Chapter 1. Preamble

Copyright 2014-2024 The Khronos Group Inc.

This Specification is protected by copyright laws and contains material proprietary to Khronos. Except as described by these terms, it or any components may not be reproduced, republished, distributed, transmitted, displayed, broadcast or otherwise exploited in any manner without the express prior written permission of Khronos.

Khronos grants a conditional copyright license to use and reproduce the unmodified Specification for any purpose, without fee or royalty, EXCEPT no licenses to any patent, trademark or other intellectual property rights are granted under these terms.

Khronos makes no, and expressly disclaims any, representations or warranties, express or implied, regarding this Specification, including, without limitation: merchantability, fitness for a particular purpose, non-infringement of any intellectual property, correctness, accuracy, completeness, timeliness, and reliability. Under no circumstances will Khronos, or any of its Promoters, Contributors or Members, or their respective partners, officers, directors, employees, agents or representatives be liable for any damages, whether direct, indirect, special or consequential damages for lost revenues, lost profits, or otherwise, arising from or in connection with these materials.

This Specification has been created under the Khronos Intellectual Property Rights Policy, which is Attachment A of the Khronos Group Membership Agreement available at https://www.khronos.org/files/member_agreement.pdf. Parties desiring to implement the Specification and make use of Khronos trademarks in relation to that implementation, and receive reciprocal patent license protection under the Khronos Intellectual Property Rights Policy must become Adopters and confirm the implementation as conformant under the process defined by Khronos for this Specification; see https://www.khronos.org/adopters.

This Specification contains substantially unmodified functionality from, and is a successor to, Khronos specifications including OpenGL, OpenGL ES and OpenCL.

The Khronos Intellectual Property Rights Policy defines the terms 'Scope', 'Compliant Portion', and 'Necessary Patent Claims'.

Some parts of this Specification are purely informative and so are EXCLUDED the Scope of this Specification. The Document Conventions section of the Introduction defines how these parts of the Specification are identified.

Where this Specification uses technical terminology, defined in the Glossary or otherwise, that refer to enabling technologies that are not expressly set forth in this Specification, those enabling technologies are EXCLUDED from the Scope of this Specification. For clarity, enabling technologies not disclosed with particularity in this Specification (e.g. semiconductor manufacturing technology, hardware architecture, processor architecture or microarchitecture, memory architecture, compiler technology, object oriented technology, basic operating system technology, compression technology, algorithms, and so on) are NOT to be considered expressly set forth; only those application program interfaces and data structures disclosed with particularity are included in the Scope of this Specification.
For purposes of the Khronos Intellectual Property Rights Policy as it relates to the definition of Necessary Patent Claims, all recommended or optional features, behaviors and functionality set forth in this Specification, if implemented, are considered to be included as Compliant Portions.

Where this Specification identifies specific sections of external references, only those specifically identified sections define normative functionality. The Khronos Intellectual Property Rights Policy excludes external references to materials and associated enabling technology not created by Khronos from the Scope of this Specification, and any licenses that may be required to implement such referenced materials and associated technologies must be obtained separately and may involve royalty payments.

Khronos and Vulkan are registered trademarks, and SPIR-V is a trademark of The Khronos Group Inc. OpenCL is a trademark of Apple Inc., used under license by Khronos. OpenGL is a registered trademark and the OpenGL ES logo is a trademark of Hewlett Packard Enterprise, used under license by Khronos. ASTC is a trademark of ARM Holdings PLC. All other product names, trademarks, and/or company names are used solely for identification and belong to their respective owners.
Chapter 2. Introduction

This document, referred to as the “Vulkan Specification” or just the “Specification” hereafter, describes the Vulkan Application Programming Interface (API). Vulkan is a C99 API designed for explicit control of low-level graphics and compute functionality.

The canonical version of the Specification is available in the official Vulkan Registry (https://registry.khronos.org/vulkan/). The source files used to generate the Vulkan specification are stored in the Vulkan Documentation Repository (https://github.com/KhronosGroup/Vulkan-Docs).

The source repository additionally has a public issue tracker and allows the submission of pull requests that improve the specification.

2.1. Document Conventions

The Vulkan specification is intended for use by both implementors of the API and application developers seeking to make use of the API, forming a contract between these parties. Specification text may address either party; typically the intended audience can be inferred from context, though some sections are defined to address only one of these parties. (For example, Valid Usage sections only address application developers). Any requirements, prohibitions, recommendations or options defined by normative terminology are imposed only on the audience of that text.

NOTE

Structure and enumerated types defined in extensions that were promoted to core in a later version of Vulkan are now defined in terms of the equivalent Vulkan core interfaces. This affects the Vulkan Specification, the Vulkan header files, and the corresponding XML Registry.

2.1.1. Ratification

Ratification of a Vulkan core version or extension is a status conferred by vote of the Khronos Board of Promoters, bringing that core version or extension under the umbrella of the Khronos IP Policy.

All Vulkan core versions and KHR extensions (including provisional specifications) are ratified, as are some multi-vendor EXT extensions. Ratification status of extensions is described in the Layers & Extensions (Informative) appendix.

NOTE

Ratification status is primarily of interest to IHVs developing GPU hardware and Vulkan implementations.

For developers, ratification does not necessarily mean that an extension is “better”; has a more stable API; or is more widely supported than alternative ways of achieving that functionality.

Interactions between ratified and non-ratified extensions are not themselves ratified.
2.1.2. Informative Language

Some language in the specification is purely informative, intended to give background or suggestions to implementors or developers.

If an entire chapter or section contains only informative language, its title will be suffixed with “(Informative)”.

All NOTEs are implicitly informative.

2.1.3. Normative Terminology

Within this specification, the key words must, required, should, recommended, may, and optional are to be interpreted as described in RFC 2119 - Key words for use in RFCs to Indicate Requirement Levels (https://www.ietf.org/rfc/rfc2119.txt). The additional key word optionally is an alternate form of optional, for use where grammatically appropriate.

These key words are highlighted in the specification for clarity. In text addressing application developers, their use expresses requirements that apply to application behavior. In text addressing implementors, their use expresses requirements that apply to implementations.

In text addressing application developers, the additional key words can and cannot are to be interpreted as describing the capabilities of an application, as follows:

**can**
This word means that the application is able to perform the action described.

**cannot**
This word means that the API and/or the execution environment provide no mechanism through which the application can express or accomplish the action described.

These key words are never used in text addressing implementors.

**NOTE**
There is an important distinction between cannot and must not, as used in this Specification. Cannot means something the application literally is unable to express or accomplish through the API, while must not means something that the application is capable of expressing through the API, but that the consequences of doing so are undefined and potentially unrecoverable for the implementation (see Valid Usage).

Unless otherwise noted in the section heading, all sections and appendices in this document are normative.

2.1.4. Technical Terminology

The Vulkan Specification makes use of common engineering and graphics terms such as Pipeline, Shader, and Host to identify and describe Vulkan API constructs and their attributes, states, and behaviors. The Glossary defines the basic meanings of these terms in the context of the Specification. The Specification text provides fuller definitions of the terms and may elaborate,
extend, or clarify the Glossary definitions. When a term defined in the Glossary is used in normative language within the Specification, the definitions within the Specification govern and supersede any meanings the terms may have in other technical contexts (i.e. outside the Specification).

2.1.5. Normative References

References to external documents are considered normative references if the Specification uses any of the normative terms defined in Normative Terminology to refer to them or their requirements, either as a whole or in part.

The following documents are referenced by normative sections of the specification:

Chapter 3. Fundamentals

This chapter introduces fundamental concepts including the Vulkan architecture and execution model, API syntax, queues, pipeline configurations, numeric representation, state and state queries, and the different types of objects and shaders. It provides a framework for interpreting more specific descriptions of commands and behavior in the remainder of the Specification.

3.1. Host and Device Environment

The Vulkan Specification assumes and requires: the following properties of the host environment with respect to Vulkan implementations:

- The host must have runtime support for 8, 16, 32 and 64-bit signed and unsigned two's-complement integers, all addressable at the granularity of their size in bytes.
- The host must have runtime support for 32- and 64-bit floating-point types satisfying the range and precision constraints in the Floating-Point Computation section.
- The representation and endianness of these types on the host must match the representation and endianness of the same types on every physical device supported.

**NOTE** Since a variety of data types and structures in Vulkan may be accessible by both host and physical device operations, the implementation should be able to access such data efficiently in both paths in order to facilitate writing portable and performant applications.

3.2. Execution Model

This section outlines the execution model of a Vulkan system.

Vulkan exposes one or more *devices*, each of which exposes one or more *queues* which may process work asynchronously to one another. The set of queues supported by a device is partitioned into *families*. Each family supports one or more types of functionality and may contain multiple queues with similar characteristics. Queues within a single family are considered *compatible* with one another, and work produced for a family of queues can be executed on any queue within that family. This specification defines the following types of functionality that queues may support: graphics, compute, video decode, video encode, protected memory management, sparse memory management, and transfer.

**NOTE** A single device may report multiple similar queue families rather than, or as well as, reporting multiple members of one or more of those families. This indicates that while members of those families have similar capabilities, they are not directly compatible with one another.

Device memory is explicitly managed by the application. Each device may advertise one or more heaps, representing different areas of memory. Memory heaps are either device-local or host-local, but are always visible to the device. Further detail about memory heaps is exposed via memory types available on that heap. Examples of memory areas that may be available on an
implementation include:

- **device-local** is memory that is physically connected to the device.
- **device-local, host visible** is device-local memory that is visible to the host.
- **host-local, host visible** is memory that is local to the host and visible to the device and host.

On other architectures, there may only be a single heap that can be used for any purpose.

### 3.2.1. Queue Operation

Vulkan queues provide an interface to the execution engines of a device. Commands for these execution engines are recorded into command buffers ahead of execution time, and then submitted to a queue for execution. Once submitted to a queue, command buffers will begin and complete execution without further application intervention, though the order of this execution is dependent on a number of implicit and explicit ordering constraints.

Work is submitted to queues using **queue submission commands** that typically take the form `vkQueue*` (e.g. `vkQueueSubmit`, `vkQueueBindSparse`), and can take a list of semaphores upon which to wait before work begins and a list of semaphores to signal once work has completed. The work itself, as well as signaling and waiting on the semaphores are all **queue operations**. Queue submission commands return control to the application once queue operations have been submitted - they do not wait for completion.

There are no implicit ordering constraints between queue operations on different queues, or between queues and the host, so these may operate in any order with respect to each other. Explicit ordering constraints between different queues or with the host can be expressed with **semaphores** and **fences**.

Command buffer submissions to a single queue respect submission order and other implicit ordering guarantees, but otherwise may overlap or execute out of order. Other types of batches and queue submissions against a single queue (e.g. sparse memory binding) have no implicit ordering constraints with any other queue submission or batch. Additional explicit ordering constraints between queue submissions and individual batches can be expressed with **semaphores** and **fences**.

Before a fence or semaphore is signaled, it is guaranteed that any previously submitted queue operations have completed execution, and that memory writes from those queue operations are available to future queue operations. Waiting on a signaled semaphore or fence guarantees that previous writes that are available are also visible to subsequent commands.

Command buffer boundaries, both between primary command buffers of the same or different batches or submissions as well as between primary and secondary command buffers, do not introduce any additional ordering constraints. In other words, submitting the set of command buffers (which can include executing secondary command buffers) between any semaphore or fence operations execute the recorded commands as if they had all been recorded into a single primary command buffer, except that the current state is reset on each boundary. Explicit ordering constraints can be expressed with **explicit synchronization primitives**.

There are a few implicit ordering guarantees between commands within a command buffer, but only covering a subset of execution. Additional explicit ordering constraints can be expressed with
the various explicit synchronization primitives.

NOTE

Implementations have significant freedom to overlap execution of work submitted to a queue, and this is common due to deep pipelining and parallelism in Vulkan devices.

Commands recorded in command buffers can perform actions, set state that persists across commands, synchronize other commands, or indirectly launch other commands, with some commands fulfilling several of these roles. The “Command Properties” section for each such command lists which of these roles the command takes:

Action

*Action commands* perform operations that can update values in memory. E.g. draw commands, dispatch commands.

State

*State setting commands* update the current state of a command buffer, affecting the operation of future action commands.

Synchronization

*Synchronization commands* impose ordering constraints on action commands, by introducing explicit execution and memory dependencies.

Indirection

*Indirection commands* execute other commands which were not directly recorded in the same command buffer.

NOTE

In the absence of explicit synchronization or implicit ordering guarantees, action commands may overlap execution or execute out of order, potentially leading to data races. However, such reordering does not affect the current state observed by any action command. Each action command uses the state in effect at the point where the command occurs in the command buffer, regardless of when it is executed.

3.3. Object Model

The devices, queues, and other entities in Vulkan are represented by Vulkan objects. At the API level, all objects are referred to by handles. There are two classes of handles, dispatchable and non-dispatchable. *Dispatchable* handle types are a pointer to an opaque type. This pointer may be used by layers as part of intercepting API commands, and thus each API command takes a dispatchable type as its first parameter. Each object of a dispatchable type must have a unique handle value during its lifetime.

*Non-dispatchable* handle types are a 64-bit integer type whose meaning is implementation-dependent. If the privateData feature is enabled for a VkDevice, each object of a non-dispatchable type created on that device must have a handle value that is unique among objects created on that device, for the duration of the object’s lifetime. Otherwise, non-dispatchable handles may encode
object information directly in the handle rather than acting as a reference to an underlying object, and thus may not have unique handle values. If handle values are not unique, then destroying one such handle must not cause identical handles of other types to become invalid, and must not cause identical handles of the same type to become invalid if that handle value has been created more times than it has been destroyed.

All objects created or allocated from a VkDevice (i.e. with a VkDevice as the first parameter) are private to that device, and must not be used on other devices.

### 3.3.1. Object Lifetime

Objects are created or allocated by vkCreate* and vkAllocate* commands, respectively. Once an object is created or allocated, its “structure” is considered to be immutable, though the contents of certain object types is still free to change. Objects are destroyed or freed by vkDestroy* and vkFree* commands, respectively.

Objects that are allocated (rather than created) take resources from an existing pool object or memory heap, and when freed return resources to that pool or heap. While object creation and destruction are generally expected to be low-frequency occurrences during runtime, allocating and freeing objects can occur at high frequency. Pool objects help accommodate improved performance of the allocations and frees.

It is an application’s responsibility to track the lifetime of Vulkan objects, and not to destroy them while they are still in use.

The ownership of application-owned memory is immediately acquired by any Vulkan command it is passed into. Ownership of such memory must be released back to the application at the end of the duration of the command, unless that command was deferred, so that the application can alter or free this memory as soon as all the commands that acquired it have returned. If the command was deferred, ownership of such memory is released back to the application when the deferred operation is complete.

The following object types are consumed when they are passed into a Vulkan command and not further accessed by the objects they are used to create. They must not be destroyed in the duration of any API command they are passed into:

- VkShaderModule
- VkPipelineCache

A VkRenderPass or VkPipelineLayout object passed as a parameter to create another object is not further accessed by that object after the duration of the command it is passed into. A VkRenderPass used in a command buffer follows the rules described below.

VkDescriptorSetLayout objects may be accessed by commands that operate on descriptor sets allocated using that layout, and those descriptor sets must not be updated with vkUpdateDescriptorSets after the descriptor set layout has been destroyed. Otherwise, a VkDescriptorSetLayout object is no longer referenced by an API command it is passed into once host execution of that command completes.
The application **must** not destroy any other type of Vulkan object until all uses of that object by the device (such as via command buffer execution) have completed.

The following Vulkan objects **must** not be destroyed while any command buffers using the object are in the **pending state**:

- VkEvent
- VkQueryPool
- VkBuffer
- VkBufferView
- VkImage
- VkImageView
- VkPipeline
- VkSampler
- VkSamplerYcbcrConversion
- VkDescriptorPool
- VkFramebuffer
- VkRenderPass
- VkCommandBuffer
- VkCommandPool
- VkDeviceMemory
- VkDescriptorSet
- VkAccelerationStructureKHR
- VkVideoSessionKHR
- VkVideoSessionParametersKHR

Destroying these objects will move any command buffers that are in the **recording or executable state**, and are using those objects, to the **invalid state**.

The following Vulkan objects **must** not be destroyed while any queue is executing commands that use the object:

- VkFence
- VkSemaphore
- VkCommandBuffer
- VkCommandPool

In general, objects **can** be destroyed or freed in any order, even if the object being freed is involved in the use of another object (e.g. use of a resource in a view, use of a view in a descriptor set, use of a **pipeline library** in another pipeline, use of a **bottom level acceleration structure** in an instance referenced by a **top level acceleration structure**, use of an object in a command buffer, binding of a
memory allocation to a resource), as long as any object that uses the freed object is not further used in any way except to be destroyed or to be reset in such a way that it no longer uses the other object (such as resetting a command buffer). If the object has been reset, then it can be used as if it never used the freed object. An exception to this is when there is a parent/child relationship between objects. In this case, the application must not destroy a parent object before its children, except when the parent is explicitly defined to free its children when it is destroyed (e.g. for pool objects, as defined below).

**VkCommandPool** objects are parents of **VkCommandBuffer** objects. **VkDescriptorPool** objects are parents of **VkDescriptorSet** objects. **VkDevice** objects are parents of many object types (all that take a **VkDevice** as a parameter to their creation).

The following Vulkan objects have specific restrictions for when they can be destroyed:

- **VkQueue** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the **VkDevice** object they are retrieved from is destroyed.
- Destroying a pool object implicitly frees all objects allocated from that pool. Specifically, destroying **VkCommandPool** frees all **VkCommandBuffer** objects that were allocated from it, and destroying **VkDescriptorPool** frees all **VkDescriptorSet** objects that were allocated from it.
- **VkDevice** objects can be destroyed when all **VkQueue** objects retrieved from them are idle, and all objects created from them have been destroyed.
  - This includes the following objects:
    - **VkFence**
    - **VkSemaphore**
    - **VkEvent**
    - **VkQueryPool**
    - **VkBuffer**
    - **VkBufferView**
    - **VkImage**
    - **VkImageView**
    - **VkShaderModule**
    - **VkPipelineCache**
    - **VkPipeline**
    - **VkPipelineLayout**
    - **VkSampler**
    - **VkSamplerYcbcrConversion**
    - **VkDescriptorSetLayout**
    - **VkDescriptorPool**
    - **VkFramebuffer**
    - **VkRenderPass**
• **VkPhysicalDevice** objects cannot be explicitly destroyed. Instead, they are implicitly destroyed when the **VkInstance** object they are retrieved from is destroyed.

• **VkInstance** objects can be destroyed once all **VkDevice** objects created from any of its **VkPhysicalDevice** objects have been destroyed.

### 3.3.2. External Object Handles

As defined above, the scope of object handles created or allocated from a **VkDevice** is limited to that logical device. Objects which are not in scope are said to be external. To bring an external object into scope, an external handle must be exported from the object in the source scope and imported into the destination scope.

**NOTE**
The scope of external handles and their associated resources may vary according to their type, but they can generally be shared across process and API boundaries.

### 3.4. Application Binary Interface

The mechanism by which Vulkan is made available to applications is platform- or implementation-defined. On many platforms the C interface described in this Specification is provided by a shared library. Since shared libraries can be changed independently of the applications that use them, they present particular compatibility challenges, and this Specification places some requirements on them.

Shared library implementations must use the default Application Binary Interface (ABI) of the standard C compiler for the platform, or provide customized API headers that cause application code to use the implementation's non-default ABI. An ABI in this context means the size, alignment, and layout of C data types; the procedure calling convention; and the naming convention for shared library symbols corresponding to C functions. Customizing the calling convention for a platform is usually accomplished by defining calling convention macros appropriately in `vk_platform.h`.

On platforms where Vulkan is provided as a shared library, library symbols beginning with “vk” and followed by a digit or uppercase letter are reserved for use by the implementation. Applications which use Vulkan must not provide definitions of these symbols. This allows the Vulkan shared library to be updated with additional symbols for new API versions or extensions without causing symbol conflicts with existing applications.

Shared library implementations should provide library symbols for commands in the highest version of this Specification they support, and for Window System Integration extensions relevant to the platform. They may also provide library symbols for commands defined by additional
These requirements and recommendations are intended to allow implementors to take advantage of platform-specific conventions for SDKs, ABIs, library versioning mechanisms, etc. while still minimizing the code changes necessary to port applications or libraries between platforms. Platform vendors, or providers of the de facto standard Vulkan shared library for a platform, are encouraged to document what symbols the shared library provides and how it will be versioned when new symbols are added.

Applications **should** only rely on shared library symbols for commands in the minimum core version required by the application. `vkGetInstanceProcAddr` and `vkGetDeviceProcAddr` **should** be used to obtain function pointers for commands in core versions beyond the application’s minimum required version.

### 3.5. Command Syntax and Duration

The Specification describes Vulkan commands as functions or procedures using C99 syntax. Language bindings for other languages such as C++ and JavaScript **may** allow for stricter parameter passing, or object-oriented interfaces.

Vulkan uses the standard C types for the base type of scalar parameters (e.g. types from `<stdint.h>`), with exceptions described below, or elsewhere in the text when appropriate:

**VkBool32** represents boolean **`True`** and **`False`** values, since C does not have a sufficiently portable built-in boolean type:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkBool32;
```

**`VK_TRUE`** represents a boolean **`True`** (unsigned integer 1) value, and **`VK_FALSE`** a boolean **`False`** (unsigned integer 0) value.

All values returned from a Vulkan implementation in a **`VkBool32`** will be either **`VK_TRUE`** or **`VK_FALSE`**.

Applications **must** not pass any other values than **`VK_TRUE`** or **`VK_FALSE`** into a Vulkan implementation where a **`VkBool32`** is expected.

**`VK_TRUE`** is a constant representing a **`VkBool32`** **`True`** value.

```c
#define VK_TRUE 1U
```

**`VK_FALSE`** is a constant representing a **`VkBool32`** **`False`** value.

```c
#define VK_FALSE 0U
```
**VkDeviceSize** represents device memory size and offset values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceSize;
```

**VkDeviceAddress** represents device buffer address values:

```c
// Provided by VK_VERSION_1_0
typedef uint64_t VkDeviceAddress;
```

Commands that create Vulkan objects are of the form `vkCreate*` and take `Vk*CreateInfo` structures with the parameters needed to create the object. These Vulkan objects are destroyed with commands of the form `vkDestroy*`.

The last in-parameter to each command that creates or destroys a Vulkan object is `pAllocator`. The `pAllocator` parameter can be set to a non-NULL value such that allocations for the given object are delegated to an application provided callback; refer to the Memory Allocation chapter for further details.

Commands that allocate Vulkan objects owned by pool objects are of the form `vkAllocate*`, and take `Vk*AllocateInfo` structures. These Vulkan objects are freed with commands of the form `vkFree*`. These objects do not take allocators; if host memory is needed, they will use the allocator that was specified when their parent pool was created.

Commands are recorded into a command buffer by calling API commands of the form `vkCmd*`. Each such command may have different restrictions on where it can be used: in a primary and/or secondary command buffer, inside and/or outside a render pass, and in one or more of the supported queue types. These restrictions are documented together with the definition of each such command.

The *duration* of a Vulkan command refers to the interval between calling the command and its return to the caller.

### 3.5.1. Lifetime of Retrieved Results

Information is retrieved from the implementation with commands of the form `vkGet*` and `vkEnumerate*`.

Unless otherwise specified for an individual command, the results are *invariant*; that is, they will remain unchanged when retrieved again by calling the same command with the same parameters, so long as those parameters themselves all remain valid.

### 3.5.2. Array Results

Some query commands of the form `vkGet*` and `vkEnumerate*` enable retrieving multiple results in the form of a return array. Such commands typically have two pointer arguments as follows:

- An element count pointer pointing to an integer variable, conventionally named as `p*Count`
where * is the capitalized singular form of the name of the retrieved values.

- A pointer to an array where the result array is retrieved, conventionally named as p* where * is the capitalized plural form of the name of the retrieved values.

If such commands are called with the array pointer set to NULL, then the number of retrievable elements is returned in the variable pointed to by the element count pointer. Otherwise, the element count pointer must point to a variable set by the application to the number of elements in the return array, and on return the variable is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the element count variable set by the application, and the command will return VK_INCOMPLETE instead of VK_SUCCESS, to indicate that not all retrievable array elements were returned.

In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to NULL, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a pNext chain, may also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as *Count where * is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as p* where * is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to NULL, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count must specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return VK_INCOMPLETE instead of VK_SUCCESS, if the query command has a VkResult return type, to indicate that not all retrievable array elements were returned.

Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output

NOTE
In practice, this means that applications will typically call such query commands twice:

- First, with the array pointer set to NULL, to retrieve the number of retrievable elements.
- Second, with the array pointer pointing to an application allocated storage for at least as many elements as indicated by the variable pointed to by the element count pointer, to retrieve at most as many of the retrievable elements.

Query commands that return one or more structures, regardless of whether they return a single or an array of structures with or without a pNext chain, may also contain arrays within those structures. Such return arrays are typically defined in the form of two members as follows:

- An integer value specifying the element count, conventionally named as *Count where * is the singular form of the name of the retrieved values.
- A pointer to an array where the result array is retrieved, conventionally named as p* where * is the capitalized plural form of the name of the retrieved values.

Analogously to query commands that return multiple results, if the command is called with the array pointer member of the output structure in question set to NULL, then the number of retrievable elements is returned in the element count member of that output structure. Otherwise, the element count must specify the number of elements in the return array, and on return the element count member is overwritten with the number of elements actually written to the return array. If the input element count is less than the number of retrievable array elements, the query will write only as many elements to the return array as specified by the input element count, and the command will return VK_INCOMPLETE instead of VK_SUCCESS, if the query command has a VkResult return type, to indicate that not all retrievable array elements were returned.

Applications need to separately track the value they provided as the input element count member for such arrays and compare those with the returned element counts in order to determine whether the actually returned element count is smaller than the size of the return array. Another side effect of this is that it is impossible for the application to determine if the number of retrievable elements has increased beyond the provided input element count so using return arrays in output
structures should be limited to invariant array results. In practice, this means that applications will typically call such query commands multiple times:

- First, with the array pointer member(s) set to NULL, to retrieve the number(s) of retrievable elements.
- Second, with the array pointer(s) pointing to an application allocated storage for at least as many elements as indicated by the element count member(s), to retrieve at most as many of the retrievable elements.
- Then the process may need to be repeated for all other newly introduced return arrays in any nested output structures indirectly specified through the previously retrieved result arrays.

Regardless of the type of query command, any array pointer member of an output structure must either be NULL, or point to an application-allocated array. Query commands must not return a pointer to implementation allocated storage in any output structure.

### 3.6. Threading Behavior

Vulkan is intended to provide scalable performance when used on multiple host threads. All commands support being called concurrently from multiple threads, but certain parameters, or components of parameters are defined to be externally synchronized. This means that the caller must guarantee that no more than one thread is using such a parameter at a given time.

More precisely, Vulkan commands use simple stores to update the state of Vulkan objects. A parameter declared as externally synchronized may have its contents updated at any time during the host execution of the command. If two commands operate on the same object and at least one of the commands declares the object to be externally synchronized, then the caller must guarantee not only that the commands do not execute simultaneously, but also that the two commands are separated by an appropriate memory barrier (if needed).

**NOTE**

Memory barriers are particularly relevant for hosts based on the ARM CPU architecture, which is more weakly ordered than many developers are accustomed to from x86/x64 programming. Fortunately, most higher-level synchronization primitives (like the pthread library) perform memory barriers as a part of mutual exclusion, so mutexing Vulkan objects via these primitives will have the desired effect.

Similarly the application must avoid any potential data hazard of application-owned memory that has its ownership temporarily acquired by a Vulkan command. While the ownership of application-owned memory remains acquired by a command the implementation may read the memory at any point, and it may write non-const qualified memory at any point. Parameters referring to non-const qualified application-owned memory are not marked explicitly as externally synchronized in the Specification.

If an application is using deferred host operations in a command, and that operation is successfully deferred, object parameters and application-owned memory passed to that command may be accessed at any time until the deferred operation is complete.
Many object types are **immutable**, meaning the objects **cannot** change once they have been created. These types of objects never need external synchronization, except that they **must** not be destroyed while they are in use on another thread. In certain special cases mutable object parameters are internally synchronized, making external synchronization unnecessary. Any command parameters that are not labeled as externally synchronized are either not mutated by the command or are internally synchronized. Additionally, certain objects related to a command's parameters (e.g. command pools and descriptor pools) **may** be affected by a command, and **must** also be externally synchronized. These implicit parameters are documented as described below.

Parameters of commands that are externally synchronized are listed below.

### Externally Synchronized Parameters

- The *instance* parameter in `vkDestroyInstance`
- The *device* parameter in `vkDestroyDevice`
- The *queue* parameter in `vkQueueSubmit`
- The *fence* parameter in `vkQueueSubmit`
- The *queue* parameter in `vkQueueWaitIdle`
- The *memory* parameter in `vkFreeMemory`
- The *memory* parameter in `vkMapMemory`
- The *memory* parameter in `vkUnmapMemory`
- The *buffer* parameter in `vkBindBufferMemory`
- The *image* parameter in `vkBindImageMemory`
- The *queue* parameter in `vkQueueBindSparse`
- The *fence* parameter in `vkQueueBindSparse`
- The *fence* parameter in `vkDestroyFence`
- The *semaphore* parameter in `vkDestroySemaphore`
- The *event* parameter in `vkDestroyEvent`
- The *event* parameter in `vkSetEvent`
- The *event* parameter in `vkResetEvent`
- The *queryPool* parameter in `vkDestroyQueryPool`
- The *buffer* parameter in `vkDestroyBuffer`
- The *bufferView* parameter in `vkDestroyBufferView`
- The *image* parameter in `vkDestroyImage`
- The *imageView* parameter in `vkDestroyImageView`
- The *shaderModule* parameter in `vkDestroyShaderModule`
- The *pipelineCache* parameter in `vkDestroyPipelineCache`
- The *dstCache* parameter in `vkMergePipelineCaches`
• The `pipeline` parameter in `vkDestroyPipeline`
• The `pipelineLayout` parameter in `vkDestroyPipelineLayout`
• The `sampler` parameter in `vkDestroySampler`
• The `descriptorSetLayout` parameter in `vkDestroyDescriptorSetLayout`
• The `descriptorPool` parameter in `vkDestroyDescriptorPool`
• The `descriptorPool` parameter in `vkResetDescriptorPool`
• The `descriptorPool` member of the `pAllocateInfo` parameter in `vkAllocateDescriptorSets`
• The `descriptorPool` parameter in `vkFreeDescriptorSets`
• The `framebuffer` parameter in `vkDestroyFramebuffer`
• The `renderPass` parameter in `vkDestroyRenderPass`
• The `commandPool` parameter in `vkDestroyCommandPool`
• The `commandPool` parameter in `vkResetCommandPool`
• The `commandPool` member of the `pAllocateInfo` parameter in `vkAllocateCommandBuffers`
• The `commandPool` parameter in `vkFreeCommandBuffers`
• The `commandBuffer` parameter in `vkBeginCommandBuffer`
• The `commandBuffer` parameter in `vkEndCommandBuffer`
• The `commandBuffer` parameter in `vkResetCommandBuffer`
• The `commandBuffer` parameter in `vkCmdBindPipeline`
• The `commandBuffer` parameter in `vkCmdSetViewport`
• The `commandBuffer` parameter in `vkCmdSetScissor`
• The `commandBuffer` parameter in `vkCmdSetLineWidth`
• The `commandBuffer` parameter in `vkCmdSetDepthBias`
• The `commandBuffer` parameter in `vkCmdSetBlendConstants`
• The `commandBuffer` parameter in `vkCmdSetDepthBounds`
• The `commandBuffer` parameter in `vkCmdSetStencilCompareMask`
• The `commandBuffer` parameter in `vkCmdSetStencilWriteMask`
• The `commandBuffer` parameter in `vkCmdBindDescriptorSets`
• The `commandBuffer` parameter in `vkCmdBindIndexBuffer`
• The `commandBuffer` parameter in `vkCmdBindVertexBuffer`
• The `commandBuffer` parameter in `vkCmdDraw`
• The `commandBuffer` parameter in `vkCmdDrawIndexed`
• The `commandBuffer` parameter in `vkCmdDrawIndirect`
• The `commandBuffer` parameter in `vkCmdDispatch`
- The `commandBuffer` parameter in `vkCmdDispatchIndirect`
- The `commandBuffer` parameter in `vkCmdCopyBuffer`
- The `commandBuffer` parameter in `vkCmdCopyImage`
- The `commandBuffer` parameter in `vkCmdBlitImage`
- The `commandBuffer` parameter in `vkCmdCopyBufferToImage`
- The `commandBuffer` parameter in `vkCmdCopyImageToBuffer`
- The `commandBuffer` parameter in `vkCmdUpdateBuffer`
- The `commandBuffer` parameter in `vkCmdFillBuffer`
- The `commandBuffer` parameter in `vkCmdClearColorImage`
- The `commandBuffer` parameter in `vkCmdClearDepthStencilImage`
- The `commandBuffer` parameter in `vkCmdClearAttachments`
- The `commandBuffer` parameter in `vkCmdResolveImage`
- The `commandBuffer` parameter in `vkCmdSetEvent`
- The `commandBuffer` parameter in `vkCmdResetEvent`
- The `commandBuffer` parameter in `vkCmdWaitEvents`
- The `commandBuffer` parameter in `vkCmdPipelineBarrier`
- The `commandBuffer` parameter in `vkCmdBeginQuery`
- The `commandBuffer` parameter in `vkCmdEndQuery`
- The `commandBuffer` parameter in `vkCmdResetQueryPool`
- The `commandBuffer` parameter in `vkCmdWriteTimestamp`
- The `commandBuffer` parameter in `vkCmdCopyQueryPoolResults`
- The `commandBuffer` parameter in `vkCmdPushConstants`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass`
- The `commandBuffer` parameter in `vkCmdNextSubpass`
- The `commandBuffer` parameter in `vkCmdEndRenderPass`
- The `commandBuffer` parameter in `vkCmdExecuteCommands`
- The `commandBuffer` parameter in `vkCmdSetDeviceMask`
- The `commandBuffer` parameter in `vkCmdDispatchBase`
- The `commandPool` parameter in `vkTrimCommandPool`
- The `ycbcrConversion` parameter in `vkDestroySamplerYcbcrConversion`
- The `descriptorUpdateTemplate` parameter in `vkDestroyDescriptorUpdateTemplate`
- The `commandBuffer` parameter in `vkCmdDrawIndirectCount`
- The `commandBuffer` parameter in `vkCmdDrawIndexedIndirectCount`
- The `commandBuffer` parameter in `vkCmdBeginRenderPass2`
- The `commandBuffer` parameter in `vkCmdNextSubpass2`
• The `commandBuffer` parameter in `vkCmdEndRenderPass2`  
• The `privateDataSlot` parameter in `vkDestroyPrivateDataSlot`  
• The `commandBuffer` parameter in `vkCmdSetEvent2`  
• The `commandBuffer` parameter in `vkCmdResetEvent2`  
• The `commandBuffer` parameter in `vkCmdWaitEvents2`  
• The `commandBuffer` parameter in `vkCmdPipelineBarrier2`  
• The `commandBuffer` parameter in `vkCmdWriteTimestamp2`  
• The `queue` parameter in `vkQueueSubmit2`  
• The `fence` parameter in `vkQueueSubmit2`  
• The `commandBuffer` parameter in `vkCmdCopyBuffer2`  
• The `commandBuffer` parameter in `vkCmdCopyImage2`  
• The `commandBuffer` parameter in `vkCmdCopyBufferToImage2`  
• The `commandBuffer` parameter in `vkCmdCopyImageToBuffer2`  
• The `commandBuffer` parameter in `vkCmdBlitImage2`  
• The `commandBuffer` parameter in `vkCmdResolveImage2`  
• The `commandBuffer` parameter in `vkCmdBeginRendering`  
• The `commandBuffer` parameter in `vkCmdEndRendering`  
• The `commandBuffer` parameter in `vkCmdSetCullMode`  
• The `commandBuffer` parameter in `vkCmdSetFrontFace`  
• The `commandBuffer` parameter in `vkCmdSetPrimitiveTopology`  
• The `commandBuffer` parameter in `vkCmdSetViewportWithCount`  
• The `commandBuffer` parameter in `vkCmdSetScissorWithCount`  
• The `commandBuffer` parameter in `vkCmdBindVertexBuffers2`  
• The `commandBuffer` parameter in `vkCmdSetDepthTestEnable`  
• The `commandBuffer` parameter in `vkCmdSetDepthWriteEnable`  
• The `commandBuffer` parameter in `vkCmdSetDepthCompareOp`  
• The `commandBuffer` parameter in `vkCmdSetDepthBoundsTestEnable`  
• The `commandBuffer` parameter in `vkCmdSetStencilTestEnable`  
• The `commandBuffer` parameter in `vkCmdSetStencilOp`  
• The `commandBuffer` parameter in `vkCmdSetRasterizerDiscardEnable`  
• The `commandBuffer` parameter in `vkCmdSetDepthBiasEnable`  
• The `commandBuffer` parameter in `vkCmdSetPrimitiveRestartEnable`  
• The `surface` parameter in `vkDestroySurfaceKHR`  
• The `surface` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`  
• The `oldSwapchain` member of the `pCreateInfo` parameter in `vkCreateSwapchainKHR`
• The `swapchain` parameter in `vkDestroySwapchainKHR`
• The `swapchain` parameter in `vkAcquireNextImageKHR`
• The `semaphore` parameter in `vkAcquireNextImageKHR`
• The `fence` parameter in `vkAcquireNextImageKHR`
• The `queue` parameter in `vkQueuePresentKHR`
• The `surface` parameter in `vkGetDeviceGroupSurfacePresentModesKHR`
• The `surface` parameter in `vkGetPhysicalDevicePresentRectanglesKHR`
• The `display` parameter in `vkCreateDisplayModeKHR`
• The `mode` parameter in `vkGetDisplayPlaneCapabilitiesKHR`
• The `videoSession` parameter in `vkDestroyVideoSessionKHR`
• The `videoSession` parameter in `vkBindVideoSessionMemoryKHR`
• The `videoSessionParameters` parameter in `vkDestroyVideoSessionParametersKHR`
• The `commandBuffer` parameter in `vkCmdBeginVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdEndVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdControlVideoCodingKHR`
• The `commandBuffer` parameter in `vkCmdDecodeVideoKHR`
• The `commandBuffer` parameter in `vkCmdBeginRenderingKHR`
• The `commandBuffer` parameter in `vkCmdEndRenderingKHR`
• The `commandBuffer` parameter in `vkCmdSetDeviceMaskKHR`
• The `commandPool` parameter in `vkTrimCommandPoolKHR`
• The `commandBuffer` parameter in `vkCmdPushDescriptorSetKHR`

• The `commandBuffer` parameter in `vkCmdSetRayTracingPipelineStackSizeKHR`
For `VkPipelineCache` objects created with `flags` containing `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, the above table is extended with the `pipelineCache` parameter to `vkCreate*Pipelines` being externally synchronized.

There are also a few instances where a command can take in an application-allocated list whose contents are externally synchronized parameters. In these cases, the caller must guarantee that at most one thread is using a given element within the list at a given time. These parameters are listed below.

### Externally Synchronized Parameter Lists

- Each element of the `pFences` parameter in `vkResetFences`
- Each element of the `pDescriptorSets` parameter in `vkFreeDescriptorSets`
- Each element of the `pCommandBuffers` parameter in `vkFreeCommandBuffers`
- Each element of the `pWaitSemaphores` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
- Each element of the `pSwapchains` member of the `pPresentInfo` parameter in `vkQueuePresentKHR`
- The `surface` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`
- The `oldSwapchain` member of each element of the `pCreateInfos` parameter in `vkCreateSharedSwapchainsKHR`

In addition, there are some implicit parameters that need to be externally synchronized. For example, when a `commandBuffer` parameter needs to be externally synchronized, it implies that the `commandPool` from which that command buffer was allocated also needs to be externally synchronized. The implicit parameters and their associated object are listed below.

### Implicit Externally Synchronized Parameters

- All `VkPhysicalDevice` objects enumerated from `instance` in `vkDestroyInstance`
- All `VkQueue` objects created from `device` in `vkDestroyDevice`
- All `VkQueue` objects created from `device` in `vkDeviceWaitIdle`
- Any `VkDescriptorSet` objects allocated from `descriptorPool` in `vkResetDescriptorPool`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkBeginCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkEndCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from in `vkResetCommandBuffer`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdBindPipeline`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetViewport`
- The `VkCommandPool` that `commandBuffer` was allocated from, in `vkCmdSetScissor`

3.7. Valid Usage

Valid usage defines a set of conditions which **must** be met in order to achieve well-defined runtime behavior in an application. These conditions depend only on Vulkan state, and the parameters or objects whose usage is constrained by the condition.

The core layer assumes applications are using the API correctly. Except as documented elsewhere in the Specification, the behavior of the core layer to an application using the API incorrectly is undefined, and **may** include program termination. However, implementations **must** ensure that incorrect usage by an application does not affect the integrity of the operating system, the Vulkan implementation, or other applications in the system using Vulkan. In particular, any guarantees made by an operating system about whether memory from one process can be visible to another process or not **must** not be violated by a Vulkan implementation for **any memory allocation**. Vulkan implementations are not **required** to make additional security or integrity guarantees beyond those provided by the OS unless explicitly directed by the application’s use of a particular feature or extension.

For instance, if an operating system guarantees that data in all its memory allocations are set to zero when newly allocated, the Vulkan implementation **must** make the same guarantees for any allocations it controls (e.g. VkDeviceMemory).

Similarly, if an operating system guarantees that use-after-free of host allocations will not result in values written by another process becoming visible, the same guarantees **must** be made by the Vulkan implementation for device memory.

If the **protectedMemory** feature is supported, the implementation provides additional guarantees when invalid usage occurs to prevent values in protected memory from being accessed or inferred outside of protected operations, as described in **Protected Memory Access Rules**.

Some valid usage conditions have dependencies on runtime limits or feature availability. It is possible to validate these conditions against Vulkan’s minimum supported values for these limits and features, or some subset of other known values.
Valid usage conditions do not cover conditions where well-defined behavior (including returning an error code) exists.

Valid usage conditions **should** apply to the command or structure where complete information about the condition would be known during execution of an application. This is such that a validation layer or linter **can** be written directly against these statements at the point they are specified.

This does lead to some non-obvious places for valid usage statements. For instance, the valid values for a structure might depend on a separate value in the calling command. In this case, the structure itself will not reference this valid usage as it is impossible to determine validity from the structure that it is invalid - instead this valid usage would be attached to the calling command.

