeline Layout Compatibility

• VUID-vkCmdDispatchBase-None-08601
For each push constant that is statically used by a bound shader, a push constant value 
must have been set for the same pipeline bind point, with a VkPipelineLayout that is 
compatible for push constants, with the VkPipelineLayout used to create the current 
VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in 
Pipeline Layout Compatibility

• VUID-vkCmdDispatchBase-maintenance4-08602
If the maintenance4 feature is not enabled, then for each push constant that is statically 
used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is 
compatible for push constants, with the VkPipelineLayout used to create the current 
VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in 
Pipeline Layout Compatibility

• VUID-vkCmdDispatchBase-None-08114
Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be 
valid as described by descriptor validity if they are statically used by a bound shader

• VUID-vkCmdDispatchBase-None-08606
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline 
bind point used by this command

• VUID-vkCmd DispatchBase-None-08608
If a pipeline is bound to the pipeline bind point used by this command, there must not 
have been any calls to dynamic state setting commands for any state not specified as 
dynamic in the VkPipeline object bound to the pipeline bind point used by this command, 
since that pipeline was bound

• VUID-vkCmdDispatchBase-None-08609
If the VkPipeline object bound to the pipeline bind point used by this command or any
**VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used to sample from any **VkImage** with a **VkImageView** of the type **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, **VK_IMAGE_VIEW_TYPE_1D_ARRAY**, **VK_IMAGE_VIEW_TYPE_2D_ARRAY** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**, in any shader stage

- **VUID-vkCmdDispatchBase-None-08610**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V **OpImageSample*** or **OpImageSparseSample*** instructions with **ImplicitLod**, **Dref** or **Proj** in their name, in any shader stage

- **VUID-vkCmdDispatchBase-None-08611**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V **OpImageSample*** or **OpImageSparseSample*** instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatchBase-None-08607**
  If the **shaderObject** is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and **VK_NULL_HANDLE** shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-uniformBuffers-06935**
  If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08612**
  If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-storageBuffers-06936**
  If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08613**
  If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource
If a bound shader accesses a VkSampler or VkImageView object that enables Y'CBCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

If a bound shader accesses a VkSampler or VkImageView object that enables Y'CBCr conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

Any shader invocation executed by this command must terminate.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource.

If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer.

baseGroupX must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0].
• VUID-vkCmdDispatchBase-baseGroupX-00422
  baseGroupY must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

• VUID-vkCmdDispatchBase-baseGroupZ-00423
  baseGroupZ must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

• VUID-vkCmdDispatchBase-groupCountX-00424
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] minus baseGroupX

• VUID-vkCmdDispatchBase-groupCountY-00425
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] minus baseGroupY

• VUID-vkCmdDispatchBase-groupCountZ-00426
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ

• VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of baseGroupX, baseGroupY, or baseGroupZ are not zero, then the bound compute pipeline must have been created with the VK_PIPELINE_CREATE_DISPATCH_BASE flag

---

**Valid Usage (Implicit)**

• VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatchBase-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchBase-videocoding
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 29. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

29.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  - A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:
  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

- The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

  Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

  See Sparse Memory Aliasing for more information.

### 29.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource **must** be bound to one or more `VkDeviceMemory` objects before use.

### 29.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 29.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 29.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the **mip tail**) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications **can** use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application **can** unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application **can** also use this functionality to access subregions of the image in a “megatexture” fashion. The application **can** create a large image and only populate the region of the image that is currently being used in the scene.

### 29.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered **safe** and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory **may** still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of `1.0f`.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

### Implementor’s Note

For implementations that **cannot** natively handle access to unbound regions of a resource, the implementation **may** allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations **may** use the same physical memory for all unbound regions of multiple resources within the same process.

#### 29.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image **can** be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource **must** start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a *mip tail region*.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image’s `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` **may** affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. **must** be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and **may** be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation **may** choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` in `VkSparseImageMemoryRequirements::flags`.

The following diagrams depict how `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` alter memory usage and requirements.

![Figure 17. Sparse Image](image)

In the absence of `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions **can** be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks **must** still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

**Figure 18. Sparse Image with Single Mip Tail**

**Figure 19. Sparse Image with Aligned Mip Size**

**Note**
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \( N \) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 20. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

\textbf{Note}

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} and \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} are present the constraints from each of these flags are in effect.

### 29.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. \texttt{VK\_FORMAT\_BC5\_UNORM\_BLOCK}), the texel size is the size of the compressed texel block (e.g. 128-bit for \texttt{BC5}) thus the dimensions of the standard sparse image block
shapes apply in terms of compressed texel blocks.

*Note*

For block-compressed formats, the dimensions of a sparse image block in terms of texels **can** be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.

<td>32 × 32 × 1</td>
</tr>
<tr>
<td>64-Bit</td>
<td>64 × 64 × 1</td>
<td>64 × 32 × 1</td>
<td>32 × 32 × 1</td>
<td>32 × 16 × 1</td>
</tr>
<tr>
<td>128-Bit</td>
<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

29.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
29.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 21. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.
per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by \( \text{VkMemoryRequirements}::\text{alignment} \).

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata must be bound prior to device use of the sparse image.

### 29.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

\( \text{VkDevice} \) objects that have the \( \text{sparseResidencyAliased} \) feature enabled are able to use the \( \text{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} \) and \( \text{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} \) flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care must be taken when performing a write operation to aliased physical memory. Memory dependencies must be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing must abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory must be created with the \( \text{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} / \text{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} \) flag.
- All resources that access aliased physical memory must interpret the memory in the same way. This implies the following:
  - Buffers and images cannot alias the same physical memory in a data consistent fashion. The physical memory ranges must be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions cannot access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory must have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory cannot be accessed in a data consistent fashion.
Note

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

29.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic sparseBinding feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages must be bound to physical memory before the device accesses the resource.

The sparseResidency features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault may support residencyNonResidentStrict.

Not faulting on access to unbound pages is not enough to support residencyNonResidentStrict. An implementation must also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this may not always be possible.

Any implementation that does not fault, but does not guarantee correct read values must not support residencyNonResidentStrict.

Any implementation that cannot access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory may be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process must not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations may allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in VkMemoryRequirements::size must be greater than or equal to the amount of physical memory required to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

  Note

  If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

  Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
29.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

29.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features must be supported and enabled on the `VkDevice` object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

**Sparse Physical Device Features**

- **sparseBinding**: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.

- **sparseResidencyBuffer**: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.

- **sparseResidencyImage2D**: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidencyImage3D**: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidency2Samples**: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidency4Samples**: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidency8Samples**: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidency16Samples**: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **sparseResidencyAliased**: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

29.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is **VK_TRUE** if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyStandard2DMultisampleBlockShape` is **VK_TRUE** if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyStandard3DBlockShape` is **VK_TRUE** if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyAlignedMipSize` is **VK_TRUE** if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the flags member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- `residencyNonResidentStrict` specifies whether the physical device **can** consistently access non-resident regions of a resource. If this property is **VK_TRUE**, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
29.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
typedef VkFlags VkSparseImageFormatFlags;

VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice, 
    VkFormat format, 
    VkImageType type, 
    VkSampleCountFlagBits samples, 
    VkImageUsageFlags usage, 
    VkImageTiling tiling, 
    uint32_t* pPropertyCount, 
    VkSparseImageFormatProperties* pProperties);

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **format** is the image format.
- **type** is the dimensionality of the image.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be set to zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`.

### Valid Usage

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094
  
  samples must be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and `flags` equal to the value that is set in `VkImageCreateInfo`::`flags` when the image is created.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter
  
  physicalDevice must be a valid `VkPhysicalDevice` handle.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter
  
  format must be a valid `VkFormat` value.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter
  
  type must be a valid `VkImageType` value.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter
  
  samples must be a valid `VkSampleCountFlagBits` value.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter
  
  usage must be a valid combination of `VkImageUsageFlagBits` values.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitmask
  
  usage must not be 0.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter
  
  tiling must be a valid `VkImageTiling` value.

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter
  
  `pPropertyCount` must be a valid pointer to a `uint32_t` value.

  
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
void vkGetPhysicalDeviceSparseImageFormatProperties2(
    VkPhysicalDevice physicalDevice, 
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo, 
    uint32_t* pPropertyCount, 
    VkSparseImageFormatProperties2* pProperties);

or the equivalent command

void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo, 
    uint32_t* pPropertyCount, 
    VkSparseImageFormatProperties2* pProperties);

• physicalDevice is the physical device from which to query the sparse image format properties.
• pFormatInfo is a pointer to a VkPhysicalDeviceSparseImageFormatInfo2 structure containing input parameters to the command.
• pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
• pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties2 structures.

vkGetPhysicalDeviceSparseImageFormatProperties2 behaves identically to vkGetPhysicalDeviceSparseImageFormatProperties, with the ability to return extended information by adding extending structures to the pNext chain of its pProperties parameter.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter pFormatInfo must be a valid pointer to a valid VkPhysicalDeviceSparseImageFormatInfo2 structure
• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
• VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties2 structures

The VkPhysicalDeviceSparseImageFormatInfo2 structure is defined as:
```
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;
```

or the equivalent

```
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceSparseImageFormatInfo2
    VkPhysicalDeviceSparseImageFormatInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the image format.
- **type** is the dimensionality of the image.
- **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.

### Valid Usage

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095**
  
  `samples` **must** be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and `flags` equal to the value that is set in `VkImageCreateInfo::flags` when the image is created.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext**
  
  `pNext` **must** be `NULL`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter**
  
  `format` **must** be a valid `VkFormat` value
• VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter
type must be a valid VkImageType value

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
samples must be a valid VkSampleCountFlagBits value

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
usage must be a valid combination of VkImageUsageFlagBits values

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
usage must not be 0

• VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
tiling must be a valid VkImageTiling value

The VkSparseImageFormatProperties2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• properties is a VkSparseImageFormatProperties structure which is populated with the same values as in vkGetPhysicalDeviceSparseImageFormatProperties.

Valid Usage (Implicit)

• VUID-VkSparseImageFormatProperties2-sType-sType
sType must be VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2

• VUID-VkSparseImageFormatProperties2-pNext-pNext
pNext must be NULL

29.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the VkPhysicalDeviceFeatures structure described previously in the Physical Device Features section) when calling vkCreateDevice. When the appropriate device features are enabled, the
VK_BUFFER_CREATE_SPARSE_* and VK_IMAGE_CREATE_SPARSE_* flags can be used. See vkCreateBuffer and vkCreateImage for details of the resource creation APIs.

Note
Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate _SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

29.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the bindable sparse block size in bytes and required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• formatProperties is a VkSparseImageFormatProperties structure specifying properties of the image format.

• imageMipTailFirstLod is the first mip level at which image subresources are included in the mip tail region.

• imageMipTailSize is the memory size (in bytes) of the mip tail region. If formatProperties.flags contains VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• imageMipTailOffset is the opaque memory offset used with VkSparseImageOpaqueMemoryBindInfo to bind the mip tail region(s).

• imageMipTailStride is the offset stride between each array-layer’s mip tail, if formatProperties.flags does not contain VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void_vkGetImageSparseMemoryRequirements(
    VkDevice device,
    VkImage image,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

• device is the logical device that owns the image.

• image is the VkImage object to get the memory requirements for.

• pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• pSparseMemoryRequirements is either NULL or a pointer to an array of VkSparseImageMemoryRequirements structures.

If pSparseMemoryRequirements is NULL, then the number of sparse memory requirements available is returned in pSparseMemoryRequirementCount. Otherwise, pSparseMemoryRequirementCount must point to a variable set by the user to the number of elements in the pSparseMemoryRequirements array, and on return the variable is overwritten with the number of structures actually written to pSparseMemoryRequirements. If pSparseMemoryRequirementCount is less than the number of sparse memory requirements available, at most pSparseMemoryRequirementCount structures will be written.

If the image was not created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT then pSparseMemoryRequirementCount will be set to zero and pSparseMemoryRequirements will not be written to.

Note
It is legal for an implementation to report a larger value in `VkMemoryRequirements ::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. This may occur when the implementation requires unused padding in the address range describing the resource.

### Valid Usage (Implicit)

- **VUID-vkGetImageSparseMemoryRequirements-device-parameter**
  - `device` **must** be a valid `VkDevice` handle
- **VUID-vkGetImageSparseMemoryRequirements-image-parameter**
  - `image` **must** be a valid `VkImage` handle
- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter**
  - `pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value
- **VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter**
  - If the value referenced by `pSparseMemoryRequirementCount` is not `0`, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements` structures
- **VUID-vkGetImageSparseMemoryRequirements-image-parent**
  - `image` **must** have been created, allocated, or retrieved from `device`

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
  VkDevice device,
  const VkImageSparseMemoryRequirementsInfo2* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
  VkDevice device,
  const VkImageSparseMemoryRequirementsInfo2* pInfo,
  uint32_t* pSparseMemoryRequirementCount,
  VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `pInfo` is a pointer to a `VkImageSparseMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
**pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

**pSparseMemoryRequirements** is either **NULL** or a pointer to an array of **VkSparseImageMemoryRequirements2** structures.

### Valid Usage (Implicit)

- **VUID-vkGetImageSparseMemoryRequirements2-device-parameter**
  
  **device** must be a valid **VkDevice** handle

- **VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter**
  
  **pInfo** must be a valid pointer to a valid **VkImageSparseMemoryRequirementsInfo2** structure

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter**
  
  **pSparseMemoryRequirementCount** must be a valid pointer to a uint32_t value

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter**
  
  If the value referenced by **pSparseMemoryRequirementCount** is not 0, and **pSparseMemoryRequirements** is not **NULL**, **pSparseMemoryRequirements** must be a valid pointer to an array of **pSparseMemoryRequirementCount** **VkSparseImageMemoryRequirements2** structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(  
    VkDevice device,  
    const VkDeviceImageMemoryRequirements* pInfo,  
    uint32_t* pSparseMemoryRequirementCount,  
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(  
    VkDevice device,  
    const VkDeviceImageMemoryRequirements* pInfo,  
    uint32_t* pSparseMemoryRequirementCount,  
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device intended to own the image.

- **pInfo** is a pointer to a **VkDeviceImageMemoryRequirements** structure containing parameters required for the memory requirements query.
• **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• **pSparseMemoryRequirements** is either **NULL** or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

### Valid Usage (Implicit)

- VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter
  - `pInfo` **must** be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure

- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
  - `pSparseMemoryRequirementCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
  - If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not **NULL**, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures

The `VkImageSparseMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **image** is the image to query.

### Valid Usage (Implicit)

- VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`

- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
  `pNext` must be `NULL`

#### 29.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.
Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit. Applications **must** use synchronization primitives to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**
Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations may include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations may only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use synchronization primitives to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind::flags` field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

\[
\text{arrayMipTailOffset} = \text{imageMipTailOffset} + \text{arrayLayer} \times \text{imageMipTailStride};
\]

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
} VkSparseMemoryBind;
```
VkDeviceMemory memory;
VkDeviceSize memoryOffset;
VkSparseMemoryBindFlags flags;
}

VkSparseMemoryBind

- resourceOffset is the offset into the resource.
- size is the size of the memory region to be bound.
- memory is the VkDeviceMemory object that the range of the resource is bound to. If memory is VK_NULL_HANDLE, the range is unbound.
- memoryOffset is the offset into the VkDeviceMemory object to bind the resource range to. If memory is VK_NULL_HANDLE, this value is ignored.
- flags is a bitmask of VkSparseMemoryBindFlagBits specifying usage of the binding operation.

The binding range \([\text{resourceOffset}, \text{resourceOffset} + \text{size}]\) has different constraints based on flags. If flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

\[
\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})
\]

\[
\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n
\]

and imageMipTailOffset, imageMipTailSize, and imageMipTailStride values are from the VkSparseImageMemoryRequirements corresponding to the metadata aspect of the image, and \(n\) is a valid array layer index for the image,

imageMipTailStride is considered to be zero for aspects where VkSparseImageMemoryRequirements::formatProperties.flags contains VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT.

If flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range must be within the range \([0, \text{VkMemoryRequirements::size}]\).

**Valid Usage**

- VUID-VkSparseMemoryBind-memory-01096
  If memory is not VK_NULL_HANDLE, memory and memoryOffset must match the memory requirements of the resource, as described in section Resource Memory Association

- VUID-VkSparseMemoryBind-resourceOffset-09491
  If the resource being bound is a VkBuffer, resourceOffset and memoryOffset must be an integer multiple of the alignment of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with the buffer resource

- VUID-VkSparseMemoryBind-resourceOffset-09492
  If the resource being bound is a VkImage, resourceOffset and memoryOffset must be an integer multiple of the alignment of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements with the image resource
If memory is not VK_NULL_HANDLE, memory must not have been created with a memory

type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.

If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in

VkExternalMemoryBufferCreateInfo::handleTypes or

VkExternalMemoryImageCreateInfo::handleTypes when the resource was created.

If memory was created by a memory import operation, the external handle type of the

imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes or

VkExternalMemoryImageCreateInfo::handleTypes when the resource was created.

Valid Usage (Implicit)

If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle.

flags must be a valid combination of VkSparseMemoryBindFlagBits values.

Bits which can be set in VkSparseMemoryBind::flags, specifying usage of a sparse memory binding

operation, are:

```c
#define VK_SPARSE_MEMORY_BIND_METADATA_BIT 0x00000001

typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

VK_SPARSE_MEMORY_BIND_METADATA_BIT specifies that the memory being bound is only for the

metadata aspect.
typedef VkFlags VkSparseMemoryBindFlags;

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag using the following structure:

typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;

- **buffer** is the VkBuffer object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  **buffer** must be a valid VkBuffer handle

- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
  **pBinds** must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  **bindCount** must be greater than 0

Memory is bound to opaque regions of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag using the following structure:

typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

- **image** is the VkImage object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.
Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the flags member of any element of pBinds contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range defined must be within the mip tail region of the metadata aspect of image.

Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  bindCount must be greater than 0

Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the resourceOffset is in the range \([0, \text{VkMemoryRequirements}::\text{size})\). This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the resourceOffset is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range specified must be within the mip tail region of the metadata aspect. In this case the resourceOffset is not required to be a simple device address offset within the resource. However, it is defined to be within \([\text{imageMipTailOffset}, \text{imageMipTailOffset} + \text{imageMipTailSize})\) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
```
VkImage
uint32_t bindCount;
const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;

- **image** is the *VkImage* object to be bound
- **bindCount** is the number of *VkSparseImageMemoryBind* structures in *pBinds* array
- **pBinds** is a pointer to an array of *VkSparseImageMemoryBind* structures

### Valid Usage

- **VUID-VkSparseImageMemoryBindInfo-subresource-01722**
  The *subresource.mipLevel* member of each element of *pBinds* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *image* was created
- **VUID-VkSparseImageMemoryBindInfo-subresource-01723**
  The *subresource.arrayLayer* member of each element of *pBinds* must be less than the *arrayLayers* specified in *VkImageCreateInfo* when *image* was created
- **VUID-VkSparseImageMemoryBindInfo-image-02901**
  *image* must have been created with *VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT* set

### Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBindInfo-image-parameter**
  *image* must be a valid *VkImage* handle
- **VUID-VkSparseImageMemoryBindInfo-pBinds-parameter**
  *pBinds* must be a valid pointer to an array of *bindCount* valid *VkSparseImageMemoryBind* structures
- **VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength**
  *bindCount* must be greater than 0

The *VkSparseImageMemoryBind* structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource    subresource;
    VkOffset3D            offset;
    VkExtent3D            extent;
    VkDeviceMemory        memory;
    VkDeviceSize          memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- **subresource** is the image *aspect* and region of interest in the image.
• **offset** are the coordinates of the first texel within the image subresource to bind.

  • **extent** is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of **offset + extent** equals the corresponding dimensions of the image subresource.

• **memory** is the VkDeviceMemory object that the sparse image blocks of the image are bound to. If **memory** is VK_NULL_HANDLE, the sparse image blocks are unbound.

• **memoryOffset** is an offset into VkDeviceMemory object. If **memory** is VK_NULL_HANDLE, this value is ignored.

• **flags** are sparse memory binding flags.