Another example is draw state - the state setters are independent, and can cause a legitimately invalid state configuration between draw calls; so the valid usage statements are attached to the place where all state needs to be valid - at the drawing command.

Valid usage conditions are described in a block labeled “Valid Usage” following each command or structure they apply to.

### 3.7.1. Usage Validation

Vulkan is a layered API. The lowest layer is the core Vulkan layer, as defined by this Specification. The application **can** use additional layers above the core for debugging, validation, and other purposes.

One of the core principles of Vulkan is that building and submitting command buffers **should** be highly efficient. Thus error checking and validation of state in the core layer is minimal, although more rigorous validation **can** be enabled through the use of layers.

Validation of correct API usage is left to validation layers. Applications **should** be developed with validation layers enabled, to help catch and eliminate errors. Once validated, released applications **should** not enable validation layers by default.

### 3.7.2. Implicit Valid Usage

Some valid usage conditions apply to all commands and structures in the API, unless explicitly denoted otherwise for a specific command or structure. These conditions are considered **implicit**, and are described in a block labeled “Valid Usage (Implicit)” following each command or structure they apply to. Implicit valid usage conditions are described in detail below.

**Valid Usage for Object Handles**

Any input parameter to a command that is an object handle **must** be a valid object handle, unless otherwise specified. An object handle is valid if:

- It has been created or allocated by a previous, successful call to the API. Such calls are noted in
the Specification.

- It has not been deleted or freed by a previous call to the API. Such calls are noted in the Specification.
- Any objects used by that object, either as part of creation or execution, must also be valid.

The reserved values `VK_NULL_HANDLE` and `NULL` can be used in place of valid non-dispatchable handles and dispatchable handles, respectively, when explicitly called out in the Specification. Any command that creates an object successfully must not return these values. It is valid to pass these values to `vkDestroy*` or `vkFree*` commands, which will silently ignore these values.

**Valid Usage for Pointers**

Any parameter that is a pointer must be a valid pointer only if it is explicitly called out by a Valid Usage statement.

A pointer is “valid” if it points at memory containing values of the number and type(s) expected by the command, and all fundamental types accessed through the pointer (e.g. as elements of an array or as members of a structure) satisfy the alignment requirements of the host processor.

**Valid Usage for Strings**

Any parameter that is a pointer to `char` must be a finite sequence of values terminated by a null character, or if explicitly called out in the Specification, can be `NULL`.

Strings specified as UTF-8 encoded must not contain invalid UTF-8 sequences. See String Representation for additional information about strings.

**Valid Usage for Enumerated Types**

Any parameter of an enumerated type must be a valid enumerant for that type. Use of an enumerant is valid if the following conditions are true:

- The enumerant is defined as part of the enumerated type.
- The enumerant is not a value suffixed with `_MAX_ENUM`.
  - This value exists only to ensure that C enum types are 32 bits in size and must not be used by applications.
- If the enumerant is used in a function that has a `VkInstance` as its first parameter and either:
  - it was added by a core version that is supported (as reported by `vkEnumerateInstanceVersion`) and the value of `VkApplicationInfo::apiVersion` is greater than or equal to the version that added it; or
  - it was added by an instance extension that was enabled for the instance.
- If the enumerant is used in a function that has a `VkPhysicalDevice` object as its first parameter and either:
  - it was added by a core version that is supported by that device (as reported by `VkPhysicalDeviceProperties::apiVersion`); or
  - it was added by an instance extension that was enabled for the instance; or
- it was added by a **device extension** that is supported by that device.

- If the enumerant is used in a function that has any other dispatchable object as its first parameter and either:
  - it was added by a core version that is supported for the device (as reported by `VkPhysicalDeviceProperties::apiVersion`); or
  - it was added by a **device extension** that was enabled for the device.

Additionally, if `maintenance5` is supported, any integer value representable in the range valid for the defined type is valid when used in a function that has a `VkPhysicalDevice object as its first parameter. Physical device queries will either return results indicating lack of support, or ignore unsupported values when used as a bit flag in a `Vk*Flags* parameter.

Any enumerated type returned from a query command or otherwise output from Vulkan to the application **must** not have a reserved value. Reserved values are values not defined by any extension for that enumerated type.

**NOTE**

In some special cases, an enumerant is only meaningful if a feature defined by an extension is also enabled, as well as the extension itself. The global “valid enumerant” rule described here does not address such cases.

**NOTE**

This language is intended to accommodate cases such as “hidden” extensions known only to driver internals, or layers enabling extensions without knowledge of the application, without allowing return of values not defined by any extension.

**NOTE**

Application developers are encouraged to be careful when using `switch` statements with Vulkan API enums. This is because new extensions can add new values to existing enums. Using a `default:` statement within a `switch` may avoid future compilation issues.

This is particularly true for enums such as `VkDriverId`, which may have values added that do not belong to a corresponding new extension.

### Valid Usage for Flags

A collection of flags is represented by a bitmask using the type `VkFlags`:

```c
// Provided by VK_VERSION_1_0
typedef uint32_t VkFlags;
```

Bitmasks are passed to many commands and structures to compactly represent options, but `VkFlags` is not used directly in the API. Instead, a `Vk*Flags` type which is an alias of `VkFlags`, and whose name matches the corresponding `Vk*FlagBits` that are valid for that type, is used.

Any `Vk*Flags` member or parameter used in the API as an input **must** be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.
An individual bit flag is valid for a Vk*Flags type if it would be a valid enumerant when used with the equivalent Vk*FlagBits type, where the bits type is obtained by taking the flag type and replacing the trailing Flags with FlagBits. For example, a flag value of type VkColorComponentFlags must contain only bit flags defined by VkColorComponentFlagBits.

Any Vk*Flags member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits type. An application cannot rely on the state of these unspecified bits.

Only the low-order 31 bits (bit positions zero through 30) are available for use as flag bits.

**NOTE**

This restriction is due to poorly defined behavior by C compilers given a C enumerant value of 0x80000000. In some cases adding this enumerant value may increase the size of the underlying Vk*FlagBits type, breaking the ABI.

A collection of 64-bit flags is represented by a bitmask using the type VkFlags64:

```c
// Provided by VK_VERSION_1_3, VK_KHR_synchronization2
typedef uint64_t VkFlags64;
```

When the 31 bits available in VkFlags are insufficient, the VkFlags64 type can be passed to commands and structures to represent up to 64 options. VkFlags64 is not used directly in the API. Instead, a Vk*Flags2 type which is an alias of VkFlags64, and whose name matches the corresponding Vk*FlagBits2 that are valid for that type, is used.

Any Vk*Flags2 member or parameter used in the API as an input must be a valid combination of bit flags. A valid combination is either zero or the bitwise OR of valid bit flags.

An individual bit flag is valid for a Vk*Flags2 type if it would be a valid enumerant when used with the equivalent Vk*FlagBits2 type, where the bits type is obtained by taking the flag type and replacing the trailing Flags2 with FlagBits2. For example, a flag value of type VkAccessFlags2KHR must contain only bit flags defined by VkAccessFlagBits2KHR.

Any Vk*Flags2 member or parameter returned from a query command or otherwise output from Vulkan to the application may contain bit flags undefined in its corresponding Vk*FlagBits2 type. An application cannot rely on the state of these unspecified bits.

**NOTE**

Both the Vk*FlagBits2 type, and the individual bits defined for that type, are defined as uint64_t integers in the C API. This is in contrast to the 32-bit types, where the Vk*FlagBits type is defined as a C enum and the individual bits as enumerants belonging to that enum. As a result, there is less compile time type checking possible for the 64-bit types. This is unavoidable since there is no sufficiently portable way to define a 64-bit enum type in C99.

**Valid Usage for Structure Types**

Any parameter that is a structure containing a sType member must have a value of sType which is a valid VkStructureType value matching the type of the structure.
Valid Usage for Structure Pointer Chains

Any parameter that is a structure containing a void* pNext member must have a value of pNext that is either NULL, or is a pointer to a valid extending structure, containing sType and pNext members as described in the Vulkan Documentation and Extensions document in the section “Extending Structures”. The set of structures connected by pNext pointers is referred to as a pNext chain.

Each structure included in the pNext chain must be defined at runtime by either:

- a core version which is supported
- an extension which is enabled
- a supported device extension in the case of physical-device-level functionality added by the device extension

Each type of extending structure must not appear more than once in a pNext chain, including any aliases. This general rule may be explicitly overridden for specific structures.

Any component of the implementation (the loader, any enabled layers, and drivers) must skip over, without processing (other than reading the sType and pNext members) any extending structures in the chain not defined by core versions or extensions supported by that component.

As a convenience to implementations and layers needing to iterate through a structure pointer chain, the Vulkan API provides two base structures. These structures allow for some type safety, and can be used by Vulkan API functions that operate on generic inputs and outputs.

The VkBaseInStructure structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseInStructure {
    VkStructureType sType;
    const struct VkBaseInStructure* pNext;
} VkBaseInStructure;
```

- sType is the structure type of the structure being iterated through.
- pNext is NULL or a pointer to the next structure in a structure chain.

VkBaseInStructure can be used to facilitate iterating through a read-only structure pointer chain.

The VkBaseOutStructure structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBaseOutStructure {
    VkStructureType sType;
    struct VkBaseOutStructure* pNext;
} VkBaseOutStructure;
```

- sType is the structure type of the structure being iterated through.
• `pNext` is NULL or a pointer to the next structure in a structure chain.

`VkBaseOutStructure` can be used to facilitate iterating through a structure pointer chain that returns data back to the application.

**Valid Usage for Nested Structures**

The above conditions also apply recursively to members of structures provided as input to a command, either as a direct argument to the command, or themselves a member of another structure.

Specifics on valid usage of each command are covered in their individual sections.

**Valid Usage for Extensions**

Instance-level functionality or behavior added by an instance extension to the API **must** not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by an instance extension to the API **must** not be used unless that extension is supported by the instance as determined by `vkEnumerateInstanceExtensionProperties`, and that extension is enabled in `VkInstanceCreateInfo`.

Physical-device-level functionality or behavior added by a device extension to the API **must** not be used unless the conditions described in Extending Physical Device From Device Extensions are met.

Device-level functionality added by a device extension that is dispatched from a `VkDevice`, or from a child object of a `VkDevice` **must** not be used unless that extension is supported by the device as determined by `vkEnumerateDeviceExtensionProperties`, and that extension is enabled in `VkDeviceCreateInfo`.

**Valid Usage for Newer Core Versions**

Instance-level functionality or behavior added by a new core version of the API **must** not be used unless it is supported by the instance as determined by `vkEnumerateInstanceVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Physical-device-level functionality or behavior added by a new core version of the API **must** not be used unless it is supported by the physical device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

Device-level functionality or behavior added by a new core version of the API **must** not be used unless it is supported by the device as determined by `VkPhysicalDeviceProperties::apiVersion` and the specified version of `VkApplicationInfo::apiVersion`.

**3.8. VkResult Return Codes**

While the core Vulkan API is not designed to capture incorrect usage, some circumstances still require return codes. Commands in Vulkan return their status via return codes that are in one of two categories:
Successful completion codes are returned when a command needs to communicate success or status information. All successful completion codes are non-negative values.

Runtime error codes are returned when a command needs to communicate a failure that could only be detected at runtime. All runtime error codes are negative values.

All return codes in Vulkan are reported via \texttt{VkResult} return values. The possible codes are:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef enum VkResult {
    VK_SUCCESS = 0,
    VK_NOT_READY = 1,
    VK_TIMEOUT = 2,
    VK_EVENT_SET = 3,
    VK_EVENT_RESET = 4,
    VK_INCOMPLETE = 5,
    VK_ERROR_OUT_OF_HOST_MEMORY = -1,
    VK_ERROR_OUT_OF_DEVICE_MEMORY = -2,
    VK_ERROR_INITIALIZATION_FAILED = -3,
    VK_ERROR_DEVICE_LOST = -4,
    VK_ERROR_MEMORY_MAP_FAILED = -5,
    VK_ERROR_LAYER_NOT_PRESENT = -6,
    VK_ERROR_EXTENSION_NOT_PRESENT = -7,
    VK_ERROR_FEATURE_NOT_PRESENT = -8,
    VK_ERROR_INCOMPATIBLE_DRIVER = -9,
    VK_ERROR_TOO_MANY_OBJECTS = -10,
    VK_ERROR_FORMAT_NOT_SUPPORTED = -11,
    VK_ERROR_FRAGMENTED_POOL = -12,
    VK_ERROR_UNKNOWN = -13,
// Provided by VK_VERSION_1_1
    VK_ERROR_OUT_OF_POOL_MEMORY = -1000069000,
// Provided by VK_VERSION_1_1
    VK_ERROR_INVALID_EXTERNAL_HANDLE = -1000072003,
// Provided by VK_VERSION_1_2
    VK_ERROR_FRAGMENTATION = -1000161000,
// Provided by VK_VERSION_1_2
    VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS = -1000257000,
// Provided by VK_VERSION_1_3
    VK_PIPELINE_COMPILE_REQUIRED = 1000297000,
// Provided by VK_KHR_surface
    VK_ERROR_SURFACE_LOST_KHR = -1000000000,
// Provided by VK_KHR_surface
    VK_ERROR_NATIVE_WINDOW_IN_USE_KHR = -1000000001,
// Provided by VK_KHR_swapchain
    VK_SUBOPTIMAL_KHR = 100001003,
// Provided by VK_KHR_swapchain
    VK_ERROR_OUT_OF_DATE_KHR = -1000001004,
// Provided by VK_KHR_display_swapchain
    VK_ERROR_INCOMPATIBLE_DISPLAY_KHR = -1000003001,
// Provided by VK_KHR_video_queue
    VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR = -1000023000,
\end{verbatim}

Success Codes

- **VK_SUCCESS** Command successfully completed
- **VK_NOT_READY** A fence or query has not yet completed
- **VK_TIMEOUT** A wait operation has not completed in the specified time
- **VK_EVENT_SET** An event is signaled
- **VK_EVENT_RESET** An event is unsignaled
- **VK_INCOMPLETE** A return array was too small for the result
• **VK_SUBOPTIMAL_KHR** A swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

• **VK_THREAD_IDLE_KHR** A deferred operation is not complete but there is currently no work for this thread to do at the time of this call.

• **VK_THREAD_DONE_KHR** A deferred operation is not complete but there is no work remaining to assign to additional threads.

• **VK_OPERATION_DEFERRED_KHR** A deferred operation was requested and at least some of the work was deferred.

• **VK_OPERATION_NOT_DEFERRED_KHR** A deferred operation was requested and no operations were deferred.

• **VK_PIPELINE_COMPILE_REQUIRED** A requested pipeline creation would have required compilation, but the application requested compilation to not be performed.

• **VK_INCOMPATIBLE_SHADER_BINARY_EXT** The provided binary shader code is not compatible with this device.

  NOTE
  In the initial version of the VK_EXT_shader_object extension, this return code was named VK_ERROR_INCOMPATIBLE_SHADER_BINARY_EXT and improperly described as an error code. The name has been changed, but the old name is retained as an alias for compatibility with old code.

**Error codes**

• **VK_ERROR_OUT_OF_HOST_MEMORY** A host memory allocation has failed.

• **VK_ERROR_OUT_OF_DEVICE_MEMORY** A device memory allocation has failed.

• **VK_ERROR_INITIALIZATION_FAILED** Initialization of an object could not be completed for implementation-specific reasons.

• **VK_ERROR_DEVICE_LOST** The logical or physical device has been lost. See Lost Device.

• **VK_ERROR_MEMORY_MAP_FAILED** Mapping of a memory object has failed.

• **VK_ERROR_LAYER_NOT_PRESENT** A requested layer is not present or could not be loaded.

• **VK_ERROR_EXTENSION_NOT_PRESENT** A requested extension is not supported.

• **VK_ERROR_FEATURE_NOT_PRESENT** A requested feature is not supported.

• **VK_ERROR_INCOMPATIBLE_DRIVER** The requested version of Vulkan is not supported by the driver or is otherwise incompatible for implementation-specific reasons.

• **VK_ERROR_TOO_MANY_OBJECTS** Too many objects of the type have already been created.

• **VK_ERROR_FORMAT_NOT_SUPPORTED** A requested format is not supported on this device.

• **VK_ERROR_FRAGMENTED_POOL** A pool allocation has failed due to fragmentation of the pool’s memory. This must only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. This should be returned in preference to VK_ERROR_OUT_OF_POOL_MEMORY, but only if the implementation is certain that the pool allocation failure was due to fragmentation.

• **VK_ERROR_SURFACE_LOST_KHR** A surface is no longer available.
• **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** The requested window is already in use by Vulkan or another API in a manner which prevents it from being used again.

• **VK_ERROR_OUT_OF_DATE_KHR** A surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications **must** query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

• **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR** The display used by a swapchain does not use the same presentable image layout, or is incompatible in a way that prevents sharing an image.

• **VK_ERROR_OUT_OF_POOL_MEMORY** A pool memory allocation has failed. This **must** only be returned if no attempt to allocate host or device memory was made to accommodate the new allocation. If the failure was definitely due to fragmentation of the pool, **VK_ERROR_FRAGMENTED_POOL** **should** be returned instead.

• **VK_ERROR_INVALID_EXTERNAL_HANDLE** An external handle is not a valid handle of the specified type.

• **VK_ERROR_FRAGMENTATION** A descriptor pool creation has failed due to fragmentation.

• **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** A buffer creation or memory allocation failed because the requested address is not available. A shader group handle assignment failed because the requested shader group handle information is no longer valid.

• **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT** An operation on a swapchain created with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** failed as it did not have exclusive full-screen access. This **may** occur due to implementation-dependent reasons, outside of the application's control.

• **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** The requested **VkImageUsageFlags** are not supported.

• **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** The requested video picture layout is not supported.

• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** A video profile operation specified via **VkVideoProfileInfoKHR::videoCodecOperation** is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** Format parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** Codec-specific parameters in a requested **VkVideoProfileInfoKHR** chain are not supported.

• **VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR** The specified video Std header version is not supported.

• **VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR** The specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

• **VK_ERROR_NOT_PERMITTED_KHR** The driver implementation has denied a request to acquire a priority above the default priority (**VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT**) because the application does not have sufficient privileges.

• **VK_ERROR_UNKNOWN** An unknown error has occurred; either the application has provided invalid
input, or an implementation failure has occurred.

If a command returns a runtime error, unless otherwise specified any output parameters will have undefined contents, except that if the output parameter is a structure with sType and pNext fields, those fields will be unmodified. Any structures chained from pNext will also have undefined contents, except that sType and pNext will be unmodified.

**VK_ERROR_OUT_OF_*_MEMORY** errors do not modify any currently existing Vulkan objects. Objects that have already been successfully created can still be used by the application.

**NOTE**
As a general rule, Free, Release, and Reset commands do not return **VK_ERROR_OUT_OF_HOST_MEMORY**, while any other command with a return code may return it. Any exceptions from this rule are described for those commands.

**VK_ERROR_UNKNOWN** will be returned by an implementation when an unexpected error occurs that cannot be attributed to valid behavior of the application and implementation. Under these conditions, it may be returned from any command returning a VkResult.

**NOTE**
**VK_ERROR_UNKNOWN** is not expected to ever be returned if the application behavior is valid, and if the implementation is bug-free. If **VK_ERROR_UNKNOWN** is received, the application should be checked against the latest validation layers to verify correct behavior as much as possible. If no issues are identified it could be an implementation issue, and the implementor should be contacted for support.

Performance-critical commands generally do not have return codes. If a runtime error occurs in such commands, the implementation will defer reporting the error until a specified point. For commands that record into command buffers (vkCmd*) runtime errors are reported by vkEndCommandBuffer.

### 3.9. Numeric Representation and Computation

Implementations normally perform computations in floating-point, and must meet the range and precision requirements defined under “Floating-Point Computation” below.

These requirements only apply to computations performed in Vulkan operations outside of shader execution, such as texture image specification and sampling, and per-fragment operations. Range and precision requirements during shader execution differ and are specified by the Precision and Operation of SPIR-V Instructions section.

In some cases, the representation and/or precision of operations is implicitly limited by the specified format of vertex or texel data consumed by Vulkan. Specific floating-point formats are described later in this section.

#### 3.9.1. Floating-Point Computation

Most floating-point computation is performed in SPIR-V shader modules. The properties of computation within shaders are constrained as defined by the Precision and Operation of SPIR-V Instructions section.
Some floating-point computation is performed outside of shaders, such as viewport and depth range calculations. For these computations, we do not specify how floating-point numbers are to be represented, or the details of how operations on them are performed, but only place minimal requirements on representation and precision as described in the remainder of this section.

We require simply that numbers' floating-point parts contain enough bits and that their exponent fields are large enough so that individual results of floating-point operations are accurate to about 1 part in $10^5$. The maximum representable magnitude for all floating-point values **must** be at least $2^{32}$.

\[ x \times 0 = 0 \times x = 0 \] for any non-infinite and non-NaN \( x \).

\[ 1 \times x = x \times 1 = x. \]

\[ x + 0 = 0 + x = x. \]

\[ 0^0 = 1. \]

Occasionally, further requirements will be specified. Most single-precision floating-point formats meet these requirements.

The special values \( \text{Inf} \) and \( -\text{Inf} \) encode values with magnitudes too large to be represented; the special value \( \text{NaN} \) encodes “Not A Number” values resulting from undefined arithmetic operations such as \( 0 / 0 \). Implementations **may** support \( \text{Inf} \) and \( \text{NaN} \) in their floating-point computations. Any computation which does not support either \( \text{Inf} \) or \( \text{NaN} \), for which that value is an input or output will yield an undefined value.

### 3.9.2. Floating-Point Format Conversions

When a value is converted to a defined floating-point representation, finite values falling between two representable finite values are rounded to one or the other. The rounding mode is not defined. Finite values whose magnitude is larger than that of any representable finite value may be rounded either to the closest representable finite value or to the appropriately signed infinity. For unsigned destination formats any negative values are converted to zero. Positive infinity is converted to positive infinity; negative infinity is converted to negative infinity in signed formats and to zero in unsigned formats; and any NaN is converted to a NaN.

### 3.9.3. 16-Bit Floating-Point Numbers

16-bit floating-point numbers are defined in the “16-bit floating-point numbers” section of the Khronos Data Format Specification.

### 3.9.4. Unsigned 11-Bit Floating-Point Numbers

Unsigned 11-bit floating-point numbers are defined in the “Unsigned 11-bit floating-point numbers” section of the Khronos Data Format Specification.
3.9.5. Unsigned 10-Bit Floating-Point Numbers

Unsigned 10-bit floating-point numbers are defined in the “Unsigned 10-bit floating-point numbers” section of the Khronos Data Format Specification.

3.9.6. General Requirements

Any representable floating-point value in the appropriate format is legal as input to a Vulkan command that requires floating-point data. The result of providing a value that is not a floating-point number to such a command is unspecified, but must not lead to Vulkan interruption or termination. For example, providing a negative zero (where applicable) or a denormalized number to a Vulkan command must yield deterministic results, while providing a NaN or Inf yields unspecified results.

Some calculations require division. In such cases (including implied divisions performed by vector normalization), division by zero produces an unspecified result but must not lead to Vulkan interruption or termination.

3.10. Fixed-Point Data Conversions

When generic vertex attributes and pixel color or depth components are represented as integers, they are often (but not always) considered to be normalized. Normalized integer values are treated specially when being converted to and from floating-point values, and are usually referred to as normalized fixed-point.

In the remainder of this section, \( b \) denotes the bit width of the fixed-point integer representation. When the integer is one of the types defined by the API, \( b \) is the bit width of that type. When the integer comes from an image containing color or depth component texels, \( b \) is the number of bits allocated to that component in its specified image format.

The signed and unsigned fixed-point representations are assumed to be \( b \)-bit binary two's-complement integers and binary unsigned integers, respectively.

3.10.1. Conversion From Normalized Fixed-Point to Floating-Point

Unsigned normalized fixed-point integers represent numbers in the range \([0,1]\). The conversion from an unsigned normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is defined as

\[
f = \frac{c}{2^b - 1}
\]

Signed normalized fixed-point integers represent numbers in the range \([-1,1]\). The conversion from a signed normalized fixed-point value \( c \) to the corresponding floating-point value \( f \) is performed using

\[
f = \max\left(\frac{c}{2^b - 1}, -1.0\right)
\]

Only the range \([-2^{b-1} + 1, 2^{b-1} - 1]\) is used to represent signed fixed-point values in the range \([-1,1]\). For
example, if \( b = 8 \), then the integer value \(-127\) corresponds to \(-1.0\) and the value \(127\) corresponds to \(1.0\). This equation is used everywhere that signed normalized fixed-point values are converted to floating-point.

Note that while zero is exactly expressible in this representation, one value (-128 in the example) is outside the representable range, and implementations must clamp it to -1.0. Where the value is subject to further processing by the implementation, e.g. during texture filtering, values less than -1.0 may be used but the result must be clamped before the value is returned to shaders.

### 3.10.2. Conversion From Floating-Point to Normalized Fixed-Point

The conversion from a floating-point value \( f \) to the corresponding unsigned normalized fixed-point value \( c \) is defined by first clamping \( f \) to the range \([0,1]\), then computing

\[
c = \text{convertFloatToUint}(f \times (2^b - 1), b)
\]

where \(\text{convertFloatToUint}(r,b)\) returns one of the two unsigned binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to 0.0 or 1.0, then \(c\) must be assigned 0 or \(2^b - 1\), respectively.

The conversion from a floating-point value \( f \) to the corresponding signed normalized fixed-point value \( c \) is performed by clamping \( f \) to the range \([-1,1]\), then computing

\[
c = \text{convertFloatToInt}(f \times (2^{b-1} - 1), b)
\]

where \(\text{convertFloatToInt}(r,b)\) returns one of the two signed two's-complement binary integer values with exactly \(b\) bits which are closest to the floating-point value \(r\). Implementations should round to nearest. If \(r\) is equal to an integer, then that integer value must be returned. In particular, if \(f\) is equal to -1.0, 0.0, or 1.0, then \(c\) must be assigned \(-(2^{b-1} - 1)\), 0, or \(2^{b-1} - 1\), respectively.

This equation is used everywhere that floating-point values are converted to signed normalized fixed-point.

### 3.11. String Representation

Strings passed into and returned from Vulkan API commands are usually defined to be null-terminated and UTF-8 encoded.

#### NOTE

Exceptions to this rule exist only when strings are defined or used by operating system APIs where that OS has a different convention. For example, \texttt{VkExportMemoryWin32HandleInfoKHR::name} is a null-terminated UTF-16 encoded string used in conjunction with Windows handles.

When a UTF-8 string is returned from a Vulkan API query, it is returned in a fixed-length buffer of \texttt{C char}. For example, a string returned in \texttt{VkPhysicalDeviceProperties::deviceName} has maximum length \texttt{VK_MAX_PHYSICAL_DEVICE_NAME_SIZE}, and a string returned in \texttt{VkExtensionProperties}
::extensionName has maximum length VK_MAX_EXTENSION_NAME_SIZE. The string, including its null terminator, will always fit completely within this buffer. If the string is shorter than the buffer size, the contents of char in the buffer following the null terminator are undefined.

When a UTF-8 string is passed into a Vulkan API, such as VkDeviceCreateInfo::ppEnabledExtensionNames, there is no explicit limit on the length of that string. However, the string must contain a valid UTF-8 encoded string and must be null-terminated.

### 3.12. Common Object Types

Some types of Vulkan objects are used in many different structures and command parameters, and are described here. These types include offsets, extents, and rectangles.

#### 3.12.1. Offsets

Offsets are used to describe a pixel location within an image or framebuffer, as an (x,y) location for two-dimensional images, or an (x,y,z) location for three-dimensional images.

A two-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset2D {
    int32_t x;
    int32_t y;
} VkOffset2D;
```

- x is the x offset.
- y is the y offset.

A three-dimensional offset is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkOffset3D {
    int32_t x;
    int32_t y;
    int32_t z;
} VkOffset3D;
```

- x is the x offset.
- y is the y offset.
- z is the z offset.

#### 3.12.2. Extents

Extents are used to describe the size of a rectangular region of pixels within an image or framebuffer, as (width,height) for two-dimensional images, or as (width,height,depth) for three-dimensional images.
A two-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent2D {
  uint32_t width;
  uint32_t height;
} VkExtent2D;
```

- `width` is the width of the extent.
- `height` is the height of the extent.

A three-dimensional extent is defined by the structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtent3D {
  uint32_t width;
  uint32_t height;
  uint32_t depth;
} VkExtent3D;
```

- `width` is the width of the extent.
- `height` is the height of the extent.
- `depth` is the depth of the extent.

### 3.12.3. Rectangles

Rectangles are used to describe a specified rectangular region of pixels within an image or framebuffer. Rectangles include both an offset and an extent of the same dimensionality, as described above. Two-dimensional rectangles are defined by the structure

```c
// Provided by VK_VERSION_1_0
typedef struct VkRect2D {
  VkOffset2D offset;
  VkExtent2D extent;
} VkRect2D;
```

- `offset` is a `VkOffset2D` specifying the rectangle offset.
- `extent` is a `VkExtent2D` specifying the rectangle extent.

### 3.12.4. Structure Types

Each value corresponds to a particular structure with a `sType` member with a matching name. As a general rule, the name of each `VkStructureType` value is obtained by taking the name of the
structure, stripping the leading \texttt{Vk}, prefixing each capital letter with \_\_, converting the entire resulting string to upper case, and prefixing it with \texttt{VK\_STRUCTURE\_TYPE\_}. For example, structures of type \texttt{VkImageCreateInfo} correspond to a \texttt{VkStructureType} value of \texttt{VK\_STRUCTURE\_TYPE\_IMAGE\_CREATE\_INFO}, and thus a structure of this type \textbf{must} have its \texttt{sType} member set to this value before it is passed to the API.

The values \texttt{VK\_STRUCTURE\_TYPE\_LOADER\_INSTANCE\_CREATE\_INFO} and \texttt{VK\_STRUCTURE\_TYPE\_LOADER\_DEVICE\_CREATE\_INFO} are reserved for internal use by the loader, and do not have corresponding Vulkan structures in this Specification.

Structure types supported by the Vulkan API include:

```c
// Provided by VK\_VERSION\_1\_0
typedef enum VkStructureType {
  VK\_STRUCTURE\_TYPE\_APPLICATION\_INFO = 0,
  VK\_STRUCTURE\_TYPE\_INSTANCE\_CREATE\_INFO = 1,
  VK\_STRUCTURE\_TYPE\_DEVICE\_QUEUE\_CREATE\_INFO = 2,
  VK\_STRUCTURE\_TYPE\_DEVICE\_CREATE\_INFO = 3,
  VK\_STRUCTURE\_TYPE\_SUBMIT\_INFO = 4,
  VK\_STRUCTURE\_TYPE\_MEMORY\_ALLOCATE\_INFO = 5,

3.13. API Name Aliases

A small number of APIs did not follow the naming conventions when initially defined. For consistency, when we discover an API name that violates the naming conventions, we rename it in the Specification, XML, and header files. For backwards compatibility, the original (incorrect) name is retained as a “typo alias”. The alias is deprecated and should not be used, but will be retained indefinitely.
**NOTE**

`VK_STENCIL_FRONT_AND_BACK` is an example of a *typo alias*. It was initially defined as part of `VkStencilFaceFlagBits`. Once the naming inconsistency was noticed, it was renamed to `VK_STENCIL_FACE_FRONT_AND_BACK`, and the old name was aliased to the correct name.
Chapter 4. Initialization

Before using Vulkan, an application must initialize it by loading the Vulkan commands, and creating a VkInstance object.

4.1. Command Function Pointers

Vulkan commands are not necessarily exposed by static linking on a platform. Commands to query function pointers for Vulkan commands are described below.

NOTE

When extensions are promoted or otherwise incorporated into another extension or Vulkan core version, command aliases may be included. Whilst the behavior of each command alias is identical, the behavior of retrieving each alias's function pointer is not. A function pointer for a given alias can only be retrieved if the extension or version that introduced that alias is supported and enabled, irrespective of whether any other alias is available.

Function pointers for all Vulkan commands can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetInstanceProcAddr(
    VkInstance instance,
    const char* pName);
```

• instance is the instance that the function pointer will be compatible with, or NULL for commands not dependent on any instance.

• pName is the name of the command to obtain.

vkGetInstanceProcAddr itself is obtained in a platform- and loader- specific manner. Typically, the loader library will export this command as a function symbol, so applications can link against the loader library, or load it dynamically and look up the symbol using platform-specific APIs.

The table below defines the various use cases for vkGetInstanceProcAddr and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be NULL.

The returned function pointer is of type PFN_vkVoidFunction, and must be cast to the type of the command being queried before use.

<table>
<thead>
<tr>
<th>instance</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>*1 invalid non-NULL instance</td>
<td>*1 global command</td>
<td>fp</td>
</tr>
<tr>
<td>NULL</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>pName</td>
<td>return value</td>
</tr>
<tr>
<td>----------</td>
<td>-------------------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>instance</td>
<td>vkGetInstanceProcAddr</td>
<td>fp</td>
</tr>
<tr>
<td>instance</td>
<td>core dispatchable command</td>
<td>fp³</td>
</tr>
<tr>
<td>instance</td>
<td>enabled instance extension dispatchable</td>
<td>fp³</td>
</tr>
<tr>
<td>instance</td>
<td>available device extension dispatchable</td>
<td>fp³</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td>NULL</td>
<td></td>
</tr>
</tbody>
</table>

1

"*" means any representable value for the parameter (including valid values, invalid values, and NULL).

2

The global commands are: `vkEnumerateInstanceVersion`, `vkEnumerateInstanceExtensionProperties`, `vkEnumerateInstanceLayerProperties`, and `vkCreateInstance`. Dispatchable commands are all other commands which are not global.

3

The returned function pointer must only be called with a dispatchable object (the first parameter) that is `instance` or a child of `instance`, e.g. `VkInstance`, `VkPhysicalDevice`, `VkDevice`, `VkQueue`, or `VkCommandBuffer`.

4

An “available device extension” is a device extension supported by any physical device enumerated by `instance`.

5

Starting with Vulkan 1.2, `vkGetInstanceProcAddr` can resolve itself with a NULL instance pointer.

Valid Usage (Implicit)

- VUID-vkGetInstanceProcAddr-instance-parameter
  If `instance` is not NULL, `instance` must be a valid `VkInstance` handle
- VUID-vkGetInstanceProcAddr-pName-parameter
  `pName` must be a null-terminated UTF-8 string

In order to support systems with multiple Vulkan implementations, the function pointers returned by `vkGetInstanceProcAddr` may point to dispatch code that calls a different real implementation for different `VkDevice` objects or their child objects. The overhead of the internal dispatch for `VkDevice` objects can be avoided by obtaining device-specific function pointers for any commands that use a
device or device-child object as their dispatchable object. Such function pointers can be obtained by calling:

```c
// Provided by VK_VERSION_1_0
PFN_vkVoidFunction vkGetDeviceProcAddr(
    VkDevice device,
    const char* pName);
```

The table below defines the various use cases for `vkGetDeviceProcAddr` and expected return value (“fp” is “function pointer”) for each case. A valid returned function pointer (“fp”) must not be `NULL`.

The returned function pointer is of type `PFN_vkVoidFunction`, and must be cast to the type of the command being queried before use. The function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device`.

<table>
<thead>
<tr>
<th>device</th>
<th>pName</th>
<th>return value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>invalid device</td>
<td>*1</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>NULL</td>
<td>undefined</td>
</tr>
<tr>
<td>device</td>
<td>requested core version²</td>
<td>fp⁴</td>
</tr>
<tr>
<td>device</td>
<td>device-level dispatchable command¹</td>
<td>fp⁴</td>
</tr>
<tr>
<td>device</td>
<td>enabled extension</td>
<td>device-level dispatchable command¹</td>
</tr>
<tr>
<td>any other case, not covered above</td>
<td>NULL</td>
<td></td>
</tr>
</tbody>
</table>

1  "*" means any representable value for the parameter (including valid values, invalid values, and `NULL`).

2  Device-level commands which are part of the core version specified by `VkApplicationInfo::apiVersion` when creating the instance will always return a valid function pointer. If the `maintenance5` feature is enabled, core commands beyond that version which are supported by the implementation will return `NULL`, otherwise the implementation may either return `NULL` or a function pointer. If a function pointer is returned, it must not be called.

3  In this function, device-level excludes all physical-device-level commands.

4  The returned function pointer must only be called with a dispatchable object (the first parameter) that is `device` or a child of `device` e.g. `VkDevice, VkQueue`, or `VkCommandBuffer`. 
Valid Usage (Implicit)

- VUID-vkGetDeviceProcAddr-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetDeviceProcAddr-pName-parameter
  pName must be a null-terminated UTF-8 string

The definition of PFN_vkVoidFunction is:

```c
// Provided by VK_VERSION_1_0
typedef void (VKAPI_PTR *PFN_vkVoidFunction)(void);
```

This type is returned from command function pointer queries, and must be cast to an actual command function pointer before use.

### 4.1.1. Extending Physical Device Core Functionality

New core physical-device-level functionality can be used when both VkPhysicalDeviceProperties::apiVersion and VkApplicationInfo::apiVersion are greater than or equal to the version of Vulkan that added the new functionality. The Vulkan version supported by a physical device can be obtained by calling vkGetPhysicalDeviceProperties.

### 4.1.2. Extending Physical Device From Device Extensions

When the VK_KHR_get_physical_device_properties2 extension is enabled, or when both the instance and the physical-device versions are at least 1.1, physical-device-level functionality of a device extension can be used with a physical device if the corresponding extension is enumerated by vkEnumerateDeviceExtensionProperties for that physical device, even before a logical device has been created.

To obtain a function pointer for a physical-device-level command from a device extension, an application can use vkGetInstanceProcAddr. This function pointer may point to dispatch code, which calls a different real implementation for different VkPhysicalDevice objects. Applications must not use a VkPhysicalDevice in any command added by an extension or core version that is not supported by that physical device.

Device extensions may define structures that can be added to the pNext chain of physical-device-level commands.

### 4.2. Instances

There is no global state in Vulkan and all per-application state is stored in a VkInstance object. Creating a VkInstance object initializes the Vulkan library and allows the application to pass information about itself to the implementation.

Instances are represented by VkInstance handles:
To query the version of instance-level functionality supported by the implementation, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumerateInstanceVersion(
    uint32_t* pApiVersion);
```

- `pApiVersion` is a pointer to a `uint32_t`, which is the version of Vulkan supported by instance-level functionality, encoded as described in Version Numbers.

**NOTE**

The intended behavior of `vkEnumerateInstanceVersion` is that an implementation should not need to perform memory allocations and should unconditionally return `VK_SUCCESS`. The loader, and any enabled layers, may return `VK_ERROR_OUT_OF_HOST_MEMORY` in the case of a failed memory allocation.

**Valid Usage (Implicit)**

- VUID-vkEnumerateInstanceVersion-pApiVersion-parameter
  
  `pApiVersion` must be a valid pointer to a `uint32_t` value

**Return Codes**

- **Success**
  - `VK_SUCCESS`

- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`

To create an instance object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateInstance(
    const VkInstanceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkInstance* pInstance);
```

- `pCreateInfo` is a pointer to a `VkInstanceCreateInfo` structure controlling creation of the instance.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pInstance` points a `VkInstance` handle in which the resulting instance is returned.

`vkCreateInstance` verifies that the requested layers exist. If not, `vkCreateInstance` will return
VK_ERROR_LAYER_NOT_PRESENT. Next vkCreateInstance verifies that the requested extensions are supported (e.g. in the implementation or in any enabled instance layer) and if any requested extension is not supported, vkCreateInstance must return VK_ERROR_EXTENSION_NOT_PRESENT. After verifying and enabling the instance layers and extensions the VkInstance object is created and returned to the application. If a requested extension is only supported by a layer, both the layer and the extension need to be specified at vkCreateInstance time for the creation to succeed.

Valid Usage

- VUID-vkCreateInstance-ppEnabledExtensionNames-01388
  All required extensions for each extension in the VkInstanceCreateInfo::ppEnabledExtensionNames list must also be present in that list

Valid Usage (Implicit)

- VUID-vkCreateInstance-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkInstanceCreateInfo structure

- VUID-vkCreateInstance-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateInstance-pInstance-parameter
  pInstance must be a valid pointer to a VkInstance handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_LAYER_NOT_PRESENT
- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INCOMPATIBLE_DRIVER

The VkInstanceCreateInfo structure is defined as:
typedef struct VkInstanceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkInstanceCreateFlags flags;
    const VkApplicationInfo* pApplicationInfo;
    uint32_t enabledLayerCount;
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
} VkInstanceCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkInstanceCreateFlagBits indicating the behavior of the instance.
- **pApplicationInfo** is NULL or a pointer to a VkApplicationInfo structure. If not NULL, this information helps implementations recognize behavior inherent to classes of applications. VkApplicationInfo is defined in detail below.
- **enabledLayerCount** is the number of global layers to enable.
- **ppEnabledLayerNames** is a pointer to an array of enabledLayerCount null-terminated UTF-8 strings containing the names of layers to enable for the created instance. The layers are loaded in the order they are listed in this array, with the first array element being the closest to the application, and the last array element being the closest to the driver. See the Layers section for further details.
- **enabledExtensionCount** is the number of global extensions to enable.
- **ppEnabledExtensionNames** is a pointer to an array of enabledExtensionCount null-terminated UTF-8 strings containing the names of extensions to enable.

### Valid Usage

- VUID-VkInstanceCreateInfo-flags-06559
  If flags has the VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR bit set, the list of enabled extensions in ppEnabledExtensionNames **must** contain VK_KHR_portability Enumeration.

### Valid Usage (Implicit)

- VUID-VkInstanceCreateInfo-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_INSTANCE_CREATE_INFO
- VUID-VkInstanceCreateInfo-pNext-pNext
  pNext **must** be NULL or a pointer to a valid instance of VkLayerSettingsCreateInfoEXT
- VUID-VkInstanceCreateInfo-sType-unique
The *sType* value of each struct in the *pNext* chain must be unique, with the exception of structures of type `VkLayerSettingsCreateInfoEXT`.

- **VUID-VkInstanceCreateInfo-flags-parameter**
  *flags* must be a valid combination of `VkInstanceCreateFlagBits` values.

- **VUID-VkInstanceCreateInfo-pApplicationInfo-parameter**
  If *pApplicationInfo* is not NULL, *pApplicationInfo* must be a valid pointer to a valid `VkApplicationInfo` structure.