---

### Valid Usage

- **VUID-VkSparseImageMemoryBind-memory-01104**
  If the sparseResidencyAliased feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges

- **VUID-VkSparseImageMemoryBind-memory-01105**
  **memory** and **memoryOffset** **must** match the memory requirements of the calling command’s **image**, as described in section Resource Memory Association

- **VUID-VkSparseImageMemoryBind-subresource-01106**
  **subresource** **must** be a valid image subresource for **image** (see Image Views)

- **VUID-VkSparseImageMemoryBind-offset-01107**
  **offset.x** **must** be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of the image

- **VUID-VkSparseImageMemoryBind-extent-09388**
  **extent.width** **must** be greater than 0

- **VUID-VkSparseImageMemoryBind-extent-01108**
  **extent.width** **must** either be a multiple of the sparse image block width of the image, or else (**extent.width + offset.x**) **must** equal the width of the image subresource

- **VUID-VkSparseImageMemoryBind-offset-01109**
  **offset.y** **must** be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of the image

- **VUID-VkSparseImageMemoryBind-extent-09389**
  **extent.height** **must** be greater than 0

- **VUID-VkSparseImageMemoryBind-extent-01110**
  **extent.height** **must** either be a multiple of the sparse image block height of the image, or else (**extent.height + offset.y**) **must** equal the height of the image subresource

- **VUID-VkSparseImageMemoryBind-offset-01111**
  **offset.z** **must** be a multiple of the sparse image block depth (VkSparseImageFormatProperties::imageGranularity.depth) of the image

- **VUID-VkSparseImageMemoryBind-extent-09390**
extent.depth must be greater than 0

- VUID-VkSparseImageMemoryBind-extent-01112
  extent.depth must either be a multiple of the sparse image block depth of the image, or else (extent.depth + offset.z) must equal the depth of the image subresource

- VUID-VkSparseImageMemoryBind-memory-02732
  If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when the image was created

- VUID-VkSparseImageMemoryBind-memory-02733
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

Valid Usage (Implicit)

- VUID-VkSparseImageMemoryBind-subresource-parameter
  subresource must be a valid VkImageSubresource structure

- VUID-VkSparseImageMemoryBind-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-VkSparseImageMemoryBind-flags-parameter
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,         // queue is the queue that the sparse binding operations will be submitted to.
    uint32_t bindInfoCount, // bindInfoCount is the number of elements in the pBindInfo array.
    const VkBindSparseInfo* pBindInfo, // pBindInfo is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
    VkFence fence)          // fence is an optional handle to a fence to be signaled. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.
```

vkQueueBindSparse is a queue submission command, with each batch defined by an element of pBindInfo as a VkBindSparseInfo structure. Batches begin execution in the order they appear in pBindInfo, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a
range is to be bound to one allocation and offset and then to another allocation and offset, then the application **must** guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to `vkQueueBindSparse` causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

### Valid Usage

- **VUID-vkQueueBindSparse-fence-01113**  
  If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be unsignaled

- **VUID-vkQueueBindSparse-fence-01114**  
  If `fence` is not `VK_NULL_HANDLE`, `fence` **must** not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueBindSparse-pSignalSemaphores-01115**  
  Each element of the `pSignalSemaphores` member of each element of `pBindInfo` **must** be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueBindSparse-pWaitSemaphores-01116**  
  When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pBindInfo` executes on `queue`, there **must** be no other queues waiting on the same semaphore

- **VUID-vkQueueBindSparse-pWaitSemaphores-03245**  
  All elements of the `pWaitSemaphores` member of all elements of `pBindInfo` referring to a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` **must** reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends **must** have also been submitted for execution

### Valid Usage (Implicit)

- **VUID-vkQueueBindSparse-queue-parameter**  
  `queue` **must** be a valid `VkQueue` handle

- **VUID-vkQueueBindSparse-pBindInfo-parameter**  
  If `bindInfoCount` is not 0, `pBindInfo` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindSparseInfo` structures

- **VUID-vkQueueBindSparse-fence-parameter**  
  If `fence` is not `VK_NULL_HANDLE`, `fence` **must** be a valid `VkFence` handle

- **VUID-vkQueueBindSparse-queuetype**  
  The `queue` **must** support sparse binding operations

- **VUID-vkQueueBindSparse-commonparent**  
  Both of `fence`, and `queue` that are valid handles of non-ignored parameters **must** have
been created, allocated, or retrieved from the same \text{VkDevice}\n
### Host Synchronization

- Host access to \textit{queue} \textbf{must} be externally synchronized
- Host access to \textit{fence} \textbf{must} be externally synchronized

### Command Properties

<table>

<td>SPARSE_BINDING</td>
<td>-</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**

- \textbf{VK_SUCCESS}

**Failure**

- \textbf{VK_ERROR_OUT_OF_HOST_MEMORY}
- \textbf{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \textbf{VK_ERROR_DEVICE_LOST}

The \text{VkBindSparseInfo} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType             sType;
    const void*                 pNext;
    uint32_t                     waitSemaphoreCount;
    const VkSemaphore*           pWaitSemaphores;
    uint32_t                     pBufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t                     imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t                     imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t                     signalSemaphoreCount;
    const VkSemaphore*           pSignalSemaphores;
} VkBindSparseInfo;
```

- \textit{sType} is a \text{VkStructureType} value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.

• **pWaitSemaphores** is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.

• **bufferBindCount** is the number of sparse buffer bindings to perform in the batch.

• **pBufferBinds** is a pointer to an array of VkSparseBufferMemoryBindInfo structures.

• **imageOpaqueBindCount** is the number of opaque sparse image bindings to perform.

• **pImageOpaqueBinds** is a pointer to an array of VkSparseImageOpaqueMemoryBindInfo structures, indicating opaque sparse image bindings to perform.

• **imageBindCount** is the number of sparse image bindings to perform.

• **pImageBinds** is a pointer to an array of VkSparseImageMemoryBindInfo structures, indicating sparse image bindings to perform.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.

• **pSignalSemaphores** is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

---

**Valid Usage**

- **VUID-VkBindSparseInfo-pWaitSemaphores-03246**
  If any element of **pWaitSemaphores** or **pSignalSemaphores** was created with a **VkSemaphoreType** of VK_SEMAPHORE_TYPE_TIMELINE then the **pNext** chain **must** include a **VkTimelineSemaphoreSubmitInfo** structure

- **VUID-VkBindSparseInfo-pNext-03247**
  If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pWaitSemaphores** was created with a **VkSemaphoreType** of VK_SEMAPHORE_TYPE_TIMELINE then its **waitSemaphoreValueCount** member **must** equal **waitSemaphoreCount**

- **VUID-VkBindSparseInfo-pNext-03248**
  If the **pNext** chain of this structure includes a **VkTimelineSemaphoreSubmitInfo** structure and any element of **pSignalSemaphores** was created with a **VkSemaphoreType** of VK_SEMAPHORE_TYPE_TIMELINE then its **signalSemaphoreValueCount** member **must** equal **signalSemaphoreCount**

- **VUID-VkBindSparseInfo-pSignalSemaphores-03249**
  For each element of **pSignalSemaphores** created with a **VkSemaphoreType** of VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of **VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues** **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed
For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

Valid Usage (Implicit)

- **VUID-VkBindSparseInfo-sType-sType**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkBindSparseInfo-pWaitSemaphores-parameter**
  
  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` must be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles.

- **VUID-VkBindSparseInfo-pBufferBinds-parameter**
  
  If `bufferBindCount` is not 0, `pBufferBinds` must be a valid pointer to an array of `bufferBindCount` valid `VkSparseBufferMemoryBindInfo` structures.

- **VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter**
  
  If `imageOpaqueBindCount` is not 0, `pImageOpaqueBinds` must be a valid pointer to an array of `imageOpaqueBindCount` valid `VkSparseImageOpaqueMemoryBindInfo` structures.

- **VUID-VkBindSparseInfo-pImageBinds-parameter**
  
  If `imageBindCount` is not 0, `pImageBinds` must be a valid pointer to an array of `imageBindCount` valid `VkSparseImageMemoryBindInfo` structures.

- **VUID-VkBindSparseInfo-pSignalSemaphores-parameter**
  
  If `signalSemaphoreCount` is not 0, `pSignalSemaphores` must be a valid pointer to an array of `signalSemaphoreCount` valid `VkSemaphore` handles.

- **VUID-VkBindSparseInfo-commonparent**
  
  Both of the elements of `pSignalSemaphores`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved.
To specify the values to use when waiting for and signaling semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`, add a `VkTimelineSemaphoreSubmitInfo` structure to the `pNext` chain of the `VkBindSparseInfo` structure.

If the `pNext` chain of `VkBindSparseInfo` includes a `VkDeviceGroupBindSparseInfo` structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The `VkDeviceGroupBindSparseInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `resourceDeviceIndex` is a device index indicating which instance of the resource is bound.
- `memoryDeviceIndex` is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the `resourceDeviceIndex`.

If this structure is not present, `resourceDeviceIndex` and `memoryDeviceIndex` are assumed to be zero.

### Valid Usage

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
  
  `resourceDeviceIndex` and `memoryDeviceIndex` must both be valid device indices

- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
  
  Each memory allocation bound in this batch must have allocated an instance for `memoryDeviceIndex`
Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO
Chapter 30. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

30.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- #define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

30.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.
On certain platforms, the Vulkan loader and ICDs may have conventions that treat
the handle as a pointer to a structure containing the platform-specific information
about the surface. This will be described in the documentation for the loader-ICD
interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code
repository. This does not affect the loader-layer interface; layers may wrap
`VkSurfaceKHR` objects.

### 30.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters
  affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is
  no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to
create another surface for the same `ANativeWindow` and any attempts to connect to the same
`ANativeWindow` through other platform mechanisms will fail.

**Note**

In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface`
simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and
`vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain's `imageExtent` does not match the surface's `currentExtent`, the
presentable images will be scaled to the surface's dimensions during presentation. `minImageExtent` is
(1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system
composer, `currentExtent` is the window size (i.e. the consumer's preferred size).

**Valid Usage (Implicit)**

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
  VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkAndroidSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• window is a pointer to the ANativeWindow to associate the surface with.

Valid Usage

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

Valid Usage (Implicit)

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
To remove an unnecessary compile time dependency, an incomplete type definition of \textit{ANativeWindow} is provided in the Vulkan headers:

```
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual \textit{ANativeWindow} type is defined in Android NDK headers.

```
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

\textit{VkAndroidSurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.2. Wayland Platform

To create a \textit{VkSurfaceKHR} object for a Wayland surface, call:

```
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- \textit{instance} is the instance to associate the surface with.
- \textit{pCreateInfo} is a pointer to a \textit{VkWaylandSurfaceCreateInfoKHR} structure containing parameters affecting the creation of the surface object.
- \textit{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- \textit{pSurface} is a pointer to a \textit{VkSurfaceKHR} handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  \textit{instance} must be a valid \textit{VkInstance} handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  \textit{pCreateInfo} must be a valid pointer to a valid \textit{VkWaylandSurfaceCreateInfoKHR} structure
If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

`pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

### Return Codes

#### Success
- `VK_SUCCESS`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

### Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304 `display` must point to a valid Wayland `wl_display`
- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305 `surface` must point to a valid Wayland `wl_surface`

### Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain’s imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each The wl_surface.attach, wl_surface.damage, and wl_surface.commit requests must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR.

// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

30.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
  VkInstance instance,
  const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
  const VkAllocationCallbacks* pAllocator, /* optional */
  VkSurfaceKHR* pSurface
);
```c
const VkAllocationCallbacks* pAllocator,
VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a `VkWin32SurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  
  `instance` must be a valid `VkInstance` handle

- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  
  `pCreateInfo` must be a valid pointer to a valid `VkWin32SurfaceCreateInfoKHR` structure

- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Some Vulkan functions may call the `SendMessage` system API when interacting with a `VkSurfaceKHR` through a `VkSwapchainKHR`. In a multithreaded environment, calling `SendMessage` from a thread that is not the thread associated with `pCreateInfo::hwnd` will block until the application has processed the window message. Thus, applications should either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so may result in deadlocks.

The functions subject to this requirement are:

- `vkCreateSwapchainKHR`
- `vkDestroySwapchainKHR`
- `vkAcquireNextImageKHR` and `vkAcquireNextImage2KHR`
The `VkWin32SurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
- `hwnd` is the Win32 `HWND` for the window to associate the surface with.

**Valid Usage**

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  `hinstance must` be a valid Win32 `HINSTANCE`
- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  `hwnd must` be a valid Win32 `HWND`

**Valid Usage (Implicit)**

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  `sType must` be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`
- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  `pNext must` be `NULL`
- VUID-VkWin32SurfaceCreateInfoKHR-flags-zero bitmask
  `flags must` be `0`

With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of a Win32 surface must have both `width` and `height` greater than 0, or both of them 0.

**Note**
Due to above restrictions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as
reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become 
\((0, 0)\) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

\[
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
\]

\(VkWin32SurfaceCreateFlagsKHR\) is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.4 XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

\[
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance, 
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkSurfaceKHR* pSurface);
\]

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateXcbSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle
### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `window` is the `xcb_window_t` for the X11 window to associate the surface with.

### Valid Usage

- `VUID-VkXcbSurfaceCreateInfoKHR-connection-01310`
  - `connection must` point to a valid X11 `xcb_connection_t`

- `VUID-VkXcbSurfaceCreateInfoKHR-window-01311`
  - `window must` be a valid X11 `xcb_window_t`

### Valid Usage (Implicit)

- `VUID-VkXcbSurfaceCreateInfoKHR-sType-sType`
  - `sType must` be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`

- `VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext`
  - `pNext must` be `NULL`

- `VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask`
  - `flags must` be `0`
With Xcb, \texttt{minImageExtent}, \texttt{maxImageExtent}, and \texttt{currentExtent} must always equal the window size.

The \texttt{currentExtent} of an Xcb surface must have both width and height greater than 0, or both of them 0.

\begin{quote}
\textit{Note}

Due to above restrictions, it is only possible to create a new swapchain on this platform with \texttt{imageExtent} being equal to the current size of the window, as reported in \texttt{VkSurfaceCapabilitiesKHR::currentExtent}.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
\end{quote}

Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a \texttt{VkSurfaceKHR} referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

\begin{verbatim}
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
\end{verbatim}

\texttt{VkXcbSurfaceCreateFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.5. Xlib Platform

To create a \texttt{VkSurfaceKHR} object for an X11 window, using the Xlib client-side library, call:

\begin{verbatim}
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
\end{verbatim}

- \texttt{instance} is the instance to associate the surface with.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkXlibSurfaceCreateInfoKHR} structure containing the parameters affecting the creation of the surface object.
- \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
• pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateXlibSurfaceKHR-instance-parameter**
  
  The `instance` must be a valid VkInstance handle.

- **VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter**
  
  The `pCreateInfo` must be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure.

- **VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter**
  
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure.

- **VUID-vkCreateXlibSurfaceKHR-pSurface-parameter**
  
  The `pSurface` must be a valid pointer to a VkSurfaceKHR handle.

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkXlibSurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dpy** is a pointer to an Xlib Display connection to the X server.
- **window** is an Xlib Window to associate the surface with.
Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
dpy must point to a valid Xlib Display

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
window must be a valid Xlib Window

Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR

- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xlib, minImageExtent, maxImageExtent, and currentExtent must always equal the window size.

The currentExtent of an Xlib surface must have both width and height greater than 0, or both of them 0.

Note

Due to above restrictions, it is only possible to create a new swapchain on this platform with imageExtent being equal to the current size of the window, as reported in VkSurfaceCapabilitiesKHR::currentExtent.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call XInitThreads() before calling any other Xlib functions.

// Provided by VK_KHR_xlib_surface
typedef VkFlags VKXlibSurfaceCreateFlagsKHR;

VKXlibSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 30.2.6. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance instance,          // instance is the instance used to create the surface.
    VkSurfaceKHR surface,        // surface is the surface to destroy.
    const VkAllocationCallbacks* pAllocator);  // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
```

Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface

- VUID-vkDestroySurfaceKHR-surface-01267
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySurfaceKHR-surface-01268
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL
Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  
  instance must be a valid VkInstance handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySurfaceKHR-surface-parent
  
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance

Host Synchronization

- Host access to surface must be externally synchronized

30.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

30.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- physicalDevice is a physical device.
• \texttt{pPropertyCount} is a pointer to an integer related to the number of display devices available or queried, as described below.

• \texttt{pProperties} is either \texttt{NULL} or a pointer to an array of \texttt{VkDisplayPropertiesKHR} structures.

If \texttt{pProperties} is \texttt{NULL}, then the number of display devices available for \texttt{physicalDevice} is returned in \texttt{pPropertyCount}. Otherwise, \texttt{pPropertyCount} must point to a variable set by the user to the number of elements in the \texttt{pProperties} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pProperties}. If the value of \texttt{pPropertyCount} is less than the number of display devices for \texttt{physicalDevice}, at most \texttt{pPropertyCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available properties were returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter \texttt{pPropertyCount} must be a valid pointer to a \texttt{uint32_t} value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by \texttt{pPropertyCount} is not 0, and \texttt{pProperties} is not \texttt{NULL}, \texttt{pProperties} must be a valid pointer to an array of \texttt{pPropertyCount} \texttt{VkDisplayPropertiesKHR} structures

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

The \texttt{VkDisplayPropertiesKHR} structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```
• **display** is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

• **displayName** is **NULL** or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display’s EDID. If **NULL**, no suitable name is available. If not **NULL**, the string pointed to **must** remain accessible and unmodified as long as **display** is valid.

• **physicalDimensions** describes the physical width and height of the visible portion of the display, in millimeters.

• **physicalResolution** describes the physical, native, or preferred resolution of the display.

  **Note**  
  For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

• **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** describing which transforms are supported by this display.

• **planeReorderPossible** tells whether the planes on this display **can** have their z order changed. If this is **VK_TRUE**, the application **can** re-arrange the planes on this display in any order relative to each other.

• **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

  **Note**  
  Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayProperties2KHR* pProperties);
```

• **physicalDevice** is a physical device.

• **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.

• **pProperties** is either **NULL** or a pointer to an array of **VkDisplayProperties2KHR** structures.

`vkGetPhysicalDeviceDisplayProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPropertiesKHR`, with the ability to return extended information via chained output structures.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayProperties2KHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayProperties2KHR` structure is defined as:

```c
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayProperties` is a `VkDisplayPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR`
- VUID-VkDisplayProperties2KHR-pNext-pNext
  `pNext` must be `NULL`
Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display planes available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkDisplayPlanePropertiesKHR structures.

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkDisplayPlanePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.

- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device’s display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice, uint32_t* pPropertyCount, VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.

- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.

- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures
The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

### Valid Usage (Implicit)

- VUID-VkDisplayPlaneProperties2KHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`

- VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  
  `pNext` **must** be `NULL`

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,                  
    uint32_t planeIndex,                              
    uint32_t* pDisplayCount,                         
    VkDisplayKHR* pDisplays);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and **must** be in the range `[0, physical device plane count - 1]`. 

---

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
• \texttt{pDisplayCount} is a pointer to an integer related to the number of displays available or queried, as described below.

• \texttt{pDisplays} is either \texttt{NULL} or a pointer to an array of \texttt{VkDisplayKHR} handles.

If \texttt{pDisplays} is \texttt{NULL}, then the number of displays usable with the specified \texttt{planeIndex} for \texttt{physicalDevice} is returned in \texttt{pDisplayCount}. Otherwise, \texttt{pDisplayCount} must point to a variable set by the user to the number of elements in the \texttt{pDisplays} array, and on return the variable is overwritten with the number of handles actually written to \texttt{pDisplays}. If the value of \texttt{pDisplayCount} is less than the number of usable display-plane pairs for \texttt{physicalDevice}, at most \texttt{pDisplayCount} handles will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available pairs were returned.

### Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  \texttt{planeIndex} must be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}

### Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  \texttt{pDisplayCount} must be a valid pointer to a \texttt{uint32_t} value

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  If the value referenced by \texttt{pDisplayCount} is not 0, and \texttt{pDisplays} is not \texttt{NULL}, \texttt{pDisplays} must be a valid pointer to an array of \texttt{pDisplayCount} \texttt{VkDisplayKHR} handles

### Return Codes

#### Success

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

#### Failure

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by \texttt{VkDisplayModeKHR} handles:
Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```cpp
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)

VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModePropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display modes available on the specified **display** for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display modes for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available display modes were returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter **display** must be a valid **VkDisplayKHR** handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter **pPropertyCount** must be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModePropertiesKHR** structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent **display** must have been created, allocated, or retrieved from **physicalDevice**
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModePropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device's built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModeProperties2KHR` structures.
vkGetDisplayModeProperties2KHR behaves similarly to vkGetDisplayModePropertiesKHR, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter**  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle.

- **VUID-vkGetDisplayModeProperties2KHR-display-parameter**  
  `display` **must** be a valid `VkDisplayKHR` handle.

- **VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter**  
  `pPropertyCount` **must** be a valid pointer to a `uint32_t` value.

- **VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter**  
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` **must** be a valid pointer to an array of `pPropertyCount` `VkDisplayModeProperties2KHR` structures.

- **VUID-vkGetDisplayModeProperties2KHR-display-parent**  
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`.

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModeProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayModeProperties` is a `VkDisplayModePropertiesKHR` structure.
The `VkDisplayModeParametersKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D visibleRegion;
    uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

- `visibleRegion` is the 2D extents of the visible region.
- `refreshRate` is a `uint32_t` that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a `refreshRate` of 60,000.

Valid Usage

- **VUID-VkDisplayModeParametersKHR-width-01990**
  The `width` member of `visibleRegion` must be greater than 0

- **VUID-VkDisplayModeParametersKHR-height-01991**
  The `height` member of `visibleRegion` must be greater than 0

- **VUID-VkDisplayModeParametersKHR-refreshRate-01992**
  `refreshRate` must be greater than 0

Additional modes may also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,     // The physical device associated with display.
    VkDisplayKHR display,                // display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,    // pCreateInfo,
    const VkAllocationCallbacks* pAllocator,         // pAllocator,
    VkDisplayModeKHR* pMode);                  // pMode);
```
• **display** is the display to create an additional mode for.

• **pCreateInfo** is a pointer to a *VkDisplayModeCreateInfoKHR* structure describing the new mode to create.

• **pAllocator** is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).

• **pMode** is a pointer to a *VkDisplayModeKHR* handle in which the mode created is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter  
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

- VUID-vkCreateDisplayModeKHR-display-parameter  
  *display* must be a valid *VkDisplayKHR* handle

- VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter  
  *pCreateInfo* must be a valid pointer to a valid *VkDisplayModeCreateInfoKHR* structure

- VUID-vkCreateDisplayModeKHR-pAllocator-parameter  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateDisplayModeKHR-pMode-parameter  
  *pMode* must be a valid pointer to a *VkDisplayModeKHR* handle

- VUID-vkCreateDisplayModeKHR-display-parent  
  *display* must have been created, allocated, or retrieved from *physicalDevice*

### Host Synchronization

- Host access to *display* must be externally synchronized

### Return Codes

#### Success

- **VK_SUCCESS**

#### Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The *VkDisplayModeCreateInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
```
VkStructureType sType;
const void* pNext;
VkDisplayModeCreateFlagsKHR flags;
VkDisplayModeParametersKHR parameters;

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use, and must be zero.

• **parameters** is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return VK_ERROR_INITIALIZATION_FAILED.

### Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR

- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```cpp
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- **physicalDevice** is the physical device associated with the display specified by **mode**

- **mode** is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.

- **planeIndex** is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.

- **pCapabilities** is a pointer to a VkDisplayPlaneCapabilitiesKHR structure in which the capabilities are returned.
Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
  **physicalDevice must** be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter
  **mode must** be a valid **VkDisplayModeKHR** handle
- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
  **pCapabilities must** be a valid pointer to a **VkDisplayPlaneCapabilitiesKHR** structure
- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent
  **mode must** have been created, allocated, or retrieved from **physicalDevice**

Host Synchronization

- Host access to **mode must** be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The **VkDisplayPlaneCapabilitiesKHR** structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- **supportedAlpha** is a bitmask of **VkDisplayPlaneAlphaFlagBitsKHR** describing the supported alpha blending modes.
- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.
• maxSrcPosition is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of maxSrcPosition must each be greater than or equal to the x and y components of minSrcPosition, respectively.

• minSrcExtent is the minimum source rectangle size supported by this plane using the specified mode.

• maxSrcExtent is the maximum source rectangle size supported by this plane using the specified mode.

• minDstPosition, maxDstPosition, minDstExtent, maxDstExtent all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, minDstPosition and maxDstPosition may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain’s presentable images on the specified display plane. This is expressed by returning minSrcPosition, maxSrcPosition, minSrcExtent, and maxSrcExtent values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images’ content to a subset or superset of the visible region in the specified display mode. This is expressed by returning minDstPosition, maxDstPosition, minDstExtent and maxDstExtent values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for minSrcPosition, maxSrcPosition, minDstPosition, and maxDstPosition, and (display mode width, display mode height) for minSrcExtent, maxSrcExtent, minDstExtent, and maxDstExtent.

The value supportedAlpha must contain at least one valid VkDisplayPlaneAlphaFlagBitsKHR bit.

These values indicate the limits of the implementation’s individual fields. Not all combinations of values within the offset and extent ranges returned in VkDisplayPlaneCapabilitiesKHR are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

• physicalDevice is the physical device associated with pDisplayPlaneInfo.

• pDisplayPlaneInfo is a pointer to a VkDisplayPlaneInfo2KHR structure describing the plane and
mode.

- **pCapabilities** is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage (Implicit)

- **VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter**
  - `pDisplayPlaneInfo` must be a valid pointer to a valid `VkDisplayPlaneInfo2KHR` structure
- **VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter**
  - `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilities2KHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```c
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **mode** is the display mode the application intends to program when using the specified plane.

**Note**
This parameter also implicitly specifies a display.
• \texttt{planeIndex} is the plane which the application intends to use with the display.

The members of \texttt{VkDisplayPlaneInfo2KHR} correspond to the arguments to \texttt{vkGetDisplayPlaneCapabilitiesKHR}, with \texttt{sType} and \texttt{pNext} added for extensibility.

### Valid Usage (Implicit)

- \textbf{VUID-VkDisplayPlaneInfo2KHR-sType-sType} \\
  \texttt{sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR}

- \textbf{VUID-VkDisplayPlaneInfo2KHR-pNext-pNext} \\
  \texttt{pNext must be NULL}

- \textbf{VUID-VkDisplayPlaneInfo2KHR-mode-parameter} \\
  \texttt{mode must be a valid VkDisplayModeKHR handle}

### Host Synchronization

- Host access to \texttt{mode} must be externally synchronized

The \texttt{VkDisplayPlaneCapabilities2KHR} structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.

- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

- \texttt{capabilities} is a \texttt{VkDisplayPlaneCapabilitiesKHR} structure.

### Valid Usage (Implicit)

- \textbf{VUID-VkDisplayPlaneCapabilities2KHR-sType-sType} \\
  \texttt{sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR}

- \textbf{VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext} \\
  \texttt{pNext must be NULL}

### 30.3.2. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with
those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a VkSurfaceKHR object for a display plane, call:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(
    VkInstance instance,
    const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a VkDisplaySurfaceCreateInfoKHR structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  - `instance` must be a valid VkInstance handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid VkDisplaySurfaceCreateInfoKHR structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  - `pSurface` must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplaySurfaceCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
```
VkStructureType
  const void*
  VkDisplaySurfaceCreateFlagsKHR
  VkDisplayModeKHR
  uint32_t
  uint32_t
  VkSurfaceTransformFlagBitsKHR
  float
  VkDisplayPlaneAlphaFlagBitsKHR
  VkExtent2D
} VkDisplaySurfaceCreateInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and must be zero.
- **displayMode** is a VkDisplayModeKHR handle specifying the mode to use when displaying this surface.
- **planeIndex** is the plane on which this surface appears.
- **planeStackIndex** is the z-order of the plane.
- **transform** is a VkSurfaceTransformFlagBitsKHR value specifying the transformation to apply to images as part of the scanout operation.
- **globalAlpha** is the global alpha value. This value is ignored if alphaMode is not VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR.
- **alphaMode** is a VkDisplayPlaneAlphaFlagBitsKHR value specifying the type of alpha blending to use.
- **imageExtent** is the size of the presentable images to use with the surface.

**Note**
Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

**Valid Usage**

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
  planeIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR

- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
  If the planeReorderPossible member of the VkDisplayPropertiesKHR structure returned by vkGetPhysicalDeviceDisplayPropertiesKHR for the display corresponding to displayMode is VK_TRUE then planeStackIndex must be less than the number of display planes supported by the device as determined by calling vkGetPhysicalDeviceDisplayPlanePropertiesKHR;
otherwise planeStackIndex must equal the currentStackIndex member of VkDisplayPlanePropertiesKHR returned by vkGetPhysicalDeviceDisplayPlanePropertiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If alphaMode is VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR then globalAlpha must be between 0 and 1, inclusive

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  alphaMode must be one of the bits present in the supportedAlpha member of VkDisplayPlaneCapabilitiesKHR for the display plane corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  transform must be one of the bits present in the supportedTransforms member of VkDisplayPropertiesKHR for the display corresponding to displayMode

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of imageExtent must be less than or equal to VkPhysicalDeviceLimits::maxImageDimension2D

Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR

- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
  displayMode must be a valid VkDisplayModeKHR handle

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
  transform must be a valid VkSurfaceTransformFlagBitsKHR value

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
  alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;

• **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
• **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
• **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
• **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image's other color components.

// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.

### 30.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);

• **physicalDevice** is the physical device.
• queueFamilyIndex is the queue family.
• surface is the surface.
• pSupported is a pointer to a VkBool32, which is set to VK_TRUE to indicate support, and VK_FALSE otherwise.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter pSupported must be a valid pointer to a VkBool32 value
- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

**30.4.1. Android Platform**

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

**30.4.2. Wayland Platform**

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:
**Valid Usage**

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter display must be a valid pointer to a wl_display value

### 30.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.

This platform-specific function can be called prior to creating a surface.

**Valid Usage**

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

30.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an xcb_connection_t to the X server.
- `visual_id` is an X11 visual (xcb_visualid_t).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
  connection must be a valid pointer to an xcb_connection_t value
30.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dpy` is a pointer to an Xlib `Display` connection to the server.
- `visualID` is an X11 visual (`VisualID`).

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- `VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315` `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- `VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter` `dpy` must be a valid pointer to a `Display` value.

30.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

*Note*

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image
creation limits have to be satisfied whenever swapchain images are created.

### 30.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

#### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523: `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211: `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

#### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter: `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter: `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter: `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilitiesKHR` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent: Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

#### Return Codes

**Success**

- `VK_SUCCESS`
The `VkSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.

- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of `minImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.

- `maxImageArrayLayers` is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
• **currentTransform** is `VkSurfaceTransformFlagBitsKHR` value indicating the surface's current transform relative to the presentation engine's natural orientation.

• **supportedCompositeAlpha** is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition *can* be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

• **supportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application *can* use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` *must* be included in the set. Implementations *may* support additional usages.

**Note**

Supported usage flags of a presentable image when using `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` presentation mode are provided by `VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags`.

**Note**

Formulas such as \( \min(N, \maxImageCount) \) are not correct, since `maxImageCount` *may* be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice, 
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo, 
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

• **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

• **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.
Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521
  
pSurfaceInfo->surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522
  
pSurfaceInfo->surface must be supported by physicalDevice, as reported by
  vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

• VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **surface** is the surface that will be associated with the swapchain.

The members of VkPhysicalDeviceSurfaceInfo2KHR correspond to the arguments to
vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with sType and pNext added for extensibility.

**Valid Usage**

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919
  surface must be a valid VkSurfaceKHR handle

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext
  pNext must be NULL
- VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

The VkSurfaceCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- surfaceCapabilities is a VkSurfaceCapabilitiesKHR structure describing the capabilities of the specified surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR
- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkSharedPresentSurfaceCapabilitiesKHR or VkSurfaceProtectedCapabilitiesKHR
- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

An application queries if a protected VkSurfaceKHR is displayable on a specific windowing system.
using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

### Valid Usage (Implicit)

- `VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sharedPresentSupportedUsageFlags` is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set but implementations may support additional usages.
Valid Usage (Implicit)

- **VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

Bits which may be set in `VkSurfaceCapabilitiesKHR::supportedTransforms` indicating the presentation transforms supported for the surface on the specified device, and possible values of `VkSurfaceCapabilitiesKHR::currentTransform` indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```c
// Provided by VK_KHR_display
```
typedef VkFlags VkSurfaceTransformFlagsKHR;

VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the following values:

```c
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```c
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

VkCompositeAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkCompositeAlphaFlagBitsKHR.

### 30.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR;
```
VkPhysicalDevice
VkSurfaceKHR
*uint32_t*
void
VkSurfaceFormatKHR*

physicalDevice, surface,
pSurfaceFormatCount, pSurfaceFormats);

• physicalDevice is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.

• surface is the surface that will be associated with the swapchain.

• pSurfaceFormatCount is a pointer to an integer related to the number of format pairs available or queried, as described below.

• pSurfaceFormats is either NULL or a pointer to an array of VkSurfaceFormatKHR structures.

If pSurfaceFormats is NULL, then the number of format pairs supported for the given surface is returned in pSurfaceFormatCount. Otherwise, pSurfaceFormatCount must point to a variable set by the user to the number of elements in the pSurfaceFormats array, and on return the variable is overwritten with the number of structures actually written to pSurfaceFormats. If the value of pSurfaceFormatCount is less than the number of format pairs supported, at most pSurfaceFormatCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. pSurfaceFormats must not contain an entry whose value for format is VK_FORMAT_UNDEFINED.

If pSurfaceFormats includes an entry whose value for colorSpace is VK_COLOR_SPACE_SRGB_NONLINEAR_KHR and whose value for format is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for VK_IMAGE_TILING_OPTIMAL, then pSurfaceFormats must also contain an entry with the same value for colorSpace and format equal to the corresponding SRGB (or UNORM) format.

Valid Usage

• VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
  surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
  surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter

1625
**pSurfaceFormatCount** must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter**
  If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormatKHR` structures

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent**
  Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

---

## Return Codes

### Success
- **VK_SUCCESS**
- **VK_INCOMPLETE**

### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The `VkSurfaceFormatKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- **format** is a `VkFormat` that is compatible with the specified surface.
- **colorSpace** is a presentation `VkColorSpaceKHR` that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(  
    VkPhysicalDevice physicalDevice,  
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,  
    uint32_t* pSurfaceFormatCount,  
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **pSurfaceInfo** is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the
surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

- `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.
- `pSurfaceFormats` is either NULL or a pointer to an array of VkSurfaceFormat2KHR structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is NULL, then the number of format tuples supported for the given surface is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
  - `pSurfaceInfo->surface` must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
  - `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  - `physicalDevice` must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  - `pSurfaceInfo` must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  - `pSurfaceFormatCount` must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
  - If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` VkSurfaceFormat2KHR structures

### Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The `VkSurfaceFormat2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceFormat2KHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`

- VUID-VkSurfaceFormat2KHR-pNext-pNext
  
  `pNext` must be `NULL`

While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
} VkColorSpaceKHR;
```

- `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` specifies support for the sRGB color space.
30.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

### Valid Usage

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524`
  - `surface` must be a valid `VkSurfaceKHR` handle

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525`
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter`
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter`
  - If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle

- `VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter`
  - `pPresentModeCount` must be a valid pointer to a `uint32_t` value
If the value referenced by `pPresentModeCount` is not 0, and `pPresentModes` is not NULL, `pPresentModes` must be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values.

Both of `physicalDevice`, and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```cpp
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- `VK_PRESENT_MODE_IMMEDIATE_KHR` specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- `VK_PRESENT_MODE_MAILBOX_KHR` specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the
queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing **cannot** be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is **required** to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode **may** result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a **shared presentable image**. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application **must** make a presentation request whenever an update is required. However, the presentation engine **may** update the current image at any point, meaning this mode **may** result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a **shared presentable image**. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine **must** update the current image without any need for further presentation requests. The application **can** indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode **may** result in visible tearing if rendering to the image is not timed correctly.

The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface **may** differ depending on the presentation mode, and can be determined as per the table below:

### Table 38. Presentable image usage queries

<table>
<thead>
<tr>
<th>Presentation mode</th>

<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by `VK_PRESENT_MODE_FIFO_KHR` is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers with a swap interval of -1 (from the `{WGL|GLX}_EXT_swap_control_tear extensions).

**30.6. Device Group Queries**

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
- `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device’s capabilities are returned.

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
  - `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

**Return Codes**

**Success**
- `VK_SUCCESS`
The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` must equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

**Valid Usage (Implicit)**

- `VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
- `VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext` `pNext` must be `NULL`

Bits which may be set in `VkDeviceGroupPresentCapabilitiesKHR::modes`, indicating which device group presentation modes are supported, are:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
```
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;

• **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR** specifies that any physical device with a presentation engine can present its own swapchain images.

• **VKDEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR** specifies that any physical device with a presentation engine can present swapchain images from any physical device in its `presentMask`.

• **VKDEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR** specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its `presentMask`.

• **VKDEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR** specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;

**VkDeviceGroupPresentModeFlagsKHR** is a bitmask type for setting a mask of zero or more **VkDeviceGroupPresentModeFlagBitsKHR**.

Some surfaces may not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

• **device** is the logical device.

• **surface** is the surface.

• **pModes** is a pointer to a **VkDeviceGroupPresentModeFlagsKHR** in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by **vkGetDeviceGroupPresentCapabilitiesKHR**.
Valid Usage

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212**
  - `surface` must be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

Valid Usage (Implicit)

- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter**
  - `surface` must be a valid `VkSurfaceKHR` handle
- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter**
  - `pModes` must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value
- **VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent**
  - Both of `device`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`.

Host Synchronization

- Host access to `surface` must be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```cpp
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(…)
```
VkPhysicalDevice
VkSurfaceKHR
uint32_t*
pRectCount
VkRect2D*
pRects);

• **physicalDevice** is the physical device.
• **surface** is the surface.
• pRectCount is a pointer to an integer related to the number of rectangles available or queried, as described below.
• pRects is either **NULL** or a pointer to an array of VkRect2D structures.

If pRects is **NULL**, then the number of rectangles used when presenting the given surface is returned in pRectCount. Otherwise, pRectCount must point to a variable set by the user to the number of elements in the pRects array, and on return the variable is overwritten with the number of structures actually written to pRects. If the value of pRectCount is less than the number of rectangles, at most pRectCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

### Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  pRectCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  If the value referenced by pRectCount is not 0, and pRects is not NULL, pRects must be a valid pointer to an array of pRectCount VkRect2D structures
- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from
Host Synchronization

- Host access to surface must be externally synchronized

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

30.7. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The VK_KHR_present_wait extension allows applications to tell the presentation engine at the vkQueuePresentKHR call that it plans on waiting for presentation by passing a VkPresentIdKHR structure. The presentId passed in that structure may then be passed to a future vkWaitForPresentKHR call to cause the application to block until that presentation is finished.

30.8. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by VkSwapchainKHR handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by VkImage objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then
queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

Note
The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device's graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by vkAcquireNextImageKHR, and before it is released by vkQueuePresentKHR. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with vkAcquireNextImageKHR. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with vkQueuePresentKHR, which releases the acquisition of the image.

The presentation engine controls the order in which presentable images are acquired for use by the application.