- **VUID-VkInstanceCreateInfo-ppEnabledLayerNames-parameter**
  If enabledLayerCount is not 0, *ppEnabledLayerNames* must be a valid pointer to an array of enabledLayerCount null-terminated UTF-8 strings.

- **VUID-VkInstanceCreateInfo-ppEnabledExtensionNames-parameter**
  If enabledExtensionCount is not 0, *ppEnabledExtensionNames* must be a valid pointer to an array of enabledExtensionCount null-terminated UTF-8 strings.

// Provided by VK_VERSION_1_0
typedef enum VkInstanceCreateFlagBits {
  // Provided by VK_KHR_portability_enumeration
  VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR = 0x00000001,
} VkInstanceCreateFlagBits;

- **VK_INSTANCE_CREATE_ENUMERATE_PORTABILITY_BIT_KHR** specifies that the instance will enumerate available Vulkan Portability-compliant physical devices and groups in addition to the Vulkan physical devices and groups that are enumerated by default.

// Provided by VK_VERSION_1_0
typedef VkFlags VkInstanceCreateFlags;

`VkInstanceCreateFlags` is a bitmask type for setting a mask of zero or more `VkInstanceCreateFlagBits`.

To create a Vulkan instance with a specific configuration of layer settings, add `VkLayerSettingsCreateInfoEXT` structures to the *pNext* chain of the `VkInstanceCreateInfo` structure, specifying the settings to be configured.

// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingsCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  uint32_t settingCount;
  const VkLayerSettingEXT* pSettings;
} VkLayerSettingsCreateInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `settingCount` is the number of settings to configure.
• `pSettings` is a pointer to an array of `settingCount` `VkLayerSettingEXT` values specifying the setting to be configured.

### Valid Usage (Implicit)

- `VUID-VkLayerSettingsCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_LAYER_SETTINGS_CREATE_INFO_EXT`
- `VUID-VkLayerSettingsCreateInfoEXT-pSettings-parameter`  
  If `settingCount` is not 0, `pSettings` must be a valid pointer to an array of `settingCount` valid `VkLayerSettingEXT` structures

The values of elements of the `VkLayerSettingsCreateInfoEXT::pSettings` array, specifying layer settings to be configured, are:

```c
// Provided by VK_EXT_layer_settings
typedef struct VkLayerSettingEXT {
    const char* pLayerName;
    const char* pSettingName;
    VkLayerSettingTypeEXT type;
    uint32_t valueCount;
    const void* pValues;
} VkLayerSettingEXT;
```

• `pLayerName` is a pointer to a null-terminated UTF-8 string naming the layer to configure the setting from.
• `pSettingName` is a pointer to a null-terminated UTF-8 string naming the setting to configure. Unknown `pSettingName` by the layer are ignored.
• `type` is a `VkLayerSettingTypeEXT` value specifying the type of the `pValues` values.
• `count` is the number of values used to configure the layer setting.
• `pValues` is a pointer to an array of `count` values of the type indicated by `type` to configure the layer setting.

When multiple `VkLayerSettingsCreateInfoEXT` structures are chained and the same `pSettingName` is referenced for the same `pLayerName`, the value of the first reference of the layer setting is used.

### Valid Usage (Implicit)

- `VUID-VkLayerSettingEXT-pLayerName-parameter`  
  `pLayerName` must be a null-terminated UTF-8 string
- `VUID-VkLayerSettingEXT-pSettingName-parameter`  
  `pSettingName` must be a null-terminated UTF-8 string
• VUID-VkLayerSettingEXT-type-parameter
type must be a valid VkLayerSettingTypeEXT value

• VUID-VkLayerSettingEXT-pValues-parameter
If valueCount is not 0, pValues must be a valid pointer to an array of valueCount bytes

Possible values of VkLayerSettingEXT::type, specifying the type of the data returned in VkLayerSettingEXT::pValues, are:

```c
// Provided by VK_EXT_layer_settings
typedef enum VkLayerSettingTypeEXT {
    VK_LAYER_SETTING_TYPE_BOOL32_EXT = 0,
    VK_LAYER_SETTING_TYPE_INT32_EXT = 1,
    VK_LAYER_SETTING_TYPE_INT64_EXT = 2,
    VK_LAYER_SETTING_TYPE_UINT32_EXT = 3,
    VK_LAYER_SETTING_TYPE_UINT64_EXT = 4,
    VK_LAYER_SETTING_TYPE_FLOAT32_EXT = 5,
    VK_LAYER_SETTING_TYPE_FLOAT64_EXT = 6,
    VK_LAYER_SETTING_TYPE_STRING_EXT = 7,
} VkLayerSettingTypeEXT;
```

• VK_LAYER_SETTING_TYPE_BOOL32_EXT specifies that the layer setting's type is VkBool32.
• VK_LAYER_SETTING_TYPE_INT32_EXT specifies that the layer setting's type is signed 32-bit integer.
• VK_LAYER_SETTING_TYPE_INT64_EXT specifies that the layer setting's type is signed 64-bit integer.
• VK_LAYER_SETTING_TYPE_UINT32_EXT specifies that the layer setting's type is unsigned 32-bit integer.
• VK_LAYER_SETTING_TYPE_UINT64_EXT specifies that the layer setting's type is unsigned 64-bit integer.
• VK_LAYER_SETTING_TYPE_FLOAT32_EXT specifies that the layer setting's type is 32-bit floating-point.
• VK_LAYER_SETTING_TYPE_FLOAT64_EXT specifies that the layer setting's type is 64-bit floating-point.
• VK_LAYER_SETTING_TYPE_STRING_EXT specifies that the layer setting's type is a pointer to a null-terminated UTF-8 string.

The VkApplicationInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkApplicationInfo {
    VkStructureType     sType;
    const void*         pNext;
    const char*         pApplicationName;
    uint32_t            applicationVersion;
    const char*         pEngineName;
    uint32_t            engineVersion;
    uint32_t            apiVersion;
} VkApplicationInfo;
```
• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **pApplicationName** is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the application.

• **applicationVersion** is an unsigned integer variable containing the developer-supplied version number of the application.

• **pEngineName** is NULL or is a pointer to a null-terminated UTF-8 string containing the name of the engine (if any) used to create the application.

• **engineVersion** is an unsigned integer variable containing the developer-supplied version number of the engine used to create the application.

• **apiVersion** **must** be the highest version of Vulkan that the application is designed to use, encoded as described in Version Numbers. The patch version number specified in apiVersion is ignored when creating an instance object. The variant version of the instance **must** match that requested in apiVersion.

Vulkan 1.0 implementations were required to return VK_ERROR_INCOMPATIBLE_DRIVER if apiVersion was larger than 1.0. Implementations that support Vulkan 1.1 or later **must** not return VK_ERROR_INCOMPATIBLE_DRIVER for any value of apiVersion.

Because Vulkan 1.0 implementations **may** fail with VK_ERROR_INCOMPATIBLE_DRIVER, applications **should** determine the version of Vulkan available before calling vkCreateInstance. If the vkGetInstanceProcAddr returns NULL for vkEnumerateInstanceVersion, it is a Vulkan 1.0 implementation. Otherwise, the application **can** call vkEnumerateInstanceVersion to determine the version of Vulkan.

As long as the instance supports at least Vulkan 1.1, an application **can** use different versions of Vulkan with an instance than it does with a device or physical device.

The Khronos validation layers will treat apiVersion as the highest API version the application targets, and will validate API usage against the minimum of that version and the implementation version (instance or device, depending on context). If an application tries to use functionality from a greater version than this, a validation error will be triggered.

For example, if the instance supports Vulkan 1.1 and three physical devices support Vulkan 1.0, Vulkan 1.1, and Vulkan 1.2, respectively, and if the application sets apiVersion to 1.2, the application **can** use the following versions of Vulkan:

- Vulkan 1.0 **can** be used with the instance and with all physical devices.
- Vulkan 1.1 **can** be used with the instance and with the physical devices that support Vulkan 1.1 and Vulkan 1.2.
- Vulkan 1.2 **can** be used with the physical device that supports Vulkan 1.2.

If we modify the above example so that the application sets apiVersion to 1.1, then
the application **must** not use Vulkan 1.2 functionality on the physical device that supports Vulkan 1.2.

**NOTE**

Providing a **NULL** `VkInstanceCreateInfo::pApplicationInfo` or providing an `apiVersion` of 0 is equivalent to providing an `apiVersion` of `VK_MAKE_API_VERSION(0,1,0,0)`.

---

### Valid Usage

- **VUID-VkApplicationInfo-apiVersion-04010**
  
  If `apiVersion` is not 0, then it **must** be greater than or equal to `VK_API_VERSION_1_0`

### Valid Usage (Implicit)

- **VUID-VkApplicationInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_APPLICATION_INFO`

- **VUID-VkApplicationInfo-pNext-pNext**
  
  `pNext` **must** be **NULL**

- **VUID-VkApplicationInfo-pApplicationName-parameter**
  
  If `pApplicationName` is not **NULL**, `pApplicationName` **must** be a null-terminated UTF-8 string

- **VUID-VkApplicationInfo-pEngineName-parameter**
  
  If `pEngineName` is not **NULL**, `pEngineName` **must** be a null-terminated UTF-8 string

---

To destroy an instance, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyInstance(  
    VkInstance instance,  
    const VkAllocationCallbacks* pAllocator);
```

- `instance` is the handle of the instance to destroy.
- `pAllocator` controls host memory allocation as described in the **Memory Allocation** chapter.

### Valid Usage

- **VUID-vkDestroyInstance-instance-00629**
  
  All child objects created using `instance` **must** have been destroyed prior to destroying `instance`

- **VUID-vkDestroyInstance-instance-00630**
  
  If `VkAllocationCallbacks` were provided when `instance` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyInstance-instance-00631**
  
  If no `VkAllocationCallbacks` were provided when `instance` was created, `pAllocator` **must**
Valid Usage (Implicit)

- VUID-vkDestroyInstance-instance-parameter
  If `instance` is not `NULL`, `instance` must be a valid `VkInstance` handle

- VUID-vkDestroyInstance-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

Host Synchronization

- Host access to `instance` must be externally synchronized

- Host access to all `VkPhysicalDevice` objects enumerated from `instance` must be externally synchronized
Chapter 5. Devices and Queues

Once Vulkan is initialized, devices and queues are the primary objects used to interact with a Vulkan implementation.

Vulkan separates the concept of *physical* and *logical* devices. A physical device usually represents a single complete implementation of Vulkan (excluding instance-level functionality) available to the host, of which there are a finite number. A logical device represents an instance of that implementation with its own state and resources independent of other logical devices.

Physical devices are represented by `VkPhysicalDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkPhysicalDevice)
```

5.1. Physical Devices

To retrieve a list of physical device objects representing the physical devices installed in the system, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumeratePhysicalDevices(
    VkInstance instance,
    uint32_t* pPhysicalDeviceCount,
    VkPhysicalDevice* pPhysicalDevices);
```

- `instance` is a handle to a Vulkan instance previously created with `vkCreateInstance`.
- `pPhysicalDeviceCount` is a pointer to an integer related to the number of physical devices available or queried, as described below.
- `pPhysicalDevices` is either `NULL` or a pointer to an array of `VkPhysicalDevice` handles.

If `pPhysicalDevices` is `NULL`, then the number of physical devices available is returned in `pPhysicalDeviceCount`. Otherwise, `pPhysicalDeviceCount` must point to a variable set by the application to the number of elements in the `pPhysicalDevices` array, and on return the variable is overwritten with the number of handles actually written to `pPhysicalDevices`. If `pPhysicalDeviceCount` is less than the number of physical devices available, at most `pPhysicalDeviceCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available physical devices were returned.

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDevices-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkEnumeratePhysicalDevices-pPhysicalDeviceCount-parameter
\textbf{pPhysicalDeviceCount must} be a valid pointer to a \texttt{uint32_t} value

- VUID-vkEnumeratePhysicalDevices-pPhysicalDevices-parameter
  If the value referenced by \texttt{pPhysicalDeviceCount} is not 0, and \texttt{pPhysicalDevices} is not NULL, \texttt{pPhysicalDevices must} be a valid pointer to an array of \texttt{pPhysicalDeviceCount} \texttt{VkPhysicalDevice} handles

\section*{Return Codes}

\textbf{Success}
- \texttt{VK\_SUCCESS}
- \texttt{VK\_INCOMPLETE}

\textbf{Failure}
- \texttt{VK\_ERROR\_OUT\_OF\_HOST\_MEMORY}
- \texttt{VK\_ERROR\_OUT\_OF\_DEVICE\_MEMORY}
- \texttt{VK\_ERROR\_INITIALIZATION\_FAILED}

To query general properties of physical devices once enumerated, call:

\begin{verbatim}
// Provided by VK\_VERSION\_1\_0
define void vkGetPhysicalDeviceProperties(
    VkPhysicalDevice physicalDevice, 
    VkPhysicalDeviceProperties* pProperties);
\end{verbatim}

- \texttt{physicalDevice} is the handle to the physical device whose properties will be queried.
- \texttt{pProperties} is a pointer to a \texttt{VkPhysicalDeviceProperties} structure in which properties are returned.

\section*{Valid Usage (Implicit)}

- VUID-vkGetPhysicalDeviceProperties-physicalDevice-parameter
  \texttt{physicalDevice must} be a valid \texttt{VkPhysicalDevice} handle
- VUID-vkGetPhysicalDeviceProperties-pProperties-parameter
  \texttt{pProperties must} be a valid pointer to a \texttt{VkPhysicalDeviceProperties} structure

The \texttt{VkPhysicalDeviceProperties} structure is defined as:
typedef struct VkPhysicalDeviceProperties {
    uint32_t apiVersion;
    uint32_t driverVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    VkPhysicalDeviceType deviceType;
    char deviceName[VK_MAX_PHYSICAL_DEVICE_NAME_SIZE];
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
    VkPhysicalDeviceLimits limits;
    VkPhysicalDeviceSparseProperties sparseProperties;
} VkPhysicalDeviceProperties;

- **apiVersion** is the version of Vulkan supported by the device, encoded as described in Version Numbers.
- **driverVersion** is the vendor-specified version of the driver.
- **vendorID** is a unique identifier for the vendor (see below) of the physical device.
- **deviceID** is a unique identifier for the physical device among devices available from the vendor.
- **deviceType** is a VkPhysicalDeviceType specifying the type of device.
- **deviceName** is an array of VK_MAX_PHYSICAL_DEVICE_NAME_SIZE char containing a null-terminated UTF-8 string which is the name of the device.
- **pipelineCacheUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the device.
- **limits** is the VkPhysicalDeviceLimits structure specifying device-specific limits of the physical device. See Limits for details.
- **sparseProperties** is the VkPhysicalDeviceSparseProperties structure specifying various sparse related properties of the physical device. See Sparse Properties for details.

**NOTE**

The value of *apiVersion* may be different than the version returned by vkEnumerateInstanceVersion; either higher or lower. In such cases, the application must not use functionality that exceeds the version of Vulkan associated with a given object. The pApiVersion parameter returned by vkEnumerateInstanceVersion is the version associated with a VkInstance and its children, except for a VkPhysicalDevice and its children. VkPhysicalDeviceProperties::apiVersion is the version associated with a VkPhysicalDevice and its children.

**NOTE**

The encoding of *driverVersion* is implementation-defined. It may not use the same encoding as *apiVersion*. Applications should follow information from the vendor on how to extract the version information from *driverVersion*.

On implementations that claim support for the Roadmap 2022 profile, the major and minor version expressed by *apiVersion* must be at least Vulkan 1.3.

The **vendorID** and **deviceID** fields are provided to allow applications to adapt to device
characteristics that are not adequately exposed by other Vulkan queries.

**NOTE** These may include performance profiles, hardware errata, or other characteristics.

The vendor identified by `vendorID` is the entity responsible for the most salient characteristics of the underlying implementation of the `VkPhysicalDevice` being queried.

**NOTE** For example, in the case of a discrete GPU implementation, this should be the GPU chipset vendor. In the case of a hardware accelerator integrated into a system-on-chip (SoC), this should be the supplier of the silicon IP used to create the accelerator.

If the vendor has a PCI vendor ID, the low 16 bits of `vendorID` must contain that PCI vendor ID, and the remaining bits must be set to zero. Otherwise, the value returned must be a valid Khronos vendor ID, obtained as described in the [Vulkan Documentation and Extensions: Procedures and Conventions](https://www.khronos.org/) document in the section “Registering a Vendor ID with Khronos”. Khronos vendor IDs are allocated starting at 0x10000, to distinguish them from the PCI vendor ID namespace. Khronos vendor IDs are symbolically defined in the `VkVendorId` type.

The vendor is also responsible for the value returned in `deviceID`. If the implementation is driven primarily by a PCI device with a PCI device ID, the low 16 bits of `deviceID` must contain that PCI device ID, and the remaining bits must be set to zero. Otherwise, the choice of what values to return may be dictated by operating system or platform policies - but should uniquely identify both the device version and any major configuration options (for example, core count in the case of multicore devices).

**NOTE** The same device ID should be used for all physical implementations of that device version and configuration. For example, all uses of a specific silicon IP GPU version and configuration should use the same device ID, even if those uses occur in different SoCs.

Khronos vendor IDs which may be returned in `VkPhysicalDeviceProperties::vendorID` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVendorId {
    VK_VENDOR_ID_KHRONOS = 0x10000,
    VK_VENDOR_ID_VIV = 0x10001,
    VK_VENDOR_ID_VSI = 0x10002,
    VK_VENDOR_ID_KAZAN = 0x10003,
    VK_VENDOR_ID_CODEPLAY = 0x10004,
    VK_VENDOR_ID_MESA = 0x10005,
    VK_VENDOR_ID_POCL = 0x10006,
    VK_VENDOR_ID_MOBILEYE = 0x10007,
} VkVendorId;
```

**NOTE** Khronos vendor IDs may be allocated by vendors at any time. Only the latest canonical versions of this Specification, of the corresponding `vk.xml` API Registry,
and of the corresponding vulkan_core.h header file **must** contain all reserved Khronos vendor IDs.

Only Khronos vendor IDs are given symbolic names at present. PCI vendor IDs returned by the implementation can be looked up in the PCI-SIG database.

**VK_MAX_PHYSICAL_DEVICE_NAME_SIZE** is the length in *char* values of an array containing a physical device name string, as returned in `VkPhysicalDeviceProperties::deviceName`.

```c
#define VK_MAX_PHYSICAL_DEVICE_NAME_SIZE 256U
```

The physical device types which **may** be returned in `VkPhysicalDeviceProperties::deviceType` are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPhysicalDeviceType {
    VK_PHYSICAL_DEVICE_TYPE_OTHER = 0,
    VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU = 1,
    VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU = 2,
    VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU = 3,
    VK_PHYSICAL_DEVICE_TYPE_CPU = 4,
} VkPhysicalDeviceType;
```

- **VK_PHYSICAL_DEVICE_TYPE_OTHER** - the device does not match any other available types.
- **VK_PHYSICAL_DEVICE_TYPE_INTEGRATED_GPU** - the device is typically one embedded in or tightly coupled with the host.
- **VK_PHYSICAL_DEVICE_TYPE_DISCRETE_GPU** - the device is typically a separate processor connected to the host via an interlink.
- **VK_PHYSICAL_DEVICE_TYPE_VIRTUAL_GPU** - the device is typically a virtual node in a virtualization environment.
- **VK_PHYSICAL_DEVICE_TYPE_CPU** - the device is typically running on the same processors as the host.

The physical device type is advertised for informational purposes only, and does not directly affect the operation of the system. However, the device type **may** correlate with other advertised properties or capabilities of the system, such as how many memory heaps there are.

To query general properties of physical devices once enumerated, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceProperties2* pProperties);
```

or the equivalent command
void vkGetPhysicalDeviceProperties2KHR(VkPhysicalDevice physicalDevice, VkPhysicalDeviceProperties2* pProperties);

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pProperties** is a pointer to a `VkPhysicalDeviceProperties2` structure in which properties are returned.

Each structure in **pProperties** and its **pNext** chain contains members corresponding to implementation-dependent properties, behaviors, or limits. `vkGetPhysicalDeviceProperties2` fills in each member to specify the corresponding value for the implementation.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceProperties2-physicalDevice-parameter **physicalDevice** must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceProperties2-pProperties-parameter **pProperties** must be a valid pointer to a `VkPhysicalDeviceProperties2` structure

The `VkPhysicalDeviceProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProperties2 {  
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceProperties properties;
} VkPhysicalDeviceProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceProperties2 VkPhysicalDeviceProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **properties** is a `VkPhysicalDeviceProperties` structure describing properties of the physical device. This structure is written with the same values as if it were written by `vkGetPhysicalDeviceProperties`.

The **pNext** chain of this structure is used to extend the structure with properties defined by extensions.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProperties2-sType-sType**
  
  *sType must be* `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROPERTIES_2`

- **VUID-VkPhysicalDeviceProperties2-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain *must* be either `NULL` or a pointer to a valid instance of:
  - `VkPhysicalDeviceAccelerationStructurePropertiesKHR`,
  - `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT`,
  - `VkPhysicalDeviceCooperativeMatrixPropertiesKHR`,
  - `VkPhysicalDeviceCustomBorderColorPropertiesEXT`,
  - `VkPhysicalDeviceDepthStencilResolveProperties`,
  - `VkPhysicalDeviceDescriptorIndexingProperties`,
  - `VkPhysicalDeviceDiscardRectanglePropertiesEXT`,
  - `VkPhysicalDeviceDriverProperties`,
  - `VkPhysicalDeviceExtendedDynamicState3PropertiesEXT`,
  - `VkPhysicalDeviceExternalMemoryHostPropertiesEXT`,
  - `VkPhysicalDeviceFloatControlsProperties`,
  - `VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR`,
  - `VkPhysicalDeviceFragmentShadingRatePropertiesKHR`,
  - `VkPhysicalDeviceHostImageCopyPropertiesEXT`,
  - `VkPhysicalDeviceIDProperties`,
  - `VkPhysicalDeviceInlineUniformBlockProperties`,
  - `VkPhysicalDeviceLayeredApiPropertiesListKHR`,
  - `VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT`,
  - `VkPhysicalDeviceLineRasterizationPropertiesKHR`,
  - `VkPhysicalDeviceMaintenance3Properties`,
  - `VkPhysicalDeviceMaintenance4Properties`,
  - `VkPhysicalDeviceMaintenance5PropertiesKHR`,
  - `VkPhysicalDeviceMaintenance6PropertiesKHR`,
  - `VkPhysicalDeviceMaintenance7PropertiesKHR`,
  - `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT`,
  - `VkPhysicalDeviceMultiviewProperties`,
  - `VkPhysicalDeviceNestedCommandBufferPropertiesEXT`,
  - `VkPhysicalDeviceOpacityMicromapPropertiesEXT`,
  - `VkPhysicalDevicePCIBusInfoPropertiesEXT`,
  - `VkPhysicalDevicePerformanceQueryPropertiesKHR`,
  - `VkPhysicalDevicePointClippingProperties`,
  - `VkPhysicalDevicePortabilitySubsetPropertiesKHR`,
  - `VkPhysicalDeviceProtectedMemoryProperties`,
  - `VkPhysicalDeviceProvokingVertexPropertiesEXT`,
  - `VkPhysicalDevicePushDescriptorPropertiesKHR`,
  - `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`,
  - `VkPhysicalDeviceRobustness2PropertiesEXT`,
  - `VkPhysicalDeviceSampleLocationsPropertiesEXT`,
  - `VkPhysicalDeviceSamplerFilterMinmaxProperties`,
  - `VkPhysicalDeviceShaderIntegerDotProductProperties`,
  - `VkPhysicalDeviceShaderObjectPropertiesEXT`,
  - `VkPhysicalDeviceShaderTileImagePropertiesEXT`,
  - `VkPhysicalDeviceSubgroupProperties`,
  - `VkPhysicalDeviceSubgroupSizeControlProperties`.
The `VkPhysicalDeviceVulkan11Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Properties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    VkBool32 deviceLUIDValid;
    uint32_t subgroupSize;
    VkShaderStageFlags subgroupSupportedStages;
    VkSubgroupFeatureFlags subgroupSupportedOperations;
    VkBool32 subgroupQuadOperationsInAllStages;
    VkPointClippingBehavior pointClippingBehavior;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
    VkBool32 protectedNoFault;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceVulkan11Properties;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the device.
- `driverUUID` is an array of `VK_UUID_SIZE` `uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- `deviceLUID` is an array of `VK_LUID_SIZE` `uint8_t` values representing a locally unique identifier for the device.
- `deviceNodeMask` is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- `deviceLUIDValid` is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.
• **subgroupSize** is the default number of invocations in each subgroup. **subgroupSize** is at least 1 if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. **subgroupSize** is a power-of-two.

• **subgroupSupportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader stages that group operations with subgroup scope are supported in. **subgroupSupportedStages** will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.

• **subgroupSupportedOperations** is a bitmask of `VkSubgroupFeatureFlagBits` specifying the sets of group operations with subgroup scope supported on this device. **subgroupSupportedOperations** will have the `VK_SUBGROUP_FEATURE_BASIC_BIT` bit set if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`.

• **subgroupQuadOperationsInAllStages** is a boolean specifying whether quad group operations are available in all stages, or are restricted to fragment and compute stages.

• **pointClippingBehavior** is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

• **maxMultiviewViewCount** is one greater than the maximum view index that can be used in a subpass.

• **maxMultiviewInstanceIndex** is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

• **protectedNoFault** specifies how an implementation behaves when an application attempts to write to unprotected memory in a protected queue operation, read from protected memory in an unprotected queue operation, or perform a query in a protected queue operation. If this limit is `VK_TRUE`, such writes will be discarded or have undefined values written, reads and queries will return undefined values. If this limit is `VK_FALSE`, applications must not perform these operations. See Protected Memory Access Rules for more information.

• **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types) in a single descriptor set that is guaranteed to satisfy any implementation-dependent constraints on the size of a descriptor set itself. Applications can query whether a descriptor set that goes beyond this limit is supported using `vkGetDescriptorSetLayoutSupport`.

• **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even if there is more space available in the heap.

If the `VkPhysicalDeviceVulkan11Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.1 functionality.

The members of `VkPhysicalDeviceVulkan11Properties` have the same values as the corresponding members of `VkPhysicalDeviceIDProperties`, `VkPhysicalDeviceSubgroupProperties`, `VkPhysicalDevicePointClippingProperties`, `VkPhysicalDeviceMultiviewProperties`, `VkPhysicalDeviceProtectedMemoryProperties`, and `VkPhysicalDeviceMaintenance3Properties`. **NOTE** The **subgroupSupportedStages**, **subgroupSupportedOperations**, and
subgroupQuadOperationsInAllStages members of this structure correspond respectively to the VkPhysicalDeviceSubgroupProperties::supportedStages, VkPhysicalDeviceSubgroupProperties::supportedOperations, and VkPhysicalDeviceSubgroupProperties::quadOperationsInAllStages members, but add the subgroup prefix to the member name.

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **driverID** is a unique identifier for the driver of the physical device.

• **driverName** is an array of **VK_MAX_DRIVER_NAME_SIZE** **char** containing a null-terminated UTF-8 string which is the name of the driver.

• **driverInfo** is an array of **VK_MAX_DRIVER_INFO_SIZE** **char** containing a null-terminated UTF-8 string with additional information about the driver.

• **conformanceVersion** is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see **VkConformanceVersion**).
• `denormBehaviorIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, denorm behavior can be set independently for different bit widths.

• `roundingModeIndependence` is a `VkShaderFloatControlsIndependence` value indicating whether, and how, rounding modes can be set independently for different bit widths.

• `shaderSignedZeroInfNanPreserveFloat16` is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 16-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 16-bit floating-point types.

• `shaderSignedZeroInfNanPreserveFloat32` is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 32-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 32-bit floating-point types.

• `shaderSignedZeroInfNanPreserveFloat64` is a boolean value indicating whether sign of a zero, Nans and \( \pm \infty \) can be preserved in 64-bit floating-point computations. It also indicates whether the `SignedZeroInfNanPreserve` execution mode can be used for 64-bit floating-point types.

• `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 16-bit floating-point types.

• `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 32-bit floating-point types.

• `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 64-bit floating-point types.

• `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 16-bit floating-point types.

• `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 32-bit floating-point types.

• `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 64-bit floating-point types.

• `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 16-bit floating-point types.

• `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 32-bit floating-point types.

• `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 64-bit floating-point types.
• **shaderRoundingModeRTZFloat16** is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTZ** execution mode can be used for 16-bit floating-point types.

• **shaderRoundingModeRTZFloat32** is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTZ** execution mode can be used for 32-bit floating-point types.

• **shaderRoundingModeRTZFloat64** is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the **RoundingModeRTZ** execution mode can be used for 64-bit floating-point types.

• **maxUpdateAfterBindDescriptorsInAllPools** is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.

• **shaderUniformBufferArrayNonUniformIndexingNative** is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers may execute multiple times in order to access all the descriptors.

• **shaderSampledImageArrayNonUniformIndexingNative** is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images may execute multiple times in order to access all the descriptors.

• **shaderStorageBufferArrayNonUniformIndexingNative** is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

• **shaderStorageImageArrayNonUniformIndexingNative** is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

• **shaderInputAttachmentArrayNonUniformIndexingNative** is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

• **robustBufferAccessUpdateAfterBind** is a boolean value indicating whether **robustBufferAccess** can be enabled on a device simultaneously with **descriptorBindingUniformBufferUpdateAfterBind**, **descriptorBindingStorageBufferUpdateAfterBind**, **descriptorBindingUniformTexelBufferUpdateAfterBind**, and/or **descriptorBindingStorageTexelBufferUpdateAfterBind**. If this is **VK_FALSE**, then either **robustBufferAccess** must be disabled or all of these update-after-bind features must be disabled.

• **quadDivergentImplicitLod** is a boolean value indicating whether implicit LOD calculations for
image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See Derivative Image Operations.

- **maxPerStageDescriptorUpdateAfterBindSamplers** is similar to **maxPerStageDescriptorSamplers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxPerStageDescriptorUpdateAfterBindUniformBuffers** is similar to **maxPerStageDescriptorUniformBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageBuffers** is similar to **maxPerStageDescriptorStorageBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxPerStageDescriptorUpdateAfterBindSampledImages** is similar to **maxPerStageDescriptorSampledImages** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageImages** is similar to **maxPerStageDescriptorStorageImages** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxPerStageDescriptorUpdateAfterBindInputAttachments** is similar to **maxPerStageDescriptorInputAttachments** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetUpdateAfterBindResources** is similar to **maxPerStageResources** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetUpdateAfterBindSamplers** is similar to **maxDescriptorSetSamplers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffers** is similar to **maxDescriptorSetUniformBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetUpdateAfterBindUniformBuffersDynamic** is similar to **maxDescriptorSetUniformBuffersDynamic** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT`, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- **maxDescriptorSetUpdateAfterBindStorageBuffers** is similar to **maxDescriptorSetStorageBuffers** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetUpdateAfterBindStorageBuffersDynamic** is similar to **maxDescriptorSetStorageBuffersDynamic** but counts descriptors from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- **maxDescriptorSetUpdateAfterBindSampledImages** is similar to **maxDescriptorSetSampledImages** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindStorageImages** is similar to **maxDescriptorSetStorageImages** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **maxDescriptorSetUpdateAfterBindInputAttachments** is similar to **maxDescriptorSetInputAttachments** but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- **supportedDepthResolveModes** is a bitmask of VkResolveModeFlagBits indicating the set of supported depth resolve modes. VK_RESOLVE_MODE_SAMPLE_ZERO_BIT must be included in the set but implementations may support additional modes.

- **supportedStencilResolveModes** is a bitmask of VkResolveModeFlagBits indicating the set of supported stencil resolve modes. VK_RESOLVE_MODE_SAMPLE_ZERO_BIT must be included in the set but implementations may support additional modes. VK_RESOLVE_MODE_AVERAGE_BIT must not be included in the set.

- **independentResolveNone** is VK_TRUE if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is VK_RESOLVE_MODE_NONE. Otherwise the implementation only supports setting both modes to the same value.

- **independentResolve** is VK_TRUE if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to VK_RESOLVE_MODE_NONE. An implementation that supports independentResolve must also support independentResolveNone.

- **filterMinmaxSingleComponentFormats** is a boolean value indicating whether a minimum set of required formats support min/max filtering.

- **filterMinmaxImageComponentMapping** is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

- **maxTimelineSemaphoreValueDifference** indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

- **framebufferIntegerColorSampleCounts** is a bitmask of VkSampleCountFlagBits indicating the color sample counts that are supported for all framebuffer color attachments with integer formats.

If the VkPhysicalDeviceVulkan12Properties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.2 functionality.

The members of VkPhysicalDeviceVulkan12Properties must have the same values as the corresponding members of VkPhysicalDeviceDriverProperties,
Valid Usage (Implicit)

• VUID-VkPhysicalDeviceVulkan12Properties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_PROPERTIES

The VkPhysicalDeviceVulkan13Properties structure is defined as:

    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
} VkPhysicalDeviceVulkan13Properties;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

minSubgroupSize is the minimum subgroup size supported by this device. minSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. minSubgroupSize is a power-of-two. minSubgroupSize is less than or equal to maxSubgroupSize. minSubgroupSize is less than or equal to subgroupSize.

maxSubgroupSize is the maximum subgroup size supported by this device. maxSubgroupSize is at least one if any of the physical device’s queues support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT. maxSubgroupSize is a power-of-two. maxSubgroupSize is greater than or equal to minSubgroupSize. maxSubgroupSize is greater than or equal to subgroupSize.

maxComputeWorkgroupSubgroups is the maximum number of subgroups supported by the implementation within a workgroup.

requiredSubgroupSizeStages is a bitfield of what shader stages support having a required subgroup size specified.

maxInlineUniformBlockSize is the maximum size in bytes of an inline uniform block binding.

maxPerStageDescriptorInlineUniformBlocks is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings
with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- **maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks** is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetInlineUniformBlocks** is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- **maxDescriptorSetUpdateAfterBindInlineUniformBlocks** is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxInlineUniformTotalSize** is the maximum total size in bytes of all inline uniform block bindings, across all pipeline shader stages and descriptor set numbers, that can be included in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit.

- **integerDotProduct8BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct8BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct8BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct4x8BitPackedUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct4x8BitPackedSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct4x8BitPackedMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct16BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- **integerDotProduct16BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 16-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.
• **integerDotProduct16BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 16-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct64BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct64BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProduct64BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating16BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
VK_TRUE if the support for 16-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating16BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 16-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 16-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 32-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 32-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitUnsignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit unsigned accumulating saturating dot product operations using the OpUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitSignedAccelerated is a boolean that will be VK_TRUE if the support for 64-bit signed accumulating saturating dot product operations using the OpSDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated is a boolean that will be VK_TRUE if the support for 64-bit mixed signedness accumulating saturating dot product operations using the OpSUDotAccSatKHR SPIR-V instruction is accelerated as defined below.

- storage Texel Buffer Offset Alignment Bytes is a byte alignment that is sufficient for a storage texel buffer of any format. The value must be a power of two.

- storage Texel Buffer Offset Single Texel Alignment indicates whether single texel alignment is sufficient for a storage texel buffer of any format.

- uniform Texel Buffer Offset Alignment Bytes is a byte alignment that is sufficient for a uniform texel buffer of any format. The value must be a power of two.

- uniform Texel Buffer Offset Single Texel Alignment indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

- max Buffer Size is the maximum size VkBuffer that can be created.

If the VkPhysicalDeviceVulkan13Properties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

These properties correspond to Vulkan 1.3 functionality.

The members of VkPhysicalDeviceVulkan13Properties must have the same values as the
corresponding members of `VkPhysicalDeviceInlineUniformBlockProperties` and `VkPhysicalDeviceSubgroupSizeControlProperties`.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceVulkan13Properties-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_PROPERTIES`

The `VkPhysicalDeviceIDProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceIDProperties {
    VkStructureType sType;
    void* pNext;
    uint8_t deviceUUID[VK_UUID_SIZE];
    uint8_t driverUUID[VK_UUID_SIZE];
    uint8_t deviceLUID[VK_LUID_SIZE];
    uint32_t deviceNodeMask;
    VkBool32 deviceLUIDValid;
} VkPhysicalDeviceIDProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities,
// VK_KHR_external_memory_capabilities, VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceIDProperties VkPhysicalDeviceIDPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **deviceUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the device.
- **driverUUID** is an array of `VK_UUID_SIZE uint8_t` values representing a universally unique identifier for the driver build in use by the device.
- **deviceLUID** is an array of `VK_LUID_SIZE uint8_t` values representing a locally unique identifier for the device.
- **deviceNodeMask** is a `uint32_t` bitfield identifying the node within a linked device adapter corresponding to the device.
- **deviceLUIDValid** is a boolean value that will be `VK_TRUE` if `deviceLUID` contains a valid LUID and `deviceNodeMask` contains a valid node mask, and `VK_FALSE` if they do not.

If the `VkPhysicalDeviceIDProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
deviceUUID must be immutable for a given device across instances, processes, driver APIs, driver versions, and system reboots.

Applications can compare the driverUUID value across instance and process boundaries, and can make similar queries in external APIs to determine whether they are capable of sharing memory objects and resources using them with the device.

deviceUUID and/or driverUUID must be used to determine whether a particular external object can be shared between driver components, where such a restriction exists as defined in the compatibility table for the particular object type:

- External memory handle types compatibility
- External semaphore handle types compatibility
- External fence handle types compatibility

If deviceUUIDValid is VK_FALSE, the values of deviceLUID and deviceNodeMask are undefined. If deviceUUIDValid is VK_TRUE and Vulkan is running on the Windows operating system, the contents of deviceUUID can be cast to an LUID object and must be equal to the locally unique identifier of a IDXGIAdapter1 object that corresponds to physicalDevice. If deviceUUIDValid is VK_TRUE, deviceNodeMask must contain exactly one bit. If Vulkan is running on an operating system that supports the Direct3D 12 API and physicalDevice corresponds to an individual device in a linked device adapter, deviceNodeMask identifies the Direct3D 12 node corresponding to physicalDevice. Otherwise, deviceNodeMask must be 1.

Although they have identical descriptions, VkPhysicalDeviceIDProperties::deviceUUID may differ from VkPhysicalDeviceProperties2::pipelineCacheUUID. The former is intended to identify and correlate devices across API and driver boundaries, while the latter is used to identify a compatible device and driver combination to use when serializing and de-serializing pipeline state.

Implementations should return deviceUUID values which are likely to be unique even in the presence of multiple Vulkan implementations (such as a GPU driver and a software renderer; two drivers for different GPUs; or the same Vulkan driver running on two logically different devices).

Khronos' conformance testing is unable to guarantee that deviceUUID values are actually unique, so implementors should make their own best efforts to ensure this. In particular, hard-coded deviceUUID values, especially all-0 bits, should never be used.

A combination of values unique to the vendor, the driver, and the hardware environment can be used to provide a deviceUUID which is unique to a high degree of certainty. Some possible inputs to such a computation are:

- Information reported by vkGetPhysicalDeviceProperties
- PCI device ID (if defined)
- PCI bus ID, or similar system configuration information.
- Driver binary checksums.
While `VkPhysicalDeviceIDProperties::deviceUUID` is specified to remain consistent across driver versions and system reboots, it is not intended to be usable as a serializable persistent identifier for a device. It may change when a device is physically added to, removed from, or moved to a different connector in a system while that system is powered down. Further, there is no reasonable way to verify with conformance testing that a given device retains the same UUID in a given system across all driver versions supported in that system. While implementations should make every effort to report consistent device UUIDs across driver versions, applications should avoid relying on the persistence of this value for uses other than identifying compatible devices for external object sharing purposes.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIDProperties-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ID_PROPERTIES`

`VK_UUID_SIZE` is the length in `uint8_t` values of an array containing a universally unique device or driver build identifier, as returned in `VkPhysicalDeviceIDProperties::deviceUUID` and `VkPhysicalDeviceIDProperties::driverUUID`.

```cpp
#define VK_UUID_SIZE                      16U
```

`VK_LUID_SIZE` is the length in `uint8_t` values of an array containing a locally unique device identifier, as returned in `VkPhysicalDeviceIDProperties::deviceLUID`.

```cpp
#define VK_LUID_SIZE                      8U
```

or the equivalent

```cpp
#define VK_LUID_SIZE_KHR                  VK_LUID_SIZE
```

The `VkPhysicalDeviceDriverProperties` structure is defined as:

```cpp
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDriverProperties {
    VkStructureType  sType;        // Type of this structure.
    void*             pNext;       // Pointer to next structure in chain.
    VkDriverId        driverID;    // Unique identifier for the device driver.
    char[VK_MAX_DRIVER_NAME_SIZE]  driverName;    // Name of the device driver.
    char[VK_MAX_DRIVER_INFO_SIZE]  driverInfo;    // Information about the device driver.
    VkConformanceVersion conformanceVersion;      // Conformance version for the device.
} VkPhysicalDeviceDriverProperties;
```
or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkPhysicalDeviceDriverProperties VkPhysicalDeviceDriverPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `driverID` is a unique identifier for the driver of the physical device.
- `driverName` is an array of `VK_MAX_DRIVER_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the driver.
- `driverInfo` is an array of `VK_MAX_DRIVER_INFO_SIZE` `char` containing a null-terminated UTF-8 string with additional information about the driver.
- `conformanceVersion` is the latest version of the Vulkan conformance test that the implementor has successfully tested this driver against prior to release (see `VkConformanceVersion`).

If the `VkPhysicalDeviceDriverProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the driver corresponding to a physical device.

`driverID` must be immutable for a given driver across instances, processes, driver versions, and system reboots.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceDriverProperties-sType-sType`

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICALDEVICE_DRIVER_PROPERTIES`

Khronos driver IDs which may be returned in `VkPhysicalDeviceDriverProperties::driverID` are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDriverId {
    VK_DRIVER_ID_AMD_PROPRIETARY = 1,
    VK_DRIVER_ID_AMD_OPEN_SOURCE = 2,
    VK_DRIVER_ID_MESA_RADV = 3,
    VK_DRIVER_ID_NVIDIA_PROPRIETARY = 4,
    VK_DRIVER_ID_INTEL_PROPRIETARY_WINDOWS = 5,
    VK_DRIVER_ID_INTEL_OPEN_SOURCE_MESA = 6,
    VK_DRIVER_ID_IMAGINATION_PROPRIETARY = 7,
    VK_DRIVER_ID_QUALCOMM_PROPRIETARY = 8,
    VK_DRIVER_ID_ARM_PROPRIETARY = 9,
    VK_DRIVER_ID_GOOGLE_SWIFTSHADER = 10,
    VK_DRIVER_ID_GGP_PROPRIETARY = 11,
    VK_DRIVER_ID_BROADCOM_PROPRIETARY = 12,
};
```
or the equivalent

// Provided by VK_KHR_driver_properties
typedef VkDriverId VkDriverIdKHR;

NOTE Khronos driver IDs may be allocated by vendors at any time. There may be multiple
driver IDs for the same vendor, representing different drivers (for e.g. different
platforms, proprietary or open source, etc.). Only the latest canonical versions of this Specification, of the corresponding vk.xml API Registry, and of the corresponding vulkan_core.h header file must contain all reserved Khronos driver IDs.