Note
This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with presentMode set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call vkQueuePresentKHR to guarantee an update. However, the presentation engine may update from it at any time.
With VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to vkQueuePresentKHR, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling vkQueuePresentKHR, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note

The VK_KHR_shared_presentable_image extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(  
    VkDevice device,  
    VkSwapchainKHR swapchain);
```

- device is the device associated with swapchain.
- swapchain is the swapchain to query.

Valid Usage (Implicit)

- VUID-vkGetSwapchainStatusKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkGetSwapchainStatusKHR-swapchain-parent
  
  swapchain must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to swapchain must be externally synchronized
### Return Codes

**Success**
- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The possible return values for `vkGetSwapchainStatusKHR` should be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.

- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

**Note**

The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.

- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.

- **pAllocator** is the allocator used for host memory allocated for the swapchain object when there
• `pSwapchain` is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:

<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set</td>
</tr>
<tr>

<td>VK_IMAGE_LAYOUT_UNDEFINED</td>
</tr>
</tbody>
</table>

The `pCreateInfo->surface` must not be destroyed until after the swapchain is destroyed.

If `oldSwapchain` is `VK_NULL_HANDLE`, and the native window referred to by `pCreateInfo->surface` is already associated with a Vulkan swapchain, `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR` must be returned.
If the native window referred to by \textit{pCreateInfo->surface} is already associated with a non-Vulkan graphics API surface, \texttt{VK_ERROR_NATIVE_WINDOW_IN_USE_KHR} must be returned.

The native window referred to by \textit{pCreateInfo->surface} must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

\texttt{vkCreateSwapchainKHR} will return \texttt{VK_ERROR_DEVICE_LOST} if the logical device was lost. The \texttt{VkSwapchainKHR} is a child of the \texttt{device}, and must be destroyed before the \texttt{device}. However, \texttt{VkSurfaceKHR} is not a child of any \texttt{VkDevice} and is not affected by the lost device. After successfully recreating a \texttt{VkDevice}, the same \texttt{VkSurfaceKHR} can be used to create a new \texttt{VkSwapchainKHR}, provided the previous one was destroyed.

\textbf{Valid Usage (Implicit)}

- \texttt{VUID-vkCreateSwapchainKHR-device-parameter} \texttt{device} must be a valid \texttt{VkDevice} handle
- \texttt{VUID-vkCreateSwapchainKHR-pCreateInfo-parameter} \texttt{pCreateInfo} must be a valid pointer to a valid \texttt{VkSwapchainCreateInfoKHR} structure
- \texttt{VUID-vkCreateSwapchainKHR-pAllocator-parameter} If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure
- \texttt{VUID-vkCreateSwapchainKHR-pSwapchain-parameter} \texttt{pSwapchain} must be a valid pointer to a \texttt{VkSwapchainKHR} handle

\textbf{Host Synchronization}

- Host access to \texttt{pCreateInfo->surface} must be externally synchronized
- Host access to \texttt{pCreateInfo->oldSwapchain} must be externally synchronized

\textbf{Return Codes}

\textbf{Success}

- \texttt{VK_SUCCESS}

\textbf{Failure}

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_DEVICE_LOST}
- \texttt{VK_ERROR_SURFACE_LOST_KHR}
- \texttt{VK_ERROR_NATIVE_WINDOW_IN_USE_KHR}
- \texttt{VK_ERROR_INITIALIZATION_FAILED}
The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
    VkColorSpaceKHR imageColorSpace;
    VkExtent2D imageExtent;
    uint32_t imageArrayLayers;
    VkImageUsageFlags imageUsage;
    VkSharingMode imageSharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR presentMode;
    VkBool32 clipped;
    VkSwapchainKHR oldSwapchain;
} VkSwapchainCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.
- **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.
- **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- **imageFormat** is a `VkFormat` value specifying the format the swapchain image(s) will be created with.
- **imageColorSpace** is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.
- **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

**Note**

On some platforms, it is normal that `maxImageExtent` may become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements.
• **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.

• **imageUsage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the (acquired) swapchain images.

• **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.

• **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when imageSharingMode is VK_SHARING_MODE_CONCURRENT.

• **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when imageSharingMode is VK_SHARING_MODE_CONCURRENT.

• **preTransform** is a VkSurfaceTransformFlagBitsKHR value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the currentTransform value returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR, the presentation engine will transform the image content as part of the presentation operation.

• **compositeAlpha** is a VkCompositeAlphaFlagBitsKHR value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

• **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.

• **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
   - If set to VK_TRUE, the presentable images associated with the swapchain **may** not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders **may** not execute for these pixels, and thus any side effects they would have had will not occur. Setting VK_TRUE does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
   - If set to VK_FALSE, presentable images associated with the swapchain will own all of the pixels they contain.

   **Note**

   Applications **should** set this value to VK_TRUE if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

• **oldSwapchain** is VK_NULL_HANDLE, or the existing non-retired swapchain currently associated with surface. Providing a valid oldSwapchain **may** aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling vkCreateSwapchainKHR with an oldSwapchain that is not VK_NULL_HANDLE, oldSwapchain is retired—even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not oldSwapchain is VK_NULL_HANDLE.
Upon calling `vkCreateSwapchainKHR` with an `oldSwapchain` that is not `VK_NULL_HANDLE`, any images from `oldSwapchain` that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy `oldSwapchain` to free all memory associated with `oldSwapchain`.

**Note**

Multiple retired swapchains can be associated with the same `VkSurfaceKHR` through multiple uses of `oldSwapchain` that outnumber calls to `vkDestroySwapchainKHR`.

After `oldSwapchain` is retired, the application can pass to `vkQueuePresentKHR` any images it had already acquired from `oldSwapchain`. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, `vkQueuePresentKHR` may fail if `oldSwapchain` has entered a state that causes `VK_ERROR_OUT_OF_DATE_KHR` to be returned.

The application can continue to use a shared presentable image obtained from `oldSwapchain` until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return `VK_ERROR_OUT_OF_DATE_KHR`.

### Valid Usage

- **VUID-VkSwapchainCreateInfoKHR-surface-01270**
  
  `surface` must be a surface that is supported by the device as determined using `vkGetPhysicalDeviceSurfaceSupportKHR`.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01272**
  
  `minImageCount` must be less than or equal to the value returned in the `maxImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface if the returned `maxImageCount` is not zero.

- **VUID-VkSwapchainCreateInfoKHR-presentMode-02839**
  
  If `presentMode` is not `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` nor `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, then `minImageCount` must be greater than or equal to the value returned in the `minImageCount` member of the `VkSurfaceCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-minImageCount-01383**
  
  `minImageCount` must be 1 if `presentMode` is either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01273**
  
  `imageFormat` and `imageColorSpace` must match the format and colorSpace members, respectively, of one of the `VkSurfaceFormatKHR` structures returned by `vkGetPhysicalDeviceSurfaceFormatsKHR` for the surface.

- **VUID-VkSwapchainCreateInfoKHR-pNext-07781**
  
  `imageExtent` must be between `minImageExtent` and `maxImageExtent`, inclusive, where
minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  imageExtent members width and height must both be non-zero

- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a subset of the supported usage flags present in the supportedUsageFlags member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, imageUsage must be a subset of the supported usage flags present in the sharedPresentSupportedUsageFlags member of the VkSharedPresentSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid pointer to an array of queueFamilyIndexCount uint32_t values

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by vkGetPhysicalDeviceSurfacePresentModesKHR for the surface
If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR

If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain must be a non-retired swapchain associated with native window referred to by surface

The implied image creation parameters of the swapchain must be supported as reported by vkGetPhysicalDeviceImageFormatProperties

If flags contains VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR then the pNext chain must include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats must have an element equal to imageFormat

If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats must be compatible with the format as described in the compatibility table

If flags does not contain VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR and the pNext chain include a VkImageFormatListCreateInfo structure then VkImageFormatListCreateInfo::viewFormatCount must be 0 or 1

If flags contains VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR, then VkSurfaceProtectedCapabilitiesKHR::supportsProtected must be VK_TRUE in the VkSurfaceProtectedCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupSwapchainCreateInfoKHR or VkImageFormatListCreateInfo

The sType value of each struct in the pNext chain must be unique

flags must be a valid combination of VkSwapchainCreateFlagBitsKHR values

surface must be a valid VkSurfaceKHR handle
• **VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter**
  `imageFormat` **must** be a valid `VkFormat` value

• **VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter**
  `imageColorSpace` **must** be a valid `VkColorSpaceKHR` value

• **VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter**
  `imageUsage` **must** be a valid combination of `VkImageUsageFlagBits` values

• **VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmap**
  `imageUsage` **must not be** 0

• **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter**
  `imageSharingMode` **must** be a valid `VkSharingMode` value

• **VUID-VkSwapchainCreateInfoKHR-preTransform-parameter**
  `preTransform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value

• **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter**
  `compositeAlpha` **must** be a valid `VkCompositeAlphaFlagBitsKHR` value

• **VUID-VkSwapchainCreateInfoKHR-presentMode-parameter**
  `presentMode` **must** be a valid `VkPresentModeKHR` value

• **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter**
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` **must** be a valid `VkSwapchainKHR` handle

• **VUID-VkSwapchainCreateInfoKHR-commonparent**
  Both of `oldSwapchain`, and `surface` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkInstance`

Bits which **can** be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
    VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
} VkSwapchainCreateFlagBitsKHR;
```

• **VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR** specifies that images created from the swapchain (i.e. with the `swapchain` member of `VkImageSwapchainCreateInfoKHR` set to this swapchain’s handle) **must** use `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT`.

• **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.

• **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain **can** be
used to create a VkImageView with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

```cpp
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

```cpp
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `modes` is a bitfield of modes that the swapchain can be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

Valid Usage (Implicit)

- VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter `modes` must be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values
- VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-requiredbitmask `modes` must not be 0

To destroy a swapchain object call:
void vkDestroySwapchainKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    const VkAllocationCallbacks* pAllocator);

- `device` is the `VkDevice` associated with `swapchain`.
- `swapchain` is the swapchain to destroy.
- `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. `swapchain` and all associated `VkImage` handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each `VkImage` will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent `VkSurfaceKHR`, and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

### Valid Usage

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from `swapchain` must have completed execution

- VUID-vkDestroySwapchainKHR-swapchain-01283
  If `VkAllocationCallbacks` were provided when `swapchain` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no `VkAllocationCallbacks` were provided when `swapchain` was created, `pAllocator` must be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroySwapchainKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If `swapchain` is not `VK_NULL_HANDLE`, `swapchain` must be a valid `VkSwapchainKHR` handle
Host Synchronization

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainCreateInfoKHR* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchains);
```

- `device` is the device to create the swapchains for.
- `swapchainCount` is the number of swapchains to create.
- `pCreateInfos` is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- `pAllocator` is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
- `pSwapchains` is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

`vkCreateSharedSwapchainsKHR` is similar to `vkCreateSwapchainKHR`, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code VK_ERROR_INCOMPATIBLE_DISPLAY_KHR. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.
Valid Usage (Implicit)

- **VUID-vkCreateSharedSwapchainsKHR-device-parameter**
  - `device` **must** be a valid `VkDevice` handle

- **VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter**
  - `pCreateInfos` **must** be a valid pointer to an array of `swapchainCount` valid `VkSwapchainCreateInfoKHR` structures

- **VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter**
  - `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- **VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength**
  - `swapchainCount` **must** be greater than 0

Host Synchronization

- Host access to `pCreateInfos[].surface` **must** be externally synchronized
- Host access to `pCreateInfos[].oldSwapchain` **must** be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(VkDevice device, VkSwapchainKHR swapchain, uint32_t* pSwapchainImageCount, /*...*/)
```
device is the device associated with swapchain.

swapchain is the swapchain to query.

pSwapchainImageCount is a pointer to an integer related to the number of presentable images available or queried, as described below.

pSwapchainImages is either NULL or a pointer to an array of VkImage handles.

If pSwapchainImages is NULL, then the number of presentable images for swapchain is returned in pSwapchainImageCount. Otherwise, pSwapchainImageCount must point to a variable set by the user to the number of elements in the pSwapchainImages array, and on return the variable is overwritten with the number of structures actually written to pSwapchainImages. If the value of pSwapchainImageCount is less than the number of presentable images for swapchain, at most pSwapchainImageCount structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available presentable images were returned.

Valid Usage (Implicit)

• VUID-vkGetSwapchainImagesKHR-device-parameter device must be a valid VkDevice handle

• VUID-vkGetSwapchainImagesKHR-swapchain-parameter swapchain must be a valid VkSwapchainKHR handle

• VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter pSwapchainImageCount must be a valid pointer to a uint32_t value

• VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter If the value referenced by pSwapchainImageCount is not 0, and pSwapchainImages is not NULL, pSwapchainImages must be a valid pointer to an array of pSwapchainImageCount VkImage handles

• VUID-vkGetSwapchainImagesKHR-swapchain-parent swapchain must have been created, allocated, or retrieved from device

Return Codes

Success

• VK_SUCCESS

• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY

• VK_ERROR_OUT_OF_DEVICE_MEMORY

Note
By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object. All presentable images are initially in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application **must** transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications **must** not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images **can** also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images **can** be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images **must** be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device, 
    VkSwapchainKHR swapchain, 
    uint64_t timeout, 
    VkSemaphore semaphore, 
    VkFence fence, 
    uint32_t* pImageIndex);
```

- **device** is the device associated with `swapchain`.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is `VK_NULL_HANDLE` or a semaphore to signal.
- **fence** is `VK_NULL_HANDLE` or a fence to signal.
- **pImageIndex** is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

### Valid Usage

- **VUID-vkAcquireNextImageKHR-swapchain-01285**
  - `swapchain **must** not be in the retired state`
If semaphore is not VK_NULL_HANDLE it must be unsignaled

If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

semaphore and fence must not both be equal to VK_NULL_HANDLE

If forward progress cannot be guaranteed for the surface used to create the swapchain member of pAcquireInfo, the timeout member of pAcquireInfo must not be UINT64_MAX

semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

device must be a valid VkDevice handle

swapchain must be a valid VkSwapchainKHR handle

If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

pImageIndex must be a valid pointer to a uint32_t value

swapchain must have been created, allocated, or retrieved from device

If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

If fence is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

Host access to swapchain must be externally synchronized

Host access to semaphore must be externally synchronized
Host access to fence must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

If an image is acquired successfully, vkAcquireNextImageKHR must either return VK_SUCCESS or VK_SUBOPTIMAL_KHR. The implementation may return VK_SUBOPTIMAL_KHR if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

When successful, vkAcquireNextImageKHR acquires a presentable image from swapchain that an application can use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once vkAcquireNextImageKHR successfully acquires an image, the semaphore signal operation referenced by semaphore, if not VK_NULL_HANDLE, and the fence signal operation referenced by fence, if not VK_NULL_HANDLE, are submitted for execution. If vkAcquireNextImageKHR does not successfully acquire an image, semaphore and fence are unaffected. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If timeout is zero, then vkAcquireNextImageKHR does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, vkAcquireNextImageKHR returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and vkAcquireNextImageKHR will block until an image is acquired or an error occurs.

Let S be the number of images in swapchain. Let M be the value of VkSurfaceCapabilitiesKHR::minImageCount.

vkAcquireNextImageKHR should not be called if the number of images that the application has currently acquired is greater than S-M. If vkAcquireNextImageKHR is called when the number of images that the application has currently acquired is less than or equal to S-M,
vkAcquireNextImageKHR must return in finite time with an allowed VkResult code.

**Note**

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use UINT64_MAX. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

**Note**

VK_SUBOPTIMAL_KHR may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either VK_SUBOPTIMAL_KHR or VK_ERROR_OUT_OF_DATE_KHR must be returned. If VK_ERROR_OUT_OF_DATE_KHR is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with VK_ERROR_OUT_OF_DATE_KHR. Applications need to create a new swapchain for the surface to continue presenting if VK_ERROR_OUT_OF_DATE_KHR is returned.

If device loss occurs (see Lost Device) before the timeout has expired, vkAcquireNextImageKHR must return in finite time with either one of the allowed success codes, or VK_ERROR_DEVICE_LOST.

If semaphore is not VK_NULL_HANDLE, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**

Use of semaphore allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If fence is not equal to VK_NULL_HANDLE, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**

Applications should not rely on vkAcquireNextImageKHR blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use fence to meter their frame generation work to match the presentation rate.

An application must wait until either the semaphore or fence is signaled before accessing the image’s data.
When the presentable image will be accessed by some stage $S$, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR`::semaphore in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including $S$.

- The synchronization command that performs any necessary image layout transition includes $S$ in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.

Exclusive ownership of presentable images corresponding to a swapchain created with `VK_SHARING_MODE_EXCLUSIVE` as defined in Resource Sharing is not altered by a call to `vkAcquireNextImageKHR`. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for `vkAcquireNextImageKHR` depend on the `timeout` provided:

- `VK_SUCCESS` is returned if an image became available.
- `VK_ERROR_SURFACE_LOST_KHR` is returned if the surface becomes no longer available.
- `VK_NOT_READY` is returned if `timeout` is zero and no image was available.
- `VK_TIMEOUT` is returned if `timeout` is greater than zero and less than `UINT64_MAX`, and no image became available within the time allowed.
- `VK_SUBOPTIMAL_KHR` is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.

- `VK_ERROR_OUT_OF_DATE_KHR` is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail. If
presentation does succeed, the mapping from the presented image to the native surface is implementation-defined. It is the application’s responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

**Note**

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems **may** squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- **device** is the device associated with `swapchain`.
- **pAcquireInfo** is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- **pImageIndex** is a pointer to a `uint32_t` that is set to the index of the next image to use.

### Valid Usage

- VUID-vkAcquireNextImage2KHR-surface-07784
  If **forward progress** cannot be guaranteed for the **surface** used to create `swapchain`, the **timeout** member of **pAcquireInfo** must not be `UINT64_MAX`

### Valid Usage (Implicit)

- VUID-vkAcquireNextImage2KHR-device-parameter
  **device** **must** be a valid `VkDevice` handle
- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  **pAcquireInfo** **must** be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  **pImageIndex** **must** be a valid pointer to a `uint32_t` value
Return Codes

Success

• VK_SUCCESS
• VK_TIMEOUT
• VK_NOT_READY
• VK_SUBOPTIMAL_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_DEVICE_LOST
• VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR

The `VkAcquireNextImageInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `swapchain` is a non-retired swapchain from which an image is acquired.
• `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
• `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
• `fence` is `VK_NULL_HANDLE` or a fence to signal.
• `deviceMask` is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If `vkAcquireNextImageInfoKHR` is used, the device mask is considered to include all physical devices in the logical device.
vkAcquireNextImage2KHR signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the deviceMask. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  swapchain must not be in the retired state

- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If semaphore is not VK_NULL_HANDLE it must be unsignaled

- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

- VUID-VkAcquireNextImageInfoKHR-fence-01289
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  deviceMask must be a valid device mask

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  deviceMask must not be zero

- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR

- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-VkAcquireNextImageInfoKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle
Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

- Host access to swapchain must be externally synchronized
- Host access to semaphore must be externally synchronized
- Host access to fence must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- `queue` is a queue that is capable of presentation to the target surface’s platform on the same device as the image’s swapchain.
- `pPresentInfo` is a pointer to a VkPresentInfoKHR structure specifying parameters of the presentation.

Note

There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

Valid Usage

- VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of pSwapchains member of pPresentInfo must be a swapchain that is created for a surface for which presentation is supported from queue as determined using a call to vkGetPhysicalDeviceSurfaceSupportKHR

- VUID-vkQueuePresentKHR-pSwapchains-01293
  If more than one member of pSwapchains was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode

- VUID-vkQueuePresentKHR-pWaitSemaphores-01294
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the pWaitSemaphores member of pPresentInfo executes on queue, there must be no other queues waiting on the same semaphore

- VUID-vkQueuePresentKHR-pWaitSemaphores-03267
All elements of the `pWaitSemaphores` member of `pPresentInfo` must be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

- VUID-vkQueuePresentKHR-pWaitSemaphores-03268
  All elements of the `pWaitSemaphores` member of `pPresentInfo` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of queue operations, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

**Note**
The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding queue operation is complete.

Calls to `vkQueuePresentKHR` may block, but must return in finite time.

**Valid Usage (Implicit)**

- VUID-vkQueuePresentKHR-queue-parameter
  `queue` must be a valid `VkQueue` handle

- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  `pPresentInfo` must be a valid pointer to a valid `VkPresentInfoKHR` structure
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to pPresentInfo->pWaitSemaphores[] must be externally synchronized
- Host access to pPresentInfo->pSwapchains[] must be externally synchronized

</tr>
</tbody>
</table>

Return Codes

Success
- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
• `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.

• `pWaitSemaphores` is NULL or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.

• `swapchainCount` is the number of swapchains being presented to by this command.

• `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries.

• `pImageIndices` is a pointer to an array of indices into the array of each swapchain’s presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.

• `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use NULL for `pResults`. If non-NULL, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application can present an image, the image’s layout must be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

---

Note

When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` should be set to 0, and the `dstStageMask` parameter should be set to `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.

---

### Valid Usage

- **VUID-VkPresentInfoKHR-pSwapchain-09231**
  Elements of `pSwapchain` must be unique

- **VUID-VkPresentInfoKHR-pImageIndices-01430**
  Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the `pSwapchains` array, and the presented image subresource must be in the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout at the time the operation is executed on a `VkDevice`

- **VUID-VkPresentInfoKHR-pNext-06235**
  If a `VkPresentIdKHR` structure is included in the `pNext` chain, and the `presentId` feature is not enabled, each `presentIds` entry in that structure must be NULL

### Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
**sType** must be **VK_STRUCTURE_TYPE_PRESENT_INFO_KHR**

- **VUID-VkPresentInfoKHR-pNext-pNext**

  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of **VkDeviceGroupPresentInfoKHR**, **VkDisplayPresentInfoKHR**, **VkFrameBoundaryEXT**, **VkPresentIdKHR**, or **VkPresentRegionsKHR**

- **VUID-VkPresentInfoKHR-sType-unique**

  The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**

  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid **VkSemaphore** handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**

  `pSwapchains` **must** be a valid pointer to an array of `swapchainCount` valid **VkSwapchainKHR** handles

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**

  `pImageIndices` **must** be a valid pointer to an array of `swapchainCount uint32_t` values

- **VUID-VkPresentInfoKHR-pResults-parameter**

  If `pResults` is not `NULL`, `pResults` **must** be a valid pointer to an array of `swapchainCount` **VkResult** values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**

  `swapchainCount` **must** be greater than 0

- **VUID-VkPresentInfoKHR-commonparent**

  Both of the elements of `pSwapchains`, and the elements of `pWaitSemaphores` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same **VkDevice**

When the **VK_KHR_incremental_present** extension is enabled, additional fields **can** be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine **may** use to only update the region of a surface that is actually changing. The application still **must** ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application **can** provide this hint by adding a **VkPresentRegionsKHR** structure to the `pNext` chain of the **VkPresentInfoKHR** structure.

The **VkPresentRegionsKHR** structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **swapchainCount** is the number of swapchains being presented to by this command.

• **pRegions** is **NULL** or a pointer to an array of **VkPresentRegionKHR** elements with **swapchainCount** entries. If not **NULL**, each element of **pRegions** contains the region that has changed since the last present to the swapchain in the corresponding entry in the **VkPresentInfoKHR::pSwapchains** array.

### Valid Usage

- **VUID-VkPresentRegionsKHR-swapchainCount-01260**
  - **swapchainCount must** be the same value as **VkPresentInfoKHR::swapchainCount**, where **VkPresentInfoKHR** is included in the **pNext** chain of this **VkPresentRegionsKHR** structure

### Valid Usage (Implicit)

- **VUID-VkPresentRegionsKHR-sType-sType**
  - **sType must** be **VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR**

- **VUID-VkPresentRegionsKHR-pRegions-parameter**
  - If **pRegions** is not **NULL**, **pRegions must** be a valid pointer to an array of **swapchainCount** valid **VkPresentRegionKHR** structures

- **VUID-VkPresentRegionsKHR-swapchainCount-arraylength**
  - **swapchainCount must** be greater than 0

For a given image and swapchain, the region to present is specified by the **VkPresentRegionKHR** structure, which is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

• **rectangleCount** is the number of rectangles in **pRectangles**, or zero if the entire image has changed and should be presented.

• **pRectangles** is either **NULL** or a pointer to an array of **VkRectLayerKHR** structures. The **VkRectLayerKHR** structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and **must** be presented. If non-**NULL**, each entry in **pRectangles** is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles **must** be specified relative to **VkSurfaceCapabilitiesKHR::currentTransform**, regardless of the swapchain’s **preTransform**. The presentation engine will apply the **preTransform** transformation to the rectangles, along with any further transformation it applies to the image content.
Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If `rectangleCount` is not 0, and `pRectangles` is not NULL, `pRectangles` must be a valid pointer to an array of `rectangleCount` valid `VkRectLayerKHR` structures.

The `VkRectLayerKHR` structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;
```

- `offset` is the origin of the rectangle, in pixels.
- `extent` is the size of the rectangle, in pixels.
- `layer` is the layer of the image. For images with only one layer, the value of `layer` must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. `VkRectLayerKHR` specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of `offset` and `extent`, after being transformed according to the `preTransform` member of the `VkSwapchainCreateInfoKHR` structure, must be no greater than the `imageExtent` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

- VUID-VkRectLayerKHR-layer-01262
  `layer` must be less than the `imageArrayLayers` member of the `VkSwapchainCreateInfoKHR` structure passed to `vkCreateSwapchainKHR`

When the `VK_KHR_display_swapchain` extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting `VkPresentInfoKHR::pNext` to point to a `VkDisplayPresentInfoKHR` structure.

The `VkDisplayPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
};
```
 VkRect2D srcRect;
 VkRect2D dstRect;
 VkBool32 persistent;
} VkDisplayPresentInfoKHR;

• **sType** is a [VkStructureType](#) value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **srcRect** is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If [VkDisplayPresentInfoKHR](#) is not specified, this region will be assumed to be the entire presentable image.

• **dstRect** is a rectangular region within the visible region of the swapchain's display mode. If [VkDisplayPresentInfoKHR](#) is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.

• **persistent**: If this is VK_TRUE, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If [VkDisplayPresentInfoKHR](#) is not specified, persistent mode will not be used.

If the extent of the **srcRect** and **dstRect** are not equal, the presented pixels will be scaled accordingly.

---

**Valid Usage**

• **VUID-VkDisplayPresentInfoKHR-srcRect-01257**
  **srcRect** **must** specify a rectangular region that is a subset of the image being presented

• **VUID-VkDisplayPresentInfoKHR-dstRect-01258**
  **dstRect** **must** specify a rectangular region that is a subset of the **visibleRegion** parameter of the display mode the swapchain being presented uses

• **VUID-VkDisplayPresentInfoKHR-persistentContent-01259**
  If the **persistentContent** member of the [VkDisplayPropertiesKHR](#) structure returned by [vkGetPhysicalDeviceDisplayPropertiesKHR](#) for the display the present operation targets is VK_FALSE, then **persistent** **must** be VK_FALSE

---

**Valid Usage (Implicit)**

• **VUID-VkDisplayPresentInfoKHR-sType-sType**
  **sType** **must** be VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR
If the `pNext` chain of `VkPresentInfoKHR` includes a `VkDeviceGroupPresentInfoKHR` structure, then that structure includes an array of device masks and a device group present mode.

The `VkDeviceGroupPresentInfoKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is zero or the number of elements in `pDeviceMasks`.
- `pDeviceMasks` is a pointer to an array of device masks, one for each element of `VkPresentInfoKHR::pSwapchains`.
- `mode` is a `VkDeviceGroupPresentModeFlagBitsKHR` value specifying the device group present mode that will be used for this present.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` must have exactly one bit set, and the corresponding physical device must have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`.

If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device must have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`. 1670
Valid Usage

• VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount must equal 0 or VkPresentInfoKHR::swapchainCount

• VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If mode is VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks must have exactly one bit set, and the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If mode is VKDEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask

• VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If mode is VKDEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask

• VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If mode is VKDEVICEGROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set in each element of pDeviceMasks, the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of pDeviceMasks must be equal to the device mask passed in VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

• VUID-VkDeviceGroupPresentInfoKHR-mode-01303
  mode must have exactly one bit set, and that bit must have been included in VkDeviceGroupSwapchainCreateInfoKHR::modes

Valid Usage (Implicit)

• VUID-VkDeviceGroupPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR

• VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter
  If swapchainCount is not 0, pDeviceMasks must be a valid pointer to an array of swapchainCount uint32_t values

• VUID-VkDeviceGroupPresentInfoKHR-mode-parameter
  mode must be a valid VkDeviceGroupPresentModeFlagBitsKHR value

The VkPresentIdKHR structure is defined as:

```c
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
  VkStructureType      sType;
```
const void* pNext;
uint32_t swapchainCount;
const uint64_t* pPresentIds;
} VkPresentIdKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to the vkQueuePresentKHR command.
- **pPresentIds** is NULL or a pointer to an array of uint64_t with swapchainCount entries. If not NULL, each non-zero value in **pPresentIds** specifies the present id to be associated with the presentation of the swapchain with the same index in the vkQueuePresentKHR call.

For applications to be able to reference specific presentation events queued by a call to vkQueuePresentKHR, an identifier needs to be associated with them. When the presentId feature is enabled, applications can include the VkPresentIdKHR structure in the **pNext** chain of the VkPresentInfoKHR structure to supply identifiers.

Each VkSwapchainKHR has a presentId associated with it. This value is initially set to zero when the VkSwapchainKHR is created.

When a VkPresentIdKHR structure with a non-NULL pPresentIds is included in the **pNext** chain of a VkPresentInfoKHR structure, each pSwapchains entry has a presentId associated in the pPresentIds array at the same index as the swapchain in the pSwapchains array. If this presentId is non-zero, then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

**Valid Usage**

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where this VkPresentIdKHR is in the **pNext** chain of the VkPresentInfoKHR structure

- **VUID-VkPresentIdKHR-presentIds-04999**
  Each presentIds entry must be greater than any previous presentIds entry passed for the associated pSwapchains entry

**Valid Usage (Implicit)**

- **VUID-VkPresentIdKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PRESENT_ID_KHR
When the presentWait feature is enabled, an application can wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a VkPresentIdKHR structure to the pNext chain of the VkPresentInfoKHR structure and then waiting for that presentation to complete by calling:

```cpp
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t presentId,
    uint64_t timeout);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain on which an image was queued for presentation.
- **presentId** is the presentation presentId to wait for.
- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

vkWaitForPresentKHR waits for the presentId associated with **swapchain** to be increased in value so that it is at least equal to **presentId**.

For VK_PRESENT_MODE_MAILBOX_KHR (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image must be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related pSwapchains entry will be increased in value so that it is at least equal to the value provided in the VkPresentIdKHR structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to vkWaitForPresentKHR will block until either the presentId associated with **swapchain** is greater than or equal to **presentId**, or timeout nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return VK_SUCCESS (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status VK_ERROR_OUT_OF_DATE_KHR (if the image was not presented to the user).
As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to `vkWaitForPresentKHR` may be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR`. Access to the swapchain data associated with this extension must be atomic within the implementation.

### Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
  swapchain must not be in the retired state

- VUID-vkWaitForPresentKHR-presentWait-06234
  The presentWait feature must be enabled

### Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  device must be a valid `VkDevice` handle

- VUID-vkWaitForPresentKHR-swapchain-parameter
  swapchain must be a valid `VkSwapchainKHR` handle

- VUID-vkWaitForPresentKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to swapchain must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS
- VK_TIMEOUT
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

`vkQueuePresentKHR` releases the acquisition of the images referenced by `imageIndices`. The queue
family corresponding to the queue vkQueuePresentKHR is executed on must have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using vkAcquireNextImageKHR.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes VK_ERROR_OUT_OF_DATE_KHR and VK_SUBOPTIMAL_KHR have the same meaning when returned by vkQueuePresentKHR as they do when returned by vkAcquireNextImageKHR. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, VK_ERROR_DEVICE_LOST is returned.
- If any of the target surfaces are no longer available the error VK_ERROR_SURFACE_LOST_KHR is returned.
- If any of the presents would have a result of VK_ERROR_OUT_OF_DATE_KHR if issued separately then VK_ERROR_OUT_OF_DATE_KHR is returned.
- If any of the presents would have a result of VK_SUBOPTIMAL_KHR if issued separately then VK_SUBOPTIMAL_KHR is returned.
- Otherwise VK_SUCCESS is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Note

The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes vkQueuePresentKHR to return VK_ERROR_OUT_OF_DATE_KHR.
Chapter 31. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

31.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed by the implementation at any time until the deferred operation enters the complete state. The application must obey the following rules while a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.
When the deferred operation is complete, the application should call `vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation may perform memory management operations on the allocator supplied to `vkCreateDeferredOperationKHR` for the deferred operation object, as described in the Memory Allocation chapter. Such allocations must occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation may perform memory management operations on this allocator during the execution of `vkDeferredOperationJoinKHR`. These operations may occur concurrently and may be performed by any joined thread. The application must ensure that the supplied allocator is able to operate correctly under these conditions.

### 31.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- `device` is the device which owns `operation`.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter `pDeferredOperation` must be a valid pointer to a `VkDeferredOperationKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` can be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread
must execute the operation to completion and return VK_SUCCESS.

2. If multiple threads have concurrently invoked vkDeferredOperationJoinKHR on the same operation, then at least one of them must complete the operation and return VK_SUCCESS.

### Valid Usage (Implicit)

- VUID-vkDeferredOperationJoinKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkDeferredOperationJoinKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle
- VUID-vkDeferredOperationJoinKHR-operation-parent
operation must have been created, allocated, or retrieved from device

### Return Codes

#### Success
- VK_SUCCESS
- VK_THREAD_DONE_KHR
- VK_THREAD_IDLE_KHR

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application can destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(VkDevice device,
                                  VkDeferredOperationKHR operation,
                                  const VkAllocationCallbacks* pAllocator);
```

- device is the device which owns operation.
- operation is the completed operation to be destroyed.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
If VkAllocationCallbacks were provided when operation was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyDeferredOperationKHR-operation-03435
If no VkAllocationCallbacks were provided when operation was created, pAllocator must be NULL.

- VUID-vkDestroyDeferredOperationKHR-operation-03436 operation must be completed

### Valid Usage (Implicit)

- VUID-vkDestroyDeferredOperationKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyDeferredOperationKHR-operation-parameter
If operation is not VK_NULL_HANDLE, operation must be a valid VkDeferredOperationKHR handle

- VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyDeferredOperationKHR-operation-parent
If operation is a valid handle, it must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to operation must be externally synchronized

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return VK_THREAD_DONE_KHR immediately, performing no useful work.

If operation is complete, vkGetDeferredOperationMaxConcurrencyKHR returns zero.

If operation is currently joined to any threads, the value returned by this command may
immediately be out of date.

If operation is pending, implementations must not return zero unless at least one thread is currently executing `vkDeferredOperationJoinKHR` on operation. If there are such threads, the implementation should return an estimate of the number of additional threads which it could profitably use.

Implementations may return $2^{32} - 1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations may return values larger than the maximum concurrency available on the host CPU. In these situations, an application should clamp the return value rather than oversubscribing the machine.

Note

The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives `VK_THREAD_IDLE_KHR`, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter `operation` must be a valid `VkDeferredOperationKHR` handle
- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent `operation` must have been created, allocated, or retrieved from `device`

The `vkGetDeferredOperationResultKHR` function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice                    device,    // device is the device which owns operation.
    VkDeferredOperationKHR     operation        // operation is the operation whose deferred result is being queried.
);
```

If no command has been deferred on `operation`, `vkGetDeferredOperationResultKHR` returns `VK_SUCCESS`.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value must be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.
**Valid Usage (Implicit)**

- VUID-vkGetDeferredOperationResultKHR-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
  operation must be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
  operation must have been created, allocated, or retrieved from device

**Return Codes**

**Success**
- VK_SUCCESS
- VK_NOT_READY
Chapter 32. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a VkDevicePrivateDataCreateInfo in the pNext chain in VkDeviceCreateInfo before device creation. Multiple VkDevicePrivateDataCreateInfo structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by VkPrivateDataSlot handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice device, 
    const VkPrivateDataSlotCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkPrivateDataSlot* pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pCreateInfo` is a pointer to a VkPrivateDataSlotCreateInfo
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPrivateDataSlot` is a pointer to a VkPrivateDataSlot handle in which the resulting private data slot is returned

Valid Usage

- VUID-vkCreatePrivateDataSlot-privateData-04564
  The privateData feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreatePrivateDataSlot-device-parameter
  device must be a valid VkDevice handle
• VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkPrivateDataSlotCreateInfo structure

• VUID-vkCreatePrivateDataSlot-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter
  pPrivateDataSlot must be a valid pointer to a VkPrivateDataSlot handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkPrivateDataSlotCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.

Valid Usage (Implicit)

• VUID-VkPrivateDataSlotCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO

• VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask
  flags must be 0

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;
```

VkPrivateDataSlotCreateFlags is a bitmask type for setting a mask, but is currently reserved for
To destroy a private data slot, call:

```c
// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `privateDataSlot` is the private data slot to destroy.

### Valid Usage

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062
  If `VkAllocationCallbacks` were provided when `privateDataSlot` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063
  If no `VkAllocationCallbacks` were provided when `privateDataSlot` was created, `pAllocator` must be `NULL`.

### Valid Usage (Implicit)

- VUID-vkDestroyPrivateDataSlot-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter
  If `privateDataSlot` is not `VK_NULL_HANDLE`, `privateDataSlot` must be a valid `VkPrivateDataSlot` handle.

- VUID-vkDestroyPrivateDataSlot-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent
  If `privateDataSlot` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `privateDataSlot` must be externally synchronized.
To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkSetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
  - `objectHandle must be device or a child of device`
- VUID-vkSetPrivateData-objectHandle-04017
  - `objectHandle must be a valid handle to an object of type objectType`

### Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
  - `device must be a valid VkDevice handle`
- VUID-vkSetPrivateData-objectType-parameter
  - `objectType must be a valid VkObjectType value`
- VUID-vkSetPrivateData-privateDataSlot-parameter
  - `privateDataSlot must be a valid VkPrivateDataSlot handle`
- VUID-vkSetPrivateData-privateDataSlot-parent
  - `privateDataSlot must have been created, allocated, or retrieved from device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

- `device` is the device that created the object
- `objectType` is a `VkObjectType` specifying the type of object data is associated with.
- `objectHandle` is a handle to the object data is associated with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data pointer storage.
- `pData` is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to `vkSetPrivateData` using the object specified by `objectHandle`.

**Note**

Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateData` for `VkSwapchainKHR` objects on which `vkSetPrivateData` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.

### Valid Usage

- VUID-vkGetPrivateData-objectType-04018
  - `objectHandle` must be `device` or a child of `device`
- VUID-vkGetPrivateData-objectHandle-09498
  - `objectHandle` must be a valid handle to an object of type `objectType`

### Valid Usage (Implicit)

- VUID-vkGetPrivateData-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetPrivateData-objectType-parameter
  - `objectType` must be a valid `VkObjectType` value
- VUID-vkGetPrivateData-privateDataSlot-parameter
  - `privateDataSlot` must be a valid `VkPrivateDataSlot` handle
- VUID-vkGetPrivateData-pData-parameter
  - `pData` must be a valid pointer to a `uint64_t` value
- VUID-vkGetPrivateData-privateDataSlot-parent
**privateDataSlot** must have been created, allocated, or retrieved from **device**.
Chapter 33. Acceleration Structures

33.1. Acceleration Structures

*Acceleration structures* are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see *Acceleration Structures*), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an *acceleration structure build command* or *copy command* has been executed with the given acceleration structure as the destination.

![Diagram of Acceleration Structure](image)

*Figure 22. Acceleration Structure*

**Caption**

The diagram shows the relationship between top and bottom level acceleration structures.

33.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.
33.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

33.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

33.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.
• Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and 
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT was set in flags, the application must provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application must provide the original micromap to the update operation.

33.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal inactive primitives or instances.

An inactive triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An inactive instance is one whose acceleration structure reference is 0.

An inactive AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via InstanceId and PrimitiveId SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.

33.1.6. Building Acceleration Structures

To build acceleration structures call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer, ...
)
```
uint32_t infoCount,
const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

Note

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `(VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR | VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR)`. Accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, as appropriate.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.
Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its
game.triangles.indexType member must have the same value which was specified
when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its
game.triangles.transformData address was NULL when srcAccelerationStructure was
  last built, then it must be NULL

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its
game.triangles.transformData address was not NULL when srcAccelerationStructure was
  last built, then it must not be NULL

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and
game.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index
  referenced must be the same as the corresponding index value when srcAccelerationStructure was
  last built

- VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, the primitiveCount member of its corresponding
  VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was
  specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if the geometry uses indices, the firstVertex member of its
  corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same
  value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount
  must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR
For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`.

For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.
• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710
  For each element of pInfos, its scratchData.deviceAddress member must be a multiple of
  VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a
  valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the
  address of a non-sparse buffer then it must be bound completely and contiguously to a
  single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be
  aligned to the size in bytes of the smallest component of the format in vertexFormat

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not
  VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid
  device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not
  VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to
  the size in bytes of the type in indexType

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexType not equal to
  VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to
  the size in bytes of the type in indexType

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not
  0, it must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
  VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the
  address of a non-sparse buffer then it must be bound completely and contiguously to a
  single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of
VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be aligned to 8 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03716
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, geometry.instances.data.deviceAddress must be aligned to 8 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03717
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-06707
  For any element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in geometry.instances.data.deviceAddress must be a valid device address containing a value obtained from vkGetAccelerationStructureDeviceAddressKHR or 0

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675
  For each pInfo[i], dstAccelerationStructure must have been created with a value of
VkAccelerationStructureCreateInfoKHR::size greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfos[i] and with each element of the pMaxPrimitiveCounts array greater than or equal to the equivalent ppBuildRangeInfos[i][j].primitiveCount values for j in [0,pInfos[i].geometryCount)

- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676
  Each element of ppBuildRangeInfos[i] must be a valid pointer to an array of pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter
  ppBuildRangeInfos must be a valid pointer to an array of infoCount VkAccelerationStructureBuildRangeInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresKHR-vidcoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructuresKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To build acceleration structures with some parameters sourced on the device call:

```c
// Provided by VK_KHRAccelerationStructure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **infoCount** is the number of acceleration structures to build.
- **pInfos** is a pointer to an array of **infoCount** `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- **pIndirectDeviceAddresses** is a pointer to an array of **infoCount** buffer device addresses which point to `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.
- **pIndirectStrides** is a pointer to an array of **infoCount** byte strides between elements of `pIndirectDeviceAddresses`.
- **ppMaxPrimitiveCounts** is a pointer to an array of **infoCount** pointers to arrays of `pInfos[i].geometryCount` values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with `vkCmdBuildAccelerationStructuresKHR`.

Accesses to any element of `pIndirectDeviceAddresses` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_INDIRECT_COMMAND_READ_BIT`.

**Valid Usage**

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild` feature must be enabled
The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced.
by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701**
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702**
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703**
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704**
The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705**
The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command **must** not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667**
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668**
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members **must** either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member must have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it must not be NULL

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced must be the same as the corresponding index value when srcAccelerationStructure was last built

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if the geometry uses indices, the firstVertex member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppMaxPrimitiveCounts[i][j] must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

For each element of pInfos, the buffer used to create its dstAccelerationStructure member must be bound to device memory

For each element of pInfos, if its mode member is
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its `srcAccelerationStructure` member **must** be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03709**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to device memory.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03671**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03672**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` **must** be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried **must** have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03674**
  The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried **must** have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802**
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803**
  For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710**
  For each element of `pInfos`, its `scratchData.deviceAddress` member **must** be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of...
VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.deviceAddress` **must** be aligned to 8 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_FALSE`, `geometry.instances.data.deviceAddress` **must** be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.arrayOfPointers` is `VK_TRUE`, each element of `geometry.instances.data.deviceAddress` in device memory **must** be aligned to 16 bytes.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.deviceAddress` **must** be a valid device address obtained from `vkGetBufferDeviceAddress`.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, if `geometry.instances.data.deviceAddress` is the address of a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` **must** be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

For any element of `pIndirectDeviceAddresses`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × pIndirectStrides[i]) - 1` **must** be in the buffer device address range of the same buffer.