Only driver IDs registered with Khronos are given symbolic names. There may be unregistered driver IDs returned.

VK_MAX_DRIVER_NAME_SIZE is the length in char values of an array containing a driver name string, as returned in VkPhysicalDeviceDriverProperties::driverName.

```c
#define VK_MAX_DRIVER_NAME_SIZE 256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_NAME_SIZE_KHR VK_MAX_DRIVER_NAME_SIZE
```

VK_MAX_DRIVER_INFO_SIZE is the length in char values of an array containing a driver information string, as returned in VkPhysicalDeviceDriverProperties::driverInfo.

```c
#define VK_MAX_DRIVER_INFO_SIZE 256U
```

or the equivalent

```c
#define VK_MAX_DRIVER_INFO_SIZE_KHR VK_MAX_DRIVER_INFO_SIZE
```

The conformance test suite version an implementation is compliant with is described with the VkConformanceVersion structure:

```c
// Provided by VK_VERSION_1_2
typedef struct VkConformanceVersion {
    uint8_t major;
    uint8_t minor;
    uint8_t subminor;
    uint8_t patch;
} VkConformanceVersion;
```

or the equivalent

```c
// Provided by VK_KHR_driver_properties
typedef VkConformanceVersion VkConformanceVersionKHR;
```

- major is the major version number of the conformance test suite.
• **minor** is the minor version number of the conformance test suite.
• **subminor** is the subminor version number of the conformance test suite.
• **patch** is the patch version number of the conformance test suite.

The **VkPhysicalDevicePCIBusInfoPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_pci_bus_info
typedef struct VkPhysicalDevicePCIBusInfoPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t pciDomain;
    uint32_t pciBus;
    uint32_t pciDevice;
    uint32_t pciFunction;
} VkPhysicalDevicePCIBusInfoPropertiesEXT;
```

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pciDomain** is the PCI bus domain.
• **pciBus** is the PCI bus identifier.
• **pciDevice** is the PCI device identifier.
• **pciFunction** is the PCI device function identifier.

If the **VkPhysicalDevicePCIBusInfoPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the PCI bus information of a physical device.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePCIBusInfoPropertiesEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PCI_BUS_INFO_PROPERTIES_EXT**

The **VkPhysicalDeviceShaderIntegerDotProductProperties** structure is defined as:
typedef struct VkPhysicalDeviceShaderIntegerDotProductProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 integerDotProduct8BitUnsignedAccelerated;
    VkBool32 integerDotProduct8BitSignedAccelerated;
    VkBool32 integerDotProduct8BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProduct4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProduct16BitUnsignedAccelerated;
    VkBool32 integerDotProduct16BitSignedAccelerated;
    VkBool32 integerDotProduct16BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct32BitUnsignedAccelerated;
    VkBool32 integerDotProduct32BitSignedAccelerated;
    VkBool32 integerDotProduct32BitMixedSignednessAccelerated;
    VkBool32 integerDotProduct64BitUnsignedAccelerated;
    VkBool32 integerDotProduct64BitSignedAccelerated;
    VkBool32 integerDotProduct64BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitUnsignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitSignedAccelerated;
    VkBool32 integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated;
} VkPhysicalDeviceShaderIntegerDotProductProperties;
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **integerDotProduct8BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit unsigned dot product operations using the *OpUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct8BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit signed dot product operations using the *OpSDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct8BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit mixed signedness dot product operations using the *OpSUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct4x8BitPackedUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit unsigned dot product operations from operands packed into 32-bit integers using the *OpUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct4x8BitPackedSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit signed dot product operations from operands packed into 32-bit integers using the *OpSDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct4x8BitPackedMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 8-bit mixed signedness dot product operations from operands packed into 32-bit integers using the *OpSUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct16BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 16-bit unsigned dot product operations using the *OpUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct16BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 16-bit signed dot product operations using the *OpSDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct16BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 16-bit mixed signedness dot product operations using the *OpSUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitUnsignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit unsigned dot product operations using the *OpUDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitSignedAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit signed dot product operations using the *OpSDotKHR* SPIR-V instruction is accelerated as defined below.

• **integerDotProduct32BitMixedSignednessAccelerated** is a boolean that will be **VK_TRUE** if the support for 32-bit mixed signedness dot product operations using the *OpSUDotKHR* SPIR-V instruction is accelerated as defined below.
instruction is accelerated as defined below.

- `integerDotProduct64BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned dot product operations using the `OpUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit signed dot product operations using the `OpSDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProduct64BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness dot product operations using the `OpSUDotKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating8BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit unsigned accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit signed accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating4x8BitPackedMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 8-bit mixed signedness accumulating saturating dot product operations from operands packed into 32-bit integers using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitSignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating16BitMixedSignednessAccelerated` is a boolean that will be `VK_TRUE` if the support for 16-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

- `integerDotProductAccumulatingSaturating32BitUnsignedAccelerated` is a boolean that will be `VK_TRUE` if the support for 32-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.
• **integerDotProductAccumulatingSaturating32BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 32-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating32BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 32-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating64BitUnsignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 64-bit unsigned accumulating saturating dot product operations using the `OpUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating64BitSignedAccelerated** is a boolean that will be `VK_TRUE` if the support for 64-bit signed accumulating saturating dot product operations using the `OpSDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

• **integerDotProductAccumulatingSaturating64BitMixedSignednessAccelerated** is a boolean that will be `VK_TRUE` if the support for 64-bit mixed signedness accumulating saturating dot product operations using the `OpSUDotAccSatKHR` SPIR-V instruction is accelerated as defined below.

If the `VkPhysicalDeviceShaderIntegerDotProductProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These are properties of the integer dot product acceleration information of a physical device.

**NOTE**
A dot product operation is deemed accelerated if its implementation provides a performance advantage over application-provided code composed from elementary instructions and/or other dot product instructions, either because the implementation uses optimized machine code sequences whose generation from application-provided code cannot be guaranteed or because it uses hardware features that cannot otherwise be targeted from application-provided code.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderIntegerDotProductProperties-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_PROPERTIES`

The `VkPhysicalDeviceShaderTileImagePropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImagePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTileImageCoherentReadAccelerated;
    VkBool32 shaderTileImageReadSampleFromPixelRateInvocation;
    VkBool32 shaderTileImageReadFromHelperInvocation;
} VkPhysicalDeviceShaderTileImagePropertiesEXT;
```
• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **shaderTileImageCoherentReadAccelerated** is a boolean that will be **VK_TRUE** if coherent reads of tile image data is accelerated.
• **shaderTileImageReadSampleFromPixelRateInvocation** is a boolean that will be **VK_TRUE** if reading from samples from a pixel rate fragment invocation is supported when **VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1**.
• **shaderTileImageReadFromHelperInvocation** is a boolean that will be **VK_TRUE** if reads of tile image data from helper fragment invocations result in valid values.

If the **VkPhysicalDeviceShaderTileImagePropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

These are properties of the tile image information of a physical device.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderTileImagePropertiesEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_PROPERTIES_EXT**

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceQueueFamilyProperties(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties* pQueueFamilyProperties);
```

• **physicalDevice** is the handle to the physical device whose properties will be queried.
• **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described below.
• **pQueueFamilyProperties** is either **NULL** or a pointer to an array of **VkQueueFamilyProperties** structures.

If **pQueueFamilyProperties** is **NULL**, then the number of queue families available is returned in **pQueueFamilyPropertyCount**. Implementations must support at least one queue family. Otherwise, **pQueueFamilyPropertyCount** must point to a variable set by the application to the number of elements in the **pQueueFamilyProperties** array, and on return the variable is overwritten with the number of structures actually written to **pQueueFamilyProperties**. If **pQueueFamilyPropertyCount** is less than the number of queue families available, at most **pQueueFamilyPropertyCount** structures will be written.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyPropertyCount-parameter**
  - `pQueueFamilyPropertyCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceQueueFamilyProperties-pQueueFamilyProperties-parameter**
  - If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not NULL, `pQueueFamilyProperties` must be a valid pointer to an array of `VkQueueFamilyProperties` structures

The `VkQueueFamilyProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueueFamilyProperties {
    VkQueueFlags queueFlags;
    uint32_t queueCount;
    uint32_t timestampValidBits;
    VkExtent3D minImageTransferGranularity;
} VkQueueFamilyProperties;
```

- **queueFlags** is a bitmask of `VkQueueFlagBits` indicating capabilities of the queues in this queue family.

- **queueCount** is the unsigned integer count of queues in this queue family. Each queue family must support at least one queue.

- **timestampValidBits** is the unsigned integer count of meaningful bits in the timestamps written via `vkCmdWriteTimestamp2` or `vkCmdWriteTimestamp`. The valid range for the count is 36 to 64 bits, or a value of 0, indicating no support for timestamps. Bits outside the valid range are guaranteed to be zeros.

- **minImageTransferGranularity** is the minimum granularity supported for image transfer operations on the queues in this queue family.

The value returned in `minImageTransferGranularity` has a unit of compressed texel blocks for images having a block-compressed format, and a unit of texels otherwise.

Possible values of `minImageTransferGranularity` are:

- (0,0,0) specifies that only whole mip levels must be transferred using the image transfer operations on the corresponding queues. In this case, the following restrictions apply to all offset and extent parameters of image transfer operations:
  - The `x`, `y`, and `z` members of a `VkOffset3D` parameter must always be zero.
  - The `width`, `height`, and `depth` members of a `VkExtent3D` parameter must always match the width, height, and depth of the image subresource corresponding to the parameter,
respectively.

- \((A_x, A_y, A_z)\) where \(A_x, A_y\), and \(A_z\) are all integer powers of two. In this case the following restrictions apply to all image transfer operations:
  - \(x, y,\) and \(z\) of a `VkOffset3D` parameter must be integer multiples of \(A_x, A_y,\) and \(A_z\), respectively.
  - width of a `VkExtent3D` parameter must be an integer multiple of \(A_x\), or else \(x + \text{width}\) must equal the width of the image subresource corresponding to the parameter.
  - height of a `VkExtent3D` parameter must be an integer multiple of \(A_y\), or else \(y + \text{height}\) must equal the height of the image subresource corresponding to the parameter.
  - depth of a `VkExtent3D` parameter must be an integer multiple of \(A_z\), or else \(z + \text{depth}\) must equal the depth of the image subresource corresponding to the parameter.
  - If the format of the image corresponding to the parameters is one of the block-compressed formats then for the purposes of the above calculations the granularity must be scaled up by the compressed texel block dimensions.

Queues supporting graphics and/or compute operations must report \((1,1,1)\) in `minImageTransferGranularity`, meaning that there are no additional restrictions on the granularity of image transfer operations for these queues. Other queues supporting image transfer operations are only required to support whole mip level transfers, thus `minImageTransferGranularity` for queues belonging to such queue families may be \((0,0,0)\).

The Device Memory section describes memory properties queried from the physical device.

For physical device feature queries see the Features chapter.

Bits which may be set in `VkQueueFamilyProperties::queueFlags`, indicating capabilities of queues in a queue family are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueueFlagBits {
    VK_QUEUE_GRAPHICS_BIT = 0x00000001,
    VK_QUEUE_COMPUTE_BIT = 0x00000002,
    VK_QUEUE_TRANSFER_BIT = 0x00000004,
    VK_QUEUE_SPARSE_BINDING_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_QUEUE_PROTECTED_BIT = 0x00000010,
    // Provided by VK_KHR_video_decode_queue
    VK_QUEUE_VIDEO_DECODE_BIT_KHR = 0x00000020,
    // Provided by VK_KHR_video_encode_queue
    VK_QUEUE_VIDEO_ENCODE_BIT_KHR = 0x00000040,
} VkQueueFlagBits;
```

- `VK_QUEUE_GRAPHICS_BIT` specifies that queues in this queue family support graphics operations.
- `VK_QUEUE_COMPUTE_BIT` specifies that queues in this queue family support compute operations.
- `VK_QUEUE_TRANSFER_BIT` specifies that queues in this queue family support transfer operations.
• **VK_QUEUE_SPARSE_BINDING_BIT** specifies that queues in this queue family support sparse memory management operations (see Sparse Resources). If any of the sparse resource features are enabled, then at least one queue family must support this bit.

• **VK_QUEUE_VIDEO_DECODE_BIT_KHR** specifies that queues in this queue family support video decode operations.

• **VK_QUEUE_VIDEO_ENCODE_BIT_KHR** specifies that queues in this queue family support video encode operations.

• **VK_QUEUE_PROTECTED_BIT** specifies that queues in this queue family support the **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** bit. (see Protected Memory). If the physical device supports the protectedMemory feature, at least one of its queue families must support this bit.

If an implementation exposes any queue family that supports graphics operations, at least one queue family of at least one physical device exposed by the implementation must support both graphics and compute operations.

Furthermore, if the protectedMemory physical device feature is supported, then at least one queue family of at least one physical device exposed by the implementation must support graphics operations, compute operations, and protected memory operations.

**NOTE**

All commands that are allowed on a queue that supports transfer operations are also allowed on a queue that supports either graphics or compute operations. Thus, if the capabilities of a queue family include **VK_QUEUE_GRAPHICS_BIT** or **VK_QUEUE_COMPUTE_BIT**, then reporting the **VK_QUEUE_TRANSFER_BIT** capability separately for that queue family is optional.

For further details see Queues.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueueFlags;
```

**VkQueueFlags** is a bitmask type for setting a mask of zero or more **VkQueueFlagBits**.

To query properties of queues available on a physical device, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceQueueFamilyProperties2(
    VkPhysicalDevice physicalDevice,
    uint32_t* pQueueFamilyPropertyCount,
    VkQueueFamilyProperties2* pQueueFamilyProperties);
```

or the equivalent command
void vkGetPhysicalDeviceQueueFamilyProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pQueueFamilyPropertyCount, 
    VkQueueFamilyProperties2* pQueueFamilyProperties);

- **physicalDevice** is the handle to the physical device whose properties will be queried.
- **pQueueFamilyPropertyCount** is a pointer to an integer related to the number of queue families available or queried, as described in `vkGetPhysicalDeviceQueueFamilyProperties`.
- **pQueueFamilyProperties** is either `NULL` or a pointer to an array of `VkQueueFamilyProperties2` structures.

`vkGetPhysicalDeviceQueueFamilyProperties2` behaves similarly to `vkGetPhysicalDeviceQueueFamilyProperties`, with the ability to return extended information in a `pNext` chain of output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-physicalDevice-parameter
  - **physicalDevice** must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyPropertyCount-parameter
  - **pQueueFamilyPropertyCount** must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceQueueFamilyProperties2-pQueueFamilyProperties-parameter
  - If the value referenced by `pQueueFamilyPropertyCount` is not 0, and `pQueueFamilyProperties` is not `NULL`, `pQueueFamilyProperties` must be a valid pointer to an array of `VkQueueFamilyProperties` `VkQueueFamilyProperties2` structures

The `VkQueueFamilyProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkQueueFamilyProperties2 {
    VkStructureType sType;
    void* pNext;
    VkQueueFamilyProperties queueFamilyProperties;
} VkQueueFamilyProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkQueueFamilyProperties2 VkQueueFamilyProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyProperties` is a `VkQueueFamilyProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceQueueFamilyProperties`.

**Valid Usage (Implicit)**

- VUID-VkQueueFamilyProperties2-sType-sType
  sType must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_PROPERTIES_2`

- VUID-VkQueueFamilyProperties2-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueueFamilyCheckpointProperties2NV`, `VkQueueFamilyGlobalPriorityPropertiesKHR`, `VkQueueFamilyQueryResultStatusPropertiesKHR`, or `VkQueueFamilyVideoPropertiesKHR`

- VUID-VkQueueFamilyProperties2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

The `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkQueueFamilyGlobalPriorityPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t priorityCount;
    VkQueueGlobalPriorityKHR priorities[VK_MAX_GLOBAL_PRIORITY_SIZE_KHR];
} VkQueueFamilyGlobalPriorityPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priorityCount` is the number of supported global queue priorities in this queue family, and it must be greater than 0.
- `priorities` is an array of `VK_MAX_GLOBAL_PRIORITY_SIZE_KHR` `VkQueueGlobalPriorityKHR` enums representing all supported global queue priorities in this queue family. The first `priorityCount` elements of the array will be valid.

If the `VkQueueFamilyGlobalPriorityPropertiesKHR` structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties`, it is filled in with the list of supported global queue priorities for the indicated family.

The valid elements of `priorities` must not contain any duplicate values.

The valid elements of `priorities` must be a continuous sequence of `VkQueueGlobalPriorityKHR` enums in the ascending order.

**NOTE** For example, returning `priorityCount` as 3 with supported `priorities` as `VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR`, `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR` and
VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR is not allowed.

### Valid Usage (Implicit)

- **VUID-VkQueueFamilyGlobalPriorityPropertiesKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_GLOBAL_PRIORITY_PROPERTIES_KHR`

`VK_MAX_GLOBAL_PRIORITY_SIZE_KHR` is the length of an array of `VkQueueGlobalPriorityKHR` enumerants representing supported queue priorities, as returned in `VkQueueFamilyGlobalPriorityPropertiesKHR::priorities`.

```c
#define VK_MAX_GLOBAL_PRIORITY_SIZE_KHR   16U
```

The `VkQueueFamilyVideoPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyVideoPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCodecOperationFlagsKHR videoCodecOperations;
} VkQueueFamilyVideoPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **videoCodecOperations** is a bitmask of `VkVideoCodecOperationFlagBitsKHR` that indicates the set of video codec operations supported by the queue family.

If this structure is included in the `pNext` chain of the `VkQueueFamilyProperties2` structure passed to `vkGetPhysicalDeviceQueueFamilyProperties2`, then it is filled with the set of video codec operations supported by the specified queue family.

### Valid Usage (Implicit)

- **VUID-VkQueueFamilyVideoPropertiesKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_VIDEO_PROPERTIES_KHR`

The `VkQueueFamilyQueryResultStatusPropertiesKHR` structure is defined as:
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- queryResultStatusSupport reports VK_TRUE if query type VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR and use of VK_QUERY_RESULT_WITH_STATUS_BIT_KHR are supported.

If this structure is included in the pNext chain of the VkQueueFamilyProperties2 structure passed to vkGetPhysicalDeviceQueueFamilyProperties2, then it is filled with information about whether result status queries are supported by the specified queue family.

Valid Usage (Implicit)

- VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR

To enumerate the performance query counters available on a queue family of a physical device, call:

// Provided by VK_KHR_performance_query
VkResult vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    uint32_t* pCounterCount,
    VkPerformanceCounterKHR* pCounters,
    VkPerformanceCounterDescriptionKHR* pCounterDescriptions);

- physicalDevice is the handle to the physical device whose queue family performance query counter properties will be queried.
- queueFamilyIndex is the index into the queue family of the physical device we want to get properties for.
- pCounterCount is a pointer to an integer related to the number of counters available or queried, as described below.
- pCounters is either NULL or a pointer to an array of VkPerformanceCounterKHR structures.
- pCounterDescriptions is either NULL or a pointer to an array of VkPerformanceCounterDescriptionKHR structures.

If pCounters is NULL and pCounterDescriptions is NULL, then the number of counters available is returned in pCounterCount. Otherwise, pCounterCount must point to a variable set by the application.
to the number of elements in the \texttt{pCounters, pCounterDescriptions}, or both arrays and on return the variable is overwritten with the number of structures actually written out. If \texttt{pCounterCount} is less than the number of counters available, at most \texttt{pCounterCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available counters were returned.

\begin{table}[h]

      \item \texttt{VK_INCOMPLETE}  
    \end{itemize}  
  \item \textbf{Failure}  
    \begin{itemize}
      \item \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}  
      \item \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}  
      \item \texttt{VK_ERROR_INITIALIZATION_FAILED}  
    \end{itemize}  
\end{itemize}
\hline
\end{tabular}
\end{table}

The \texttt{VkPerformanceCounterKHR} structure is defined as:
typedef struct VkPerformanceCounterKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterUnitKHR unit;
    VkPerformanceCounterScopeKHR scope;
    VkPerformanceCounterStorageKHR storage;
    uint8_t uuid[VK_UUID_SIZE];
} VkPerformanceCounterKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **unit** is a `VkPerformanceCounterUnitKHR` specifying the unit that the counter data will record.
- **scope** is a `VkPerformanceCounterScopeKHR` specifying the scope that the counter belongs to.
- **storage** is a `VkPerformanceCounterStorageKHR` specifying the storage type that the counter's data uses.
- **uuid** is an array of size `VK_UUID_SIZE`, containing 8-bit values that represent a universally unique identifier for the counter of the physical device.

**Valid Usage (Implicit)**

- **VUID-VkPerformanceCounterKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_KHR`

- **VUID-VkPerformanceCounterKHR-pNext-pNext**
  
  `pNext` must be `NULL`

Performance counters have an associated unit. This unit describes how to interpret the performance counter result.

The performance counter unit types which **may** be returned in `VkPerformanceCounterKHR::unit` are:
typedef enum VkPerformanceCounterUnitKHR {
    VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR = 0,
    VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR = 1,
    VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR = 2,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR = 3,
    VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR = 4,
    VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR = 5,
    VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR = 6,
    VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR = 7,
    VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR = 8,
    VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR = 9,
    VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR = 10,
} VkPerformanceCounterUnitKHR;

• VK_PERFORMANCE_COUNTER_UNIT_GENERIC_KHR - the performance counter unit is a generic data point.
• VK_PERFORMANCE_COUNTER_UNIT_PERCENTAGE_KHR - the performance counter unit is a percentage (%).
• VK_PERFORMANCE_COUNTER_UNIT_NANOSECONDS_KHR - the performance counter unit is a value of nanoseconds (ns).
• VK_PERFORMANCE_COUNTER_UNIT_BYTES_KHR - the performance counter unit is a value of bytes.
• VK_PERFORMANCE_COUNTER_UNIT_BYTES_PER_SECOND_KHR - the performance counter unit is a value of bytes/s.
• VK_PERFORMANCE_COUNTER_UNIT_KELVIN_KHR - the performance counter unit is a temperature reported in Kelvin.
• VK_PERFORMANCE_COUNTER_UNIT_WATTS_KHR - the performance counter unit is a value of watts (W).
• VK_PERFORMANCE_COUNTER_UNIT_VOLTS_KHR - the performance counter unit is a value of volts (V).
• VK_PERFORMANCE_COUNTER_UNIT_AMPS_KHR - the performance counter unit is a value of amps (A).
• VK_PERFORMANCE_COUNTER_UNIT_HERTZ_KHR - the performance counter unit is a value of hertz (Hz).
• VK_PERFORMANCE_COUNTER_UNIT_CYCLES_KHR - the performance counter unit is a value of cycles.

Performance counters have an associated scope. This scope describes the granularity of a performance counter.

The performance counter scope types which may be returned in VkPerformanceCounterKHR::scope are:
typedef enum VkPerformanceCounterScopeKHR {
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR = 0,
    VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR = 1,
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR = 2,
    // VK_QUERY_SCOPE_COMMAND_BUFFER_KHR is a deprecated alias
    VK_QUERY_SCOPE_COMMAND_BUFFER_KHR =
    VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR,
    // VK_QUERY_SCOPE_RENDER_PASS_KHR is a deprecated alias
    VK_QUERY_SCOPE_RENDER_PASS_KHR = VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR,
    // VK_QUERY_SCOPE_COMMAND_KHR is a deprecated alias
    VK_QUERY_SCOPE_COMMAND_KHR = VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR,
} VkPerformanceCounterScopeKHR;

- VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR - the performance counter scope is a single complete command buffer.
- VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR - the performance counter scope is zero or more complete render passes. The performance query containing the performance counter must begin and end outside a render pass instance.
- VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_KHR - the performance counter scope is zero or more commands.

Performance counters have an associated storage. This storage describes the payload of a counter result.

The performance counter storage types which may be returned in VkPerformanceCounterKHR::storage are:

typedef enum VkPerformanceCounterStorageKHR {
    VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR = 0,
    VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR = 1,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR = 2,
    VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR = 3,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR = 4,
    VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR = 5,
} VkPerformanceCounterStorageKHR;

- VK_PERFORMANCE_COUNTER_STORAGE_INT32_KHR - the performance counter storage is a 32-bit signed integer.
- VK_PERFORMANCE_COUNTER_STORAGE_INT64_KHR - the performance counter storage is a 64-bit signed integer.
- VK_PERFORMANCE_COUNTER_STORAGE_UINT32_KHR - the performance counter storage is a 32-bit unsigned integer.
- VK_PERFORMANCE_COUNTER_STORAGE_UINT64_KHR - the performance counter storage is a 64-bit unsigned integer.
VK_PERFORMANCE_COUNTER_STORAGE_FLOAT32_KHR - the performance counter storage is a 32-bit floating-point.

VK_PERFORMANCE_COUNTER_STORAGE_FLOAT64_KHR - the performance counter storage is a 64-bit floating-point.

The VkPerformanceCounterDescriptionKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceCounterDescriptionKHR {
    VkStructureType sType;
    void* pNext;
    VkPerformanceCounterDescriptionFlagsKHR flags;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char category[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
} VkPerformanceCounterDescriptionKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPerformanceCounterDescriptionFlagBitsKHR indicating the usage behavior for the counter.
- **name** is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the name of the counter.
- **category** is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the category of the counter.
- **description** is an array of size VK_MAX_DESCRIPTION_SIZE, containing a null-terminated UTF-8 string specifying the description of the counter.

### Valid Usage (Implicit)

- VUID-VkPerformanceCounterDescriptionKHR-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_PERFORMANCE_COUNTER_DESCRIPTION_KHR

- VUID-VkPerformanceCounterDescriptionKHR-pNext-pNext
  
  **pNext** must be NULL

Bits which **can** be set in VkPerformanceCounterDescriptionKHR::flags, specifying usage behavior of a performance counter, are:
typedef enum VkPerformanceCounterDescriptionFlagBitsKHR {
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR = 0x00000001,
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR = 0x00000002,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR is a deprecated alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_KHR =
        VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR,
    // VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR is a deprecated alias
    VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_KHR =
        VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR,
} VkPerformanceCounterDescriptionFlagBitsKHR;

- VK_PERFORMANCE_COUNTER_DESCRIPTION_PERFORMANCE_IMPACTING_BIT_KHR specifies that recording the counter may have a noticeable performance impact.

- VK_PERFORMANCE_COUNTER_DESCRIPTION_CONCURRENTLY_IMPACTED_BIT_KHR specifies that concurrently recording the counter while other submitted command buffers are running may impact the accuracy of the recording.

typedef VkFlags VkPerformanceCounterDescriptionFlagsKHR;

VkPerformanceCounterDescriptionFlagsKHR is a bitmask type for setting a mask of zero or more VkPerformanceCounterDescriptionFlagBitsKHR.

5.2. Devices

Device objects represent logical connections to physical devices. Each device exposes a number of queue families each having one or more queues. All queues in a queue family support the same operations.

As described in Physical Devices, a Vulkan application will first query for all physical devices in a system. Each physical device can then be queried for its capabilities, including its queue and queue family properties. Once an acceptable physical device is identified, an application will create a corresponding logical device. The created logical device is then the primary interface to the physical device.

How to enumerate the physical devices in a system and query those physical devices for their queue family properties is described in the Physical Device Enumeration section above.

A single logical device can be created from multiple physical devices, if those physical devices belong to the same device group. A device group is a set of physical devices that support accessing each other’s memory and recording a single command buffer that can be executed on all the physical devices. Device groups are enumerated by calling vkEnumeratePhysicalDeviceGroups, and a logical device is created from a subset of the physical devices in a device group by passing the physical devices through VkDeviceGroupDeviceCreateInfo. For two physical devices to be in the
same device group, they must support identical extensions, features, and properties.

Physical devices in the same device group must be so similar because there are no rules for how different features/properties would interact. They must return the same values for nearly every invariant vkGetPhysicalDevice* feature, property, capability, etc., but could potentially differ for certain queries based on things like having a different display connected, or a different compositor. The specification does not attempt to enumerate which state is in each category, because such a list would quickly become out of date.

To retrieve a list of the device groups present in the system, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkEnumeratePhysicalDeviceGroups(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group_creation
VkResult vkEnumeratePhysicalDeviceGroupsKHR(
    VkInstance instance,
    uint32_t* pPhysicalDeviceGroupCount,
    VkPhysicalDeviceGroupProperties* pPhysicalDeviceGroupProperties);
```

- `instance` is a handle to a Vulkan instance previously created with vkCreateInstance.
- `pPhysicalDeviceGroupCount` is a pointer to an integer related to the number of device groups available or queried, as described below.
- `pPhysicalDeviceGroupProperties` is either NULL or a pointer to an array of VkPhysicalDeviceGroupProperties structures.

If `pPhysicalDeviceGroupProperties` is NULL, then the number of device groups available is returned in `pPhysicalDeviceGroupCount`. Otherwise, `pPhysicalDeviceGroupCount` must point to a variable set by the application to the number of elements in the `pPhysicalDeviceGroupProperties` array, and on return the variable is overwritten with the number of structures actually written to `pPhysicalDeviceGroupProperties`. If `pPhysicalDeviceGroupCount` is less than the number of device groups available, at most `pPhysicalDeviceGroupCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available device groups were returned.

Every physical device must be in exactly one device group.

**Valid Usage (Implicit)**

- VUID-vkEnumeratePhysicalDeviceGroups-instance-parameter
instance must be a valid VkInstance handle

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupCount-parameter
  pPhysicalDeviceGroupCount must be a valid pointer to a uint32_t value

- VUID-vkEnumeratePhysicalDeviceGroups-pPhysicalDeviceGroupProperties-parameter
  If the value referenced by pPhysicalDeviceGroupCount is not 0, and
  pPhysicalDeviceGroupProperties is not NULL, pPhysicalDeviceGroupProperties must be a
  valid pointer to an array of pPhysicalDeviceGroupCount VkPhysicalDeviceGroupProperties
  structures

### Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED

The VkPhysicalDeviceGroupProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceGroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t physicalDeviceCount;
    VkPhysicalDevice physicalDevices[VK_MAX_DEVICE_GROUP_SIZE];
    VkBool32 subsetAllocation;
} VkPhysicalDeviceGroupProperties;
```

or the equivalent

```c
// Provided by VK_KHR_device_group_creation
typedef VkPhysicalDeviceGroupProperties VkPhysicalDeviceGroupPropertiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **physicalDeviceCount** is the number of physical devices in the group.
- **physicalDevices** is an array of VK_MAX_DEVICE_GROUP_SIZE VkPhysicalDevice handles representing
  all physical devices in the group. The first physicalDeviceCount elements of the array will be
  valid.
• **subsetAllocation** specifies whether logical devices created from the group support allocating device memory on a subset of devices, via the `deviceMask` member of the `VkMemoryAllocateFlagsInfo`. If this is `VK_FALSE`, then all device memory allocations are made across all physical devices in the group. If `physicalDeviceCount` is 1, then `subsetAllocation` must be `VK_FALSE`.

---

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGroupProperties-sType-sType  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GROUP_PROPERTIES`
- VUID-VkPhysicalDeviceGroupProperties-pNext-pNext  
  *pNext* must be `NULL`

---

**VK_MAX_DEVICE_GROUP_SIZE** is the length of an array containing `VkPhysicalDevice` handle values representing all physical devices in a group, as returned in `VkPhysicalDeviceGroupProperties`::physicalDevices.

```c
#define VK_MAX_DEVICE_GROUP_SIZE          32U
```

or the equivalent

```c
#define VK_MAX_DEVICE_GROUP_SIZE_KHR      VK_MAX_DEVICE_GROUP_SIZE
```

---

### 5.2.1. Device Creation

Logical devices are represented by `VkDevice` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkDevice)
```

A logical device is created as a *connection* to a physical device. To create a logical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDevice(  
    VkPhysicalDevice physicalDevice,  
    const VkDeviceCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDevice* pDevice);
```

- **physicalDevice** must be one of the device handles returned from a call to `vkEnumeratePhysicalDevices` (see Physical Device Enumeration).
- **pCreateInfo** is a pointer to a `VkDeviceCreateInfo` structure containing information about how to create the device.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pDevice` is a pointer to a handle in which the created `VkDevice` is returned.

`vkCreateDevice` verifies that extensions and features requested in the `ppEnabledExtensionNames` and `pEnabledFeatures` members of `pCreateInfo`, respectively, are supported by the implementation. If any requested extension is not supported, `vkCreateDevice` must return `VK_ERROR_EXTENSION_NOT_PRESENT`. If any requested feature is not supported, `vkCreateDevice` must return `VK_ERROR_FEATURE_NOT_PRESENT`. Support for extensions can be checked before creating a device by querying `vkEnumerateDeviceExtensionProperties`. Support for features can similarly be checked by querying `vkGetPhysicalDeviceFeatures`.

After verifying and enabling the extensions the `VkDevice` object is created and returned to the application.

Multiple logical devices can be created from the same physical device. Logical device creation may fail due to lack of device-specific resources (in addition to other errors). If that occurs, `vkCreateDevice` will return `VK_ERROR_TOO_MANY_OBJECTS`.

### Valid Usage

- **VUID-vkCreateDevice-ppEnabledExtensionNames-01387**
  All required device extensions for each extension in the `VkDeviceCreateInfo` ::`ppEnabledExtensionNames` list must also be present in that list

### Valid Usage (Implicit)

- **VUID-vkCreateDevice-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkCreateDevice-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkDeviceCreateInfo` structure

- **VUID-vkCreateDevice-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateDevice-pDevice-parameter**
  `pDevice` must be a valid pointer to a `VkDevice` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The VkDeviceCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceCreateFlags flags;
    uint32_t queueCreateInfoCount;
    const VkDeviceQueueCreateInfo* pQueueCreateInfos;
    // enabledLayerCount is deprecated and should not be used
    uint32_t enabledLayerCount;
    // ppEnabledLayerNames is deprecated and should not be used
    const char* const* ppEnabledLayerNames;
    uint32_t enabledExtensionCount;
    const char* const* ppEnabledExtensionNames;
    const VkPhysicalDeviceFeatures* pEnabledFeatures;
} VkDeviceCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **queueCreateInfoCount** is the unsigned integer size of the pQueueCreateInfos array. Refer to the Queue Creation section below for further details.
- **pQueueCreateInfos** is a pointer to an array of VkDeviceQueueCreateInfo structures describing the queues that are requested to be created along with the logical device. Refer to the Queue Creation section below for further details.
- **enabledLayerCount** is deprecated and ignored.
- **ppEnabledLayerNames** is deprecated and ignored. See Device Layer Deprecation.
- **enabledExtensionCount** is the number of device extensions to enable.
- **ppEnabledExtensionNames** is a pointer to an array of enabledExtensionCount null-terminated UTF-8 strings containing the names of extensions to enable for the created device. See the Extensions section for further details.
- **pEnabledFeatures** is NULL or a pointer to a VkPhysicalDeviceFeatures structure containing boolean indicators of all the features to be enabled. Refer to the Features section for further details.
Valid Usage

• VUID-VkDeviceCreateInfo-queueFamilyIndex-02802
  The `queueFamilyIndex` member of each element of `pQueueCreateInfos` must be unique within `pQueueCreateInfos`, except that two members can share the same `queueFamilyIndex` if one describes protected-capable queues and one describes queues that are not protected-capable.

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-06755
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, the sum of their `queueCount` members must be less than or equal to the `queueCount` member of the `VkQueueFamilyProperties` structure, as returned by `vkGetPhysicalDeviceQueueFamilyProperties` in the `pQueueFamilyProperties[queueFamilyIndex]`.

• VUID-VkDeviceCreateInfo-pQueueCreateInfos-06654
  If multiple elements of `pQueueCreateInfos` share the same `queueFamilyIndex`, then all of such elements must have the same global priority level, which can be specified explicitly by the including a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure in the `pNext` chain, or by the implicit default value.

• VUID-VkDeviceCreateInfo-pNext-00373
  If the `pNext` chain includes a `VkPhysicalDeviceFeatures2` structure, then `pEnabledFeatures` must be `NULL`.

• VUID-VkDeviceCreateInfo-pNext-02829
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan11Features` structure, then it must not include a `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDeviceMultiviewFeatures`, `VkPhysicalDeviceVariablePointersFeatures`, `VkPhysicalDeviceProtectedMemoryFeatures`, `VkPhysicalDeviceSamplerYcbcrConversionFeatures`, or `VkPhysicalDeviceShaderDrawParametersFeatures` structure.

• VUID-VkDeviceCreateInfo-pNext-02830
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then it must not include a `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceShaderAtomicInt64Features`, `VkPhysicalDeviceShaderFloat16Int8Features`, `VkPhysicalDeviceDescriptorIndexingFeatures`, `VkPhysicalDeviceScalarBlockLayoutFeatures`, `VkPhysicalDeviceImagelessFramebufferFeatures`, `VkPhysicalDeviceUniformBufferStandardLayoutFeatures`, `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures`, `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures`, `VkPhysicalDeviceHostQueryResetFeatures`, `VkPhysicalDeviceTimelineSemaphoreFeatures`, `VkPhysicalDeviceBufferDeviceAddressFeatures`, or `VkPhysicalDeviceVulkanMemoryModelFeatures` structure.

• VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-04476
  If `ppEnabledExtensionNames` contains "VK_KHR_shader_draw_parameters" and the `pNext` chain...
includes a `VkPhysicalDeviceVulkan11Features` structure, then `VkPhysicalDeviceVulkan11Features::shaderDrawParameters` must be VK_TRUE

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02831
  If `ppEnabledExtensionNames` contains "VK_KHR_draw_indirect_count" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::drawIndirectCount` must be VK_TRUE

- VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-02832
  If `ppEnabledExtensionNames` contains "VK_KHR_sampler_mirror_clamp_to_edge" and the `pNext` chain includes a `VkPhysicalDeviceVulkan12Features` structure, then `VkPhysicalDeviceVulkan12Features::samplerMirrorClampToEdge` must be VK_TRUE

- VUID-VkDeviceCreateInfo-pNext-06532
  If the `pNext` chain includes a `VkPhysicalDeviceVulkan13Features` structure, then it must not include a `VkPhysicalDeviceDynamicRenderingFeatures`, `VkPhysicalDeviceImageRobustnessFeatures`, `VkPhysicalDeviceInlineUniformBlockFeatures`, `VkPhysicalDeviceMaintenance4Features`, `VkPhysicalDevicePipelineCreationCacheControlFeatures`, `VkPhysicalDevicePrivateDataFeatures`, `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures`, `VkPhysicalDeviceShaderIntegerDotProductFeatures`, `VkPhysicalDeviceSynchronization2Features`, `VkPhysicalDeviceTextureCompressionASTCHDRFeatures`, or `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure

- VUID-VkDeviceCreateInfo-pProperties-04451
  If the `VK_KHR_portability_subset` extension is included in `pProperties` of `vkEnumerateDeviceExtensionProperties`, `ppEnabledExtensionNames` must include "VK_KHR_portability_subset"

- VUID-VkDeviceCreateInfo-None-04897
  If `sparseImageFloat32Atomics` is enabled, `shaderImageFloat32Atomics` must be enabled

- VUID-VkDeviceCreateInfo-None-04898
  If `sparseImageFloat32AtomicAdd` is enabled, `shaderImageFloat32AtomicAdd` must be enabled

### Valid Usage (Implicit)

- **VUID-VkDeviceCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_CREATE_INFO`

- **VUID-VkDeviceCreateInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceDeviceMemoryReportCreateInfoEXT`, `VkDeviceGroupDeviceCreateInfo`, `VkDevicePrivateDataCreateInfo`, `VkPhysicalDevice16BitStorageFeatures`, `VkPhysicalDevice8BitStorageFeatures`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR`, `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT`,...
VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT,
VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT,
VkPhysicalDeviceBufferDeviceAddressFeatures,
VkPhysicalDeviceColorWriteEnableFeaturesEXT,

VkPhysicalDeviceMemoryPriorityFeaturesEXT, VkPhysicalDeviceMultiviewFeatures,
VkPhysicalDeviceNestedCommandBufferFeaturesEXT,
VkPhysicalDeviceOpacityMicromapFeaturesEXT,
VkPhysicalDevicePerformanceQueryFeaturesKHR,
VkPhysicalDevicePipelineCreationCacheControlFeatures,
VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR,
VkPhysicalDevicePortabilitySubsetFeaturesKHR, VkPhysicalDevicePresentIdFeaturesKHR,
VkPhysicalDevicePresentWaitFeaturesKHR,
VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT,
VkPhysicalDevicePrivateDataFeatures, VkPhysicalDeviceProtectedMemoryFeatures,
VkPhysicalDeviceProkvingVertexFeaturesEXT, VkPhysicalDeviceRayQueryFeaturesKHR,
VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR,
VkPhysicalDeviceRayTracingPipelineFeaturesKHR,
VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR,
VkPhysicalDeviceRobustness2FeaturesEXT,
VkPhysicalDeviceSamplerYcbcrConversionFeatures,
VkPhysicalDeviceScalarBlockLayoutFeatures,
VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures,
The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkDeviceDeviceMemoryReportCreateInfoEXT` or `VkDevicePrivateDataCreateInfo`.

- **VUID-VkDeviceCreateInfo-sType-unique**
  - `sType` must be unique.

- **VUID-VkDeviceCreateInfo-flags-zerobitmask**
  - `flags` must be `0`.

- **VUID-VkDeviceCreateInfo-pQueueCreateInfos-parameter**
  - `pQueueCreateInfos` must be a valid pointer to an array of `queueCreateInfoCount` valid `VkDeviceQueueCreateInfo` structures.

- **VUID-VkDeviceCreateInfo-ppEnabledLayerNames-parameter**
  - If `enabledLayerCount` is not `0`, `ppEnabledLayerNames` must be a valid pointer to an array of `enabledLayerCount` null-terminated UTF-8 strings.