For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × pIndirectStrides[i]) - 1` **must** be in the buffer device address range of the same buffer.
For any element of \( p\text{IndirectDeviceAddresses} \), the buffer from which it was queried must have been created with the \( \text{VK\_BUFFER\_USAGE\_INDIRECT\_BUFFER\_BIT} \) bit set

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648
  Each element of \( p\text{IndirectDeviceAddresses} \) must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-03787
  Each element of \( p\text{IndirectStrides} \) must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649
  \( \text{commandBuffer} \) must not be a protected command buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651
  Each \( \text{VkAccelerationStructureBuildRangeInfoKHR} \) structure referenced by any element of \( p\text{IndirectDeviceAddresses} \) must be a valid \( \text{VkAccelerationStructureBuildRangeInfoKHR} \) structure

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652
  \( \text{pInfos}[i].\text{dstAccelerationStructure} \) must have been created with a value of \( \text{VkAccelerationStructureCreateInfoKHR}::\text{size} \) greater than or equal to the memory size required by the build operation, as returned by \( \text{vkGetAccelerationStructureBuildSizesKHR} \) with \( \text{pBuildInfo} = \text{pInfos}[i] \) and \( \text{pMaxPrimitiveCounts} = \text{ppMaxPrimitiveCounts}[i] \)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653
  Each \( \text{ppMaxPrimitiveCounts}[i][j] \) must be greater than or equal to the \( \text{primitiveCount} \) value specified by the \( \text{VkAccelerationStructureBuildRangeInfoKHR} \) structure located at \( p\text{IndirectDeviceAddresses}[i] + (j \times p\text{IndirectStrides}[i]) \)

### Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  \( \text{pInfos} \) must be a valid pointer to an array of \( \text{infoCount} \) valid \( \text{VkAccelerationStructureBuildGeometryInfoKHR} \) structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  \( p\text{IndirectDeviceAddresses} \) must be a valid pointer to an array of \( \text{infoCount} \) \( \text{VkDeviceAddress} \) values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  \( p\text{IndirectStrides} \) must be a valid pointer to an array of \( \text{infoCount} \) \( \text{uint32\_t} \) values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  \( \text{ppMaxPrimitiveCounts} \) must be a valid pointer to an array of \( \text{infoCount} \) \( \text{uint32\_t} \) values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  \( \text{commandBuffer} \) must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support compute
operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkAccelerationStructureBuildGeometryInfoKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is a VkAccelerationStructureTypeKHR value specifying the type of acceleration structure being built.
• **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsKHR` specifying additional parameters of the acceleration structure.

• **mode** is a `VkBuildAccelerationStructureModeKHR` value specifying the type of operation to perform.

• **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.

• **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.

• **geometryCount** specifies the number of geometries that will be built into `dstAccelerationStructure`.

• **pGeometries** is a pointer to an array of `VkAccelerationStructureGeometryKHR` structures.

• **ppGeometries** is a pointer to an array of pointers to `VkAccelerationStructureGeometryKHR` structures.

• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`. Each element of the non-NULL array describes the data used to build each acceleration structure geometry.

The index of each element of the `pGeometries` or `ppGeometries` members of `VkAccelerationStructureBuildGeometryInfoKHR` is used as the `geometry index` during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.

Members `srcAccelerationStructure` and `dstAccelerationStructure` may be the same or different for an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

---

### Valid Usage

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654
  - `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788
  - Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` must be `1`

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` the `geometryType` member of
elements of either \texttt{pGeometries} or \texttt{ppGeometries} \textbf{must} not be \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792**
  If \texttt{type} is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} then the \texttt{geometryType} member of each geometry in either \texttt{pGeometries} or \texttt{ppGeometries} \textbf{must} be the same

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793**
  If \texttt{type} is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} then \texttt{geometryCount} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794**
  If \texttt{type} is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} and the \texttt{geometryType} member of either \texttt{pGeometries} or \texttt{ppGeometries} is \texttt{VK_GEOMETRY_TYPE_AABBS_KHR}, the total number of AABBs in all geometries \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795**
  If \texttt{type} is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} and the \texttt{geometryType} member of either \texttt{pGeometries} or \texttt{ppGeometries} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, the total number of triangles in all geometries \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796**
  If \texttt{flags} has the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR} bit set, then it \textbf{must} not have the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR} bit set

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-07334**
  If \texttt{flags} has the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT} bit set then it \textbf{must} not have the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT} bit set

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType**
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext**
  \texttt{pNext} \textbf{must} be \texttt{NULL}

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter**
  \texttt{type} \textbf{must} be a valid \texttt{VkAccelerationStructureTypeKHR} value

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter**
  \texttt{flags} \textbf{must} be a valid combination of \texttt{VkBuildAccelerationStructureFlagBitsKHR} values

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter**
  If \texttt{geometryCount} is not 0, and \texttt{pGeometries} is not \texttt{NULL}, \texttt{pGeometries} \textbf{must} be a valid pointer to an array of \texttt{geometryCount} valid \texttt{VkAccelerationStructureGeometryKHR} structures

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter**
  If \texttt{geometryCount} is not 0, and \texttt{ppGeometries} is not \texttt{NULL}, \texttt{ppGeometries} \textbf{must} be a valid pointer
to an array of `geometryCount` valid pointers to valid `VkAccelerationStructureGeometryKHR` structures

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent**
  Both of `dstAccelerationStructure`, and `srcAccelerationStructure` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkBuildAccelerationStructureModeKHR` enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` specifies that the destination acceleration structure will be built using the specified geometries.
- `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The `VkDeviceOrHostAddressKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- `hostAddress` is a host memory address.

The `VkDeviceOrHostAddressConstKHR` union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- `hostAddress` is a const host memory address.
The `VkAccelerationStructureGeometryKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `geometryType` describes which type of geometry this `VkAccelerationStructureGeometryKHR` refers to.
- `geometry` is a `VkAccelerationStructureGeometryDataKHR` union describing the geometry data for the relevant geometry type.
- `flags` is a bitmask of `VkGeometryFlagBitsKHR` values describing additional properties of how the geometry should be built.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR`

- VUID-VkAccelerationStructureGeometryKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter
  `geometryType` must be a valid `VkGeometryTypeKHR` value

- VUID-VkAccelerationStructureGeometryKHR-triangles-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `triangles` member of `geometry` must be a valid `VkAccelerationStructureGeometryTrianglesDataKHR` structure

- VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the `aabbs` member of `geometry` must be a valid `VkAccelerationStructureGeometryAabbsDataKHR` structure

- VUID-VkAccelerationStructureGeometryKHR-instances-parameter
  If `geometryType` is `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the `instances` member of `geometry` must be a valid `VkAccelerationStructureGeometryInstancesDataKHR` structure

- VUID-VkAccelerationStructureGeometryKHR-flags-parameter
  `flags` must be a valid combination of `VkGeometryFlagBitsKHR` values

The `VkAccelerationStructureGeometryDataKHR` union is defined as:

```c
1714
```
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR triangles;
    VkAccelerationStructureGeometryAabbsDataKHR aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;

- **triangles** is a VkAccelerationStructureGeometryTrianglesDataKHR structure.
- **aabbs** is a VkAccelerationStructureGeometryAabbsDataKHR structure.
- **instances** is a VkAccelerationStructureGeometryInstancesDataKHR structure.

The VkAccelerationStructureGeometryTrianglesDataKHR structure is defined as:

typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **vertexFormat** is the VkFormat of each vertex element.
- **vertexData** is a device or host address to memory containing vertex data for this geometry.
- **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.
- **vertexStride** is the stride in bytes between each vertex.
- **indexType** is the VkIndexType of each index element.
- **indexData** is a device or host address to memory containing index data for this geometry.
- **transformData** is a device or host address to memory containing an optional reference to a VkTransformMatrixKHR structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

**Note**

Unlike the stride for vertex buffers in VkVertexInputBindingDescription for graphics pipelines which must not exceed maxVertexInputBindingStride,
vertexStride for acceleration structure geometry is instead restricted to being a 32-bit value.

### Valid Usage

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
  - **vertexStride** must be a multiple of the size in bytes of the smallest component of **vertexFormat**
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
  - **vertexStride** must be less than or equal to \(2^{32}-1\)
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
  - The format features of **vertexFormat** must contain **VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR**
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798
  - **indexType** must be **VK_INDEX_TYPE_UINT16**, **VK_INDEX_TYPE_UINT32**, or **VK_INDEX_TYPE_NONE_KHR**

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  - **sType** must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR**
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  - **pNext** must be NULL or a pointer to a valid instance of **VkAccelerationStructureTrianglesOpacityMicromapEXT**
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  - The **sType** value of each struct in the **pNext** chain must be unique
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  - **vertexFormat** must be a valid **VkFormat** value
- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  - **indexType** must be a valid **VkIndexType** value

The **VkAccelerationStructureTrianglesOpacityMicromapEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **indexType** is the type of triangle indices used when indexing this micromap.

• **indexBuffer** is the address containing the triangle indices.

• **indexStride** is the byte stride between triangle indices.

• **baseTriangle** is the base value added to the non-negative triangle indices.

• **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.

• **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.

• **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.

• **micromap** is the handle to the micromap object to include in this geometry.

If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the **pNext** chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from **indexBuffer** using **indexType** and **indexStride**. If that value is the unsigned cast of one of the values from `VkOpacityMicromapSpecialIndexEXT` then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from **micromap** at that index plus **baseTriangle**.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given **format** and **subdivisionLevel** the number of triangles in this geometry matching those values after indirection and special index handling must be equal to the sum of matching **count** provided.

If **micromap** is `VK_NULL_HANDLE`, then every value read from **indexBuffer** must be one of the values in `VkOpacityMicromapSpecialIndexEXT`.

### Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be `NULL`

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT`

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter
**indexType** must be a valid `VkIndexType` value

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If `usageCountsCount` is not 0, and `pUsageCounts` is not NULL, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not 0, and `ppUsageCounts` is not NULL, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle

The `VkOpacityMicromapSpecialIndexEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;
```

- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT` specifies that the entire triangle is fully transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT` specifies that the entire triangle is fully opaque.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT` specifies that the entire triangle is unknown-transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT` specifies that the entire triangle is unknown-opaque.

The `VkTransformMatrixKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;
```

- `matrix` is a 3x4 row-major affine transformation matrix.

**Valid Usage**

- VUID-VkTransformMatrixKHR-matrix-03799
  The first three columns of `matrix` must define an invertible 3x3 matrix
The `VkAccelerationStructureGeometryAabbsDataKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `data` is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
- `stride` is the stride in bytes between each entry in `data`. The stride must be a multiple of `8`.

### Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  `stride` must be a multiple of `8`

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  `stride` must be less than or equal to $2^{32}-1$

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR`

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  `pNext` must be `NULL`

The `VkAabbPositionsKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

- `minX` is the x position of one opposing corner of a bounding box.
• minY is the y position of one opposing corner of a bounding box.
• minZ is the z position of one opposing corner of a bounding box.
• maxX is the x position of the other opposing corner of a bounding box.
• maxY is the y position of the other opposing corner of a bounding box.
• maxZ is the z position of the other opposing corner of a bounding box.

Valid Usage

• VUID-VkAabbPositionsKHR-minX-03546
  minY must be less than or equal to maxX
• VUID-VkAabbPositionsKHR-minY-03547
  minY must be less than or equal to maxY
• VUID-VkAabbPositionsKHR-minZ-03548
  minZ must be less than or equal to maxZ

The VkAccelerationStructureGeometryInstancesDataKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• arrayOfPointers specifies whether data is used as an array of addresses or just an array.
• data is either the address of an array of device or host addresses referencing individual VkAccelerationStructureInstanceKHR structures if arrayOfPointers is VK_TRUE, or the address of an array of VkAccelerationStructureInstanceKHR structures. Addresses and VkAccelerationStructureInstanceKHR structures are tightly packed.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR
• VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
  pNext must be NULL

Acceleration structure instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which
includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

- **transform** is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.
- **accelerationStructureReference** is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory
- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another
method to set values according to the correct bit pattern.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter

  flags must be a valid combination of VkGeometryInstanceFlagBitsKHR values

Possible values of flags in the instance modifying the behavior of that instance are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
        VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR,
    } VkGeometryInstanceFlagBitsKHR;
```

- **VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR** disables face culling for this instance.
- **VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR** indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.
- **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V NoOpaqueKHR ray flag.
- **VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V OpaqueKHR ray flag.

**VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** and **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** must not be used in the same flag.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

**VkGeometryInstanceFlagsKHR** is a bitmask type for setting a mask of zero or more **VkGeometryInstanceFlagBitsKHR**.

**VkAccelerationStructureBuildRangeInfoKHR** is defined as:

1722
```c
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
  uint32_t primitiveCount;
  uint32_t primitiveOffset;
  uint32_t firstVertex;
  uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- **primitiveCount** defines the number of primitives for a corresponding acceleration structure geometry.
- **primitiveOffset** defines an offset in bytes into the memory where primitive data is defined.
- **firstVertex** is the index of the first vertex to build from for triangle geometry.
- **transformOffset** defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the VkGeometryTypeKHR used:

- For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, **primitiveCount** is the number of triangles to be built, where each triangle is treated as 3 vertices.
  - If the geometry uses indices, **primitiveCount** × 3 indices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, starting at an offset of **primitiveOffset**. The value of **firstVertex** is added to the index values before fetching vertices.
  - If the geometry does not use indices, **primitiveCount** × 3 vertices are consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, starting at an offset of **primitiveOffset** + `VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride` × **firstVertex**.
  - If `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` is not NULL, a single `VkTransformMatrixKHR` structure is consumed from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, at an offset of **transformOffset**. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

- For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, **primitiveCount** is the number of axis-aligned bounding boxes. **primitiveCount** `VkAabbPositionsKHR` structures are consumed from `VkAccelerationStructureGeometryAabbsDataKHR::data`, starting at an offset of **primitiveOffset**.

- For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, **primitiveCount** is the number of acceleration structures. **primitiveCount** `VkAccelerationStructureInstanceKHR` structures are consumed from `VkAccelerationStructureGeometryInstancesDataKHR::data`, starting at an offset of **primitiveOffset**.

**Valid Usage**

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry uses indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::indexData` must be a multiple of the element size of `VkAccelerationStructureGeometryTrianglesDataKHR::indexType`

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657

For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the geometry does not use indices, the offset `primitiveOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData` must be a multiple of the component size of `VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat`

- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658

For geometries of type `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the offset `transformOffset` from `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` must be a multiple of 16

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659

For geometries of type `VK_GEOMETRY_TYPE_AABBS_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryAabbsDataKHR::data` must be a multiple of 8

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03660

For geometries of type `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the offset `primitiveOffset` from `VkAccelerationStructureGeometryInstancesDataKHR::data` must be a multiple of 16

### 33.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
defined void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
• **firstQuery** is the first query index within the query pool that will contain the **accelerationStructureCount** number of results.

Accesses to any of the acceleration structures listed in **pAccelerationStructures** must be synchronized with the **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR** pipeline stage or the **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage, and an access type of **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR**.

• If **queryType** is **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR**, then the value written out is the number of bytes required by a compacted acceleration structure.

• If **queryType** is **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR**, then the value written out is the number of bytes required by a serialized acceleration structure.

---

**Valid Usage**

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924**
  The **VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure** feature must be enabled

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493**
  The queries identified by **queryPool** and **firstQuery** must be **unavailable**

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-06742**
  **queryType** must be **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR**, **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR**, **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR**, or **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR**

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
  All acceleration structures in **pAccelerationStructures** must have been built prior to the execution of this command

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in **pAccelerationStructures** must have been built with **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** if **queryType** is **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR**

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736**
  The buffer used to create each acceleration structure in **pAccelerationStructures** must be bound to device memory

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880**
  The sum of **query** plus **accelerationStructureCount** must be less than or equal to the number of queries in **queryPool**

• **VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
  All acceleration structures in **pAccelerationStructures** must have been built prior to the execution of this command
Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount`
  valid `VkAccelerationStructureKHR` handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  `queryType` must be a valid `VkQueryType` value

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-vidmodalcoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  `accelerationStructureCount` must be greater than 0

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have
  been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
  synchronized

1726
To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` **must** be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

### Valid Usage

- **VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature **must** be enabled

- **VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737**
  The buffer used to create `pInfo->src` **must** be bound to device memory

- **VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738**
  The buffer used to create `pInfo->dst` **must** be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter**
  `pInfo` **must** be a valid pointer to a valid `VkCopyAccelerationStructureInfoKHR` structure

- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdCopyAccelerationStructureKHR-renderpass**
  This command **must** only be called outside of a render pass instance
• VUID-vkCmdCopyAccelerationStructureKHR-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

The VkCopyAccelerationStructureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void*   pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• src is the source acceleration structure for the copy.
• dst is the target acceleration structure for the copy.
• mode is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

Valid Usage

• VUID-VkCopyAccelerationStructureInfoKHR-mode-03410
  mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR or VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR
• VUID-VkCopyAccelerationStructureInfoKHR-src-04963
  The sourceCopyAccelerationStructure structure src must have been constructed prior to the execution
of this command

• VUID-VkCopyAccelerationStructureInfoKHR-src-03411
  If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build.

• VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718
  The buffer used to create `src` must be bound to device memory.

• VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719
  The buffer used to create `dst` must be bound to device memory.

• VUID-VkCopyAccelerationStructureInfoKHR-dst-07791
  The range of memory backing `dst` that is accessed by this command must not overlap the memory backing `src` that is accessed by this command.

• VUID-VkCopyAccelerationStructureInfoKHR-dst-07792
  `dst` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.

Valid Usage (Implicit)

• VUID-VkCopyAccelerationStructureInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR`.

• VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext
  `pNext` must be `NULL`.

• VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
  `src` must be a valid `VkAccelerationStructureKHR` handle.

• VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
  `dst` must be a valid `VkAccelerationStructureKHR` handle.

• VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value.

• VUID-VkCopyAccelerationStructureInfoKHR-commonparent
  Both of `dst`, and `src` must have been created, allocated, or retrieved from the same `VkDevice`.

Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
} VkCopyAccelerationStructureModeKHR;
```

• `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR` creates a direct copy of the acceleration
structure specified in src into the one specified by dst. The dst acceleration structure must have been created with the same parameters as src. If src contains references to other acceleration structures, dst will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure src into dst. The acceleration structure dst must have been created with a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` after the build of the acceleration structure specified by src. If src contains references to other acceleration structures, dst will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR** serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer, 
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_TRANSFER_WRITE_BIT.

This command produces the same results as `vkCopyAccelerationStructureToMemoryKHR`, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

The defined header structure for the serialized data consists of:

- **VK_UUID_SIZE** bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- **VK_UUID_SIZE** bytes of data identifying the compatibility for comparison using `vkGetDeviceAccelerationStructureCompatibilityKHR`
- A 64-bit integer of the total size matching the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`
• A 64-bit integer of the deserialized size to be passed in to `VkAccelerationStructureCreateInfoKHR::size`.

• A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by `vkGetAccelerationStructureDeviceAddressKHR` are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

**Valid Usage**

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739**
  `pInfo->dst.deviceAddress` must be a valid device address for a buffer bound to device memory.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740**
  `pInfo->dst.deviceAddress` must be aligned to 256 bytes.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741**
  If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559**
  The buffer used to create `pInfo->src` must be bound to device memory.

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.

### Valid Usage

• VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959
  The source acceleration structure src must have been constructed prior to the execution of this command

• VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561
The memory pointed to by \texttt{dst} \textbf{must} be at least as large as the serialization size of \texttt{src}, as reported by \texttt{vkWriteAccelerationStructuresPropertiesKHR} or \texttt{vkCmdWriteAccelerationStructuresPropertiesKHR} with a query type of \texttt{VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR}.

- \texttt{VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412}
  \texttt{mode} \textbf{must} be \texttt{VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR}.

\section*{Valid Usage (Implicit)}

- \texttt{VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType}
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR}.

- \texttt{VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext}
  \texttt{pNext} \textbf{must} be \texttt{NULL}.

- \texttt{VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter}
  \texttt{src} \textbf{must} be a valid \texttt{VkAccelerationStructureKHR} handle.

- \texttt{VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter}
  \texttt{mode} \textbf{must} be a valid \texttt{VkCopyAccelerationStructureModeKHR} value.

To copy device memory to an acceleration structure call:

\begin{verbatim}
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
\end{verbatim}

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.

- \texttt{pInfo} is a pointer to a \texttt{VkCopyMemoryToAccelerationStructureInfoKHR} structure defining the copy operation.

Accesses to \texttt{pInfo->dst} \textbf{must} be synchronized with the \texttt{VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR} pipeline stage or the \texttt{VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR} pipeline stage, and an access type of \texttt{VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR}. Accesses to the buffer indicated by \texttt{pInfo->src.deviceAddress} \textbf{must} be synchronized with the \texttt{VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR} pipeline stage or the \texttt{VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR} pipeline stage, and an access type of \texttt{VK_ACCESS_TRANSFER_READ_BIT}.

This command can accept acceleration structures produced by either \texttt{vkCmdCopyAccelerationStructureToMemoryKHR} or \texttt{vkCopyAccelerationStructureToMemoryKHR}.

The structure provided as input to deserialize is as described in \texttt{vkCmdCopyAccelerationStructureToMemoryKHR}, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before
deserialization. These do not need to be built at deserialize time, but must be created.

### Valid Usage

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742**
  `pInfo->src.deviceAddress` must be a valid device address for a buffer bound to device memory.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743**
  `pInfo->src.deviceAddress` must be aligned to 256 bytes.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744**
  If the buffer pointed to by `pInfo->src.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745**
  The buffer used to create `pInfo->dst` must be bound to device memory.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToAccelerationStructureInfoKHR` structure.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass**
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding**
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960**
  The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyAccelerationStructureToMemoryKHR`, potentially modified to relocate acceleration structure references as described in that command.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746**
  `dst` must have been created with a `size` greater than or equal to that used to serialize the data in `src`.
Valid Usage (Implicit)

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR}

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext
  \textit{pNext} must be \texttt{NULL}

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter
  \textit{dst} must be a valid \texttt{VkAccelerationStructureKHR} handle

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter
  \textit{mode} must be a valid \texttt{VkCopyAccelerationStructureModeKHR} value

To check if a serialized acceleration structure is compatible with the current device call:

// Provided by VK_KHR_acceleration_structure

\begin{verbatim}
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
\end{verbatim}

- \textit{device} is the device to check the version against.
- \textit{pVersionInfo} is a pointer to a \texttt{VkAccelerationStructureVersionInfoKHR} structure specifying version information to check against the device.
- \textit{pCompatibility} is a pointer to a \texttt{VkAccelerationStructureCompatibilityKHR} value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928
  The \texttt{VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure} feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
  \textit{device} must be a valid \texttt{VkDevice} handle

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  \textit{pVersionInfo} must be a valid pointer to a valid \texttt{VkAccelerationStructureVersionInfoKHR} structure

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  \textit{pCompatibility} must be a valid pointer to a \texttt{VkAccelerationStructureCompatibilityKHR} value
The `VkAccelerationStructureVersionInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pVersionData** is a pointer to the version header of an acceleration structure as defined in `vkCmdCopyAccelerationStructureToMemoryKHR`.

*Note: pVersionData is a pointer to an array of 2×`VK_UUID_SIZE` uint8_t values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.*

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
- VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext
  `pNext` must be NULL
- VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter
  `pVersionData` must be a valid pointer to an array of `2 × VK_UUID_SIZE` uint8_t values

Possible values of `pCompatibility` returned by `vkGetDeviceAccelerationStructureCompatibilityKHR` are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR` if the `pVersionData` version acceleration structure is compatible with device.
- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR` if the `pVersionData` version
acceleration structure is not compatible with device.

33.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the accelerationStructureHostCommands feature is enabled:

- `vkBuildAccelerationStructuresKHR` corresponding to `vkCmdBuildAccelerationStructuresKHR`
- `vkCopyAccelerationStructureKHR` corresponding to `vkCmdCopyAccelerationStructureKHR`
- `vkCopyAccelerationStructureToMemoryKHR` corresponding to `vkCmdCopyAccelerationStructureToMemoryKHR`
- `vkCopyMemoryToAccelerationStructureKHR` corresponding to `vkCmdCopyMemoryToAccelerationStructureKHR`
- `vkWriteAccelerationStructuresPropertiesKHR` corresponding to `vkCmdWriteAccelerationStructuresPropertiesKHR`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands must be bound to host-visible memory, and all input data for acceleration structure builds must be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

**Note**

The `vkBuildAccelerationStructuresKHR` and `vkCmdBuildAccelerationStructuresKHR` may use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application can use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

**Note**

For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
```

---

1738
VkDevice device,
VkDeferredOperationKHR deferredOperation,
uint32_t infoCount,
const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);

- **device** is the VkDevice for which the acceleration structures are being built.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **infoCount** is the number of acceleration structures to build. It specifies the number of the pInfos structures and ppBuildRangeInfos pointers that must be provided.
- **pInfos** is a pointer to an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- **ppBuildRangeInfos** is a pointer to an array of infoCount pointers to arrays ofVkAccelerationStructureBuildRangeInfoKHR structures. Each ppBuildRangeInfos[i] is a pointer to an array of pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].

This command fulfills the same task as vkCmdBuildAccelerationStructuresKHR but is executed by the host.

The vkBuildAccelerationStructuresKHR command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same vkBuildAccelerationStructuresKHR call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

### Valid Usage

- **VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581**
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

- **VUID-vkBuildAccelerationStructuresKHR-mode-04628**
  The mode member of each element of pInfos must be a valid VkBuildAccelerationStructureModeKHR value

- **VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the srcAccelerationStructure member of any element of pInfos is not VK_NULL_HANDLE, the srcAccelerationStructure member must be a valid VkAccelerationStructureKHR handle
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must not be VK_NULL_HANDLE.

The srcAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos.

The dstAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos.

The dstAccelerationStructure member of any element of pInfos must not be the same acceleration structure as the dstAccelerationStructure member of any other element of pInfos.

For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

For each element of pInfos, if its type member is VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR, its dstAccelerationStructure member must have been created with a value of VkAccelerationStructureCreateInfoKHR::type equal to either VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, inactive primitives in its srcAccelerationStructure member must not be made active.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive.

The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos.

The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command.
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a mode equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was NULL when `srcAccelerationStructure` was last built, then it **must** be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, then its `geometry.triangles.transformData` address was NULL when `srcAccelerationStructure` was last built.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced must be the same as the corresponding index value when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pGeomtries-03675**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[j].primitiveCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03676**
  For each element of `pInfos`, if `dstAccelerationStructure` has been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount)`

- **VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03677**
  Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678**
  Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures
If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03722**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to host-visible device memory.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03723**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to host-visible device memory.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03724**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03725**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03726**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03771**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, `geometry.triangles.vertexData.hostAddress` must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03772**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.hostAddress` must be a valid host address.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03773**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.hostAddress` is not `0`, it must be a valid host address.
• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03774**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR`, `geometry.aabbs.data.hostAddress` **must** be a valid host address.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03775**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03776**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03777**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to memory that was not allocated with multiple instances.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03778**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.hostAddress` **must** be a valid host address.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-03779**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.hostAddress` **must** be a valid `VkAccelerationStructureKHR` object.

---

**Valid Usage (Implicit)**

• **VUID-vkBuildAccelerationStructuresKHR-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

• **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle.

• **VUID-vkBuildAccelerationStructuresKHR-pInfos-parameter**
  `pInfos` **must** be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures.

• **VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter**
  `ppBuildRangeInfos` **must** be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.

• **VUID-vkBuildAccelerationStructuresKHR-infoCount-arraylength**
  `infoCount` **must** be greater than 0.

• **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent**
  If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved.
Return Codes

Success

• VK_SUCCESS
• VK_OPERATION_DEFERRED_KHR
• VK_OPERATION_NOT_DEFERRED_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

• `device` is the device which owns the acceleration structures.
• `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
• `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureKHR` but is executed by the host.

Valid Usage

• VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands`

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

• VUID-vkCopyAccelerationStructureKHR-buffer-03727
The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst must be bound to host-visible device memory feature must be enabled

• VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

• VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS
  • VK_OPERATION_DEFERRED_KHR
  • VK_OPERATION_NOT_DEFERRED_KHR

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
);```
const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);

- **device** is the device which owns pInfo->dst.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **pInfo** is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMemoryToAccelerationStructureKHR but is executed by the host.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

### Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
  pInfo->src.hostAddress must be a valid host pointer

- VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
  pInfo->src.hostAddress must be aligned to 16 bytes

- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
  The buffer used to create pInfo->dst must be bound to host-visible device memory

- VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid
**VkDeferredOperationKHR handle**

- **VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

- **VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent**
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

---

**Return Codes**

**Success**

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- device is the device which owns pInfo->src.
- deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
- pInfo is a pointer to a VkCopyAccelerationStructureToMemoryInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureToMemoryKHR but is executed by the host.

This command produces the same results as vkCmdCopyAccelerationStructureToMemoryKHR, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.
Valid Usage

• VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

• VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

• VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731
  The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732
  pInfo->dst.hostAddress must be a valid host pointer

• VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751
  pInfo->dst.hostAddress must be aligned to 16 bytes

• VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

• VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS
To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- `device` is the device which owns the acceleration structures in `pAccelerationStructures`.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.

### Valid Usage

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR` ::accelerationStructureHostCommands feature **must** be enabled

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
  All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in `pAccelerationStructures` **must** have been built with
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR if queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742
  queryType must be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR,
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR,
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, or
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR, then stride must be a multiple of the size of VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06734
  If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR, then pData must point to a VkDeviceSize

- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452
  dataSize must be greater than or equal to accelerationStructureCount*stride

- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to host-visible device memory

- VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to memory that was not allocated with multiple instances
Valid Usage (Implicit)

- VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid VkAccelerationStructureKHR handles

- VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter
queryType must be a valid VkQueryType value

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
accelerationStructureCount must be greater than 0

- VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength
dataSize must be greater than 0

- VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent
Each element of pAccelerationStructures must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
Chapter 34. Micromap

34.1. Micromaps

*Acceleration structures* store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A *micromap* organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a *bottom level acceleration structure*.

An *opacity micromap* is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A micromap is considered to be constructed if a *micromap build command* or *copy command* has been executed with the given acceleration structure as the destination.

34.1.1. Building Micromaps

To build micromaps call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the `VkMicromapBuildInfoEXT`::`scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of (`VK_ACCESS_2_MICROMAP_READ_BIT_EXT` | `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`). Accesses to `VkMicromapBuildInfoEXT::dstMicromap` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`.

1754
Accesses to other input buffers as identified by any used values of `VkMicromapBuildInfoEXT::data` or `VkMicromapBuildInfoEXT::triangleArray` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07461**
  
  For each `pInfos[i]`, the `dstMicromap` must have been created with a value of `VkMicromapCreateInfoEXT::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetMicromapBuildSizesEXT` with `pBuildInfo = pInfos[i]`

- **VUID-vkCmdBuildMicromapsEXT-mode-07462**
  
  The `mode` member of each element of `pInfos` must be a valid `VkBuildMicromapModeEXT` value

- **VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463**
  
  The `dstMicromap` member of any element of `pInfos` must be a valid `VkMicromapEXT` handle

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07464**
  
  For each element of `pInfos` its `type` member must match the value of `VkMicromapCreateInfoEXT::type` when its `dstMicromap` was created

- **VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465**
  
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstMicromap` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkCmdBuildMicromapsEXT-dstMicromap-07466**
  
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command

- **VUID-vkCmdBuildMicromapsEXT-scratchData-07467**
  
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07508**
  
  For each element of `pInfos`, the buffer used to create its `dstMicromap` member must be bound to device memory

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07509**
  
  If `pInfos[i].mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to `vkGetMicromapBuildSizesEXT` with an identical `VkMicromapBuildInfoEXT` structure and primitive count
The buffers from which the buffer device addresses for all of the data and triangleArray members of all pInfo[i] are queried must have been created with the VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT usage flag.

For each element of pInfo[i] the buffer from which the buffer device address pInfo[i].scratchData.deviceAddress is queried must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag.

For each element of pInfo, its scratchData.deviceAddress, data.deviceAddress, and triangleArray.deviceAddress members must be valid device addresses obtained from vkGetBufferDeviceAddress.

For each element of pInfo, if scratchData.deviceAddress, data.deviceAddress, or triangleArray.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

For each element of pInfo, its scratchData.deviceAddress member must be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment.

For each element of pInfo, its triangleArray.deviceAddress and data.deviceAddress members must be a multiple of 256.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support compute operations.

This command must only be called outside of a render pass instance.

This command must only be called outside of a video coding scope.

infoCount must be greater than 0.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Formats which can be set in `VkMicromapUsageEXT::format` and `VkMicromapTriangleEXT::format` for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

- `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
- `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

Note

For compactness, these values are stored as 16-bit in some structures.

The `VkMicromapBuildInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
} VkMicromapBuildInfoEXT;
```
VkDeviceOrHostAddressConstKHR data;
VkDeviceOrHostAddressKHR scratchData;
VkDeviceOrHostAddressConstKHR triangleArray;
VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• type is a VkMicromapTypeEXT value specifying the type of micromap being built.
• flags is a bitmask of VkBuildMicromapFlagBitsEXT specifying additional parameters of the micromap.
• mode is a VkBuildMicromapModeEXT value specifying the type of operation to perform.
• dstMicromap is a pointer to the target micromap for the build.
• usageCountsCount specifies the number of usage counts structures that will be used to determine the size of this micromap.
• pUsageCounts is a pointer to an array of VkMicromapUsageEXT structures.
• ppUsageCounts is a pointer to an array of pointers to VkMicromapUsageEXT structures.
• data is the device or host address to memory which contains the data for the micromap.
• scratchData is the device or host address to memory that will be used as scratch memory for the build.
• triangleArray is the device or host address to memory containing the VkMicromapTriangleEXT data
• triangleArrayStride is the stride in bytes between each element of triangleArray

Only one of pUsageCounts or ppUsageCounts can be a valid pointer, the other must be NULL. The elements of the non-NULL array describe the total counts used to build each micromap. Each element contains a count which is the number of micromap triangles of that format and subdivisionLevel contained in the micromap. Multiple elements with the same format and subdivisionLevel are allowed and the total count for that format and subdivisionLevel is the sum of the count for each element.

Each micromap triangle refers to one element in triangleArray which contains the format and subdivisionLevel for that particular triangle as well as a dataOffset in bytes which is the location relative to data where that triangle’s micromap data begins. The data at triangleArray is laid out as a 4 byte unsigned integer for the dataOffset followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile VkMicromapTriangleEXT to match this pattern.

For opacity micromaps, the data at data is packed as either one bit per element for VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT or two bits per element for VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in Ray Opacity Micromap.
Valid Usage

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516
  Only one of pUsageCounts or ppUsageCounts can be a valid pointer, the other must be NULL

- VUID-VkMicromapBuildInfoEXT-type-07517
  If type is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT the format member of VkMicromapUsageEXT must be a valid value from VkOpacityMicromapFormatEXT

- VUID-VkMicromapBuildInfoEXT-type-07518
  If type is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT the format member of VkMicromapTriangleEXT must be a valid value from VkOpacityMicromapFormatEXT

Valid Usage (Implicit)

- VUID-VkMicromapBuildInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT

- VUID-VkMicromapBuildInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkMicromapBuildInfoEXT-type-parameter
  type must be a valid VkMicromapTypeEXT value

- VUID-VkMicromapBuildInfoEXT-flags-parameter
  flags must be a valid combination of VkBuildMicromapFlagBitsEXT values

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter
  If usageCountsCount is not 0, and pUsageCounts is not NULL, pUsageCounts must be a valid pointer to an array of usageCountsCount VkMicromapUsageEXT structures

- VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter
  If usageCountsCount is not 0, and ppUsageCounts is not NULL, ppUsageCounts must be a valid pointer to an array of usageCountsCount valid pointers to VkMicromapUsageEXT structures

The VkBuildMicromapModeEXT enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- VK_BUILD_MICROMAP_MODE_BUILD_EXT specifies that the destination micromap will be built using the specified data.

The VkMicromapUsageEXT structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
```
• `count` is the number of triangles in the usage format defined by the `subdivisionLevel` and `format` below in the micromap

• `subdivisionLevel` is the subdivision level of this usage format

• `format` is the format of this usage format

### Valid Usage

- **VUID-VkMicromapUsageEXT-format-07519**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` **must** be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`

- **VUID-VkMicromapUsageEXT-format-07520**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` **must** be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel`

- **VUID-VkMicromapUsageEXT-format-07521**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` **must** be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel`

The `format` is interpreted based on the `type` of the micromap using it.

The `VkMicromapTriangleEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;
```

- `dataOffset` is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.

- `subdivisionLevel` is the subdivision level of this triangle

- `format` is the format of this triangle
Valid Usage

• VUID-VkMicromapTriangleEXT-format-07522
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT then format must be VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT or VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT

• VUID-VkMicromapTriangleEXT-format-07523
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and format is VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT then subdivisionLevel must be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel

• VUID-VkMicromapTriangleEXT-format-07524
  If the VkMicromapTypeEXT of the micromap is VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT and format is VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT then subdivisionLevel must be less than or equal to VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel

The format is interpreted based on the type of the micromap using it.

34.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer commandBuffer,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- commandBuffer is the command buffer into which the command will be recorded.
- micromapCount is the count of micromaps for which to query the property.
- pMicromaps is a pointer to an array of existing previously built micromaps.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryPool is the query pool that will manage the results of the query.
- firstQuery is the first query index within the query pool that will contain the micromapCount number of results.

Accesses to any of the micromaps listed in pMicromaps must be synchronized with the
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT.

- If `queryType` is VK_QUERY_TYPE_MICROMAP.Serialization_Size_EXT, then the value written out is the number of bytes required by a serialized micromap.
- If `queryType` is VK_QUERY_TYPE_MICROMAP.Compacted_Size_EXT, then the value written out is the number of bytes required by a compacted micromap.

### Valid Usage

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525
  *queryPool must* have been created with a `queryType` matching `queryType`

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526
  The queries identified by `queryPool` and `firstQuery` *must be unavailable*

- VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527
  The buffer used to create each micromap in `pMicrmaps` *must be* bound to device memory

- VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528
  The sum of `query` plus `micromapCount` *must be* less than or equal to the number of queries in `queryPool`

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` *must have* been constructed prior to the execution of this command

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` *must have* been constructed with VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if `queryType` is VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503
  `queryType` *must be* VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or VK_QUERY_TYPE_MICROMAP_SERIALIZE_SIZE_EXT

### Valid Usage (Implicit)

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
  `commandBuffer must be` a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
  `pMicromaps must be` a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
  `queryType must be` a valid `VkQueryType` value

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
  `queryPool must be` a valid `VkQueryPool` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteMicromapsPropertiesEXT-videscoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  micromapCount must be greater than 0

- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of commandBuffer, queryPool, and the elements of pmicromaps must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pInfo is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command copies the pInfo->src micromap to the pInfo->dst micromap in the manner specified by pInfo->mode.

Accesses to pInfo->src and pInfo->dst must be synchronized with the
VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT or VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT as appropriate.

Valid Usage

- VUID-vkCmdCopyMicromapEXT-buffer-07529
  The buffer used to create pInfo->src must be bound to device memory
- VUID-vkCmdCopyMicromapEXT-buffer-07530
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMicromapInfoEXT structure
- VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkCopyMicromapInfoEXT structure is defined as:
// Provided by VK_EXT_opacity_micromap

typedef struct VkCopyMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **src** is the source micromap for the copy.
- **dst** is the target micromap for the copy.
- **mode** is a *VkCopyMicromapModeEXT* value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMicromapInfoEXT-mode-07531**
  
  *mode* must be *VK_COPY_MICROMAP_MODE_COMPACT_EXT* or *VK_COPY_MICROMAP_MODE_CLONE_EXT*

- **VUID-VkCopyMicromapInfoEXT-src-07532**
  
  The source acceleration structure *src* must have been constructed prior to the execution of this command

- **VUID-VkCopyMicromapInfoEXT-mode-07533**
  
  If *mode* is *VK_COPY_MICROMAP_MODE_COMPACT_EXT*, *src* must have been constructed with *VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT* in the build

- **VUID-VkCopyMicromapInfoEXT-buffer-07534**
  
  The buffer used to create *src* must be bound to device memory

- **VUID-VkCopyMicromapInfoEXT-buffer-07535**
  
  The buffer used to create *dst* must be bound to device memory

### Valid Usage (Implicit)

- **VUID-VkCopyMicromapInfoEXT-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT*

- **VUID-VkCopyMicromapInfoEXT-pNext-pNext**
  
  *pNext* must be NULL

- **VUID-VkCopyMicromapInfoEXT-src-parameter**
  
  *src* must be a valid *VkMicromapEXT* handle

- **VUID-VkCopyMicromapInfoEXT-dst-parameter**
  
  *dst* must be a valid *VkMicromapEXT* handle
• VUID-VkCopyMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

• VUID-VkCopyMicromapInfoEXT-commonparent
  Both of dst, and src must have been created, allocated, or retrieved from the same VkDevice

Possible values of mode specifying additional operations to perform during the copy, are:

```cpp
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
  VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
  VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
  VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
  VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

• VK_COPY_MICROMAP_MODE_CLONE_EXT creates a direct copy of the micromap specified in src into the one specified by dst. The dst micromap must have been created with the same parameters as src.