- **VUID-VkDeviceCreateInfo-ppEnabledExtensionNames-parameter**
  - If `enabledExtensionCount` is not `0`, `ppEnabledExtensionNames` must be a valid pointer to an
array of enabledExtensionCount null-terminated UTF-8 strings

• VUID-VkDeviceCreateInfo-pEnabledFeatures-parameter
  If pEnabledFeatures is not NULL, pEnabledFeatures must be a valid pointer to a valid
  VkPhysicalDeviceFeatures structure

• VUID-VkDeviceCreateInfo-queueCreateInfoCount-arraylength
  queueCreateInfoCount must be greater than 0

// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceCreateFlags;

VkDeviceCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A logical device can be created that connects to one or more physical devices by adding a
VkDeviceGroupDeviceCreateInfo structure to the pNext chain of VkDeviceCreateInfo. The
VkDeviceGroupDeviceCreateInfo structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupDeviceCreateInfo {
  VkStructureType sType;
  const void* pNext;
  uint32_t physicalDeviceCount;
  const VkPhysicalDevice* pPhysicalDevices;
} VkDeviceGroupDeviceCreateInfo;

or the equivalent

// Provided by VK_KHR_device_group_creation
typedef VkDeviceGroupDeviceCreateInfo VkDeviceGroupDeviceCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• physicalDeviceCount is the number of elements in the pPhysicalDevices array.
• pPhysicalDevices is a pointer to an array of physical device handles belonging to the same
device group.

The elements of the pPhysicalDevices array are an ordered list of the physical devices that the
logical device represents. These must be a subset of a single device group, and need not be in the
same order as they were enumerated. The order of the physical devices in the pPhysicalDevices
array determines the device index of each physical device, with element i being assigned a device
index of i. Certain commands and structures refer to one or more physical devices by using device
indices or device masks formed using device indices.

A logical device created without using VkDeviceGroupDeviceCreateInfo, or with physicalDeviceCount
equal to zero, is equivalent to a physicalDeviceCount of one and pPhysicalDevices pointing to the
The physicalDevice parameter to vkCreateDevice. In particular, the device index of that physical device is zero.

### Valid Usage

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00375
  - Each element of pPhysicalDevices must be unique

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-00376
  - All elements of pPhysicalDevices must be in the same device group as enumerated by vkEnumeratePhysicalDeviceGroups

- VUID-VkDeviceGroupDeviceCreateInfo-physicalDeviceCount-00377
  - If physicalDeviceCount is not 0, the physicalDevice parameter of vkCreateDevice must be an element of pPhysicalDevices

### Valid Usage (Implicit)

- VUID-VkDeviceGroupDeviceCreateInfo-sType-sType
  - sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_DEVICE_CREATE_INFO

- VUID-VkDeviceGroupDeviceCreateInfo-pPhysicalDevices-parameter
  - If physicalDeviceCount is not 0, pPhysicalDevices must be a valid pointer to an array of physicalDeviceCount valid VkPhysicalDevice handles

To register callbacks for underlying device memory events of type VkDeviceMemoryReportEventGetTypeEXT, add one or multiple VkDeviceDeviceMemoryReportCreateInfoEXT structures to the pNext chain of the VkDeviceCreateInfo structure.

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkDeviceDeviceMemoryReportCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    PFN_vkDeviceMemoryReportCallbackEXT pfnUserCallback;
    void* pUserData;
} VkDeviceDeviceMemoryReportCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is 0 and reserved for future use.
- **pfnUserCallback** is the application callback function to call.
- **pUserData** is user data to be passed to the callback.

The callback may be called from multiple threads simultaneously.
The callback **must** be called only once by the implementation when a `VkDeviceMemoryReportEventTypeEXT` event occurs.

**NOTE**  
The callback could be called from a background thread other than the thread calling the Vulkan commands.

### Valid Usage (Implicit)

- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-sType-sType**  
  `sType` **must** be `VK_STRUCTURE_TYPE_DEVICE_DEVICE_MEMORY_REPORT_CREATE_INFO_EXT`

- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-flags-zerobitmask**  
  `flags` **must** be `0`

- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pfnUserCallback-parameter**  
  `pfnUserCallback` **must** be a valid `PFN_vkDeviceMemoryReportCallbackEXT` value

- **VUID-VkDeviceDeviceMemoryReportCreateInfoEXT-pUserData-parameter**  
  `pUserData` **must** be a pointer value

The prototype for the `VkDeviceDeviceMemoryReportCreateInfoEXT::pfnUserCallback` function implemented by the application is:

```c
// Provided by VK_EXT_device_memory_report
typedef void (VKAPI_PTR *PFN_vkDeviceMemoryReportCallbackEXT)(
    const VkDeviceMemoryReportCallbackDataEXT* pCallbackData,
    void* pUserData);
```

- `pCallbackData` contains all the callback related data in the `VkDeviceMemoryReportCallbackDataEXT` structure.
- `pUserData` is the user data provided when the `VkDeviceDeviceMemoryReportCreateInfoEXT` was created.

The callback **must** not make calls to any Vulkan commands.

The definition of `VkDeviceMemoryReportCallbackDataEXT` is:
// Provided by VK_EXT_device_memory_report

typedef struct VkDeviceMemoryReportCallbackDataEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceMemoryReportFlagsEXT flags;
    VkDeviceMemoryReportEventTypeEXT type;
    uint64_t memoryObjectId;
    VkDeviceSize size;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint32_t heapIndex;
} VkDeviceMemoryReportCallbackDataEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is 0 and reserved for future use.
- `type` is a `VkDeviceMemoryReportEventTypeEXT` type specifying the type of event reported in this `VkDeviceMemoryReportCallbackDataEXT` structure.
- `memoryObjectId` is the unique id for the underlying memory object as described below.
- `size` is the size of the memory object in bytes. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `size` is a valid `VkDeviceSize` value. Otherwise, `size` is undefined.
- `objectType` is a `VkObjectType` value specifying the type of the object associated with this device memory report event. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `objectType` is a valid `VkObjectType` enum. Otherwise, `objectType` is undefined.
- `objectHandle` is the object this device memory report event is attributed to. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT`, `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT`, `objectHandle` is a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and Vulkan Handle Relationship table. Otherwise, `objectHandle` is undefined.
- `heapIndex` describes which memory heap this device memory allocation is made from. If `type` is `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT` or `VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT`, `heapIndex` corresponds to one of the valid heaps from the `VkPhysicalDeviceMemoryProperties` structure. Otherwise, `heapIndex` is undefined.

`memoryObjectId` is used to avoid double-counting on the same memory object.

If an internally-allocated device memory object or a `VkDeviceMemory` cannot be exported,
memoryObjectId must be unique in the VkDevice.

If an internally-allocated device memory object or a VkDeviceMemory supports being exported, memoryObjectId must be unique system wide.

If an internal device memory object or a VkDeviceMemory is backed by an imported external memory object, memoryObjectId must be unique system wide.

**Implementor’s Note**

If the heap backing an internally-allocated device memory cannot be used to back VkDeviceMemory, implementations can advertise that heap with no types.

```
This structure should only be considered valid during the lifetime of the triggered callback.

For VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT and
VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT events, objectHandle usually will not yet exist when the application or tool receives the callback. objectHandle will only exist when the create or allocate call that triggered the event returns, and if the allocation or import ends up failing objectHandle will not ever exist.
```

**Valid Usage (Implicit)**

- VUID-VkDeviceMemoryReportCallbackDataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_MEMORY_REPORT_CALLBACK_DATA_EXT

- VUID-VkDeviceMemoryReportCallbackDataEXT-pNext-pNext
  pNext must be NULL

```c
// Provided by VK_EXT_device_memory_report
typedef VkFlags VkDeviceMemoryReportFlagsEXT;
```

VkDeviceMemoryReportFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkDeviceMemoryReportCallbackDataEXT::type, specifying event types which cause the device driver to call the callback, are:
// Provided by VK_EXT_device_memory_report
typedef enum VkDeviceMemoryReportEventTypeEXT {
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT = 0,
    VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT = 1,
    VKDEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT = 2,
    VKDEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT = 3,
    VKDEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT = 4,
} VkDeviceMemoryReportEventTypeEXT;

- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATE_EXT specifies this event corresponds to the allocation of an internal device memory object or a VkDeviceMemory.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_FREE_EXT specifies this event corresponds to the deallocation of an internally-allocated device memory object or a VkDeviceMemory.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_IMPORT_EXT specifies this event corresponds to the import of an external memory object.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_UNIMPORT_EXT specifies this event is the release of an imported external memory object.
- VK_DEVICE_MEMORY_REPORT_EVENT_TYPE_ALLOCATION_FAILED_EXT specifies this event corresponds to the failed allocation of an internal device memory object or a VkDeviceMemory.

To reserve private data storage slots, add a VkDevicePrivateDataCreateInfo structure to the pNext chain of the VkDeviceCreateInfo structure. Reserving slots in this manner is not strictly necessary, but doing so may improve performance.

// Provided by VK_VERSION_1_3
typedef struct VkDevicePrivateDataCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t privateDataSlotRequestCount;
} VkDevicePrivateDataCreateInfo;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- privateDataSlotRequestCount is the amount of slots to reserve.

Valid Usage (Implicit)

- VUID-VkDevicePrivateDataCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_PRIVATE_DATA_CREATE_INFO

5.2.2. Device Use

The following is a high-level list of VkDevice uses along with references on where to find more
information:

- Creation of queues. See the Queues section below for further details.
- Creation and tracking of various synchronization constructs. See Synchronization and Cache Control for further details.
- Allocating, freeing, and managing memory. See Memory Allocation and Resource Creation for further details.
- Creation and destruction of command buffers and command buffer pools. See Command Buffers for further details.
- Creation, destruction, and management of graphics state. See Pipelines and Resource Descriptors, among others, for further details.

5.2.3. Lost Device

A logical device may become lost for a number of implementation-specific reasons, indicating that pending and future command execution may fail and cause resources and backing memory to become undefined.

Typical reasons for device loss will include things like execution timing out (to prevent denial of service), power management events, platform resource management, implementation errors.

Applications not adhering to valid usage may also result in device loss being reported, however this is not guaranteed. Even if device loss is reported, the system may be in an unrecoverable state, and further usage of the API is still considered invalid.

When this happens, certain commands will return VK_ERROR_DEVICE_LOST. After any such event, the logical device is considered lost. It is not possible to reset the logical device to a non-lost state, however the lost state is specific to a logical device (VkDevice), and the corresponding physical device (VkPhysicalDevice) may be otherwise unaffected.

In some cases, the physical device may also be lost, and attempting to create a new logical device will fail, returning VK_ERROR_DEVICE_LOST. This is usually indicative of a problem with the underlying implementation, or its connection to the host. If the physical device has not been lost, and a new logical device is successfully created from that physical device, it must be in the non-lost state.

Whilst logical device loss may be recoverable, in the case of physical device loss, it is unlikely that an application will be able to recover unless additional, unaffected physical devices exist on the system. The error is largely informational and intended only to inform the application that a platform issue has occurred, and should be investigated further. For example, underlying hardware may have developed a fault or become physically disconnected from the rest of the system. In many cases, physical device loss may cause other more serious issues such as the operating system crashing; in which case it may not be reported via the Vulkan API.

When a device is lost, its child objects are not implicitly destroyed and their handles are still valid.
Those objects **must** still be destroyed before their parents or the device **can** be destroyed (see the Object Lifetime section). The host address space corresponding to device memory mapped using `vkMapMemory` is still valid, and host memory accesses to these mapped regions are still valid, but the contents are undefined. It is still legal to call any API command on the device and child objects.

Once a device is lost, command execution **may** fail, and certain commands that return a `VkResult` **may** return `VK_ERROR_DEVICE_LOST`. These commands can be identified by the inclusion of `VK_ERROR_DEVICE_LOST` in the Return Codes section for each command. Commands that do not allow runtime errors **must** still operate correctly for valid usage and, if applicable, return valid data.

Commands that wait indefinitely for device execution (namely `vkDeviceWaitIdle`, `vkQueueWaitIdle`, `vkWaitForFences` or `vkAcquireNextImageKHR` with a maximum timeout, and `vkGetQueryPoolResults` with the `VK_QUERY_RESULT_WAIT_BIT` bit set in `flags`) **must** return in finite time even in the case of a lost device, and return either `VK_SUCCESS` or `VK_ERROR_DEVICE_LOST`. For any command that **may** return `VK_ERROR_DEVICE_LOST`, for the purpose of determining whether a command buffer is in the pending state, or whether resources are considered in-use by the device, a return value of `VK_ERROR_DEVICE_LOST` is equivalent to `VK_SUCCESS`.

If a device was created with the `maintenance5` feature enabled, and any device command returns `VK_ERROR_DEVICE_LOST`, then all device commands for which `VK_ERROR_DEVICE_LOST` is a valid return value and which happen-after it on the same host thread **must** return `VK_ERROR_DEVICE_LOST`.

Device commands executing on other threads **must** begin returning `VK_ERROR_DEVICE_LOST` within finite time.

The content of any external memory objects that have been exported from or imported to a lost device become undefined. Objects on other logical devices or in other APIs which are associated with the same underlying memory resource as the external memory objects on the lost device are unaffected other than their content becoming undefined. The layout of subresources of images on other logical devices that are bound to `VkDeviceMemory` objects associated with the same underlying memory resources as external memory objects on the lost device becomes `VK_IMAGE_LAYOUT_UNDEFINED`.

The state of `VkSemaphore` objects on other logical devices created by importing a semaphore payload with temporary permanence which was exported from the lost device is undefined. The state of `VkSemaphore` objects on other logical devices that permanently share a semaphore payload with a `VkSemaphore` object on the lost device is undefined, and remains undefined following any subsequent signal operations. Implementations **must** ensure pending and subsequently submitted wait operations on such semaphores behave as defined in Semaphore State Requirements For Wait Operations for external semaphores not in a valid state for a wait operation.

### 5.2.4. Device Destruction

To destroy a device, call:
void vkDestroyDevice(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator);

- **device** is the logical device to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

To ensure that no work is active on the device, `vkDeviceWaitIdle` can be used to gate the destruction of the device. Prior to destroying a device, an application is responsible for destroying/freeing any Vulkan objects that were created using that device as the first parameter of the corresponding `vkCreate*` or `vkAllocate*` command.

**NOTE**
The lifetime of each of these objects is bound by the lifetime of the `VkDevice` object. Therefore, to avoid resource leaks, it is critical that an application explicitly free all of these resources prior to calling `vkDestroyDevice`.

**Valid Usage**

- VUID-vkDestroyDevice-device-05137
  All child objects created on **device** must have been destroyed prior to destroying **device**

- VUID-vkDestroyDevice-device-00379
  If `VkAllocationCallbacks` were provided when **device** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDevice-device-00380
  If no `VkAllocationCallbacks` were provided when **device** was created, **pAllocator** must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyDevice-device-parameter
  If **device** is not NULL, **device** must be a valid `VkDevice` handle

- VUID-vkDestroyDevice-pAllocator-parameter
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

**Host Synchronization**

- Host access to **device** must be externally synchronized
- Host access to all `VkQueue` objects created from **device** must be externally synchronized
5.3. Queues

5.3.1. Queue Family Properties

As discussed in the Physical Device Enumeration section above, the vkGetPhysicalDeviceQueueFamilyProperties command is used to retrieve details about the queue families and queues supported by a device.

Each index in the pQueueFamilyProperties array returned by vkGetPhysicalDeviceQueueFamilyProperties describes a unique queue family on that physical device. These indices are used when creating queues, and they correspond directly with the queueFamilyIndex that is passed to the vkCreateDevice command via the VkDeviceQueueCreateInfo structure as described in the Queue Creation section below.

Grouping of queue families within a physical device is implementation-dependent.

NOTE

The general expectation is that a physical device groups all queues of matching capabilities into a single family. However, while implementations should do this, it is possible that a physical device may return two separate queue families with the same capabilities.

Once an application has identified a physical device with the queue(s) that it desires to use, it will create those queues in conjunction with a logical device. This is described in the following section.

5.3.2. Queue Creation

Creating a logical device also creates the queues associated with that device. The queues to create are described by a set of VkDeviceQueueCreateInfo structures that are passed to vkCreateDevice in pQueueCreateInfos.

Queues are represented by VkQueue handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkQueue)
```

The VkDeviceQueueCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDeviceQueueCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueCount;
    const float* pQueuePriorities;
} VkDeviceQueueCreateInfo;
```
**Valid Usage**

- **VUID-VkDeviceQueueCreateInfo-queueFamilyIndex-00381**
  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties

- **VUID-VkDeviceQueueCreateInfo-queueCount-00382**
  queueCount must be less than or equal to the queueCount member of the VkQueueFamilyProperties structure, as returned by vkGetPhysicalDeviceQueueFamilyProperties in the pQueueFamilyProperties[queueFamilyIndex]

- **VUID-VkDeviceQueueCreateInfo-pQueuePriorities-00383**
  Each element of pQueuePriorities must be between 0.0 and 1.0 inclusive

- **VUID-VkDeviceQueueCreateInfo-flags-02861**
  If the protectedMemory feature is not enabled, the VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT bit of flags must not be set

- **VUID-VkDeviceQueueCreateInfo-flags-06449**
  If flags includes VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, queueFamilyIndex must be the index of a queue family that includes the VK_QUEUE_PROTECTED_BIT capability

**Valid Usage (Implicit)**

- **VUID-VkDeviceQueueCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_CREATE_INFO

- **VUID-VkDeviceQueueCreateInfo-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of VkDeviceQueueGlobalPriorityCreateInfoKHR

- **VUID-VkDeviceQueueCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkDeviceQueueCreateInfo-flags-parameter**
  flags must be a valid combination of VkDeviceQueueCreateFlagBits values
• **VUID-VkDeviceQueueCreateInfo-pQueuePriorities-parameter**
  *pQueuePriorities* must be a valid pointer to an array of *queueCount* `float` values

• **VUID-VkDeviceQueueCreateInfo-queueCount-arraylength**
  *queueCount* must be greater than 0

Bits which can be set in `VkDeviceQueueCreateInfo::flags`, specifying usage behavior of a queue, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDeviceQueueCreateFlagBits {
    // Provided by VK_VERSION_1_1
    VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT = 0x00000001,
} VkDeviceQueueCreateFlagBits;
```

• **VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT** specifies that the device queue is a protected-capable queue.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDeviceQueueCreateFlags;
```

`VkDeviceQueueCreateFlags` is a bitmask type for setting a mask of zero or more `VkDeviceQueueCreateFlagBits`.

Queues can be created with a system-wide priority by adding a `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure to the `pNext` chain of `VkDeviceQueueCreateInfo`.

The `VkDeviceQueueGlobalPriorityCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkDeviceQueueGlobalPriorityCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkQueueGlobalPriorityKHR globalPriority;
} VkDeviceQueueGlobalPriorityCreateInfoKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **globalPriority** is the system-wide priority associated to these queues as specified by `VkQueueGlobalPriorityKHR`

Queues created without specifying `VkDeviceQueueGlobalPriorityCreateInfoKHR` will default to `VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR`. 
Valid Usage (Implicit)

- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_QUEUE_GLOBAL_PRIORITY_CREATE_INFO_KHR

- VUID-VkDeviceQueueGlobalPriorityCreateInfoKHR-globalPriority-parameter
  globalPriority must be a valid VkQueueGlobalPriorityKHR value

Possible values of VkDeviceQueueGlobalPriorityCreateInfoKHR::globalPriority, specifying a system-wide priority level are:

```c
// Provided by VK_KHR_global_priority
typedef enum VkQueueGlobalPriorityKHR {
    VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR = 128,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR = 256,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR = 512,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR = 1024,
    VK_QUEUE_GLOBAL_PRIORITY_LOW_EXT = VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_EXT = VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_HIGH_EXT = VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR,
    VK_QUEUE_GLOBAL_PRIORITY_REALTIME_EXT = VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR,
} VkQueueGlobalPriorityKHR;
```

Priority values are sorted in ascending order. A comparison operation on the enum values can be used to determine the priority order.

- VK_QUEUE_GLOBAL_PRIORITY_LOW_KHR is below the system default. Useful for non-interactive tasks.
- VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR is the system default priority.
- VK_QUEUE_GLOBAL_PRIORITY_HIGH_KHR is above the system default.
- VK_QUEUE_GLOBAL_PRIORITY_REALTIME_KHR is the highest priority. Useful for critical tasks.

Queues with higher system priority may be allotted more processing time than queues with lower priority. An implementation may allow a higher-priority queue to starve a lower-priority queue until the higher-priority queue has no further commands to execute.

Priorities imply no ordering or scheduling constraints.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

The global priority level of a queue takes precedence over the per-process queue priority (VkDeviceQueueCreateInfo::pQueuePriorities).

Abuse of this feature may result in starving the rest of the system of implementation resources. Therefore, the driver implementation may deny requests to acquire a priority above the default priority (VK_QUEUE_GLOBAL_PRIORITY_MEDIUM_KHR) if the caller does not have sufficient privileges. In this scenario VK_ERROR_NOT_PERMITTED_KHR is returned.
The driver implementation may fail the queue allocation request if resources required to complete the operation have been exhausted (either by the same process or a different process). In this scenario VK_ERROR_INITIALIZATION_FAILED is returned.

If the globalPriorityQuery feature is enabled and the requested global priority is not reported via VkQueueFamilyGlobalPriorityPropertiesKHR, the driver implementation must fail the queue creation. In this scenario, VK_ERROR_INITIALIZATION_FAILED is returned.

To retrieve a handle to a VkQueue object, call:

```c
void vkGetDeviceQueue(
    VkDevice device,
    uint32_t queueFamilyIndex,
    uint32_t queueIndex,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index within this queue family of the queue to retrieve.
- `pQueue` is a pointer to a VkQueue object that will be filled with the handle for the requested queue.

vkGetDeviceQueue must only be used to get queues that were created with the flags parameter of VkDeviceQueueCreateInfo set to zero. To get queues that were created with a non-zero flags parameter use vkGetDeviceQueue2.

**Valid Usage**

- VUID-vkGetDeviceQueue-queueFamilyIndex-00384 `queueFamilyIndex` must be one of the queue family indices specified when `device` was created, via the VkDeviceQueueCreateInfo structure

- VUID-vkGetDeviceQueue-queueIndex-00385 `queueIndex` must be less than the value of `VkDeviceQueueCreateInfo::queueCount` for the queue family indicated by `queueFamilyIndex` when `device` was created

- VUID-vkGetDeviceQueue-flags-01841 `VkDeviceQueueCreateInfo::flags` must have been set to zero when `device` was created

**Valid Usage (Implicit)**

- VUID-vkGetDeviceQueue-device-parameter `device` must be a valid VkDevice handle

- VUID-vkGetDeviceQueue-pQueue-parameter `pQueue` must be a valid pointer to a VkQueue handle
To retrieve a handle to a `VkQueue` object with specific `VkDeviceQueueCreateFlags` creation flags, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceQueue2(
    VkDevice device,
    const VkDeviceQueueInfo2* pQueueInfo,
    VkQueue* pQueue);
```

- `device` is the logical device that owns the queue.
- `pQueueInfo` is a pointer to a `VkDeviceQueueInfo2` structure, describing parameters of the device queue to be retrieved.
- `pQueue` is a pointer to a `VkQueue` object that will be filled with the handle for the requested queue.

### Valid Usage (Implicit)

- VUID-vkGetDeviceQueue2-device-parameter
  - `device` must be a valid `VkDevice` handle.
- VUID-vkGetDeviceQueue2-pQueueInfo-parameter
  - `pQueueInfo` must be a valid pointer to a valid `VkDeviceQueueInfo2` structure.
- VUID-vkGetDeviceQueue2-pQueue-parameter
  - `pQueue` must be a valid pointer to a `VkQueue` handle.

The `VkDeviceQueueInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceQueueInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceQueueCreateFlags flags;
    uint32_t queueFamilyIndex;
    uint32_t queueIndex;
} VkDeviceQueueInfo2;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkDeviceQueueInfo2` can be used to provide additional device queue parameters to `vkGetDeviceQueue2`.
- `flags` is a `VkDeviceQueueCreateFlags` value indicating the flags used to create the device queue.
- `queueFamilyIndex` is the index of the queue family to which the queue belongs.
- `queueIndex` is the index of the queue to retrieve from within the set of queues that share both the queue family and flags specified.
The queue returned by `vkGetDeviceQueue2` must have the same `flags` value from this structure as that used at device creation time in a `VkDeviceQueueCreateInfo` structure.

Normally, if you create both protected-capable and non-protected-capable queues with the same family, they are treated as separate lists of queues and `queueIndex` is relative to the start of the list of queues specified by both `queueFamilyIndex` and `flags`. However, for historical reasons, some implementations may exhibit different behavior. These divergent implementations instead concatenate the lists of queues and treat `queueIndex` as relative to the start of the first list of queues with the given `queueFamilyIndex`. This only matters in cases where an application has created both protected-capable and non-protected-capable queues from the same queue family.

For such divergent implementations, the maximum value of `queueIndex` is equal to the sum of `VkDeviceQueueCreateInfo::queueCount` minus one, for all `VkDeviceQueueCreateInfo` structures that share a common `queueFamilyIndex`.

Such implementations will return `NULL` for either the protected or unprotected queues when calling `vkGetDeviceQueue2` with `queueIndex` in the range zero to `VkDeviceQueueCreateInfo::queueCount` minus one. In cases where these implementations returned `NULL`, the corresponding queues are instead located in the extended range described in the preceding two paragraphs.

This behavior will not be observed on any driver that has passed Vulkan conformance test suite version 1.3.3.0, or any subsequent version. This information can be found by querying `VkPhysicalDeviceDriverProperties::conformanceVersion`.

**Valid Usage**

- VUID-VkDeviceQueueInfo2-queueFamilyIndex-01842
  `queueFamilyIndex` must be one of the queue family indices specified when `device` was created, via the `VkDeviceQueueCreateInfo` structure

- VUID-VkDeviceQueueInfo2-flags-06225
  `flags` must be equal to `VkDeviceQueueCreateInfo::flags` for a `VkDeviceQueueCreateInfo` structure for the queue family indicated by `queueFamilyIndex` when `device` was created

- VUID-VkDeviceQueueInfo2-queueIndex-01843
  `queueIndex` must be less than `VkDeviceQueueCreateInfo::queueCount` for the corresponding queue family and flags indicated by `queueFamilyIndex` and `flags` when `device` was created

**Valid Usage (Implicit)**

- VUID-VkDeviceQueueInfo2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_QUEUE_INFO_2`

- VUID-VkDeviceQueueInfo2-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkDeviceQueueInfo2-flags-parameter
**5.3.3. Queue Family Index**

The queue family index is used in multiple places in Vulkan in order to tie operations to a specific family of queues.

When retrieving a handle to the queue via `vkGetDeviceQueue`, the queue family index is used to select which queue family to retrieve the `VkQueue` handle from as described in the previous section.

When creating a `VkCommandPool` object (see Command Pools), a queue family index is specified in the `VkCommandPoolCreateInfo` structure. Command buffers from this pool can only be submitted on queues corresponding to this queue family.

When creating `VkImage` (see Images) and `VkBuffer` (see Buffers) resources, a set of queue families is included in the `VkImageCreateInfo` and `VkBufferCreateInfo` structures to specify the queue families that can access the resource.

When inserting a `VkBufferMemoryBarrier` or `VkImageMemoryBarrier` (see Pipeline Barriers), a source and destination queue family index is specified to allow the ownership of a buffer or image to be transferred from one queue family to another. See the Resource Sharing section for details.

**5.3.4. Queue Priority**

Each queue is assigned a priority, as set in the `VkDeviceQueueCreateInfo` structures when creating the device. The priority of each queue is a normalized floating-point value between 0.0 and 1.0, which is then translated to a discrete priority level by the implementation. Higher values indicate a higher priority, with 0.0 being the lowest priority and 1.0 being the highest.

Within the same device, queues with higher priority may be allotted more processing time than queues with lower priority. The implementation makes no guarantees with regards to ordering or scheduling among queues with the same priority, other than the constraints defined by any explicit synchronization primitives. The implementation makes no guarantees with regards to queues across different devices.

An implementation may allow a higher-priority queue to starve a lower-priority queue on the same `VkDevice` until the higher-priority queue has no further commands to execute. The relationship of queue priorities must not cause queues on one `VkDevice` to starve queues on another `VkDevice`.

No specific guarantees are made about higher priority queues receiving more processing time or better quality of service than lower priority queues.

**5.3.5. Queue Submission**

Work is submitted to a queue via *queue submission* commands such as `vkQueueSubmit2` or `vkQueueSubmit`. Queue submission commands define a set of *queue operations* to be executed by the underlying physical device, including synchronization with semaphores and fences.

Submission commands take as parameters a target queue, zero or more *batches* of work, and an
optional fence to signal upon completion. Each batch consists of three distinct parts:

1. Zero or more semaphores to wait on before execution of the rest of the batch.
   ◦ If present, these describe a semaphore wait operation.
2. Zero or more work items to execute.
   ◦ If present, these describe a queue operation matching the work described.
3. Zero or more semaphores to signal upon completion of the work items.
   ◦ If present, these describe a semaphore signal operation.

If a fence is present in a queue submission, it describes a fence signal operation.

All work described by a queue submission command must be submitted to the queue before the command returns.

Sparse Memory Binding

In Vulkan it is possible to sparsely bind memory to buffers and images as described in the Sparse Resource chapter. Sparse memory binding is a queue operation. A queue whose flags include the VK_QUEUE_SPARSE_BINDING_BIT must be able to support the mapping of a virtual address to a physical address on the device. This causes an update to the page table mappings on the device. This update must be synchronized on a queue to avoid corrupting page table mappings during execution of graphics commands. By binding the sparse memory resources on queues, all commands that are dependent on the updated bindings are synchronized to only execute after the binding is updated. See the Synchronization and Cache Control chapter for how this synchronization is accomplished.

5.3.6. Queue Destruction

Queues are created along with a logical device during vkCreateDevice. All queues associated with a logical device are destroyed when vkDestroyDevice is called on that device.
Chapter 6. Command Buffers

Command buffers are objects used to record commands which can be subsequently submitted to a device queue for execution. There are two levels of command buffers - primary command buffers, which can execute secondary command buffers, and which are submitted to queues, and secondary command buffers, which can be executed by primary command buffers, and which are not directly submitted to queues.

Command buffers are represented by VkCommandBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_HANDLE(VkCommandBuffer)
```

Recorded commands include commands to bind pipelines and descriptor sets to the command buffer, commands to modify dynamic state, commands to draw (for graphics rendering), commands to dispatch (for compute), commands to execute secondary command buffers (for primary command buffers only), commands to copy buffers and images, and other commands.

Each command buffer manages state independently of other command buffers. There is no inheritance of state across primary and secondary command buffers, or between secondary command buffers. When a command buffer begins recording, all state in that command buffer is undefined. When secondary command buffer(s) are recorded to execute on a primary command buffer, the secondary command buffer inherits no state from the primary command buffer, and all state of the primary command buffer is undefined after an execute secondary command buffer command is recorded. There is one exception to this rule - if the primary command buffer is inside a render pass instance, then the render pass and subpass state is not disturbed by executing secondary command buffers. For state dependent commands (such as draws and dispatches), any state consumed by those commands must not be undefined.

Unless otherwise specified, and without explicit synchronization, the various commands submitted to a queue via command buffers may execute in arbitrary order relative to each other, and/or concurrently. Also, the memory side effects of those commands may not be directly visible to other commands without explicit memory dependencies. This is true within a command buffer, and across command buffers submitted to a given queue. See the synchronization chapter for information on implicit and explicit synchronization between commands.

6.1. Command Buffer Lifecycle

Each command buffer is always in one of the following states:

Initial

When a command buffer is allocated, it is in the initial state. Some commands are able to reset a command buffer (or a set of command buffers) back to this state from any of the executable, recording or invalid state. Command buffers in the initial state can only be moved to the recording state, or freed.
Recording

`vkBeginCommandBuffer` changes the state of a command buffer from the initial state to the *recording state*. Once a command buffer is in the recording state, `vkCmd*` commands can be used to record to the command buffer.

Executable

`vkEndCommandBuffer` ends the recording of a command buffer, and moves it from the recording state to the *executable state*. Executable command buffers can be submitted, reset, or recorded to another command buffer.

Pending

Queue submission of a command buffer changes the state of a command buffer from the executable state to the *pending state*. Whilst in the pending state, applications must not attempt to modify the command buffer in any way - as the device may be processing the commands recorded to it. Once execution of a command buffer completes, the command buffer either reverts back to the *executable state*, or if it was recorded with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT`, it moves to the *invalid state*. A synchronization command should be used to detect when this occurs.

Invalid

Some operations, such as modifying or deleting a resource that was used in a command recorded to a command buffer, will transition the state of that command buffer into the *invalid state*. Command buffers in the invalid state can only be reset or freed.

![Figure 1. Lifecycle of a command buffer](image)

Any given command that operates on a command buffer has its own requirements on what state a command buffer must be in, which are detailed in the valid usage constraints for that command.

Resetting a command buffer is an operation that discards any previously recorded commands and puts a command buffer in the *initial state*. Resetting occurs as a result of `vkResetCommandBuffer` or `vkResetCommandPool`, or as part of `vkBeginCommandBuffer` (which additionally puts the command buffer in the *recording state*).

Secondary command buffers can be recorded to a primary command buffer via...
vkCmdExecuteCommands. This partially ties the lifecycle of the two command buffers together - if the primary is submitted to a queue, both the primary and any secondaries recorded to it move to the pending state. Once execution of the primary completes, so it does for any secondary recorded within it. After all executions of each command buffer complete, they each move to their appropriate completion state (either to the executable state or the invalid state, as specified above).

If a secondary moves to the invalid state or the initial state, then all primary buffers it is recorded in move to the invalid state. A primary moving to any other state does not affect the state of a secondary recorded in it.

NOTE: Resetting or freeing a primary command buffer removes the lifecycle linkage to all secondary command buffers that were recorded into it.

6.2. Command Pools

Command pools are opaque objects that command buffer memory is allocated from, and which allow the implementation to amortize the cost of resource creation across multiple command buffers. Command pools are externally synchronized, meaning that a command pool must not be used concurrently in multiple threads. That includes use via recording commands on any command buffers allocated from the pool, as well as operations that allocate, free, and reset command buffers or the pool itself.

Command pools are represented by VkCommandPool handles:

// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkCommandPool)

To create a command pool, call:

// Provided by VK_VERSION_1_0
VkResult vkCreateCommandPool(
    VkDevice device, 
    const VkCommandPoolCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkCommandPool* pCommandPool);

- device is the logical device that creates the command pool.
- pCreateInfo is a pointer to a VkCommandPoolCreateInfo structure specifying the state of the command pool object.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pCommandPool is a pointer to a VkCommandPool handle in which the created pool is returned.

Valid Usage

- VUID-vkCreateCommandPool-queueFamilyIndex-01937
pCreateInfo->queueFamilyIndex must be the index of a queue family available in the logical device device

Valid Usage (Implicit)

- VUID-vkCreateCommandPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateCommandPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkCommandPoolCreateInfo structure

- VUID-vkCreateCommandPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateCommandPool-pCommandPool-parameter
  pCommandPool must be a valid pointer to a VkCommandPool handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandPoolCreateInfo {
  VkStructureType sType;
  const void* pNext;
  VkCommandPoolCreateFlags flags;
  uint32_t queueFamilyIndex;
} VkCommandPoolCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkCommandPoolCreateFlagBits indicating usage behavior for the pool and command buffers allocated from it.
- **queueFamilyIndex** designates a queue family as described in section Queue Family Properties. All command buffers allocated from this command pool must be submitted on queues from the same queue family.
Valid Usage

• VUID-VkCommandPoolCreateInfo-flags-02860
  If the protectedMemory feature is not enabled, the VK_COMMAND_POOL_CREATE_PROTECTED_BIT bit of flags must not be set

Valid Usage (Implicit)

• VUID-VkCommandPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_COMMAND_POOL_CREATE_INFO

• VUID-VkCommandPoolCreateInfo-pNext-pNext
  pNext must be NULL

• VUID-VkCommandPoolCreateInfo-flags-parameter
  flags must be a valid combination of VkCommandPoolCreateFlagBits values

Bits which can be set in VkCommandPoolCreateInfo::flags, specifying usage behavior for a command pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolCreateFlagBits {
    VK_COMMAND_POOL_CREATE_TRANSIENT_BIT = 0x00000001,
    VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT = 0x00000002,
} VkCommandPoolCreateFlagBits;
```

• VK_COMMAND_POOL_CREATE_TRANSIENT_BIT specifies that command buffers allocated from the pool will be short-lived, meaning that they will be reset or freed in a relatively short timeframe. This flag may be used by the implementation to control memory allocation behavior within the pool.

• VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT allows any command buffer allocated from a pool to be individually reset to the initial state; either by calling vkResetCommandBuffer, or via the implicit reset when calling vkBeginCommandBuffer. If this flag is not set on a pool, then vkResetCommandBuffer must not be called for any command buffer allocated from that pool.

• VK_COMMAND_POOL_CREATE_PROTECTED_BIT specifies that command buffers allocated from the pool are protected command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolCreateFlags;
```

VkCommandPoolCreateFlags is a bitmask type for setting a mask of zero or more VkCommandPoolCreateFlagBits.

To trim a command pool, call:
Provided by VK_VERSION_1_1

```c
void vkTrimCommandPool(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

or the equivalent command

Provided by VK_KHR_maintenance1

```c
void vkTrimCommandPoolKHR(
    VkDevice device,
    VkCommandPool commandPool,
    VkCommandPoolTrimFlags flags);
```

- `device` is the logical device that owns the command pool.
- `commandPool` is the command pool to trim.
- `flags` is reserved for future use.

Trimming a command pool recycles unused memory from the command pool back to the system. Command buffers allocated from the pool are not affected by the command.

This command provides applications with some control over the internal memory allocations used by command pools.

Unused memory normally arises from command buffers that have been recorded and later reset, such that they are no longer using the memory. On reset, a command buffer can return memory to its command pool, but the only way to release memory from a command pool to the system requires calling `vkResetCommandPool`, which cannot be executed while any command buffers from that pool are still in use. Subsequent recording operations into command buffers will reuse this memory but since total memory requirements fluctuate over time, unused memory can accumulate.

In this situation, trimming a command pool **may** be useful to return unused memory back to the system, returning the total outstanding memory allocated by the pool back to a more “average” value.

Implementations utilize many internal allocation strategies that make it impossible to guarantee that all unused memory is released back to the system. For instance, an implementation of a command pool **may** involve allocating memory in bulk from the system and sub-allocating from that memory. In such an implementation any live command buffer that holds a reference to a bulk allocation would prevent that allocation from being freed, even if only a small proportion of the bulk allocation is in use.

In most cases trimming will result in a reduction in allocated but unused memory, but it does not guarantee the “ideal” behavior.

**NOTE**
Trimming may be an expensive operation, and should not be called frequently. Trimming should be treated as a way to relieve memory pressure after application-known points when there exists enough unused memory that the cost of trimming is “worth” it.

Valid Usage (Implicit)

- **VUID-vkTrimCommandPool-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkTrimCommandPool-commandPool-parameter**
  commandPool must be a valid VkCommandPool handle

- **VUID-vkTrimCommandPool-flags-zerobitmask**
  flags must be 0

- **VUID-vkTrimCommandPool-commandPool-parent**
  commandPool must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkCommandPoolTrimFlags;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance1
typedef VkCommandPoolTrimFlags VkCommandPoolTrimFlagsKHR;
```

VkCommandPoolTrimFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To reset a command pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandPool(
    VkDevice device,            // Provided by VK_VERSION_1_0
    VkCommandPool commandPool,  // Provided by VK_VERSION_1_0
    VkCommandPoolResetFlags flags);
```

- **device** is the logical device that owns the command pool.
- **commandPool** is the command pool to reset.
- **flags** is a bitmask of VkCommandPoolResetFlagBits controlling the reset operation.
Resetting a command pool recycles all of the resources from all of the command buffers allocated from the command pool back to the command pool. All command buffers that have been allocated from the command pool are put in the initial state.

Any primary command buffer allocated from another VkCommandPool that is in the recording or executable state and has a secondary command buffer allocated from commandPool recorded into it, becomes invalid.

Valid Usage

- VUID-vkResetCommandPool-commandPool-00040
  All VkCommandBuffer objects allocated from commandPool must not be in the pending state

Valid Usage (Implicit)

- VUID-vkResetCommandPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkResetCommandPool-commandPool-parameter
  commandPool must be a valid VkCommandPool handle

- VUID-vkResetCommandPool-flags-parameter
  flags must be a valid combination of VkCommandPoolResetFlagBits values

- VUID-vkResetCommandPool-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to commandPool must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_DEVICE_MEMORY

Bits which can be set in vkResetCommandPool::flags, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandPoolResetFlagBits {
    VK_COMMAND_POOL_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandPoolResetFlagBits;
```
VK_COMMAND_POOL_RESET_RELEASE_RESOURCES Bit specifies that resetting a command pool recycles all of the resources from the command pool back to the system.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandPoolResetFlags;
```

VkCommandPoolResetFlags is a bitmask type for setting a mask of zero or more VkCommandPoolResetFlagBits.

To destroy a command pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyCommandPool(
    VkDevice device,            
    VkCommandPool commandPool, 
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the command pool.
- `commandPool` is the handle of the command pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all command buffers allocated from the pool are freed.

Any primary command buffer allocated from another VkCommandPool that is in the recording or executable state and has a secondary command buffer allocated from `commandPool` recorded into it, becomes invalid.