• VK_COPY_MICROMAP_MODE_SERIALIZE_EXT serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.

• VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT deserializes the semi-opaque serialization format in the buffer to the micromap.

• VK_COPY_MICROMAP_MODE_COMPACT_EXT creates a more compact version of a micromap src into dst. The micromap dst must have been created with a size at least as large as that returned by vkCmdWriteMicromapsPropertiesEXT after the build of the micromap specified by src.

To copy a micromap to device memory call:

```cpp
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
  VkCommandBuffer commandBuffer,
  const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

• commandBuffer is the command buffer into which the command will be recorded.

• pInfo is an a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

Accesses to pInfo->src must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_READ_BIT_EXT. Accesses to the buffer indicated by pInfo->dst.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_TRANSFER_WRITE_BIT.

This command produces the same results as vkCopyMicromapToMemoryEXT, but writes its result.
to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using `vkGetDeviceMicromapCompatibilityEXT` The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536**
  
  pInfo->dst.deviceAddress **must** be a valid device address for a buffer bound to device memory

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537**
  
  pInfo->dst.deviceAddress **must** be aligned to 256 bytes

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538**
  
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539**
  
  The **buffer** used to create pInfo->src **must** be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter**
  
  commandBuffer **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter**
  
  pInfo **must** be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording**
  
  commandBuffer **must** be in the recording state

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that commandBuffer was allocated from **must** support compute operations

- **VUID-vkCmdCopyMicromapToMemoryEXT-renderpass**
  
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdCopyMicromapToMemoryEXT-videocoding**
  
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

// Provided by VK_EXT_opacity_micromap
define struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

Valid Usage

- VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
  The source micromap `src` must have been constructed prior to the execution of this command
- VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
  The memory pointed to by `dst` must be at least as large as the serialization size of `src`, as reported by `vkWriteMicromapsPropertiesEXT` or `vkCmdWriteMicromapsPropertiesEXT` with a query type of `VK_QUERY_TYPE_MICROMAP.Serialization_SIZE_EXT`.
- VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
  `mode` must be `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`
Valid Usage (Implicit)

- VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT`

- VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
  *pNext* must be `NULL`

- VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
  *src* must be a valid `VkMicromapEXT` handle

- VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
  *mode* must be a valid `VkCopyMicromapModeEXT` value

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_opacity_micromap
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *pInfo* is a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

Accesses to *pInfo->dst* must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by *pInfo->src.deviceAddress* must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

Valid Usage

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  *pInfo->src.deviceAddress* must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  *pInfo->src.deviceAddress* must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  If the buffer pointed to by *pInfo->src.deviceAddress* is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  The *buffer* used to create *pInfo->dst* must be bound to device memory
Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToMicromapInfoEXT` structure

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• src is the device or host address to memory containing the source data for the copy.
• dst is the target micromap for the copy.
• mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.

Valid Usage

• VUID-VkCopyMemoryToMicromapInfoEXT-src-07547
  The source memory pointed to by src must contain data previously serialized using vkCmdCopyMicromapToMemoryEXT

• VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548
  mode must be VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT

• VUID-VkCopyMemoryToMicromapInfoEXT-src-07549
  The data in src must have a format compatible with the destination physical device as returned by vkGetDeviceMicromapCompatibilityEXT

• VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550
  dst must have been created with a size greater than or equal to that used to serialize the data in src

Valid Usage (Implicit)

• VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

• VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  pNext must be NULL

• VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  dst must be a valid VkMicromapEXT handle

• VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
  VkDevice device,
  const VkMicromapVersionInfoEXT* pVersionInfo,
  VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

• device is the device to check the version against.
• pVersionInfo is a pointer to a VkMicromapVersionInfoEXT structure specifying version
information to check against the device.

- **pCompatibility** is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

### Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The micromap feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  `pVersionInfo` **must** be a valid pointer to a valid `VkMicromapVersionInfoEXT` structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  `pCompatibility` **must** be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value

The `VkMicromapVersionInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapVersionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pVersionData` is a pointer to the version header of a micromap as defined in `vkCmdCopyMicromapToMemoryEXT`

**Note**

`pVersionData` is a pointer to an array of `2xVK_UUID_SIZE uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.
Valid Usage (Implicit)

- VUID-VkMicromapVersionInfoEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT`

- VUID-VkMicromapVersionInfoEXT-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkMicromapVersionInfoEXT-pVersionData-parameter
  `pVersionData` **must** be a valid pointer to an array of `$2 \times VK_UUID_SIZE$ uint8_t values

34.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the `micromapHostCommands` feature is enabled:

- `vkBuildMicromapsEXT` corresponding to `vkCmdBuildMicromapsEXT`
- `vkCopyMicromapEXT` corresponding to `vkCmdCopyMicromapEXT`
- `vkCopyMicromapToMemoryEXT` corresponding to `vkCmdCopyMicromapToMemoryEXT`
- `vkCopyMemoryToMicromapEXT` corresponding to `vkCmdCopyMemoryToMicromapEXT`
- `vkWriteMicromapsPropertiesEXT` corresponding to `vkCmdWriteMicromapsPropertiesEXT`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All micromaps used by the host commands **must** be bound to host-visible memory, and all input data for micromap builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

**Note**

The `vkBuildMicromapsEXT` and `vkCmdBuildMicromapsEXT` **may** use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

**Note**

For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
```
uint32_t infoCount,
const VkMicromapBuildInfoEXT* pInfos);

- **device** is the VkDevice for which the micromaps are being built.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **infoCount** is the number of micromaps to build. It specifies the number of the pInfos that must be provided.
- **pInfos** is a pointer to an array of infoCount VkMicromapBuildInfoEXT structures defining the geometry used to build each micromap.

This command fulfills the same task as vkCmdBuildMicromapsEXT but is executed by the host.

The vkBuildMicromapsEXT command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**
This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

**Valid Usage**

- **VUID-vkBuildMicromapsEXT-pInfos-07461**
  For each pInfos[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfos[i]

- **VUID-vkBuildMicromapsEXT-mode-07462**
  The mode member of each element of pInfos must be a valid VkBuildMicromapModeEXT value

- **VUID-vkBuildMicromapsEXT-dstMicromap-07463**
  The dstMicromap member of any element of pInfos must be a valid VkMicromapEXT handle

- **VUID-vkBuildMicromapsEXT-pInfos-07464**
  For each element of pInfos its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

- **VUID-vkBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfos, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-dstMicromap-07466**
  The range of memory backing the dstMicromap member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData
member of any element of pInfos (including the same element), which is accessed by this command

- VUID-vkBuildMicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

- VUID-vkBuildMicromapsEXT-pInfos-07552
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to host-visible device memory

- VUID-vkBuildMicromapsEXT-pInfos-07553
  For each element of pInfos, all referenced addresses of pInfos[i].data.hostAddress must be valid host memory

- VUID-vkBuildMicromapsEXT-pInfos-07554
  For each element of pInfos, all referenced addresses of pInfos[i].triangleArray.hostAddress must be valid host memory

- VUID-vkBuildMicromapsEXT-micromapHostCommands-07555
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

- VUID-vkBuildMicromapsEXT-pInfos-07556
  If pInfos[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfos[i].scratchData.hostAddress and pInfos[i].scratchData.hostAddress + N - 1 must be valid host memory, where N is given by the buildScratchSize member of the VkMicromapBuildSizesInfoEXT structure returned from a call to vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to memory that was not allocated with multiple instances

---

**Valid Usage (Implicit)**

- VUID-vkBuildMicromapsEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkBuildMicromapsEXT-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures

- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0

- VUID-vkBuildMicromapsEXT-deferredOperation-parent
If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device.

### Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapInfoEXT* pInfo);
```

- `device` is the device which owns the micromaps.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapEXT` but is executed by the host.

### Valid Usage

- VUID-vkCopyMicromapEXT-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

- VUID-vkCopyMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMicromapEXT-buffer-07558
  The buffer used to create `pInfo->src` must be bound to host-visible device memory

- VUID-vkCopyMicromapEXT-buffer-07559
  The buffer used to create `pInfo->dst` must be bound to host-visible device memory

- VUID-vkCopyMicromapEXT-micromapHostCommands-07560
The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled.

- VUID-vkCopyMicromapEXT-buffer-07561
  The buffer used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances.

- VUID-vkCopyMicromapEXT-buffer-07562
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- VUID-vkCopyMicromapEXT-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkCopyMicromapEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

- VUID-vkCopyMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure.

- VUID-vkCopyMicromapEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```
• **device** is the device which owns `pInfo->dst`.

• **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.

• **pInfo** is a pointer to a `VkCopyMemoryToMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToMicromapEXT` but is executed by the host.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

### Valid Usage

- **VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with `deferredOperation` must be complete.

- **VUID-vkCopyMemoryToMicromapEXT-pInfo-07563**
  `pInfo->src.hostAddress` must be a valid host pointer.

- **VUID-vkCopyMemoryToMicromapEXT-pInfo-07564**
  `pInfo->src.hostAddress` must be aligned to 16 bytes.

- **VUID-vkCopyMemoryToMicromapEXT-buffer-07565**
  The buffer used to create `pInfo->dst` must be bound to host-visible device memory.

- **VUID-vkCopyMemoryToMicromapEXT-micromapHostCommands-07566**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled.

- **VUID-vkCopyMemoryToMicromapEXT-buffer-07567**
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances.

### Valid Usage (Implicit)

- **VUID-vkCopyMemoryToMicromapEXT-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter**
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

- **VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToMicromapInfoEXT` structure.
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

## Return Codes

### Success
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy a micromap to host accessible memory, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMicromapToMemoryEXT` but is executed by the host.

This command produces the same results as `vkCmdCopyMicromapToMemoryEXT`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

## Valid Usage

- **VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03677**
  If `deferredOperation` is not `VK_NULL_HANDLE`, it **must** be a valid `VkDeferredOperationKHR` object.

- **VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678**
Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The `buffer` used to create `pInfo->src` must be bound to host-visible device memory

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  `pInfo->dst.hostAddress` must be a valid host pointer

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  `pInfo->dst.hostAddress` must be aligned to 16 bytes

- VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The `buffer` used to create `pInfo->src` must be bound to memory that was not allocated with multiple instances

**Valid Usage (Implicit)**

- VUID-vkCopyMicromapToMemoryEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query micromap size parameters on the host, call:
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);

• device is the device which owns the micromaps in pMicromaps.
• micromapCount is the count of micromaps for which to query the property.
• pMicromaps is a pointer to an array of existing previously built micromaps.
• queryType is a VkQueryType value specifying the property to be queried.
• dataSize is the size in bytes of the buffer pointed to by pData.
• pData is a pointer to a user-allocated buffer where the results will be written.
• stride is the stride in bytes between results for individual queries within pData.

This command fulfills the same task as vkCmdWriteMicromapsPropertiesEXT but is executed by the host.

Valid Usage

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in pMicromaps must have been constructed prior to the execution of this command

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in pMicromaps must have been constructed with
  VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT if queryType is
  VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07503
  queryType must be VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT or
  VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07504
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZE_SIZE_EXT, then stride must be a
  multiple of the size of VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07505
  If queryType is VK_QUERY_TYPE_MICROMAP_SERIALIZE_SIZE_EXT, then pData must point to a
  VkDeviceSize

• VUID-vkWriteMicromapsPropertiesEXT-queryType-07506
  If queryType is

• VUID-vkWriteMicromapsPropertiesEXT-dataSize-07507
**dataSize** must be greater than or equal to **micromapCount*stride**

- **UID-vkWriteMicromapsPropertiesEXT-buffer-07577**
  The **buffer** used to create each micromap in **pMicromaps** must be bound to host-visible device memory

- **UID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578**
  The **VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands** feature must be enabled

- **UID-vkWriteMicromapsPropertiesEXT-buffer-07579**
  The **buffer** used to create each micromap in **pMicromaps** must be bound to memory that was not allocated with multiple instances

---

**Valid Usage (Implicit)**

- **UID-vkWriteMicromapsPropertiesEXT-device-parameter**
  **device** must be a valid **VkDevice** handle

- **UID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter**
  **pMicromaps** must be a valid pointer to an array of **micromapCount** valid **VkMicromapEXT** handles

- **UID-vkWriteMicromapsPropertiesEXT-queryType-parameter**
  **queryType** must be a valid **VkQueryType** value

- **UID-vkWriteMicromapsPropertiesEXT-pData-parameter**
  **pData** must be a valid pointer to an array of **dataSize** bytes

- **UID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength**
  **micromapCount** must be greater than 0

- **UID-vkWriteMicromapsPropertiesEXT-dataSize-arraylength**
  **dataSize** must be greater than 0

- **UID-vkWriteMicromapsPropertiesEXT-pMicromaps-parent**
  Each element of **pMicromaps** must have been created, allocated, or retrieved from **device**

---

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
Chapter 35. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute `OpRayQueryProceedKHR` or a pipeline trace ray instruction. When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` can be used for ray tracing in a ray tracing pipeline. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` can be used in any shader stage.

35.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

Note

Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in an bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space $\mathbf{a}$ to ray space $\mathbf{r}$ according to the ray origin and direction as follows:

\[
\begin{pmatrix}
  x_r \\
  y_r \\
  z_r
\end{pmatrix} =
\begin{pmatrix}
  a_x^2(1 - c) + c & a_xa_y(1 - c) - sa_z & a_xa_z(1 - c) + sa_y \\
  a_xa_y(1 - c) + sa_z & a_y^2(1 - c) + c & a_ya_z(1 - c) - sa_x \\
  a_xa_z(1 - c) - sa_y & a_ya_z(1 - c) + sa_x & a_z^2(1 - c) + c
\end{pmatrix}
\begin{pmatrix}
  x_{as} - o_x \\
  y_{as} - o_y \\
  z_{as} - o_z
\end{pmatrix}
\]

$a$ is the axis of rotation from the unnormalized ray direction vector $\mathbf{d}$ to the axis vector $\mathbf{k}$:
\[ a = \begin{cases} \frac{d \times k}{\|d \times k\|} & \text{if } \|d \times k\| \neq 0 \\ (0, 1, 0) & \text{if } \|d \times k\| = 0 \end{cases} \]

\( s \) and \( c \) are the sine and cosine of the angle of rotation about \( a \) from \( d \) to \( k \):

\[
\begin{align*}
    c &= \frac{d \cdot k}{\|d\|} \\
    s &= \sqrt{1 - c^2}
\end{align*}
\]

\( k \) is the unit vector:

\[
    k = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix}
\]

\( o \) and \( d \) are the ray origin and unnormalized direction, respectively; the vector described by \( x_{as}, y_{as} \), and \( z_{as} \) is any position in acceleration structure space; and the vector described by \( x_{r}, y_{r}, \) and \( z_{r} \) is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \( xyz_{as} \) such that

\[
\begin{align*}
    x_{r} &= 0 \\
    y_{r} &= 0 \\
    t_{min} &< \frac{z_{r}}{\|d\|} < t_{max} & \text{if the primitive is a triangle,} \\
    t_{min} &\leq \frac{z_{r}}{\|d\|} \leq t_{max} & \text{otherwise}
\end{align*}
\]

(where \( t = \frac{z_{r}}{\|d\|} \)), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.</td>
</tr>
</tbody>
</table>
The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its $t_{\text{min}}$ is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting $t_{\text{min}}$ slightly.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positive intersections being reported to the application.

For triangle intersection candidates, the $b$ and $c$ barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with a pipeline trace ray instruction, these values are available as a vector of 2 32-bit floating point values in the HitAttributeKHR storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between operations performed on different intersection candidates.
35.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a **shared vertex**.
- Any set of two triangles with two shared vertices that were specified in the same **winding order** in each triangle have a **shared edge** defined by those vertices.

A closed fan is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations **should** not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

35.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

35.2.1. Ray Primitive Culling

If the rayTraversalPrimitiveCulling or rayQuery features are enabled, the SkipTrianglesKHR and SkipAABBsKHR ray flags can be specified when tracing a ray. SkipTrianglesKHR and SkipAABBsKHR are mutually exclusive. SkipTrianglesKHR is also mutually exclusive with CullBackFacingTrianglesKHR and CullFrontFacingTrianglesKHR.

If SkipTrianglesKHR was included in the Ray Flags operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if SkipTrianglesKHR was included in their Ray Flags operand.

If SkipAABBsKHR was included in the Ray Flags operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR was included in the pipeline, traversal with pipeline trace ray instructions will all behave as if SkipAABBsKHR was included in their Ray Flags operand.
35.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of `VkAccelerationStructureInstanceKHR::mask` used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if \( \text{mask} \& \text{Cull Mask} == 0 \), the intersection is dropped, and no further processing occurs.

35.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} x_r^i y_r^{i+1} - x_r^{i+1} y_r^i
\]

where \( x_r^i \) and \( y_r^i \) are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \( (i + 1) \mod n \).

By default, if \( a \) is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if \( a \) is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray's perspective in a clockwise rotation order. `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with a pipeline trace ray instruction, the HitKindKHR built-in is set to HitKindFrontFacingTriangleKHR if the intersection is with front-facing geometry, and HitKindBackFacingTriangleKHR if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with OpRayQueryProceedKHR, OpRayQueryGetIntersectionFrontFaceKHR will return true for intersection candidates with front faces, or false for back faces.
Culling

If `CullBackFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (`a == 0`) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR` Ray Flags are mutually exclusive.

35.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

Determination

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the Ray Flags parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return true for opaque intersection candidates, and false for non-opaque intersection candidates.
Culling

If CullOpaqueKHR is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If CullNoOpaqueKHR is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR Ray Flags are mutually exclusive.

35.2.5. Ray Opacity Micromap

A VK_GEOMETRY_TYPE_TRIANGLES_KHR geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT is not set in its instance then the micromap is used to determine geometry opacity instead of the VK_GEOMETRY_OPAQUE_BIT_KHR flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from ⌊u⌋ + ⌊v⌋, clamping ⌊u⌋ as needed to keep the sum less than or equal to 1 << subdivisionlevel. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 24. Example ordering for micromap data](image)

Note

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on
VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT in the instance of the candidate intersection or ForceOpacityMicromap2StateEXT ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode. If the result of the micromap lookup is to treat the intersection candidate as ignored, no further processing of that candidate is done.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT, each element is represented by a two bit value at the index derived above.

35.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.
35.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with a pipeline trace ray instruction, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with a pipeline trace ray instruction, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

35.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with a pipeline trace ray instruction, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

35.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its $t$ value is compared to $t_{\text{max}}$ to determine which intersection is closer, where $t$ is the parametric distance along the ray at which the intersection occurred.

- If $t < t_{\text{max}}$, $t_{\text{max}}$ is set to $t$ and the candidate is set as the current closest hit.
- If $t > t_{\text{max}}$, the candidate is dropped and no further processing of that candidate occurs.
- If $t = t_{\text{max}}$, the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

35.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with pipeline trace ray instructions which can invoke a closest hit shader, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with a pipeline trace ray instruction where no hit result was identified, the miss shader identified by the Miss Index parameter of the instruction is invoked. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.
If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `false`. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.

No further processing of a ray query occurs after this result is determined.
Chapter 36. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray tracing pipeline execution](image)

**Caption**

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, a pipeline trace ray instruction can be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a VkBuffer object known as a shader binding table. OpExecuteCallableKHR can also be used in ray tracing pipelines to invoke a callable shader.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. Traversal, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The Workgroup scope and variables with a storage class of Workgroup must not be used in the ray tracing pipeline.

### 36.1. Shader Call Instructions

A shader call is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- OpTraceRayKHR which may invoke intersection, any-hit, closest hit, or miss shaders,
• OpReportIntersectionKHR which may invoke any-hit shaders, and
• OpExecuteCallableKHR which will invoke a callable shader.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups may be unrelated to the subgroup of the parent invocation.

Pipeline trace ray instructions can be used recursively; invoked shaders can themselves execute pipeline trace ray instructions, to a maximum depth defined by the maxRayRecursionDepth limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications must not invoke a shader with a recursion depth greater than the value of maxPipelineRayRecursionDepth specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. OpExecuteCallableKHR) but there is an upper bound determined by the stack size.

An invocation repack instruction is a ray tracing instruction where the implementation may change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which may result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it may be resumed in a different subgroup or at a different SubgroupLocalInvocationId within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same SubgroupLocalInvocationId.

The OpTraceRayKHR, OpReportIntersectionKHR, and OpExecuteCallableKHR instructions are invocation repack instructions.

The invocations that are executing before a shader call instruction, after the instruction, or are created by the instruction, are shader-call-related.

If the implementation changes the composition of subgroups, the values of SubgroupSize, SubgroupLocalInvocationId, and builtin variables that are derived from them (SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, SubgroupLtMask) must be changed accordingly by the invocation repack instruction. The application must use Volatile semantics on these BuiltIn variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application must use Volatile semantics on any RayTmaxKHR decorated BuiltIn used in an intersection shader.

Note