Valid Usage

- VUID-vkDestroyCommandPool-commandPool-00041
  All VkCommandBuffer objects allocated from `commandPool` must not be in the pending state

- VUID-vkDestroyCommandPool-commandPool-00042
  If VkAllocationCallbacks were provided when `commandPool` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyCommandPool-commandPool-00043
  If no VkAllocationCallbacks were provided when `commandPool` was created, `pAllocator` must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyCommandPool-device-parameter
  `device` must be a valid VkDevice handle

- VUID-vkDestroyCommandPool-commandPool-parameter
  If `commandPool` is not VK_NULL_HANDLE, `commandPool` must be a valid VkCommandPool
6.3. Command Buffer Allocation and Management

To allocate command buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateCommandBuffers(  
    VkDevice device,  
    const VkCommandBufferAllocateInfo* pAllocateInfo,  
    VkCommandBuffer* pCommandBuffers);
```

- `device` is the logical device that owns the command pool.
- `pAllocateInfo` is a pointer to a `VkCommandBufferAllocateInfo` structure describing parameters of the allocation.
- `pCommandBuffers` is a pointer to an array of `VkCommandBuffer` handles in which the resulting command buffer objects are returned. The array must be at least the length specified by the `commandBufferCount` member of `pAllocateInfo`. Each allocated command buffer begins in the initial state.

`vkAllocateCommandBuffers` can be used to allocate multiple command buffers. If the allocation of any of those command buffers fails, the implementation must free all successfully allocated command buffer objects from this command, set all entries of the `pCommandBuffers` array to `NULL` and return the error.

**NOTE**  
Filling `pCommandBuffers` with `NULL` values on failure is an exception to the default error behavior that output parameters will have undefined contents.

When command buffers are first allocated, they are in the initial state.

**Valid Usage (Implicit)**

- VUID-vkAllocateCommandBuffers-device-parameter
device must be a valid VkDevice handle

- VUID-vkAllocateCommandBuffers-pAllocateInfo-parameter
  pAllocateInfo must be a valid pointer to a valid VkCommandBufferAllocateInfo structure

- VUID-vkAllocateCommandBuffers-pCommandBuffers-parameter
  pCommandBuffers must be a valid pointer to an array of pAllocateInfo->commandBufferCount VkCommandBuffer handles

- VUID-vkAllocateCommandBuffers-pAllocateInfo::commandBufferCount-arraylength
  pAllocateInfo->commandBufferCount must be greater than 0

Host Synchronization

- Host access to pAllocateInfo->commandPool must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCommandBufferAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferAllocateInfo {
    VkStructureType sType;
    const void*pNext;
    VkCommandPool commandPool;
    VkCommandBufferLevel level;
    uint32_t commandBufferCount;
} VkCommandBufferAllocateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `commandPool` is the command pool from which the command buffers are allocated.
- `level` is a VkCommandBufferLevel value specifying the command buffer level.
- `commandBufferCount` is the number of command buffers to allocate from the pool.
Valid Usage (Implicit)

- VUID-VkCommandBufferAllocateInfo-sType-sType
  sType **must** be **VK_STRUCTURE_TYPE_COMMAND_BUFFER_ALLOCATE_INFO**

- VUID-VkCommandBufferAllocateInfo-pNext-pNext
  pNext **must** be **NULL**

- VUID-VkCommandBufferAllocateInfo-commandPool-parameter
  commandPool **must** be a valid **VkCommandPool** handle

- VUID-VkCommandBufferAllocateInfo-level-parameter
  level **must** be a valid **VkCommandBufferLevel** value

Possible values of **VkCommandBufferAllocateInfo::level**, specifying the command buffer level, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferLevel {
    VK_COMMAND_BUFFER_LEVEL_PRIMARY = 0,
    VK_COMMAND_BUFFER_LEVEL_SECONDARY = 1,
} VkCommandBufferLevel;
```

- **VK_COMMAND_BUFFER_LEVEL_PRIMARY** specifies a primary command buffer.

- **VK_COMMAND_BUFFER_LEVEL_SECONDARY** specifies a secondary command buffer.

To reset a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetCommandBuffer(
    VkCommandBuffer commandBuffer,     commandBuffer,
    VkCommandBufferResetFlags flags);   flags);
```

- **commandBuffer** is the command buffer to reset. The command buffer **can** be in any state other than **pending**, and is moved into the **initial state**.

- **flags** is a bitmask of **VkCommandBufferResetFlagBits** controlling the reset operation.

Any primary command buffer that is in the **recording or executable state** and has **commandBuffer** recorded into it, becomes **invalid**.

Valid Usage

- VUID-vkResetCommandBuffer-commandBuffer-00045
  commandBuffer **must** not be in the **pending state**

- VUID-vkResetCommandBuffer-commandBuffer-00046
  commandBuffer **must** have been allocated from a pool that was created with the
  **VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT**
Valid Usage (Implicit)

- VUID-vkResetCommandBuffer-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkResetCommandBuffer-flags-parameter
  flags must be a valid combination of VkCommandBufferResetFlagBits values

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Bits which can be set in vkResetCommandBuffer::flags, controlling the reset operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferResetFlagBits {
    VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT = 0x00000001,
} VkCommandBufferResetFlagBits;
```

- **VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT** specifies that most or all memory resources currently owned by the command buffer should be returned to the parent command pool. If this flag is not set, then the command buffer may hold onto memory resources and reuse them when recording commands. commandBuffer is moved to the initial state.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferResetFlags;
```

**VkCommandBufferResetFlags** is a bitmask type for setting a mask of zero or more VkCommandBufferResetFlagBits.

To free command buffers, call:
// Provided by VK_VERSION_1_0
void vkFreeCommandBuffers(
    VkDevice device,
    VkCommandPool commandPool,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);

- device is the logical device that owns the command pool.
- commandPool is the command pool from which the command buffers were allocated.
- commandBufferCount is the length of the pCommandBuffers array.
- pCommandBuffers is a pointer to an array of handles of command buffers to free.

Any primary command buffer that is in the recording or executable state and has any element of pCommandBuffers recorded into it, becomes invalid.

**Valid Usage**

- VUID-vkFreeCommandBuffers-pCommandBuffers-00047
  All elements of pCommandBuffers must not be in the pending state
- VUID-vkFreeCommandBuffers-pCommandBuffers-00048
  pCommandBuffers must be a valid pointer to an array of commandBufferCount VkCommandBuffer handles, each element of which must either be a valid handle or NULL

**Valid Usage (Implicit)**

- VUID-vkFreeCommandBuffers-device-parameter
  device must be a valid VkDevice handle
- VUID-vkFreeCommandBuffers-commandPool-parameter
  commandPool must be a valid VkCommandPool handle
- VUID-vkFreeCommandBuffers-commandBufferCount-arraylength
  commandBufferCount must be greater than 0
- VUID-vkFreeCommandBuffers-commandPool-parent
  commandPool must have been created, allocated, or retrieved from device
- VUID-vkFreeCommandBuffers-pCommandBuffers-parent
  Each element of pCommandBuffers that is a valid handle must have been created, allocated, or retrieved from commandPool

**Host Synchronization**

- Host access to commandPool must be externally synchronized
- Host access to each member of pCommandBuffers must be externally synchronized
6.4. Command Buffer Recording

To begin recording a command buffer, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBeginCommandBuffer(
    VkCommandBuffer commandBuffer,
    const VkCommandBufferBeginInfo* pBeginInfo);
```

- `commandBuffer` is the handle of the command buffer which is to be put in the recording state.
- `pBeginInfo` is a pointer to a `VkCommandBufferBeginInfo` structure defining additional information about how the command buffer begins recording.

### Valid Usage

- VUID-vkBeginCommandBuffer-commandBuffer-00049 `commandBuffer` must not be in the recording or pending state
- VUID-vkBeginCommandBuffer-commandBuffer-00050 If `commandBuffer` was allocated from a `VkCommandPool` which did not have the `VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT` flag set, `commandBuffer` must be in the initial state
- VUID-vkBeginCommandBuffer-commandBuffer-00051 If `commandBuffer` is a secondary command buffer, the `pInheritanceInfo` member of `pBeginInfo` must be a valid `VkCommandBufferInheritanceInfo` structure
- VUID-vkBeginCommandBuffer-commandBuffer-00052 If `commandBuffer` is a secondary command buffer and either the `occlusionQueryEnable` member of the `pInheritanceInfo` member of `pBeginInfo` is `VK_FALSE`, or the `occlusionQueryPrecise` feature is not enabled, then `pBeginInfo->pInheritanceInfo->queryFlags` must not contain `VK_QUERY_CONTROL_PRECISE_BIT`
- VUID-vkBeginCommandBuffer-commandBuffer-02840 If `commandBuffer` is a primary command buffer, then `pBeginInfo->flags` must not set both the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` and the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flags

### Valid Usage (Implicit)

- VUID-vkBeginCommandBuffer-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkBeginCommandBuffer-pBeginInfo-parameter `pBeginInfo` must be a valid pointer to a valid `VkCommandBufferBeginInfo` structure
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkCommandBufferBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBufferUsageFlags flags;
    const VkCommandBufferInheritanceInfo* pInheritanceInfo;
} VkCommandBufferBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkCommandBufferUsageFlagBits` specifying usage behavior for the command buffer.
- `pInheritanceInfo` is a pointer to a `VkCommandBufferInheritanceInfo` structure, used if `commandBuffer` is a secondary command buffer. If this is a primary command buffer, then this value is ignored.

Valid Usage

- VUID-VkCommandBufferBeginInfo-flags-09123
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-VkCommandBufferBeginInfo-flags-00055
  If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, the framebuffer member of `pInheritanceInfo` must be either `VK_NULL_HANDLE`, or a valid `VkFramebuffer` that is compatible with the `renderPass` member of `pInheritanceInfo`
If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `dynamicRendering` feature is not enabled, the `renderPass` member of `pInheritanceInfo` must not be `VK_NULL_HANDLE`.

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is `VK_NULL_HANDLE`, the `pNext` chain of `pInheritanceInfo` must include a `VkCommandBufferInheritanceRenderingInfo` structure.

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `renderPass` member of `pInheritanceInfo` must be a valid `VkRenderPass`.

If `flags` contains `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` and the `renderPass` member of `pInheritanceInfo` is not `VK_NULL_HANDLE`, the `subpass` member of `pInheritanceInfo` must be a valid subpass index within the `renderPass` member of `pInheritanceInfo`.

Valid Usage (Implicit)

- **VUID-VkCommandBufferBeginInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COMMAND_BUFFER_BEGIN_INFO`

- **VUID-VkCommandBufferBeginInfo-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDeviceGroupCommandBufferBeginInfo`

- **VUID-VkCommandBufferBeginInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkCommandBufferBeginInfo-flags-parameter**
  `flags` must be a valid combination of `VkCommandBufferUsageFlagBits` values

Bits which **can** be set in `VkCommandBufferBeginInfo::flags`, specifying usage behavior for a command buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCommandBufferUsageFlagBits {
    VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT = 0x00000001,
    VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT = 0x00000002,
    VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT = 0x00000004,
} VkCommandBufferUsageFlagBits;
```

- **VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT** specifies that each recording of the command buffer will only be submitted once, and the command buffer will be reset and recorded again between each submission.
• **VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT** specifies that a secondary command buffer is considered to be entirely inside a render pass. If this is a primary command buffer, then this bit is ignored.

• **VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT** specifies that a command buffer can be resubmitted to any queue of the same queue family while it is in the *pending state*, and recorded into multiple primary command buffers.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCommandBufferUsageFlags;
```

*VkCommandBufferUsageFlags* is a bitmask type for setting a mask of zero or more *VkCommandBufferUsageFlagBits*.

If the command buffer is a secondary command buffer, then the *VkCommandBufferInheritanceInfo* structure defines any state that will be inherited from the primary command buffer:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCommandBufferInheritanceInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    uint32_t subpass;
   VkFramebuffer framebuffer;
    VkBool32 occlusionQueryEnable;
    VkQueryControlFlags queryFlags;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkCommandBufferInheritanceInfo;
```

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is *NULL* or a pointer to a structure extending this structure.

• **renderPass** is a *VkRenderPass* object defining which render passes the *VkCommandBuffer* will be *compatible* with and *can* be executed within.

• **subpass** is the index of the subpass within the render pass instance that the *VkCommandBuffer* will be executed within.

• **framebuffer** *can* refer to the *VkFramebuffer* object that the *VkCommandBuffer* will be rendering to if it is executed within a render pass instance. It *can* be *VK_NULL_HANDLE* if the framebuffer is not known.

  **NOTE** Specifying the exact framebuffer that the secondary command buffer will be executed with *may* result in better performance at command buffer execution time.

• **occlusionQueryEnable** specifies whether the command buffer *can* be executed while an occlusion query is active in the primary command buffer. If this is *VK_TRUE*, then this command buffer *can* be executed whether the primary command buffer has an occlusion query active or
not. If this is VK_FALSE, then the primary command buffer must not have an occlusion query active.

- **queryFlags** specifies the query flags that can be used by an active occlusion query in the primary command buffer when this secondary command buffer is executed. If this value includes the VK_QUERY_CONTROL_PRECISE_BIT bit, then the active query can return boolean results or actual sample counts. If this bit is not set, then the active query must not use the VK_QUERY_CONTROL_PRECISE_BIT bit.

- **pipelineStatistics** is a bitmask of VkQueryPipelineStatisticFlagBits specifying the set of pipeline statistics that can be counted by an active query in the primary command buffer when this secondary command buffer is executed. If this value includes a given bit, then this command buffer can be executed whether the primary command buffer has a pipeline statistics query active that includes this bit or not. If this value excludes a given bit, then the active pipeline statistics query must not be from a query pool that counts that statistic.

If the VkCommandBuffer will not be executed within a render pass instance, or if the render pass instance was begun with vkCmdBeginRendering, renderPass, subpass, and framebuffer are ignored.

**Valid Usage**

- **VUID-VkCommandBufferInheritanceInfo-occlusionQueryEnable-00056**
  If the inheritedQueries feature is not enabled, occlusionQueryEnable must be VK_FALSE

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-00057**
  If the inheritedQueries feature is enabled, queryFlags must be a valid combination of VkQueryControlFlagBits values

- **VUID-VkCommandBufferInheritanceInfo-queryFlags-02788**
  If the inheritedQueries feature is not enabled, queryFlags must be 0

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-02789**
  If the pipelineStatisticsQuery feature is enabled, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- **VUID-VkCommandBufferInheritanceInfo-pipelineStatistics-00058**
  If the pipelineStatisticsQuery feature is not enabled, pipelineStatistics must be 0

**Valid Usage (Implicit)**

- **VUID-VkCommandBufferInheritanceInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_INFO

- **VUID-VkCommandBufferInheritanceInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkAttachmentSampleCountInfoAMD, VkCommandBufferInheritanceRenderingInfo, VkMultiviewPerViewAttributesInfoNVX, VkRenderingAttachmentLocationInfoKHR, or VkRenderingInputAttachmentIndexInfoKHR

- **VUID-VkCommandBufferInheritanceInfo-sType-unique**
The sType value of each struct in the pNext chain must be unique

- VUID-VkCommandBufferInheritanceInfo-commonparent
  Both of framebuffer, and renderPass that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

NOTE On some implementations, not using the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT bit enables command buffers to be patched in-place if needed, rather than creating a copy of the command buffer.

If a command buffer is in the invalid, or executable state, and the command buffer was allocated from a command pool with the VK_COMMAND_POOL_CREATE_RESET_COMMAND_BUFFER_BIT flag set, then vkBeginCommandBuffer implicitly resets the command buffer, behaving as if vkResetCommandBuffer had been called with VK_COMMAND_BUFFER_RESET_RELEASE_RESOURCES_BIT not set. After the implicit reset, commandBuffer is moved to the recording state.

The VkCommandBufferInheritanceRenderingInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferInheritanceRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
    VkSampleCountFlagBits rasterizationSamples;
} VkCommandBufferInheritanceRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkCommandBufferInheritanceRenderingInfo
VkCommandBufferInheritanceRenderingInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkRenderingFlagBits used by the render pass instance.
- viewMask is the view mask used for rendering.
- colorAttachmentCount is the number of color attachments specified in the render pass instance.
- pColorAttachmentFormats is a pointer to an array of VkFormat values defining the format of color attachments.
- depthAttachmentFormat is a VkFormat value defining the format of the depth attachment.
• **stencilAttachmentFormat** is a `VkFormat` value defining the format of the stencil attachment.

• **rasterizationSamples** is a `VkSampleCountFlagBits` specifying the number of samples used in rasterization.

If the `pNext` chain of `VkCommandBufferInheritanceInfo` includes a `VkCommandBufferInheritanceRenderingInfo` structure, then that structure controls parameters of dynamic render pass instances that the `VkCommandBuffer` can be executed within. If `VkCommandBufferInheritanceInfo::renderPass` is not `VK_NULL_HANDLE`, or `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT` is not specified in `VkCommandBufferBeginInfo::flags`, parameters of this structure are ignored.

If `colorAttachmentCount` is 0 and the `variableMultisampleRate` feature is enabled, `rasterizationSamples` is ignored.

If `depthAttachmentFormat`, `stencilAttachmentFormat`, or any element of `pColorAttachmentFormats` is `VK_FORMAT_UNDEFINED`, it indicates that the corresponding attachment is unused within the render pass and writes to those attachments are discarded.

### Valid Usage

- **VUID-VkCommandBufferInheritanceRenderingInfo-colorAttachmentCount-06004**
  If `colorAttachmentCount` is not 0, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-variableMultisampleRate-06005**
  If the `variableMultisampleRate` feature is not enabled, `rasterizationSamples` **must** be a valid `VkSampleCountFlagBits` value.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06540**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a depth component.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06007**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-06492**
  If any element of `pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

- **VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06541**
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format that includes a stencil aspect.

- **VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-06199**
  If `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it **must** be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- **VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-06200**
  If `depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED` and `stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` **must** equal `stencilAttachmentFormat`.

- **VUID-VkCommandBufferInheritanceRenderingInfo-multiview-06008**
If the multiview feature is not enabled, viewMask must be 0.

- VUID-VkCommandBufferInheritanceRenderingInfo-viewMask-06009
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount.

## Valid Usage (Implicit)

- VUID-VkCommandBufferInheritanceRenderingInfo-sType-sType
  
  - sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_INHERITANCE_RENDERING_INFO.

- VUID-VkCommandBufferInheritanceRenderingInfo-flags-parameter
  
  - flags must be a valid combination of VkRenderingFlagBits values.

- VUID-VkCommandBufferInheritanceRenderingInfo-pColorAttachmentFormats-parameter
  
  - If colorAttachmentCount is not 0, pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values.

- VUID-VkCommandBufferInheritanceRenderingInfo-depthAttachmentFormat-parameter
  
  - depthAttachmentFormat must be a valid VkFormat value.

- VUID-VkCommandBufferInheritanceRenderingInfo-stencilAttachmentFormat-parameter
  
  - stencilAttachmentFormat must be a valid VkFormat value.

- VUID-VkCommandBufferInheritanceRenderingInfo-rasterizationSamples-parameter
  
  - If rasterizationSamples is not 0, rasterizationSamples must be a valid VkSampleCountFlagBits value.

Once recording starts, an application records a sequence of commands (vkCmd*) to set state in the command buffer, draw, dispatch, and other commands.

To complete recording of a command buffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkEndCommandBuffer(
    VkCommandBuffer commandBuffer);
```

- commandBuffer is the command buffer to complete recording.

The command buffer must have been in the recording state, and, if successful, is moved to the executable state.

If there was an error during recording, the application will be notified by an unsuccessful return code returned by vkEndCommandBuffer, and the command buffer will be moved to the invalid state.

In case the application recorded one or more video encode operations into the command buffer, implementations may return the VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.
Applications **should** not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

### Valid Usage

- VUID-vkEndCommandBuffer-commandBuffer-00059
  
  `commandBuffer` **must** be in the **recording state**

- VUID-vkEndCommandBuffer-commandBuffer-00060
  
  If `commandBuffer` is a primary command buffer, there **must** not be an active render pass instance

- VUID-vkEndCommandBuffer-commandBuffer-00061
  
  All queries made **active** during the recording of `commandBuffer` **must** have been made inactive

- VUID-vkEndCommandBuffer-None-06991
  
  There **must** be no video session object bound

### Valid Usage (Implicit)

- VUID-vkEndCommandBuffer-commandBuffer-parameter
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

When a command buffer is in the executable state, it **can** be submitted to a queue for execution.
6.5. Command Buffer Submission

**NOTE** Submission can be a high overhead operation, and applications **should** attempt to batch work together into as few calls to `vkQueueSubmit` or `vkQueueSubmit2` as possible.

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkQueueSubmit2(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
VkResult vkQueueSubmit2KHR(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo2* pSubmits,
    VkFence fence);
```

- `queue` is the queue that the command buffers will be submitted to.
- `submitCount` is the number of elements in the `pSubmits` array.
- `pSubmits` is a pointer to an array of `VkSubmitInfo2` structures, each specifying a command buffer submission batch.
- `fence` is an **optional** handle to a fence to be signaled once all submitted command buffers have completed execution. If `fence` is not `VK_NULL_HANDLE`, it defines a fence signal operation.

`vkQueueSubmit2` is a **queue submission command**, with each batch defined by an element of `pSubmits`.

Semaphore operations submitted with `vkQueueSubmit2` have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the **semaphore** section of **the synchronization chapter**.

If any command buffer submitted to this queue is in the **executable state**, it is moved to the **pending state**. Once execution of all submissions of a command buffer complete, it moves from the **pending state**, back to the **executable state**. If a command buffer was recorded with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` flag, it instead moves back to the **invalid state**.

If `vkQueueSubmit2` fails, it **may** return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation **must** ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit2` fails in such a way
that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.

**Valid Usage**

- **VUID-vkQueueSubmit2-fence-04894**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsignaled

- **VUID-vkQueueSubmit2-fence-04895**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueSubmit2-synchronization2-03866**
  The `synchronization2` feature must be enabled

- **VUID-vkQueueSubmit2-commandBuffer-03867**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` referenced a `VkEvent`, that event must not be referenced by a command that has been submitted to another queue and is still in the pending state

- **VUID-vkQueueSubmit2-semaphore-03868**
  The `semaphore` member of any binary semaphore element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit2-stageMask-03869**
  The `stageMask` member of any element of the `pSignalSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which queue belongs to

- **VUID-vkQueueSubmit2-stageMask-03870**
  The `stageMask` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` must only include pipeline stages that are supported by the queue family which queue belongs to

- **VUID-vkQueueSubmit2-semaphore-03871**
  When a semaphore wait operation for a binary semaphore is executed, as defined by the `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits`, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit2-semaphore-03873**
  The `semaphore` member of any element of the `pWaitSemaphoreInfos` member of any element of `pSubmits` that was created with a `VkSemaphoreTypeKHR` of `VK_SEMAPHORE_TYPE_BINARY_KHR` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

- **VUID-vkQueueSubmit2-commandBuffer-03874**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit2-commandBuffer-03875**
If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the `pending state`

- **VUID-vkQueueSubmit2-commandBuffer-03876**
  Any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit2-commandBuffer-03877**
  If any secondary command buffers recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state

- **VUID-vkQueueSubmit2-commandBuffer-03878**
  The `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` must have been allocated from a `VkCommandPool` that was created for the same queue family `queue` belongs to

- **VUID-vkQueueSubmit2-commandBuffer-03879**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` includes a Queue Family Ownership Transfer Acquire Operation, there must exist a previously submitted Queue Family Ownership Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens before the acquire operation

- **VUID-vkQueueSubmit2-commandBuffer-03880**
  If a command recorded into the `commandBuffer` member of any element of the `pCommandBufferInfos` member of any element of `pSubmits` was a `vkCmdBeginQuery` whose `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held continuously on the `VkDevice` that `queue` was retrieved from, throughout recording of those command buffers

- **VUID-vkQueueSubmit2-queue-06447**
  If `queue` was not created with `VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT`, the flags member of any element of `pSubmits` must not include `VK_SUBMIT_PROTECTED_BIT_KHR`

### Valid Usage (Implicit)

- **VUID-vkQueueSubmit2-queue-parameter**
  `queue` must be a valid `VkQueue` handle

- **VUID-vkQueueSubmit2-pSubmits-parameter**
  If `submitCount` is not 0, `pSubmits` must be a valid pointer to an array of `submitCount` valid `VkSubmitInfo2` structures

- **VUID-vkQueueSubmit2-fence-parameter**
  If `fence` is not `VK_NULL_HANDLE`, `fence` must be a valid `VkFence` handle
VUID-vkQueueSubmit2-commonparent

Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

### Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**
- Vk_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSubmitInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkSubmitFlags flags;
    uint32_t waitSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pWaitSemaphoreInfos;
    uint32_t commandBufferInfoCount;
    const VkCommandBufferSubmitInfo* pCommandBufferInfos;
    uint32_t signalSemaphoreInfoCount;
    const VkSemaphoreSubmitInfo* pSignalSemaphoreInfos;
} VkSubmitInfo2;
```

or the equivalent
typedef VkSubmitInfo2 VkSubmitInfo2KHR;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of *VkSubmitFlagBits*.

• **waitSemaphoreInfoCount** is the number of elements in *pWaitSemaphoreInfos*.

• **pWaitSemaphoreInfos** is a pointer to an array of *VkSemaphoreSubmitInfo* structures defining semaphore wait operations.

• **commandBufferInfoCount** is the number of elements in *pCommandBufferInfos* and the number of command buffers to execute in the batch.

• **pCommandBufferInfos** is a pointer to an array of *VkCommandBufferSubmitInfo* structures describing command buffers to execute in the batch.

• **signalSemaphoreInfoCount** is the number of elements in *pSignalSemaphoreInfos*.

• **pSignalSemaphoreInfos** is a pointer to an array of *VkSemaphoreSubmitInfo* describing semaphore signal operations.

---

**Valid Usage**

• **VUID-VkSubmitInfo2-semaphore-03881**
  If the same semaphore is used as the *semaphore* member of both an element of *pSignalSemaphoreInfos* and *pWaitSemaphoreInfos*, and that semaphore is a timeline semaphore, the *value* member of the *pSignalSemaphoreInfos* element **must** be greater than the *value* member of the *pWaitSemaphoreInfos* element

• **VUID-VkSubmitInfo2-semaphore-03882**
  If the *semaphore* member of any element of *pSignalSemaphoreInfos* is a timeline semaphore, the *value* member of that element **must** have a value greater than the current value of the semaphore when the semaphore signal operation is executed

• **VUID-VkSubmitInfo2-semaphore-03883**
  If the *semaphore* member of any element of *pSignalSemaphoreInfos* is a timeline semaphore, the *value* member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than *maxTimelineSemaphoreValueDifference*

• **VUID-VkSubmitInfo2-semaphore-03884**
  If the *semaphore* member of any element of *pWaitSemaphoreInfos* is a timeline semaphore, the *value* member of that element **must** have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on that semaphore by more than *maxTimelineSemaphoreValueDifference*

• **VUID-VkSubmitInfo2-flags-03886**
  If **flags** includes *VK_SUBMIT_PROTECTED_BIT*, all elements of *pCommandBuffers** must** be protected command buffers
If flags does not include VK_SUBMIT_PROTECTED_BIT, each element of pCommandBuffers must not be a protected command buffer.

If any commandBuffer member of an element of pCommandBufferInfos contains any resumed render pass instances, they must be suspended by a render pass instance earlier in submission order within pCommandBufferInfos.

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, they must be resumed by a render pass instance later in submission order within pCommandBufferInfos.

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and the render pass instance that resumes it.

If any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, there must be no render pass instances between that render pass instance and the render pass instance that resumes it.

If the variableSampleLocations limit is not supported, and any commandBuffer member of an element of pCommandBufferInfos contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_SUBMIT_INFO_2

Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFrameBoundaryEXT, VkPerformanceQuerySubmitInfoKHR, or VkWin32KeyedMutexAcquireReleaseInfoKHR

The sType value of each struct in the pNext chain must be unique

flags must be a valid combination of VkSubmitFlagBits values

If waitSemaphoreInfoCount is not 0, pWaitSemaphoreInfos must be a valid pointer to an array of waitSemaphoreInfoCount valid VkSemaphoreSubmitInfo structures

If commandBufferInfoCount is not 0, pCommandBufferInfos must be a valid pointer to an array
of `commandBufferInfoCount` valid `VkCommandBufferSubmitInfo` structures

- **VUID-VkSubmitInfo2-pSignalSemaphoreInfos-parameter**
  If `signalSemaphoreInfoCount` is not 0, `pSignalSemaphoreInfos` must be a valid pointer to an array of `signalSemaphoreInfoCount` valid `VkSemaphoreSubmitInfo` structures.

Bits which **can** be set in `VkSubmitInfo2::flags`, specifying submission behavior, are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkSubmitFlagBits {
    VK_SUBMIT_PROTECTED_BIT = 0x00000001,
    VK_SUBMIT_PROTECTED_BIT_KHR = VK_SUBMIT_PROTECTED_BIT,
} VkSubmitFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlagBits VkSubmitFlagBitsKHR;
```

- **VK_SUBMIT_PROTECTED_BIT** specifies that this batch is a protected submission.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags VkSubmitFlags;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkSubmitFlags VkSubmitFlagsKHR;
```

`VkSubmitFlags` is a bitmask type for setting a mask of zero or more `VkSubmitFlagBits`.

The `VkSemaphoreSubmitInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
    VkPipelineStageFlags2 stageMask;
    uint32_t deviceIndex;
} VkSemaphoreSubmitInfo;
```

or the equivalent
typedef VkSemaphoreSubmitInfo VkSemaphoreSubmitInfoKHR;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **semaphore** is a VkSemaphore affected by this operation.
• **value** is either the value used to signal **semaphore** or the value waited on by **semaphore**, if **semaphore** is a timeline semaphore. Otherwise it is ignored.
• **stageMask** is a VkPipelineStageFlags2 mask of pipeline stages which limit the first synchronization scope of a semaphore signal operation, or second synchronization scope of a semaphore wait operation as described in the semaphore wait operation and semaphore signal operation sections of the synchronization chapter.
• **deviceIndex** is the index of the device within a device group that executes the semaphore wait or signal operation.

Whether this structure defines a semaphore wait or signal operation is defined by how it is used.

## Valid Usage

- **VUID-VkSemaphoreSubmitInfo-stageMask-03929**
  If the geometryShader feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-03930**
  If the tessellationShader feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-03933**
  If the transformFeedback feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-VkSemaphoreSubmitInfo-stageMask-07317**
  If the attachmentFragmentShadingRate feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-VkSemaphoreSubmitInfo-stageMask-07947**
  If the rayTracingPipeline feature is not enabled, **stageMask** must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-VkSemaphoreSubmitInfo-device-03888**
  If the device that **semaphore** was created on is not a device group, **deviceIndex** must be 0

- **VUID-VkSemaphoreSubmitInfo-device-03889**
  If the device that **semaphore** was created on is a device group, **deviceIndex** must be a valid device index
Valid Usage (Implicit)

- VUID-VkSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_SUBMIT_INFO
- VUID-VkSemaphoreSubmitInfo-pNext-pNext
  pNext must be NULL
- VUID-VkSemaphoreSubmitInfo-semaphore-parameter
  semaphore must be a valid VkSemaphore handle
- VUID-VkSemaphoreSubmitInfo-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits2 values

The VkCommandBufferSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCommandBufferSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkCommandBuffer commandBuffer;
    uint32_t deviceMask;
} VkCommandBufferSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkCommandBufferSubmitInfo VkCommandBufferSubmitInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **commandBuffer** is a VkCommandBuffer to be submitted for execution.
- **deviceMask** is a bitmask indicating which devices in a device group execute the command buffer. A deviceMask of 0 is equivalent to setting all bits corresponding to valid devices in the group to 1.

Valid Usage

- VUID-VkCommandBufferSubmitInfo-commandBuffer-03890
  commandBuffer must not have been allocated with VK_COMMAND_BUFFER_LEVEL_SECONDARY
- VUID-VkCommandBufferSubmitInfo-deviceMask-03891
  If deviceMask is not 0, it must be a valid device mask
Valid Usage (Implicit)

- **VUID-VkCommandBufferSubmitInfo-sType-sType**
  
sType must be VK_STRUCTURE_TYPE_COMMAND_BUFFER_SUBMIT_INFO

- **VUID-VkCommandBufferSubmitInfo-pNext-pNext**
  
pNext must be NULL

- **VUID-VkCommandBufferSubmitInfo-commandBuffer-parameter**
  
  commandBuffer must be a valid VkCommandBuffer handle

To submit command buffers to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueSubmit(
    VkQueue queue,
    uint32_t submitCount,
    const VkSubmitInfo* pSubmits,
    VkFence fence);
```

- **queue** is the queue that the command buffers will be submitted to.
- **submitCount** is the number of elements in the **pSubmits** array.
- **pSubmits** is a pointer to an array of VkSubmitInfo structures, each specifying a command buffer submission batch.
- **fence** is an optional handle to a fence to be signaled once all submitted command buffers have completed execution. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueSubmit is a queue submission command, with each batch defined by an element of **pSubmits**. Batches begin execution in the order they appear in **pSubmits**, but may complete out of order.

Fence and semaphore operations submitted with **vkQueueSubmit** have additional ordering constraints compared to other submission commands, with dependencies involving previous and subsequent queue operations. Information about these additional constraints can be found in the semaphore and fence sections of the synchronization chapter.

Details on the interaction of **pWaitDstStageMask** with synchronization are described in the semaphore wait operation section of the synchronization chapter.

The order that batches appear in **pSubmits** is used to determine submission order, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these batches may overlap or otherwise execute out of order.

If any command buffer submitted to this queue is in the executable state, it is moved to the pending state. Once execution of all submissions of a command buffer complete, it moves from the pending state, back to the executable state. If a command buffer was recorded with the VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT flag, it instead moves to the invalid state.
If `vkQueueSubmit` fails, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced by the submitted command buffers and any semaphores referenced by `pSubmits` is unaffected by the call or its failure. If `vkQueueSubmit` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`. See Lost Device.

### Valid Usage

- **VUID-vkQueueSubmit-fence-00063**
  - If `fence` is not `VK_NULL_HANDLE`, `fence` must be unsignaled

- **VUID-vkQueueSubmit-fence-00064**
  - If `fence` is not `VK_NULL_HANDLE`, `fence` must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-vkQueueSubmit-pCommandBuffers-00065**
  - Any calls to `vkCmdSetEvent`, `vkCmdResetEvent` or `vkCmdWaitEvents` that have been recorded into any of the command buffer elements of the `pCommandBuffers` member of any element of `pSubmits`, must not reference any `VkEvent` that is referenced by any of those commands in a command buffer that has been submitted to another queue and is still in the *pending state*

- **VUID-vkQueueSubmit-pWaitDstStageMask-00066**
  - Any stage flag included in any element of the `pWaitDstStageMask` member of any element of `pSubmits` must be a pipeline stage supported by one of the capabilities of `queue`, as specified in the table of supported pipeline stages

- **VUID-vkQueueSubmit-pSignalSemaphores-00067**
  - Each binary semaphore element of the `pSignalSemaphores` member of any element of `pSubmits` must be unsignaled when the semaphore signal operation it defines is executed on the device

- **VUID-vkQueueSubmit-pWaitSemaphores-00068**
  - When a semaphore wait operation referring to a binary semaphore defined by any element of the `pWaitSemaphores` member of any element of `pSubmits` executes on `queue`, there must be no other queues waiting on the same semaphore

- **VUID-vkQueueSubmit-pWaitSemaphores-03238**
  - All elements of the `pWaitSemaphores` member of all elements of `pSubmits` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

- **VUID-vkQueueSubmit-pCommandBuffers-00070**
  - Each element of the `pCommandBuffers` member of each element of `pSubmits` must be in the pending or executable state

- **VUID-vkQueueSubmit-pCommandBuffers-00071**
  - If any element of the `pCommandBuffers` member of any element of `pSubmits` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`, it must not be in the pending state
• VUID-vkQueueSubmit-pCommandBuffers-00072
Any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits must be in the pending or executable state

• VUID-vkQueueSubmit-pCommandBuffers-00073
If any secondary command buffers recorded into any element of the pCommandBuffers member of any element of pSubmits was not recorded with the VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT, it must not be in the pending state

• VUID-vkQueueSubmit-pCommandBuffers-00074
Each element of the pCommandBuffers member of each element of pSubmits must have been allocated from a VkCommandPool that was created for the same queue family queue belongs to

• VUID-vkQueueSubmit-pSubmits-02207
If any element of pSubmits->pCommandBuffers includes a Queue Family Ownership Transfer Acquire Operation, there must exist a previously submitted Queue Family Ownership Transfer Release Operation on a queue in the queue family identified by the acquire operation, with parameters matching the acquire operation as defined in the definition of such acquire operations, and which happens-before the acquire operation

• VUID-vkQueueSubmit-pCommandBuffers-03220
If a command recorded into any element of pCommandBuffers was a vkCmdBeginQuery whose queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held continuously on the VkDevice that queue was retrieved from, throughout recording of those command buffers

• VUID-vkQueueSubmit-pSubmits-02808
Any resource created with VK_SHARING_MODE_EXCLUSIVE that is read by an operation specified by pSubmits must not be owned by any queue family other than the one which queue belongs to, at the time it is executed

• VUID-vkQueueSubmit-pSubmits-04626
Any resource created with VK_SHARING_MODE_CONCURRENT that is accessed by an operation specified by pSubmits must have included the queue family of queue at resource creation time

• VUID-vkQueueSubmit-queue-06448
If queue was not created with VK_DEVICE_QUEUE_CREATE_PROTECTED_BIT, there must be no element of pSubmits that includes a VkProtectedSubmitInfo structure in its pNext chain with protectedSubmit equal to VK_TRUE

Valid Usage (Implicit)

• VUID-vkQueueSubmit-queue-parameter
queue must be a valid VkQueue handle

• VUID-vkQueueSubmit-pSubmits-parameter
If submitCount is not 0, pSubmits must be a valid pointer to an array of submitCount valid VkSubmitInfo structures

• VUID-vkQueueSubmit-fence-parameter
If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueSubmit-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    const VkPipelineStageFlags* pWaitDstStageMask;
    uint32_t commandBufferCount;
    const VkCommandBuffer* pCommandBuffers;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkSubmitInfo;
```

- sType is a VkStructureType value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **waitSemaphoreCount** is the number of semaphores upon which to wait before executing the command buffers for the batch.

• **pWaitSemaphores** is a pointer to an array of **VkSemaphore** handles upon which to wait before the command buffers for this batch begin execution. If semaphores to wait on are provided, they define a **semaphore wait operation**.

• **pWaitDstStageMask** is a pointer to an array of pipeline stages at which each corresponding semaphore wait will occur.

• **commandBufferCount** is the number of command buffers to execute in the batch.

• **pCommandBuffers** is a pointer to an array of **VkCommandBuffer** handles to execute in the batch.

• **signalSemaphoreCount** is the number of semaphores to be signaled once the commands specified in **pCommandBuffers** have completed execution.

• **pSignalSemaphores** is a pointer to an array of **VkSemaphore** handles which will be signaled when the command buffers for this batch have completed execution. If semaphores to be signaled are provided, they define a **semaphore signal operation**.

The order that command buffers appear in **pCommandBuffers** is used to determine **submission order**, and thus all the implicit ordering guarantees that respect it. Other than these implicit ordering guarantees and any explicit synchronization primitives, these command buffers may overlap or otherwise execute out of order.

---

### Valid Usage

- **VUID-VkSubmitInfo-pWaitDstStageMask-04090**  
  If the **geometryShader** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04091**  
  If the **tessellationShader** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** or **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**

- **VUID-VkSubmitInfo-pWaitDstStageMask-04094**  
  If the **transformFeedback** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT**

- **VUID-VkSubmitInfo-pWaitDstStageMask-07319**  
  If the **attachmentFragmentShadingRate** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-VkSubmitInfo-pWaitDstStageMask-03937**  
  If the **synchronization2** feature is not enabled, **pWaitDstStageMask** must not be 0

- **VUID-VkSubmitInfo-pWaitDstStageMask-07950**  
  If the **rayTracingPipeline** feature is not enabled, **pWaitDstStageMask** must not contain **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR**

- **VUID-VkSubmitInfo-pCommandBuffers-00075**  
  Each element of **pCommandBuffers** must not have been allocated with
• VUID-VkSubmitInfo-pWaitDstStageMask-00078
  Each element of pWaitDstStageMask must not include VK_PIPELINE_STAGE_HOST_BIT

• VUID-VkSubmitInfo-pWaitSemaphores-03239
  If any element of pWaitSemaphores or pSignalSemaphores was created with a
  VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, then the pNext chain must include a
  VkTimelineSemaphoreSubmitInfo structure

• VUID-VkSubmitInfo-pNext-03240
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure
  and any element of pWaitSemaphores was created with a VkSemaphoreType of
  VK_SEMAPHORE_TYPE_TIMELINE, then its waitSemaphoreValueCount member must equal
  waitSemaphoreCount

• VUID-VkSubmitInfo-pNext-03241
  If the pNext chain of this structure includes a VkTimelineSemaphoreSubmitInfo structure
  and any element of pSignalSemaphores was created with a VkSemaphoreType of
  VK_SEMAPHORE_TYPE_TIMELINE, then its signalSemaphoreValueCount member must equal
  signalSemaphoreCount

• VUID-VkSubmitInfo-pSignalSemaphores-03242
  For each element of pSignalSemaphores created with a VkSemaphoreType of
  VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of
  VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value greater
  than the current value of the semaphore when the semaphore signal operation is
  executed

• VUID-VkSubmitInfo-pWaitSemaphores-03243
  For each element of pWaitSemaphores created with a VkSemaphoreType of
  VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of
  VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues must have a value which does
  not differ from the current value of the semaphore or the value of any outstanding
  semaphore wait or signal operation on that semaphore by more than
  maxTimelineSemaphoreValueDifference

• VUID-VkSubmitInfo-pSignalSemaphores-03244
  For each element of pSignalSemaphores created with a VkSemaphoreType of
  VK_SEMAPHORE_TYPE_TIMELINE the corresponding element of
  VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues must have a value which does
  not differ from the current value of the semaphore or the value of any outstanding
  semaphore wait or signal operation on that semaphore by more than
  maxTimelineSemaphoreValueDifference

• VUID-VkSubmitInfo-pNext-04120
  If the pNext chain of this structure does not include a VkProtectedSubmitInfo structure with
  protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be an
  unprotected command buffer

• VUID-VkSubmitInfo-pNext-04148
  If the pNext chain of this structure includes a VkProtectedSubmitInfo structure with
  protectedSubmit set to VK_TRUE, then each element of the pCommandBuffers array must be a
protected command buffer

- VUID-VkSubmitInfo-pCommandBuffers-06193
  If `pCommandBuffers` contains any resumed render pass instances, they **must** be suspended by a render pass instance earlier in submission order within `pCommandBuffers`

- VUID-VkSubmitInfo-pCommandBuffers-06014
  If `pCommandBuffers` contains any suspended render pass instances, they **must** be resumed by a render pass instance later in submission order within `pCommandBuffers`

- VUID-VkSubmitInfo-pCommandBuffers-06015
  If `pCommandBuffers` contains any suspended render pass instances, there **must** be no action or synchronization commands executed in a primary or secondary command buffer between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-pCommandBuffers-06016
  If `pCommandBuffers` contains any suspended render pass instances, there **must** be no render pass instances between that render pass instance and the render pass instance that resumes it

- VUID-VkSubmitInfo-variableSampleLocations-06017
  If the variableSampleLocations limit is not supported, and any element of `pCommandBuffers` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, **must** use the same sample locations

**Valid Usage (Implicit)**

- VUID-VkSubmitInfo-sType-sType
  The `sType` **must** be `VK_STRUCTURE_TYPE_SUBMIT_INFO`

- VUID-VkSubmitInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkD3D12FenceSubmitInfoKHR`, `VkDeviceGroupSubmitInfo`, `VkFrameBoundaryEXT`, `VkPerformanceQuerySubmitInfoKHR`, `VkProtectedSubmitInfo`, `VkTimelineSemaphoreSubmitInfo`, or `VkWin32KeyedMutexAcquireReleaseInfoKHR`

- VUID-VkSubmitInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain **must** be unique

- VUID-VkSubmitInfo-pWaitSemaphores-parameter
  If `waitSemaphoreCount` is not 0, `pWaitSemaphores` **must** be a valid pointer to an array of `waitSemaphoreCount` valid `VkSemaphore` handles

- VUID-VkSubmitInfo-pWaitDstStageMask-parameter
  If `waitSemaphoreCount` is not 0, `pWaitDstStageMask` **must** be a valid pointer to an array of `waitSemaphoreCount` valid combinations of `VkPipelineStageFlagBits` values

- VUID-VkSubmitInfo-pCommandBuffers-parameter
  If `commandBufferCount` is not 0, `pCommandBuffers` **must** be a valid pointer to an array of `commandBufferCount` valid `VkCommandBuffer` handles
If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles.

Each of the elements of pCommandBuffers, the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkSubmitInfo structure when using vkQueueSubmit or the VkBindSparseInfo structure when using vkQueueBindSparse. The VkTimelineSemaphoreSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkTimelineSemaphoreSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValueCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValueCount;
    const uint64_t* pSignalSemaphoreValues;
} VkTimelineSemaphoreSubmitInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkTimelineSemaphoreSubmitInfo VkTimelineSemaphoreSubmitInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- waitSemaphoreValueCount is the number of semaphore wait values specified in pWaitSemaphoreValues.
- pWaitSemaphoreValues is a pointer to an array of waitSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
- signalSemaphoreValueCount is the number of semaphore signal values specified in pSignalSemaphoreValues.
- pSignalSemaphoreValues is a pointer to an array signalSemaphoreValueCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively was not created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.
Valid Usage (Implicit)

- VUID-VkTimelineSemaphoreSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_TIMELINE_SEMAPHORE_SUBMIT_INFO

- VUID-VkTimelineSemaphoreSubmitInfo-pWaitSemaphoreValues-parameter
  If waitSemaphoreValueCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValueCount uint64_t values

- VUID-VkTimelineSemaphoreSubmitInfo-pSignalSemaphoreValues-parameter
  If signalSemaphoreValueCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValueCount uint64_t values

To specify the values to use when waiting for and signaling semaphores whose current payload refers to a Direct3D 12 fence, add a VkD3D12FenceSubmitInfoKHR structure to the pNext chain of the VkSubmitInfo structure. The VkD3D12FenceSubmitInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkD3D12FenceSubmitInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreValuesCount;
    const uint64_t* pWaitSemaphoreValues;
    uint32_t signalSemaphoreValuesCount;
    const uint64_t* pSignalSemaphoreValues;
} VkD3D12FenceSubmitInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- waitSemaphoreValuesCount is the number of semaphore wait values specified in pWaitSemaphoreValues.
- pWaitSemaphoreValues is a pointer to an array of waitSemaphoreValuesCount values for the corresponding semaphores in VkSubmitInfo::pWaitSemaphores to wait for.
- signalSemaphoreValuesCount is the number of semaphore signal values specified in pSignalSemaphoreValues.
- pSignalSemaphoreValues is a pointer to an array of signalSemaphoreValuesCount values for the corresponding semaphores in VkSubmitInfo::pSignalSemaphores to set when signaled.

If the semaphore in VkSubmitInfo::pWaitSemaphores or VkSubmitInfo::pSignalSemaphores corresponding to an entry in pWaitSemaphoreValues or pSignalSemaphoreValues respectively does not currently have a payload referring to a Direct3D 12 fence, the implementation must ignore the value in the pWaitSemaphoreValues or pSignalSemaphoreValues entry.

NOTE | As the introduction of the external semaphore handle type
VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY is preserved for backwards compatibility. However, applications should prefer importing such handle types into semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, and use the VkTimelineSemaphoreSubmitInfo structure instead of the VkD3D12FenceSubmitInfoKHR structure to specify the values to use when waiting for and signaling such semaphores.

Valid Usage

- VUID-VkD3D12FenceSubmitInfoKHR-waitSemaphoreValuesCount-00079
  waitSemaphoreValuesCount must be the same value as VkSubmitInfo::waitSemaphoreCount, where this structure is in the pNext chain of a VkSubmitInfo structure

- VUID-VkD3D12FenceSubmitInfoKHR-signalSemaphoreValuesCount-00080
  signalSemaphoreValuesCount must be the same value as VkSubmitInfo::signalSemaphoreCount, where this structure is in the pNext chain of a VkSubmitInfo structure

Valid Usage (Implicit)

- VUID-VkD3D12FenceSubmitInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_D3D12_FENCE_SUBMIT_INFO_KHR

- VUID-VkD3D12FenceSubmitInfoKHR-pWaitSemaphoreValues-parameter
  If waitSemaphoreValuesCount is not 0, and pWaitSemaphoreValues is not NULL, pWaitSemaphoreValues must be a valid pointer to an array of waitSemaphoreValuesCount uint64_t values

- VUID-VkD3D12FenceSubmitInfoKHR-pSignalSemaphoreValues-parameter
  If signalSemaphoreValuesCount is not 0, and pSignalSemaphoreValues is not NULL, pSignalSemaphoreValues must be a valid pointer to an array of signalSemaphoreValuesCount uint64_t values

When submitting work that operates on memory imported from a Direct3D 11 resource to a queue, the keyed mutex mechanism may be used in addition to Vulkan semaphores to synchronize the work. Keyed mutexes are a property of a properly created shareable Direct3D 11 resource. They can only be used if the imported resource was created with the D3D11_RESOURCE_MISC_SHARED_KEYEDMUTEX flag.

To acquire keyed mutexes before submitted work and/or release them after, add a VkWin32KeyedMutexAcquireReleaseInfoKHR structure to the pNext chain of the VkSubmitInfo structure.

The VkWin32KeyedMutexAcquireReleaseInfoKHR structure is defined as:
typedef struct VkWin32KeyedMutexAcquireReleaseInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t acquireCount;
    const VkDeviceMemory* pAcquireSyncs;
    const uint64_t* pAcquireKeys;
    const uint64_t* pAcquireTimeouts;
    uint32_t releaseCount;
    const VkDeviceMemory* pReleaseSyncs;
    const uint64_t* pReleaseKeys;
} VkWin32KeyedMutexAcquireReleaseInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **acquireCount** is the number of entries in the `pAcquireSyncs`, `pAcquireKeys`, and `pAcquireTimeouts` arrays.
• **pAcquireSyncs** is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
• **pAcquireKeys** is a pointer to an array of mutex key values to wait for prior to beginning the submitted work. Entries refer to the keyed mutex associated with the corresponding entries in `pAcquireSyncs`.
• **pAcquireTimeouts** is a pointer to an array of timeout values, in millisecond units, for each acquire specified in `pAcquireKeys`.
• **releaseCount** is the number of entries in the `pReleaseSyncs` and `pReleaseKeys` arrays.
• **pReleaseSyncs** is a pointer to an array of `VkDeviceMemory` objects which were imported from Direct3D 11 resources.
• **pReleaseKeys** is a pointer to an array of mutex key values to set when the submitted work has completed. Entries refer to the keyed mutex associated with the corresponding entries in `pReleaseSyncs`.

**Valid Usage**

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-pAcquireSyncs-00081
  Each member of `pAcquireSyncs` and `pReleaseSyncs` must be a device memory object imported by setting `VkImportMemoryWin32HandleInfoKHR::handleType` to `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`

**Valid Usage (Implicit)**

• VUID-VkWin32KeyedMutexAcquireReleaseInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_KEYED_MUTEX_ACQUIRE_RELEASE_INFO_KHR`
If the pNext chain of VkSubmitInfo includes a VkProtectedSubmitInfo structure, then the structure indicates whether the batch is protected. The VkProtectedSubmitInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkProtectedSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    VkBool32 protectedSubmit;
} VkProtectedSubmitInfo;
```

- `protectedSubmit` specifies whether the batch is protected. If `protectedSubmit` is `VK_TRUE`, the batch is protected. If `protectedSubmit` is `VK_FALSE`, the batch is unprotected. If the `VkSubmitInfo::pNext` chain does not include this structure, the batch is unprotected.

### Valid Usage (Implicit)

- VUID-VkProtectedSubmitInfo-sType-sType: `sType` must be `VK_STRUCTURE_TYPE_PROTECTED_SUBMIT_INFO`

If the `pNext` chain of VkSubmitInfo includes a VkDeviceGroupSubmitInfo structure, then that structure includes device indices and masks specifying which physical devices execute semaphore operations and command buffers.

The VkDeviceGroupSubmitInfo structure is defined as:
typedef struct VkDeviceGroupSubmitInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const uint32_t* pWaitSemaphoreDeviceIndices;
    uint32_t commandBufferCount;
    const uint32_t* pCommandBufferDeviceMasks;
    uint32_t signalSemaphoreCount;
    const uint32_t* pSignalSemaphoreDeviceIndices;
} VkDeviceGroupSubmitInfo;

or the equivalent

typedef VkDeviceGroupSubmitInfo VkDeviceGroupSubmitInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- waitSemaphoreCount is the number of elements in the pWaitSemaphoreDeviceIndices array.
- pWaitSemaphoreDeviceIndices is a pointer to an array of waitSemaphoreCount device indices indicating which physical device executes the semaphore wait operation in the corresponding element of VkSubmitInfo::pWaitSemaphores.
- commandBufferCount is the number of elements in the pCommandBufferDeviceMasks array.
- pCommandBufferDeviceMasks is a pointer to an array of commandBufferCount device masks indicating which physical devices execute the command buffer in the corresponding element of VkSubmitInfo::pCommandBuffers. A physical device executes the command buffer if the corresponding bit is set in the mask.
- signalSemaphoreCount is the number of elements in the pSignalSemaphoreDeviceIndices array.
- pSignalSemaphoreDeviceIndices is a pointer to an array of signalSemaphoreCount device indices indicating which physical device executes the semaphore signal operation in the corresponding element of VkSubmitInfo::pSignalSemaphores.

If this structure is not present, semaphore operations and command buffers execute on device index zero.

Valid Usage

- VUID-VkDeviceGroupSubmitInfo-waitSemaphoreCount-00082 waitSemaphoreCount must equal VkSubmitInfo::waitSemaphoreCount
- VUID-VkDeviceGroupSubmitInfo-commandBufferCount-00083 commandBufferCount must equal VkSubmitInfo::commandBufferCount
- VUID-VkDeviceGroupSubmitInfo-signalSemaphoreCount-00084
signalSemaphoreCount must equal VkSubmitInfo::signalSemaphoreCount

• VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-00085
  All elements of pWaitSemaphoreDeviceIndices and pSignalSemaphoreDeviceIndices must be valid device indices

• VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-00086
  All elements of pCommandBufferDeviceMasks must be valid device masks

Valid Usage (Implicit)

• VUID-VkDeviceGroupSubmitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_SUBMIT_INFO

• VUID-VkDeviceGroupSubmitInfo-pWaitSemaphoreDeviceIndices-parameter
  If waitSemaphoreCount is not 0, pWaitSemaphoreDeviceIndices must be a valid pointer to an array of waitSemaphoreCount uint32_t values

• VUID-VkDeviceGroupSubmitInfo-pCommandBufferDeviceMasks-parameter
  If commandBufferCount is not 0, pCommandBufferDeviceMasks must be a valid pointer to an array of commandBufferCount uint32_t values

• VUID-VkDeviceGroupSubmitInfo-pSignalSemaphoreDeviceIndices-parameter
  If signalSemaphoreCount is not 0, pSignalSemaphoreDeviceIndices must be a valid pointer to an array of signalSemaphoreCount uint32_t values

If the pNext chain of VkSubmitInfo includes a VkPerformanceQuerySubmitInfoKHR structure, then the structure indicates which counter pass is active for the batch in that submit.

The VkPerformanceQuerySubmitInfoKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPerformanceQuerySubmitInfoKHR {
  VkStructureType sType;
  const void* pNext;
  uint32_t counterPassIndex;
} VkPerformanceQuerySubmitInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• counterPassIndex specifies which counter pass index is active.

If the VkSubmitInfo::pNext chain does not include this structure, the batch defaults to use counter pass index 0.

Valid Usage

• VUID-VkPerformanceQuerySubmitInfoKHR-counterPassIndex-03221
The counterPassIndex must be less than the number of counter passes required by any queries within the batch. The required number of counter passes for a performance query is obtained by calling `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

Valid Usage (Implicit)

- VUID-VkPerformanceQuerySubmitInfoKHR-sType-sType

sType must be `VK_STRUCTURE_TYPE_PERFORMANCE_QUERY_SUBMIT_INFO_KHR`.

### 6.6. Queue Forward Progress

When using binary semaphores, the application must ensure that command buffer submissions will be able to complete without any subsequent operations by the application on any queue. After any call to `vkQueueSubmit` (or other queue operation), for every queued wait on a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` there must be a prior signal of that semaphore that will not be consumed by a different wait on the semaphore.

When using timeline semaphores, wait-before-signal behavior is well-defined and applications can submit work via `vkQueueSubmit` defining a timeline semaphore wait operation before submitting a corresponding semaphore signal operation. For each timeline semaphore wait operation defined by a call to `vkQueueSubmit`, the application must ensure that a corresponding semaphore signal operation is executed before forward progress can be made.

If a command buffer submission waits for any events to be signaled, the application must ensure that command buffer submissions will be able to complete without any subsequent operations by the application. Events signaled by the host must be signaled before the command buffer waits on those events.

**NOTE**

The ability for commands to wait on the host to set an events was originally added to allow low-latency updates to resources between host and device. However, to ensure quality of service, implementations would necessarily detect extended stalls in execution and timeout after a short period. As this period is not defined in the Vulkan specification, it is impossible to correctly validate any application with any wait period. Since the original users of this functionality were highly limited and platform-specific, this functionality is now considered defunct and should not be used.

### 6.7. Secondary Command Buffer Execution

Secondary command buffers must not be directly submitted to a queue. To record a secondary command buffer to execute as part of a primary command buffer, call:
void vkCmdExecuteCommands(
    VkCommandBuffer commandBuffer,
    uint32_t commandBufferCount,
    const VkCommandBuffer* pCommandBuffers);

- `commandBuffer` is a handle to a primary command buffer that the secondary command buffers are executed in.
- `commandBufferCount` is the length of the `pCommandBuffers` array.
- `pCommandBuffers` is a pointer to an array of `commandBufferCount` secondary command buffer handles, which are recorded to execute in the primary command buffer in the order they are listed in the array.

If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, and it was recorded into any other primary command buffer which is currently in the executable or recording state, that primary command buffer becomes invalid.

If the `nestedCommandBuffer` feature is enabled it is valid usage for `vkCmdExecuteCommands` to also be recorded to a secondary command buffer.

---

**Valid Usage**

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00088**
  Each element of `pCommandBuffers` **must** have been allocated with a level of `VK_COMMAND_BUFFER_LEVEL_SECONDARY`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00089**
  Each element of `pCommandBuffers` **must** be in the pending or executable state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00091**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not be in the pending state

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00092**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not have already been recorded to `commandBuffer`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00093**
  If any element of `pCommandBuffers` was not recorded with the `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT` flag, it **must** not appear more than once in `pCommandBuffers`

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00094**
  Each element of `pCommandBuffers` **must** have been allocated from a `VkCommandPool` that was created for the same queue family as the `VkCommandPool` from which `commandBuffer` was allocated

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00096**
If `vkCmdExecuteCommands` is being called within a render pass instance, each element of `pCommandBuffers` must have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00099**
  If `vkCmdExecuteCommands` is being called within a render pass instance, and any element of `pCommandBuffers` was recorded with `VkCommandBufferInheritanceInfo::framebuffer` not equal to `VK_NULL_HANDLE`, that `VkFramebuffer` must match the `VkFramebuffer` used in the current render pass instance.

- **VUID-vkCmdExecuteCommands-contents-09680**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, and `vkCmdNextSubpass` has not been called in the current render pass instance, the `contents` parameter of `vkCmdBeginRenderPass` must have been set to `VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS`, or `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT`.

- **VUID-vkCmdExecuteCommands-None-09681**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be compatible with the current render pass.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06019**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::subpass` set to the index of the subpass which the given command buffer will be executed in.

- **VUID-vkCmdExecuteCommands-pBeginInfo-06020**
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRenderPass`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be compatible with the current render pass.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00100**
  If `vkCmdExecuteCommands` is not being called within a render pass instance, each element of `pCommandBuffers` must not have been recorded with the `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00101**
  If the `inheritedQueries` feature is not enabled, `commandBuffer` must not have any queries active.

- **VUID-vkCmdExecuteCommands-commandBuffer-00102**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00103**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00104**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00105**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00106**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.

- **VUID-vkCmdExecuteCommands-commandBuffer-00107**
  If `commandBuffer` has a `VK_QUERY_TYPE_OCCLUSION` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo::occlusionQueryEnable` set to `VK_TRUE`.
::queryFlags having all bits set that are set for the query

- **VUID-vkCmdExecuteCommands-commandBuffer-00104**
  If `commandBuffer` has a `VK_QUERY_TYPE_PIPELINE_STATISTICS` query active, then each element of `pCommandBuffers` must have been recorded with `VkCommandBufferInheritanceInfo ::pipelineStatistics` having all bits set that are set in the `VkQueryPool` the query uses.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-00105**
  Each element of `pCommandBuffers` must not begin any query types that are active in `commandBuffer`.

- **VUID-vkCmdExecuteCommands-commandBuffer-07594**
  `commandBuffer` must not have any queries other than `VK_QUERY_TYPE_OCCLUSION` and `VK_QUERY_TYPE_PIPELINE_STATISTICS` active.

- **VUID-vkCmdExecuteCommands-commandBuffer-01820**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be a protected command buffer.

- **VUID-vkCmdExecuteCommands-commandBuffer-01821**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, each element of `pCommandBuffers` must be an unprotected command buffer.

- **VUID-vkCmdExecuteCommands-None-02286**
  This command must not be recorded when transform feedback is active.

- **VUID-vkCmdExecuteCommands-commandBuffer-06533**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` must not read from the memory backing that image subresource in any other way.

- **VUID-vkCmdExecuteCommands-commandBuffer-06534**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in `commandBuffer` in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` must not write to that image subresource as an attachment.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06535**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will write to an image subresource as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not read from the memory backing that image subresource in any other way.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06536**
  If `vkCmdExecuteCommands` is being called within a render pass instance and any recorded command in a given element of `pCommandBuffers` will read from an image subresource used as an attachment in any way other than as an attachment, commands recorded in elements of `pCommandBuffers` at a higher index must not write to that image subresource as an attachment.

- **VUID-vkCmdExecuteCommands-pCommandBuffers-06021**
  If `pCommandBuffers` contains any suspended render pass instances, there must be no action or synchronization commands between that render pass instance and any render pass.
instance that resumes it

- VUID-vkCmdExecuteCommands-pCommandBuffers-06022
  If `pCommandBuffers` contains any suspended render pass instances, there must be no render pass instances between that render pass instance and any render pass instance that resumes it.

- VUID-vkCmdExecuteCommands-variableSampleLocations-06023
  If the variableSampleLocations limit is not supported, and any element of `pCommandBuffers` contains any suspended render pass instances, where a graphics pipeline has been bound, any pipelines bound in the render pass instance that resumes it, or any subsequent render pass instances that resume from that one and so on, must use the same sample locations.

- VUID-vkCmdExecuteCommands-flags-06024
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, its `VkRenderingInfo::flags` parameter must have included `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

- VUID-vkCmdExecuteCommands-pBeginInfo-06025
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the render passes specified in the `pBeginInfo->pInheritanceInfo->renderPass` members of the `vkBeginCommandBuffer` commands used to begin recording each element of `pCommandBuffers` must be `VK_NULL_HANDLE`.

- VUID-vkCmdExecuteCommands-flags-06026
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `flags` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::flags` parameter to `vkCmdBeginRendering`, excluding `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`.

- VUID-vkCmdExecuteCommands-colorAttachmentCount-06027
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, the `colorAttachmentCount` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the `VkRenderingInfo::colorAttachmentCount` parameter to `vkCmdBeginRendering`.

- VUID-vkCmdExecuteCommands-imageView-06028
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo::pColorAttachments` parameter to `vkCmdBeginRendering` is not `VK_NULL_HANDLE`, the corresponding element of the `pColorAttachmentFormats` member of the `VkCommandBufferInheritanceRenderingInfo` structure included in the `pNext` chain of `VkCommandBufferBeginInfo::pInheritanceInfo` used to begin recording each element of `pCommandBuffers` must be equal to the format used to create that image view.

- VUID-vkCmdExecuteCommands-imageView-07606
  If `vkCmdExecuteCommands` is being called within a render pass instance begun with `vkCmdBeginRendering`, if the `imageView` member of an element of the `VkRenderingInfo`
::pColorAttachments parameter to vkCmdBeginRendering is VK_NULL_HANDLE, the corresponding element of the pColorAttachmentFormats member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06029**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the depthAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the format used to create that image view

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06030**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, if the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering is not VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the format used to create that image view

- **VUID-vkCmdExecuteCommands-pDepthAttachment-06774**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the VkRenderingInfo::pDepthAttachment->imageView parameter to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the depthAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteCommands-pStencilAttachment-06775**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering and the VkRenderingInfo::pStencilAttachment->imageView parameter to vkCmdBeginRendering was VK_NULL_HANDLE, the value of the stencilAttachmentFormat member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteCommands-viewMask-06031**
  If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the viewMask member of the VkCommandBufferInheritanceRenderingInfo structure included in the pNext chain of VkCommandBufferBeginInfo::pInheritanceInfo used to begin recording each element of pCommandBuffers must be equal to the VkRenderingInfo::viewMask parameter to vkCmdBeginRendering

- **VUID-vkCmdExecuteCommands-commandBuffer-09375**
  commandBuffer must not be a secondary command buffer unless the nestedCommandBuffer feature is enabled
• VUID-vkCmdExecuteCommands-nestedCommandBuffer-09376
If the nestedCommandBuffer feature is enabled, the command buffer nesting level of each element of pCommandBuffers must be less than maxCommandBufferNestingLevel.

• VUID-vkCmdExecuteCommands-nestedCommandBufferRendering-09377
If the nestedCommandBufferRendering feature is not enabled, and commandBuffer is a secondary command buffer, commandBuffer must not have been recorded with VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT.

• VUID-vkCmdExecuteCommands-nestedCommandBufferSimultaneousUse-09378
If the nestedCommandBufferSimultaneousUse feature is not enabled, and commandBuffer is a secondary command buffer, each element of pCommandBuffers must not have been recorded with VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT.

• VUID-vkCmdExecuteCommands-pCommandBuffers-09504
If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the color attachment mapping state specified by VkRenderingAttachmentLocationInfoKHR in the inheritance info of each element of pCommandBuffers and in the current state of commandBuffer must match.

• VUID-vkCmdExecuteCommands-pCommandBuffers-09505
If vkCmdExecuteCommands is being called within a render pass instance begun with vkCmdBeginRendering, the input attachment mapping state specified by VkRenderingInputAttachmentIndexInfoKHR in the inheritance info of each element of pCommandBuffers and in the current state of commandBuffer must match.

Valid Usage (Implicit)

• VUID-vkCmdExecuteCommands-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle.

• VUID-vkCmdExecuteCommands-pCommandBuffers-parameter
pCommandBuffers must be a valid pointer to an array of commandBufferCount valid VkCommandBuffer handles.

• VUID-vkCmdExecuteCommands-commandBuffer-recording
commandBuffer must be in the recording state.

• VUID-vkCmdExecuteCommands-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations.

• VUID-vkCmdExecuteCommands-videocoding
This command must only be called outside of a video coding scope.

• VUID-vkCmdExecuteCommands-commandBufferCount-arraylength
commandBufferCount must be greater than 0.

• VUID-vkCmdExecuteCommands-commonparent
Both of commandBuffer, and the elements of pCommandBuffers must have been created, allocated, or retrieved from the same VkDevice.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

6.8. Nested Command Buffers

In addition to secondary command buffer execution from primary command buffers, an implementation may support nested command buffers, which enable secondary command buffers to be executed from other secondary command buffers. If the `nestedCommandBuffer` feature is enabled, the implementation supports nested command buffers. Nested command buffer execution works the same as primary-to-secondary execution, except that it is subject to some additional implementation-defined limits.

Each secondary command buffer has a command buffer nesting level, which is determined at `vkEndCommandBuffer` time and evaluated at `vkCmdExecuteCommands` time. A secondary command buffer that executes no other secondary command buffers has a command buffer nesting level of zero. Otherwise, the command buffer nesting level of a secondary command buffer is equal to the maximum nesting level of all secondary command buffers executed by that command buffer plus one. Some implementations may have a limit on the maximum nesting level of secondary command buffers that can be recorded. This limit is advertised in `maxCommandBufferNestingLevel`.

If the `nestedCommandBufferRendering` feature is enabled, the implementation supports calling `vkCmdExecuteCommands` inside secondary command buffers recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`. If the `nestedCommandBufferSimultaneousUse` feature is enabled, the implementation supports calling `vkCmdExecuteCommands` with secondary command buffers recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`.

Whenever `vkCmdExecuteCommands` is recorded inside a secondary command buffer recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`, each member of `pCommandBuffers` must have been recorded with a `VkCommandBufferBeginInfo` with `VkCommandBufferInheritanceInfo` compatible with the `VkCommandBufferInheritanceInfo` of the command buffer into which the `vkCmdExecuteCommands` call is being recorded. The `VkCommandBufferInheritanceRenderingInfo` structures are compatible when the `VkCommandBufferInheritanceRenderingInfo::renderpass` are
compatible, or if they are VK_NULL_HANDLE then the members match, and all other members of VkCommandBufferInheritanceRenderingInfo match. This requirement applies recursively, down to the most nested command buffer and up to the command buffer where the render pass was originally begun.

6.9. Command Buffer Device Mask

Each command buffer has a piece of state storing the current device mask of the command buffer. This mask controls which physical devices within the logical device all subsequent commands will execute on, including state-setting commands, action commands, and synchronization commands.

Scissor and viewport state (excluding the count of each) can be set to different values on each physical device (only when set as dynamic state), and each physical device will render using its local copy of the state. Other state is shared between physical devices, such that all physical devices use the most recently set values for the state. However, when recording an action command that uses a piece of state, the most recent command that set that state must have included all physical devices that execute the action command in its current device mask.

The command buffer's device mask is orthogonal to the pCommandBufferDeviceMasks member of VkDeviceGroupSubmitInfo. Commands only execute on a physical device if the device index is set in both device masks.

If the pNext chain of VkCommandBufferBeginInfo includes a VkDeviceGroupCommandBufferBeginInfo structure, then that structure includes an initial device mask for the command buffer.

The VkDeviceGroupCommandBufferBeginInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupCommandBufferBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
} VkDeviceGroupCommandBufferBeginInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupCommandBufferBeginInfo VkDeviceGroupCommandBufferBeginInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `deviceMask` is the initial value of the command buffer's device mask.

The initial device mask also acts as an upper bound on the set of devices that can ever be in the device mask in the command buffer.
If this structure is not present, the initial value of a command buffer’s device mask is set to include all physical devices in the logical device when the command buffer begins recording.

**Valid Usage**

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00106
  
  `deviceMask` must be a valid device mask value

- VUID-VkDeviceGroupCommandBufferBeginInfo-deviceMask-00107
  
  `deviceMask` must not be zero

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupCommandBufferBeginInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_COMMAND_BUFFER_BEGIN_INFO`

To update the current device mask of a command buffer, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdSetDeviceMask(
    VkCommandBuffer commandBuffer,  
    uint32_t deviceMask);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdSetDeviceMaskKHR(
    VkCommandBuffer commandBuffer,  
    uint32_t deviceMask);
```

- `commandBuffer` is command buffer whose current device mask is modified.
- `deviceMask` is the new value of the current device mask.

`deviceMask` is used to filter out subsequent commands from executing on all physical devices whose bit indices are not set in the mask, except commands beginning a render pass instance, commands transitioning to the next subpass in the render pass instance, and commands ending a render pass instance, which always execute on the set of physical devices whose bit indices are included in the `deviceMask` member of the `VkDeviceGroupRenderPassBeginInfo` structure passed to the command beginning the corresponding render pass instance.

**Valid Usage**

- VUID-vkCmdSetDeviceMask-deviceMask-00108
  
  `deviceMask` must be a valid device mask value
• VUID-vkCmdSetDeviceMask-deviceMask-00109
deviceMask must not be zero

• VUID-vkCmdSetDeviceMask-deviceMask-00110
deviceMask must not include any set bits that were not in the
VkDeviceGroupCommandBufferBeginInfo::deviceMask value when the command buffer began recording

• VUID-vkCmdSetDeviceMask-deviceMask-00111
If vkCmdSetDeviceMask is called inside a render pass instance, deviceMask must not include any set bits that were not in the VkDeviceGroupRenderPassBeginInfo::deviceMask value when the render pass instance began recording

Valid Usage (Implicit)

• VUID-vkCmdSetDeviceMask-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetDeviceMask-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdSetDeviceMask-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 7. Synchronization and Cache Control

Synchronization of access to resources is primarily the responsibility of the application in Vulkan. The order of execution of commands with respect to the host and other commands on the device has few implicit guarantees, and needs to be explicitly specified. Memory caches and other optimizations are also explicitly managed, requiring that the flow of data through the system is largely under application control.

 Whilst some implicit guarantees exist between commands, five explicit synchronization mechanisms are exposed by Vulkan:

**Fences**

Fences can be used to communicate to the host that execution of some task on the device has completed, controlling resource access between host and device.

**Semaphores**

Semaphores can be used to control resource access across multiple queues.

**Events**

Events provide a fine-grained synchronization primitive which can be signaled either within a command buffer or by the host, and can be waited upon within a command buffer or queried on the host. Events can be used to control resource access within a single queue.

**Pipeline Barriers**

Pipeline barriers also provide synchronization control within a command buffer, but at a single point, rather than with separate signal and wait operations. Pipeline barriers can be used to control resource access within a single queue.

**Render Pass Objects**

Render pass objects provide a synchronization framework for rendering tasks, built upon the concepts in this chapter. Many cases that would otherwise need an application to use other synchronization primitives can be expressed more efficiently as part of a render pass. Render pass objects can be used to control resource access within a single queue.

### 7.1. Execution and Memory Dependencies

An operation is an arbitrary amount of work to be executed on the host, a device, or an external entity such as a presentation engine. Synchronization commands introduce explicit execution dependencies, and memory dependencies between two sets of operations defined by the command’s two synchronization scopes.

The synchronization scopes define which other operations a synchronization command is able to create execution dependencies with. Any type of operation that is not in a synchronization command’s synchronization scopes will not be included in the resulting dependency. For example, for many synchronization commands, the synchronization scopes can be limited to just operations executing in specific pipeline stages, which allows other pipeline stages to be excluded from a
dependency. Other scoping options are possible, depending on the particular command.

An **execution dependency** is a guarantee that for two sets of operations, the first set must happen-before the second set. If an operation happens-before another operation, then the first operation must complete before the second operation is initiated. More precisely:

- Let $\text{Ops}_1$ and $\text{Ops}_2$ be separate sets of operations.
- Let $\text{Sync}$ be a synchronization command.
- Let $\text{Scope}_{\text{1st}}$ and $\text{Scope}_{\text{2nd}}$ be the synchronization scopes of $\text{Sync}$.
- Let $\text{ScopedOps}_1$ be the intersection of sets $\text{Ops}_1$ and $\text{Scope}_{\text{1st}}$.
- Let $\text{ScopedOps}_2$ be the intersection of sets $\text{Ops}_2$ and $\text{Scope}_{\text{2nd}}$.
- Submitting $\text{Ops}_1$, $\text{Sync}$ and $\text{Ops}_2$ for execution, in that order, will result in execution dependency $\text{ExeDep}$ between $\text{ScopedOps}_1$ and $\text{ScopedOps}_2$.
- Execution dependency $\text{ExeDep}$ guarantees that $\text{ScopedOps}_1$ happen-before $\text{ScopedOps}_2$.

An **execution dependency chain** is a sequence of execution dependencies that form a happens-before relation between the first dependency's $\text{ScopedOps}_1$ and the final dependency's $\text{ScopedOps}_2$. For each consecutive pair of execution dependencies, a chain exists if the intersection of $\text{Scope}_{\text{2nd}}$ in the first dependency and $\text{Scope}_{\text{1st}}$ in the second dependency is not an empty set. The formation of a single execution dependency from an execution dependency chain can be described by substituting the following in the description of execution dependencies:

- Let $\text{Sync}$ be a set of synchronization commands that generate an execution dependency chain.
- Let $\text{Scope}_{\text{1st}}$ be the first synchronization scope of the first command in $\text{Sync}$.
- Let $\text{Scope}_{\text{2nd}}$ be the second synchronization scope of the last command in $\text{Sync}$.

Execution dependencies alone are not sufficient to guarantee that values resulting from writes in one set of operations can be read from another set of operations.

Three additional types of operations are used to control memory access. **Availability operations** cause the values generated by specified memory write accesses to become available to a memory domain for future access. Any available value remains available until a subsequent write to the same memory location occurs (whether it is made available or not) or the memory is freed. **Memory domain operations** cause writes that are available to a source memory domain to become available to a destination memory domain (an example of this is making writes available to the host domain available to the device domain). **Visibility operations** cause values available to a memory domain to become visible to specified memory accesses.

Availability, visibility, memory domains, and memory domain operations are formally defined in the **Availability and Visibility** section of the **Memory Model** chapter. Which API operations perform each of these operations is defined in **Availability, Visibility, and Domain Operations**.

A **memory dependency** is an execution dependency which includes availability and visibility operations such that:

- The first set of operations happens-before the availability operation.
• The availability operation happens-before the visibility operation.
• The visibility operation happens-before the second set of operations.

Once written values are made visible to a particular type of memory access, they can be read or written by that type of memory access. Most synchronization commands in Vulkan define a memory dependency.

The specific memory accesses that are made available and visible are defined by the *access scopes* of a memory dependency. Any type of access that is in a memory dependency’s first access scope and occurs in `ScopedOps_1` is made available. Any type of access that is in a memory dependency’s second access scope and occurs in `ScopedOps_2` has any available writes made visible to it. Any type of operation that is not in a synchronization command’s access scopes will not be included in the resulting dependency.

A memory dependency enforces availability and visibility of memory accesses and execution order between two sets of operations. Adding to the description of execution dependency chains:

• Let `MemOps_1` be the set of memory accesses performed by `ScopedOps_1`.
• Let `MemOps_2` be the set of memory accesses performed by `ScopedOps_2`.
• Let `AccessScope_{1st}` be the first access scope of the first command in the `Sync` chain.
• Let `AccessScope_{2nd}` be the second access scope of the last command in the `Sync` chain.
• Let `ScopedMemOps_1` be the intersection of sets `MemOps_1` and `AccessScope_{1st}`.
• Let `ScopedMemOps_2` be the intersection of sets `MemOps_2` and `AccessScope_{2nd}`.
• Submitting `Ops_1`, `Sync`, and `Ops_2` for execution, in that order, will result in a memory dependency `MemDep` between `ScopedOps_1` and `ScopedOps_2`.

Memory dependency `MemDep` guarantees that:

- Memory writes in `ScopedMemOps_1` are made available.
- Available memory writes, including those from `ScopedMemOps_1`, are made visible to `ScopedMemOps_2`.

**NOTE**

Execution and memory dependencies are used to solve data hazards, i.e. to ensure that read and write operations occur in a well-defined order. Write-after-read hazards can be solved with just an execution dependency, but read-after-write and write-after-write hazards need appropriate memory dependencies to be included between them. If an application does not include dependencies to solve these hazards, the results and execution orders of memory accesses are undefined.

### 7.1.1. Image Layout Transitions

Image subresources **can** be transitioned from one layout to another as part of a memory dependency (e.g. by using an image memory barrier). When a layout transition is specified in a memory dependency, it happens-after the availability operations in the memory dependency, and happens-before the visibility operations. Image layout transitions **may** perform read and write accesses on all memory bound to the image subresource range, so applications **must** ensure that all memory writes have been made available before a layout transition is executed. Available memory
is automatically made visible to a layout transition, and writes performed by a layout transition are automatically made available.

Layout transitions always apply to a particular image subresource range, and specify both an old layout and new layout. The old layout must either be VK_IMAGE_LAYOUT_UNDEFINED, or match the current layout of the image subresource range. If the old layout matches the current layout of the image subresource range, the transition preserves the contents of that range. If the old layout is VK_IMAGE_LAYOUT_UNDEFINED, the contents of that range may be discarded.

NOTE

Image layout transitions with VK_IMAGE_LAYOUT_UNDEFINED allow the implementation to discard the image subresource range, which can provide performance or power benefits. Tile-based architectures may be able to avoid flushing tile data to memory, and immediate style renderers may be able to achieve fast metadata clears to reinitialize frame buffer compression state, or similar.

If the contents of an attachment are not needed after a render pass completes, then applications should use VK_ATTACHMENT_STORE_OP_DONT_CARE.

As image layout transitions may perform read and write accesses on the memory bound to the image, if the image subresource affected by the layout transition is bound to peer memory for any device in the current device mask then the memory heap the bound memory comes from must support the VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT and VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT capabilities as returned by vkGetDeviceGroupPeerMemoryFeatures.

NOTE

Applications must ensure that layout transitions happen-after all operations accessing the image with the old layout, and happen-before any operations that will access the image with the new layout. Layout transitions are potentially read/write operations, so not defining appropriate memory dependencies to guarantee this will result in a data race.

Image layout transitions interact with memory aliasing.

Layout transitions that are performed via image memory barriers execute in their entirety in submission order, relative to other image layout transitions submitted to the same queue, including those performed by render passes. In effect there is an implicit execution dependency from each such layout transition to all layout transitions previously submitted to the same queue.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus when the image member of an image memory barrier is an image created with this flag the application can chain a VkSampleLocationsInfoEXT structure to the pNext chain of VkImageMemoryBarrier2 or VkImageMemoryBarrier to specify the sample locations to use during any image layout transition.

If the VkSampleLocationsInfoEXT structure does not match the sample location state last used to render to the image subresource range specified by subresourceRange, or if no VkSampleLocationsInfoEXT structure is present, then the contents of the given image subresource range becomes undefined as if oldLayout would equal VK_IMAGE_LAYOUT_UNDEFINED.
7.1.2. Pipeline Stages

The work performed by an action command consists of multiple operations, which are performed as a sequence of logically independent steps known as pipeline stages. The exact pipeline stages executed depend on the particular command that is used, and current command buffer state when the command was recorded.

**NOTE** Operations performed by synchronization commands (e.g. availability and visibility operations) are not executed by a defined pipeline stage. However other commands can still synchronize with them by using the synchronization scopes to create a dependency chain.

Execution of operations across pipeline stages must adhere to implicit ordering guarantees, particularly including pipeline stage order. Otherwise, execution across pipeline stages may overlap or execute out of order with regards to other stages, unless otherwise enforced by an execution dependency.

Several of the synchronization commands include pipeline stage parameters, restricting the synchronization scopes for that command to just those stages. This allows fine grained control over the exact execution dependencies and accesses performed by action commands. Implementations should use these pipeline stages to avoid unnecessary stalls or cache flushing.

Bits which can be set in a VkPipelineStageFlags2 mask, specifying stages of execution, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkPipelineStageFlagBits2
typedef VkFlags64 VkPipelineStageFlagBits2;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_NONE_KHR = 0ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_TOP_OF_PIPE_BIT_KHR = 0x00000001ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT_KHR = 0x00000002ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT = 0x00000004ULL;
static const VkPipelineStageFlagBits2 VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT_KHR = 0x00000004ULL;

• **VK_PIPELINE_STAGE_2_NONE** specifies no stages of execution.

• **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where indirect command parameters are consumed.

• **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT** specifies the stage of the pipeline where index buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT** specifies the stage of the pipeline where vertex buffers are consumed.

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT**

• **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT** specifies the vertex shader stage.
• **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.

• **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.

• **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.

• **VK_PIPELINE_STAGE_2_PRE_RASTERIZATION_SHADERS_BIT** is equivalent to specifying all supported pre-rasterization shader stages:
  ◦ **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  ◦ **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.

• **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.

• **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline where final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and vkCmdClearAttachments.

• **VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT** specifies the compute shader stage.

• **VK_PIPELINE_STAGE_2_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.

• **VK_PIPELINE_STAGE_2_COPY_BIT** specifies the execution of all copy commands, including vkCmdCopyQueryPoolResults.

• **VK_PIPELINE_STAGE_2_BLIT_BIT** specifies the execution of vkCmdBlitImage.

• **VK_PIPELINE_STAGE_2_RESOLVE_BIT** specifies the execution of vkCmdResolveImage.

• **VK_PIPELINE_STAGE_2_CLEAR_BIT** specifies the execution of clear commands, with the exception of vkCmdClearAttachments.

• **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** is equivalent to specifying all of:
  ◦ **VK_PIPELINE_STAGE_2_COPY_BIT**
  ◦ **VK_PIPELINE_STAGE_2_BLIT_BIT**
  ◦ **VK_PIPELINE_STAGE_2_RESOLVE_BIT**
  ◦ **VK_PIPELINE_STAGE_2_CLEAR_BIT**
  ◦ **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR**
• **VK_PIPELINE_STAGE_2RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages.

• **VK_PIPELINE_STAGE_2ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of acceleration structure commands or acceleration structure copy commands.

• **VK_PIPELINE_STAGE_2ACCELERATION_STRUCTURE_COPY_BIT_KHR** specifies the execution of acceleration structure copy commands.

• **VK_PIPELINE_STAGE_2ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_2DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT**
  - **VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT**
  - **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT**
  - **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

• **VK_PIPELINE_STAGE_2ALL_COMMANDS_BIT** specifies all operations performed by all commands supported on the queue it is used with.

• **VK_PIPELINE_STAGE_2TRANSFORM_FEEDBACK_BIT_EXT** specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

• **VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.

• **VK_PIPELINE_STAGE_2VIDEO_DECODE_BIT_KHR** specifies the execution of video decode operations.

• **VK_PIPELINE_STAGE_2VIDEO_ENCODE_BIT_KHR** specifies the execution of video encode operations.

• **VK_PIPELINE_STAGE_2MICROMAP_BUILD_BIT_EXT** specifies the execution of micromap commands.

• **VK_PIPELINE_STAGE_2TOP_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the second synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2NONE** in the first scope.

• **VK_PIPELINE_STAGE_2BOTTOM_OF_PIPE_BIT** is equivalent to **VK_PIPELINE_STAGE_2ALL_COMMANDS_BIT** with VkAccessFlags2 set to 0 when specified in the first synchronization scope, but equivalent to **VK_PIPELINE_STAGE_2NONE** in the second scope.

**NOTE** The **TOP** and **BOTTOM** pipeline stages are deprecated, and applications should prefer **VK_PIPELINE_STAGE_2ALL_COMMANDS_BIT** and **VK_PIPELINE_STAGE_2NONE**.
NOTE: The \texttt{VkPipelineStageFlags2} bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how \texttt{VkPipelineStageFlagBits} is defined. The first 31 values are common to both, and are interchangeable.

\texttt{VkPipelineStageFlags2} is a bitmask type for setting a mask of zero or more \texttt{VkPipelineStageFlagBits2} flags:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkPipelineStageFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPipelineStageFlags2 VkPipelineStageFlags2KHR;
```

Bits which can be set in a \texttt{VkPipelineStageFlags} mask, specifying stages of execution, are:
typedef enum VkPipelineStageFlagBits {
    VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT = 0x00000001,
    VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT = 0x00000002,
    VK_PIPELINE_STAGE_VERTEX_INPUT_BIT = 0x00000004,
    VK_PIPELINE_STAGE_VERTEX_SHADER_BIT = 0x00000008,
    VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT = 0x00000010,
    VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT = 0x00000020,
    VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT = 0x00000040,
    VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT = 0x00000080,
    VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT = 0x00000100,
    VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT = 0x00000200,
    VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT = 0x00000400,
    VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT = 0x00000800,
    VK_PIPELINE_STAGE_TRANSFER_BIT = 0x00001000,
    VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT = 0x00002000,
    VK_PIPELINE_STAGE_HOST_BIT = 0x00004000,
    VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT = 0x00008000,
    VK_PIPELINE_STAGE_ALL_COMMANDS_BIT = 0x00010000,
} VkPipelineStageFlagBits;

These values all have the same meaning as the equivalently named values for VkPipelineStageFlags2.

- **VK_PIPELINE_STAGE_NONE** specifies no stages of execution.
- **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT** specifies the stage of the pipeline where VkDrawIndirect*/ VkDispatchIndirect*/ VkTraceRaysIndirect* data structures are consumed.
- **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** specifies the stage of the pipeline where vertex and index buffers are consumed.
- **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT** specifies the vertex shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT** specifies the tessellation control shader stage.
- **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT** specifies the tessellation evaluation shader stage.
- **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT** specifies the geometry shader stage.
- **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** specifies the fragment shader stage.
- **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where early fragment tests (depth and stencil tests before fragment shading) are performed. This stage also includes render pass load operations for framebuffer attachments with a depth/stencil format.
- **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** specifies the stage of the pipeline where late fragment tests (depth and stencil tests after fragment shading) are performed. This stage also includes render pass store operations for framebuffer attachments with a depth/stencil format.
- **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** specifies the stage of the pipeline after blending where the final color values are output from the pipeline. This stage includes blending, logic operations, render pass load and store operations for color attachments, render pass multisample resolve operations, and vkCmdClearAttachments.
- **VK_PIPELINE_STAGE_COMPUTE_SHADER_BIT** specifies the execution of a compute shader.
- **VK_PIPELINE_STAGE_TRANSFER_BIT** specifies the following commands:
  - All copy commands, including vkCmdCopyQueryPoolResults
  - vkCmdBlitImage2 and vkCmdBlitImage
  - vkCmdResolveImage2 and vkCmdResolveImage
  - All clear commands, with the exception of vkCmdClearAttachments
- **VK_PIPELINE_STAGE_HOST_BIT** specifies a pseudo-stage indicating execution on the host of reads/writes of device memory. This stage is not invoked by any commands recorded in a command buffer.
- **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** specifies the execution of vkCmdBuildAccelerationStructuresKHR, vkCmdBuildAccelerationStructuresIndirectKHR, vkCmdCopyAccelerationStructureKHR, vkCmdCopyAccelerationStructureToMemoryKHR, vkCmdCopyMemoryToAccelerationStructureKHR, and vkCmdWriteAccelerationStructuresPropertiesKHR.
- **VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR** specifies the execution of the ray tracing shader stages, via vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR
- **VK_PIPELINE_STAGE_ALL_GRAPHICS_BIT** specifies the execution of all graphics pipeline stages, and is equivalent to the logical OR of:
  - **VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT**
  - **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT**
  - **VK_PIPELINE_STAGE_VERTEX_SHADER_BIT**
  - **VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT**
  - **VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT**
  - **VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT**
  - **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT**
  - **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT**
  - **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT**

 VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
 punkty

• VK_PIPELINE_STAGE_ALL_COMMANDS_BIT specifies all operations performed by all commands supported on the queue it is used with.

• VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT specifies the stage of the pipeline where vertex attribute output values are written to the transform feedback buffers.

• VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies the stage of the pipeline where the fragment shading rate attachment is read to determine the fragment shading rate for portions of a rasterized primitive.

• VK_PIPELINE_STAGE_TOP_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the second synchronization scope, but specifies no stage of execution when specified in the first scope.

• VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT is equivalent to VK_PIPELINE_STAGE_ALL_COMMANDS_BIT with VkAccessFlags set to 0 when specified in the first synchronization scope, but specifies no stage of execution when specified in the second scope.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineStageFlags;

VkPipelineStageFlags is a bitmask type for setting a mask of zero or more VkPipelineStageFlagBits.

If a synchronization command includes a source stage mask, its first synchronization scope only includes execution of the pipeline stages specified in that mask and any logically earlier stages. Its first access scope only includes memory accesses performed by pipeline stages explicitly specified in the source stage mask.

If a synchronization command includes a destination stage mask, its second synchronization scope only includes execution of the pipeline stages specified in that mask and any logically later stages. Its second access scope only includes memory accesses performed by pipeline stages explicitly specified in the destination stage mask.

**NOTE**

Note that access scopes do not interact with the logically earlier or later stages for either scope - only the stages the application specifies are considered part of each access scope.

Certain pipeline stages are only available on queues that support a particular set of operations. The following table lists, for each pipeline stage flag, which queue capability flag must be supported by the queue. When multiple flags are enumerated in the second column of the table, it means that the pipeline stage is supported on the queue if it supports any of the listed capability flags. For further details on queue capabilities see Physical Device Enumeration and Queues.

*Table 3. Supported pipeline stage flags*

</table>

Pipeline stages that execute as a result of a command logically complete execution in a specific order, such that completion of a logically later pipeline stage **must** not happen-before completion of a logically earlier stage. This means that including any stage in the source stage mask for a particular synchronization command also implies that any logically earlier stages are included in **Scope1st** for that command.

Similarly, initiation of a logically earlier pipeline stage **must** not happen-after initiation of a logically later pipeline stage. Including any given stage in the destination stage mask for a particular synchronization command also implies that any logically later stages are included in **Scope2nd** for that command.

NOTE

Implementations **may** not support synchronization at every pipeline stage for every synchronization operation. If a pipeline stage that an implementation does not support synchronization for appears in a source stage mask, it **may** substitute any logically later stage in its place for the first synchronization scope. If a pipeline stage that an implementation does not support synchronization for appears in a destination stage mask, it **may** substitute any logically earlier stage in its place for the second synchronization scope.

For example, if an implementation is unable to signal an event immediately after vertex shader execution is complete, it **may** instead signal the event after color attachment output has completed.

If an implementation makes such a substitution, it **must** not affect the semantics of execution or memory dependencies or image and buffer memory barriers.

**Graphics pipelines** are executable on queues supporting **VK_QUEUE_GRAPHICS_BIT**. Stages executed by graphics pipelines **can** only be specified in commands recorded for queues supporting **VK_QUEUE_GRAPHICS_BIT**.

The graphics pipeline executes the following stages, with the logical ordering of the stages matching the order specified here:

- **VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT**
• VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT
• VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT
• VK_PIPELINE_STAGE_2_VERTEX_SHADER_BIT
• VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT
• VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT
• VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT
• VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
• VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT
• VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT
• VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT

For the compute pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT

For the transfer pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_TRANSFER_BIT

For host operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_HOST_BIT

For acceleration structure build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

For acceleration structure copy operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR

For opacity micromap build operations, only one pipeline stage occurs, so no order is guaranteed:

• VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

For the ray tracing pipeline, the following stages occur in this order:

• VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT
• VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

For the video decode pipeline, the following stages occur in this order:
For the video encode pipeline, the following stages occur in this order:

- **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR**

### 7.1.3. Access Types

Memory in Vulkan can be accessed from within shader invocations and via some fixed-function stages of the pipeline. The access type is a function of the descriptor type used, or how a fixed-function stage accesses memory.

Some synchronization commands take sets of access types as parameters to define the access scopes of a memory dependency. If a synchronization command includes a source access mask, its first access scope only includes accesses via the access types specified in that mask. Similarly, if a synchronization command includes a destination access mask, its second access scope only includes accesses via the access types specified in that mask.

Bits which can be set in the `srcAccessMask` and `dstAccessMask` members of `VkMemoryBarrier2KHR`, `VkImageMemoryBarrier2KHR`, and `VkBufferMemoryBarrier2KHR`, specifying access behavior, are:

```c
// Provided by VK_VERSION_1_3
// Flag bits for VkAccessFlagBits2
typedef VkFlags64 VkAccessFlagBits2;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_NONE_KHR = 0ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT = 0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT_KHR = 0x00000001ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT = 0x00000002ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INDEX_READ_BIT_KHR = 0x00000002ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT_KHR = 0x00000004ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_UNIFORM_READ_BIT = 0x00000008ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_UNIFORM_READ_BIT_KHR = 0x00000008ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT = 0x00000010ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT_KHR = 0x00000010ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_READ_BIT = 0x00000020ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_READ_BIT_KHR = 0x00000020ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_WRITE_BIT = 0x00000040ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_SHADER_WRITE_BIT_KHR = 0x00000040ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT = 0x00000080ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT_KHR = 0x00000080ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT_KHR = 0x00000100ULL;
static const VkAccessFlagBits2 VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200ULL;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkAccessFlagBits2 VkAccessFlagBits2KHR;

• VK_ACCESS_2_NONE specifies no accesses.
• VK_ACCESS_2_MEMORY_READ_BIT specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
• VK_ACCESS_2_MEMORY_WRITE_BIT specifies all write accesses. It is always valid in any access mask,
and is treated as equivalent to setting all WRITE access flags that are valid where it is used.

- **VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT** specifies read access to command data read from indirect buffers as part of an indirect build, trace, drawing or dispatch command. Such access occurs in the VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT pipeline stage.

- **VK_ACCESS_2_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT pipeline stage.

- **VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT pipeline stage.

- **VK_ACCESS_2_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.

- **VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT pipeline stage.

- **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT** specifies read access to a uniform texel buffer or sampled image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_STORAGE_READ_BIT** specifies read access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR** specifies read access to a shader binding table in any shader pipeline stage.

- **VK_ACCESS_2_SHADER_READ_BIT** is equivalent to the logical OR of:
  - **VK_ACCESS_2_SHADER_SAMPLED_READ_BIT**
  - **VK_ACCESS_2_SHADER_STORAGE_READ_BIT**

- **VK_ACCESS_2_SHADER_WRITE_BIT** is equivalent to **VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT**.

- **VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending (other than advanced blend operations), logic operations or certain render pass load operations in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage or via fragment shader tile image reads in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT pipeline stage.

- **VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color attachment during a render pass or via certain render pass load, store, and multisample resolve operations. Such access occurs in the VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT or VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT pipeline stages or via fragment shader tile image reads in the VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT pipeline stage.

- **VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations.
Such access occurs in the VkPipelineStage2EarlyFragmentTestsBit or VkPipelineStage2LateFragmentTestsBit pipeline stages.

- **VkAccess2TransferReadBit** specifies read access to an image or buffer in a copy operation. Such access occurs in the VkPipelineStage2CopyBit, VkPipelineStage2BlitBit, or VkPipelineStage2ResolveBit pipeline stages.

- **VkAccess2TransferWriteBit** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the VkPipelineStage2CopyBit, VkPipelineStage2BlitBit, VkPipelineStage2ClearBit, or VkPipelineStage2ResolveBit pipeline stages.

- **VkAccess2HostReadBit** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VkPipelineStage2HostBit pipeline stage.

- **VkAccess2HostWriteBit** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the VkPipelineStage2HostBit pipeline stage.

- **VkAccess2TransformFeedbackWriteBitExt** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the VkPipelineStage2TransformFeedbackBitExt pipeline stage.

- **VkAccess2TransformFeedbackCounterReadBitExt** specifies read access to a transform feedback counter buffer which is read when vkCmdBeginTransformFeedbackEXT executes. Such access occurs in the VkPipelineStage2TransformFeedbackBitExt pipeline stage.

- **VkAccess2TransformFeedbackCounterWriteBitExt** specifies write access to a transform feedback counter buffer which is written when vkCmdEndTransformFeedbackEXT executes. Such access occurs in the VkPipelineStage2TransformFeedbackBitExt pipeline stage.

- **VkAccess2ColorAttachmentReadNoncoherentBitExt** specifies read access to color attachments, including advanced blend operations. Such access occurs in the VkPipelineStage2ColorAttachmentOutputBit pipeline stage.

- **VkAccess2AccelerationStructureReadBitKHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VkPipelineStage2RayTracingShaderBitKHR pipeline stage or VkPipelineStage2AccelerationStructureBuildBitKHR pipeline stage.

- **VkAccess2AccelerationStructureWriteBitKHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VkPipelineStage2AccelerationStructureBuildBitKHR pipeline stage.

- **VkAccess2FragmentShadingRateAttachmentReadBitKHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VkPipelineStage2FragmentShadingRateAttachmentBitKHR pipeline stage.

- **VkAccess2VideoDecodeReadBitKHR** specifies read access to an image or buffer resource in a video decode operation. Such access occurs in the VkPipelineStage2VideoDecodeBitKHR pipeline stage.

- **VkAccess2VideoDecodeWriteBitKHR** specifies write access to an image or buffer resource in a video decode operation. Such access occurs in the VkPipelineStage2VideoDecodeBitKHR pipeline stage.
pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR** specifies read access to an image or buffer resource in a video encode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

- **VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR** specifies write access to an image or buffer resource in a video encode operation. Such access occurs in the **VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR** pipeline stage.

- **VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT** specifies write access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage.

- **VK_ACCESS_2_MICROMAP_READ_BIT_EXT** specifies read access to a micromap object. Such access occurs in the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** and **VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stages.

**NOTE**

In situations where an application wishes to select all access types for a given set of pipeline stages, **VK_ACCESS_2_MEMORY_READ_BIT** or **VK_ACCESS_2_MEMORY_WRITE_BIT** can be used. This is particularly useful when specifying stages that only have a single access type.

**NOTE**

The **VkAccessFlags2** bitmask goes beyond the 31 individual bit flags allowable within a C99 enum, which is how **VkAccessFlagBits** is defined. The first 31 values are common to both, and are interchangeable.

**VkAccessFlags2** is a bitmask type for setting a mask of zero or more **VkAccessFlagBits2**:

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkAccessFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkAccessFlags2 VkAccessFlags2KHR;
```

Bits which **can** be set in the **srcAccessMask** and **dstAccessMask** members of **VkSubpassDependency**, **VkSubpassDependency2**, **VkMemoryBarrier**, **VkBufferMemoryBarrier**, and **VkImageMemoryBarrier**, specifying access behavior, are:
typedef enum VkAccessFlagBits {
    VK_ACCESS_INDIRECT_COMMAND_READ_BIT = 0x00000001,
    VK_ACCESS_INDEX_READ_BIT = 0x00000002,
    VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT = 0x00000004,
    VK_ACCESS_UNIFORM_READ_BIT = 0x00000008,
    VK_ACCESS_INPUT_ATTACHMENT_READ_BIT = 0x00000010,
    VK_ACCESS_SHADER_READ_BIT = 0x00000020,
    VK_ACCESS_SHADER_WRITE_BIT = 0x00000040,
    VK_ACCESS_COLOR_ATTACHMENT_READ_BIT = 0x00000080,
    VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT = 0x00000100,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT = 0x00000200,
    VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT = 0x00000400,
    VK_ACCESS_TRANSFER_READ_BIT = 0x00000800,
    VK_ACCESS_TRANSFER_WRITE_BIT = 0x00001000,
    VK_ACCESS_HOST_READ_BIT = 0x00002000,
    VK_ACCESS_HOST_WRITE_BIT = 0x00004000,
    VK_ACCESS_MEMORY_READ_BIT = 0x00008000,
    VK_ACCESS_MEMORY_WRITE_BIT = 0x00010000,
    // Provided by VK_VERSION_1_3
    VK_ACCESS_NONE = 0,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT = 0x02000000,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT = 0x04000000,
    // Provided by VK_EXT_transform_feedback
    VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT = 0x08000000,
    // Provided by VK_EXT_blend_operation_advanced
    VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT = 0x00080000,
    // Provided by VK_KHR_acceleration_structure
    VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR = 0x00200000,
    // Provided by VK_KHR_acceleration_structure
    VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR = 0x00400000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR = 0x00800000,
    // Provided by VK_KHR_synchronization2
    VK_ACCESS_NONE_KHR = VK_ACCESS_NONE,
} VkAccessFlagBits;

These values all have the same meaning as the equivalently named values for VkAccessFlags2.

- **VK_ACCESS_NONE** specifies no accesses.
- **VK_ACCESS_MEMORY_READ_BIT** specifies all read accesses. It is always valid in any access mask, and is treated as equivalent to setting all READ access flags that are valid where it is used.
- **VK_ACCESS_MEMORY_WRITE_BIT** specifies all write accesses. It is always valid in any access mask, and is treated as equivalent to setting all WRITE access flags that are valid where it is used.
- **VK_ACCESS_INDIRECT_COMMAND_READ_BIT** specifies read access to indirect command data read as part of an indirect build, trace, drawing or dispatching command. Such access occurs in the
VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT pipeline stage.

- **VK_ACCESS_INDEX_READ_BIT** specifies read access to an index buffer as part of an indexed drawing command, bound by `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`. Such access occurs in the **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** pipeline stage.

- **VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT** specifies read access to a vertex buffer as part of a drawing command, bound by `vkCmdBindVertexBuffers`. Such access occurs in the **VK_PIPELINE_STAGE_VERTEX_INPUT_BIT** pipeline stage.

- **VK_ACCESS_UNIFORM_READ_BIT** specifies read access to a uniform buffer in any shader pipeline stage.

- **VK_ACCESS_INPUT_ATTACHMENT_READ_BIT** specifies read access to an input attachment within a render pass during fragment shading. Such access occurs in the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_SHADER_READ_BIT** specifies read access to a uniform texel buffer, sampled image, storage buffer, physical storage buffer, shader binding table, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_SHADER_WRITE_BIT** specifies write access to a storage buffer, physical storage buffer, storage texel buffer, or storage image in any shader pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT** specifies read access to a color attachment, such as via blending (other than advanced blend operations), logic operations or certain render pass load operations in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT** specifies write access to a color, resolve, or depth/stencil resolve attachment during a render pass or via certain render pass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT** specifies read access to a depth/stencil attachment, via depth or stencil operations or certain render pass load operations in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages or via fragment shader tile image reads in the **VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT** pipeline stage.

- **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT** specifies write access to a depth/stencil attachment, via depth or stencil operations or certain render pass load and store operations. Such access occurs in the **VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT** or **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stages.

- **VK_ACCESS_TRANSFER_READ_BIT** specifies read access to an image or buffer in a copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

- **VK_ACCESS_TRANSFER_WRITE_BIT** specifies write access to an image or buffer in a clear or copy operation. Such access occurs in the **VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT** pipeline stage.

- **VK_ACCESS_HOST_READ_BIT** specifies read access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.

- **VK_ACCESS_HOST_WRITE_BIT** specifies write access by a host operation. Accesses of this type are not performed through a resource, but directly on memory. Such access occurs in the **VK_PIPELINE_STAGE_HOST_BIT** pipeline stage.
VK_PIPELINE_STAGE_HOST_BIT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT** specifies write access to a transform feedback buffer made when transform feedback is active. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT** specifies read access to a transform feedback counter buffer which is read when vkCmdBeginTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT** specifies write access to a transform feedback counter buffer which is written when vkCmdEndTransformFeedbackEXT executes. Such access occurs in the VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT pipeline stage.

- **VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT** specifies read access to color attachments, including advanced blend operations. Such access occurs in the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR** specifies read access to an acceleration structure as part of a trace, build, or copy command, or to an acceleration structure scratch buffer as part of a build command. Such access occurs in the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR pipeline stage or VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR** specifies write access to an acceleration structure or acceleration structure scratch buffer as part of a build or copy command. Such access occurs in the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage.

- **VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR** specifies read access to a fragment shading rate attachment during rasterization. Such access occurs in the VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR pipeline stage.

Certain access types are only performed by a subset of pipeline stages. Any synchronization command that takes both stage masks and access masks uses both to define the access scopes - only the specified access types performed by the specified stages are included in the access scope. An application must not specify an access flag in a synchronization command if it does not include a pipeline stage in the corresponding stage mask that is able to perform accesses of that type. The following table lists, for each access flag, which pipeline stages can perform that type of access.

*Table 4. Supported access types*

</table>
typedef VkFlags VkAccessFlags;

VkAccessFlags is a bitmask type for setting a mask of zero or more VkAccessFlagBits.

If a memory object does not have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property, then vkFlushMappedMemoryRanges must be called in order to guarantee that writes to the memory object from the host are made available to the host domain, where they can be further made available to the device domain via a domain operation. Similarly, vkInvalidateMappedMemoryRanges must be called to guarantee that writes which are available to the host domain are made visible to host operations.

If the memory object does have the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT property flag, writes to the memory object from the host are automatically made available to the host domain. Similarly, writes made available to the host domain are automatically made visible to the host.

Queue submission commands automatically perform a domain operation from host to device for all writes performed before the command executes, so in most cases an explicit memory barrier is not needed for this case. In the few circumstances where a submit does not occur between the host write and the device read access, writes can be made available by using an explicit memory barrier.

### 7.1.4. Framebuffer Region Dependencies

Pipeline stages that operate on, or with respect to, the framebuffer are collectively the framebuffer-space pipeline stages. These stages are:

- VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
- VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT
- VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT

For these pipeline stages, an execution or memory dependency from the first set of operations to the second set can either be a single framebuffer-global dependency, or split into multiple framebuffer-local dependencies. A dependency with non-framebuffer-space pipeline stages is neither framebuffer-global nor framebuffer-local.

A framebuffer region is a set of sample (x, y, layer, sample) coordinates that is a subset of the entire framebuffer.

Both synchronization scopes of a framebuffer-local dependency include only the operations performed within corresponding framebuffer regions (as defined below). No ordering guarantees are made between different framebuffer regions for a framebuffer-local dependency.

Both synchronization scopes of a framebuffer-global dependency include operations on all framebuffer-regions.
If the first synchronization scope includes operations on pixels/fragments with \( N \) samples and the second synchronization scope includes operations on pixels/fragments with \( M \) samples, where \( N \) does not equal \( M \), then a framebuffer region containing all samples at a given \((x, y, \text{layer})\) coordinate in the first synchronization scope corresponds to a region containing all samples at the same coordinate in the second synchronization scope. In other words, it is a pixel granularity dependency. If \( N \) equals \( M \), then a framebuffer region containing a single \((x, y, \text{layer, sample})\) coordinate in the first synchronization scope corresponds to a region containing the same sample at the same coordinate in the second synchronization scope. In other words, it is a sample granularity dependency.

**NOTE**

Since fragment shader invocations are not specified to run in any particular groupings, the size of a framebuffer region is implementation-dependent, not known to the application, and **must** be assumed to be no larger than specified above.

**NOTE**

Practically, the pixel vs. sample granularity dependency means that if an input attachment has a different number of samples than the pipeline's `rasterizationSamples`, then a fragment **can** access any sample in the input attachment's pixel even if it only uses framebuffer-local dependencies. If the input attachment has the same number of samples, then the fragment **can** only access the covered samples in its input `SampleMask` (i.e. the fragment operations happen-after a framebuffer-local dependency for each sample the fragment covers). To access samples that are not covered, a framebuffer-global dependency is required.

If a synchronization command includes a `dependencyFlags` parameter, and specifies the `VK_DEPENDENCY_BY_REGION_BIT` flag, then it defines framebuffer-local dependencies for the framebuffer-space pipeline stages in that synchronization command, for all framebuffer regions. If no `dependencyFlags` parameter is included, or the `VK_DEPENDENCY_BY_REGION_BIT` flag is not specified, then a framebuffer-global dependency is specified for those stages. The `VK_DEPENDENCY_BY_REGION_BIT` flag does not affect the dependencies between non-framebuffer-space pipeline stages, nor does it affect the dependencies between framebuffer-space and non-framebuffer-space pipeline stages.

**NOTE**

Framebuffer-local dependencies are more efficient for most architectures; particularly tile-based architectures - which can keep framebuffer-regions entirely in on-chip registers and thus avoid external bandwidth across such a dependency. Including a framebuffer-global dependency in your rendering will usually force all implementations to flush data to memory, or to a higher level cache, breaking any potential locality optimizations.

### 7.1.5. View-Local Dependencies

In a render pass instance that has `multiview` enabled, dependencies **can** be either view-local or view-global.

A view-local dependency only includes operations from a single `source view` from the source subpass in the first synchronization scope, and only includes operations from a single `destination`...
view from the destination subpass in the second synchronization scope. A view-global dependency includes all views in the view mask of the source and destination subpasses in the corresponding synchronization scopes.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag, then it defines view-local dependencies for that synchronization command, for all views. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_VIEW_LOCAL_BIT` flag is not specified, then a view-global dependency is specified.

### 7.1.6. Device-Local Dependencies

Dependencies can be either device-local or non-device-local. A device-local dependency acts as multiple separate dependencies, one for each physical device that executes the synchronization command, where each dependency only includes operations from that physical device in both synchronization scopes. A non-device-local dependency is a single dependency where both synchronization scopes include operations from all physical devices that participate in the synchronization command. For subpass dependencies, all physical devices in the `VkDeviceGroupRenderPassBeginInfo::deviceMask` participate in the dependency, and for pipeline barriers all physical devices that are set in the command buffer's current device mask participate in the dependency.

If a synchronization command includes a `dependencyFlags` parameter and specifies the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag, then it defines a non-device-local dependency for that synchronization command. If no `dependencyFlags` parameter is included or the `VK_DEPENDENCY_DEVICE_GROUP_BIT` flag is not specified, then it defines device-local dependencies for that synchronization command, for all participating physical devices.

Semaphore and event dependencies are device-local and only execute on the one physical device that performs the dependency.

### 7.2. Implicit Synchronization Guarantees

A small number of implicit ordering guarantees are provided by Vulkan, ensuring that the order in which commands are submitted is meaningful, and avoiding unnecessary complexity in common operations.

*Submission order* is a fundamental ordering in Vulkan, giving meaning to the order in which action and synchronization commands are recorded and submitted to a single queue. Explicit and implicit ordering guarantees between commands in Vulkan all work on the premise that this ordering is meaningful. This order does not itself define any execution or memory dependencies; synchronization commands and other orderings within the API use this ordering to define their scopes.

Submission order for any given set of commands is based on the order in which they were recorded to command buffers and then submitted. This order is determined as follows:

1. The initial order is determined by the order in which `vkQueueSubmit` and `vkQueueSubmit2` commands are executed on the host, for a single queue, from first to last.
2. The order in which VkSubmitInfo structures are specified in the pSubmits parameter of vkQueueSubmit, or in which VkSubmitInfo2 structures are specified in the pSubmits parameter of vkQueueSubmit2, from lowest index to highest.

3. The order in which command buffers are specified in the pCommandBuffers member of VkSubmitInfo or VkSubmitInfo2 from lowest index to highest.

4. The order in which commands outside of a render pass were recorded to a command buffer on the host, from first to last.

5. The order in which commands inside a single subpass were recorded to a command buffer on the host, from first to last.

NOTE

When using a render pass object with multiple subpasses, commands in different subpasses have no defined submission order relative to each other, regardless of the order in which the subpasses were recorded. Commands within a subpass are still ordered relative to other commands in the same subpass, and those outside of the render pass.

State commands do not execute any operations on the device, instead they set the state of the command buffer when they execute on the host, in the order that they are recorded. Action commands consume the current state of the command buffer when they are recorded, and will execute state changes on the device as required to match the recorded state.

The order of primitives passing through the graphics pipeline and image layout transitions as part of an image memory barrier provide additional guarantees based on submission order.

Execution of pipeline stages within a given command also has a loose ordering, dependent only on a single command.

Signal operation order is a fundamental ordering in Vulkan, giving meaning to the order in which semaphore and fence signal operations occur when submitted to a single queue. The signal operation order for queue operations is determined as follows:

1. The initial order is determined by the order in which vkQueueSubmit and vkQueueSubmit2 commands are executed on the host, for a single queue, from first to last.

2. The order in which VkSubmitInfo structures are specified in the pSubmits parameter of vkQueueSubmit, or in which VkSubmitInfo2 structures are specified in the pSubmits parameter of vkQueueSubmit2, from lowest index to highest.

3. The fence signal operation defined by the fence parameter of a vkQueueSubmit or vkQueueSubmit2 or vkQueueBindSparse command is ordered after all semaphore signal operations defined by that command.

Semaphore signal operations defined by a single VkSubmitInfo or VkSubmitInfo2 or VkBindSparseInfo structure are unordered with respect to other semaphore signal operations defined within the same structure.

The vkSignalSemaphore command does not execute on a queue but instead performs the signal operation from the host. The semaphore signal operation defined by executing a vkSignalSemaphore command happens-after the vkSignalSemaphore command is invoked and
When signaling timeline semaphores, it is the responsibility of the application to ensure that they are ordered such that the semaphore value is strictly increasing. Because the first synchronization scope for a semaphore signal operation contains all semaphore signal operations which occur earlier in submission order, all semaphore signal operations contained in any given batch are guaranteed to happen-after all semaphore signal operations contained in any previous batches. However, no ordering guarantee is provided between the semaphore signal operations defined within a single batch. This, combined with the requirement that timeline semaphore values strictly increase, means that it is invalid to signal the same timeline semaphore twice within a single batch.

If an application wishes to ensure that some semaphore signal operation happens-after some other semaphore signal operation, it can submit a separate batch containing only semaphore signal operations, which will happen-after the semaphore signal operations in any earlier batches.

When signaling a semaphore from the host, the only ordering guarantee is that the signal operation happens-after when `vkSignalSemaphore` is called and happens-before it returns. Therefore, it is invalid to call `vkSignalSemaphore` while there are any outstanding signal operations on that semaphore from any queue submissions unless those queue submissions have some dependency which ensures that they happen-after the host signal operation. One example of this would be if the pending signal operation is, itself, waiting on the same semaphore at a lower value and the call to `vkSignalSemaphore` signals that lower value. Furthermore, if there are two or more processes or threads signaling the same timeline semaphore from the host, the application must ensure that the `vkSignalSemaphore` with the lower semaphore value returns before `vkSignalSemaphore` is called with the higher value.

### 7.3. Fences

Fences are a synchronization primitive that can be used to insert a dependency from a queue to the host. Fences have two states - signaled and unsignaled. A fence can be signaled as part of the execution of a queue submission command. Fences can be unsignaled on the host with `vkResetFences`. Fences can be waited on by the host with the `vkWaitForFences` command, and the current state can be queried with `vkGetFenceStatus`.

The internal data of a fence may include a reference to any resources and pending work associated with signal or unsignal operations performed on that fence object, collectively referred to as the fence's payload. Mechanisms to import and export that internal data to and from fences are provided below. These mechanisms indirectly enable applications to share fence state between two or more fences and other synchronization primitives across process and API boundaries.

Fences are represented by `VkFence` handles:
To create a fence, call:

```c
VkResult vkCreateFence(
    VkDevice device,
    const VkFenceCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFence* pFence);
```

- `device` is the logical device that creates the fence.
- `pCreateInfo` is a pointer to a `VkFenceCreateInfo` structure containing information about how the fence is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFence` is a pointer to a handle in which the resulting fence object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateFence-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateFence-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkFenceCreateInfo` structure
- VUID-vkCreateFence-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateFence-pFence-parameter
  - `pFence` must be a valid pointer to a `VkFence` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkFenceCreateInfo` structure is defined as:
typedef struct VkFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFenceCreateFlags flags;
} VkFenceCreateInfo;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkFenceCreateFlagBits` specifying the initial state and behavior of the fence.

### Valid Usage (Implicit)

- **VUID-VkFenceCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_FENCE_CREATE_INFO`

- **VUID-VkFenceCreateInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportFenceCreateInfo` or `VkExportFenceWin32HandleInfoKHR`

- **VUID-VkFenceCreateInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkFenceCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkFenceCreateFlagBits` values

// Provided by VK_VERSION_1_0
typedef enum VkFenceCreateFlagBits {
    VK_FENCE_CREATE_SIGNALED_BIT = 0x00000001,
} VkFenceCreateFlagBits;

- **VK_FENCE_CREATE_SIGNALED_BIT** specifies that the fence object is created in the signaled state. Otherwise, it is created in the unsignaled state.

// Provided by VK_VERSION_1_0
typedef VkFlags VkFenceCreateFlags;

- `VkFenceCreateFlags` is a bitmask type for setting a mask of zero or more `VkFenceCreateFlagBits`.

To create a fence whose payload can be exported to external handles, add a `VkExportFenceCreateInfo` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceCreateInfo` structure is defined as:
typedef struct VkExportFenceCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlags handleTypes;
} VkExportFenceCreateInfo;

or the equivalent

typedef VkExportFenceCreateInfo VkExportFenceCreateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleTypes** is a bitmask of `VkExternalFenceHandleTypeFlagBits` specifying one or more fence handle types the application can export from the resulting fence. The application can request multiple handle types for the same fence.

### Valid Usage

- VUID-VkExportFenceCreateInfo-handleTypes-01446
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalFenceProperties`

### Valid Usage (Implicit)

- VUID-VkExportFenceCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_FENCE_CREATE_INFO`

- VUID-VkExportFenceCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalFenceHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a fence, add a `VkExportFenceWin32HandleInfoKHR` structure to the `pNext` chain of the `VkFenceCreateInfo` structure. The `VkExportFenceWin32HandleInfoKHR` structure is defined as:
// Provided by VK_KHR_external_fence_win32
typedef struct VkExportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportFenceWin32HandleInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pAttributes is a pointer to a Windows SECURITY_ATTRIBUTES structure specifying security attributes of the handle.
- dwAccess is a DWORD specifying access rights of the handle.
- name is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created fence.

If VkExportFenceCreateInfo is not included in the same pNext chain, this structure is ignored.

If VkExportFenceCreateInfo is included in the pNext chain of VkFenceCreateInfo with a Windows handleType, but either VkExportFenceWin32HandleInfoKHR is not included in the pNext chain, or it is included but pAttributes is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights will be

DXGI_SHAREDRESOURCE_READ | DXGI_SHAREDRESOURCE_WRITE

for handles of the following types:

VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT

1

Valid Usage

- VUID-VkExportFenceWin32HandleInfoKHR-handleTypes-01447
  If VkExportFenceCreateInfo::handleTypes does not include VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT, a VkExportFenceWin32HandleInfoKHR structure must not be included in the pNext chain of VkFenceCreateInfo

Valid Usage (Implicit)
To export a Windows handle representing the state of a fence, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkGetFenceWin32HandleKHR(
    VkDevice device,
    const VkFenceGetWin32HandleInfoKHR* pGetWin32HandleInfo,
    HANDLE* pHandle);
```

- **device** is the logical device that created the fence being exported.
- **pGetWin32HandleInfo** is a pointer to a `VkFenceGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- **pHandle** will return the Windows handle representing the fence state.

For handle types defined as NT handles, the handles returned by `vkGetFenceWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence Payloads.

### Valid Usage (Implicit)

- **VUID-vkGetFenceWin32HandleKHR-device-parameter**
  
  device must be a valid `VkDevice` handle

- **VUID-vkGetFenceWin32HandleKHR-pGetWin32HandleInfo-parameter**
  
  `pGetWin32HandleInfo` must be a valid pointer to a valid `VkFenceGetWin32HandleInfoKHR` structure

- **VUID-vkGetFenceWin32HandleKHR-pHandle-parameter**
  
  `pHandle` must be a valid pointer to a `HANDLE` value

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
The `VkFenceGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkFenceGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

**Valid Usage**

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01448**
  
  `handleType` must have been included in `VkExportFenceCreateInfo::handleTypes` when the `fence`'s current payload was created

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01449**
  
  If `handleType` is defined as an NT handle, `vkGetFenceWin32HandleKHR` must be called no more than once for each valid unique combination of `fence` and `handleType`

- **VUID-VkFenceGetWin32HandleInfoKHR-fence-01450**
  
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was included in `VkExternalFenceProperties::exportFromImportedHandleTypes` for `handleType`

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01451**
  
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution

- **VUID-VkFenceGetWin32HandleInfoKHR-handleType-01452**
  
  `handleType` must be defined as an NT handle or a global share handle

**Valid Usage (Implicit)**

- **VUID-VkFenceGetWin32HandleInfoKHR-sType-sType**
sType must be VK_STRUCTURE_TYPE_FENCE_GET_WIN32_HANDLE_INFO_KHR

- VUID-VkFenceGetWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkFenceGetWin32HandleInfoKHR-fence-parameter
  fence must be a valid VkFence handle

- VUID-VkFenceGetWin32HandleInfoKHR-handleType-parameter
  handleType must be a valid VkExternalFenceHandleTypeFlagBits value

To export a POSIX file descriptor representing the payload of a fence, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkGetFenceFdKHR(
    VkDevice device,
    const VkFenceGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- device is the logical device that created the fence being exported.
- pGetFdInfo is a pointer to a VkFenceGetFdInfoKHR structure containing parameters of the export operation.
- pFd will return the file descriptor representing the fence payload.

Each call to vkGetFenceFdKHR must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**NOTE** Ownership can be released in many ways. For example, the application can call close() on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a fence payload.

If pGetFdInfo->handleType is VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT and the fence is signaled at the time vkGetFenceFdKHR is called, pFd may return the value -1 instead of a valid file descriptor.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an execve system call is made.

Exporting a file descriptor from a fence may have side effects depending on the transference of the specified handle type, as described in Importing Fence State.

**Valid Usage (Implicit)**

- VUID-vkGetFenceFdKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetFenceFdKHR-pGetFdInfo-parameter
  pGetFdInfo must be a valid pointer to a valid VkFenceGetFdInfoKHR structure
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkFenceGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_fence_fd
typedef struct VkFenceGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkFenceGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fence` is the fence from which state will be exported.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalFenceHandleTypeFlagBits` for a description of the properties of the defined external fence handle types.

Valid Usage

- VUID-VkFenceGetFdInfoKHR-handleType-01453
  `handleType` must have been included in `VkExportFenceCreateInfo::handleTypes` when `fence`'s current payload was created
- VUID-VkFenceGetFdInfoKHR-handleType-01454
  If `handleType` refers to a handle type with copy payload transference semantics, `fence` must be signaled, or have an associated `fence signal operation` pending execution
- VUID-VkFenceGetFdInfoKHR-fence-01455
  `fence` must not currently have its payload replaced by an imported payload as described below in Importing Fence Payloads unless that imported payload's handle type was
Valid Usage (Implicit)

- VUID-VkFenceGetFdInfoKHR-sType-sType
  sType **must** be `VK_STRUCTURE_TYPE_FENCE_GET_FD_INFO_KHR`

- VUID-VkFenceGetFdInfoKHR-pNext-pNext
  pNext **must** be `NULL`

- VUID-VkFenceGetFdInfoKHR-fence-parameter
  fence **must** be a valid `VkFence` handle

- VUID-VkFenceGetFdInfoKHR-handleType-parameter
  handleType **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

To destroy a fence, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyFence(
    VkDevice device,  // device is the logical device that destroys the fence.
    VkFence fence,    // fence is the handle of the fence to destroy.
    const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

Valid Usage

- VUID-vkDestroyFence-fence-01120
  All queue submission commands that refer to fence **must** have completed execution

- VUID-vkDestroyFence-fence-01121
  If `VkAllocationCallbacks` were provided when fence was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyFence-fence-01122
  If no `VkAllocationCallbacks` were provided when fence was created, pAllocator **must** be `NULL`

Valid Usage (Implicit)

- VUID-vkDestroyFence-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyFence-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-vkDestroyFence-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyFence-fence-parent
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to fence must be externally synchronized

To query the status of a fence from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetFenceStatus(
    VkDevice device,  // device is the logical device that owns the fence.
    VkFence fence);   // fence is the handle of the fence to query.
```

Upon success, vkGetFenceStatus returns the status of the fence object, with the following return codes:

Table 5. Fence Object Status Codes

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SUCCESS</td>
<td>The fence specified by fence is signaled.</td>
</tr>
<tr>
<td>VK_NOT_READY</td>
<td>The fence specified by fence is unsignaled.</td>
</tr>
<tr>
<td>VK_ERROR_DEVICE_LOST</td>
<td>The device has been lost. See Lost Device.</td>
</tr>
</tbody>
</table>

If a queue submission command is pending execution, then the value returned by this command may immediately be out of date.

If the device has been lost (see Lost Device), vkGetFenceStatus may return any of the above status codes. If the device has been lost and vkGetFenceStatus is called repeatedly, it will eventually return either VK_SUCCESS or VK_ERROR_DEVICE_LOST.
Valid Usage (Implicit)

- VUID-vkGetFenceStatus-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetFenceStatus-fence-parameter
  fence must be a valid VkFence handle

- VUID-vkGetFenceStatus-fence-parent
  fence must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_NOT_READY

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To set the state of fences to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetFences(
    VkDevice device,
    uint32_t fenceCount,
    const VkFence* pFences);
```

- device is the logical device that owns the fences.
- fenceCount is the number of fences to reset.
- pFences is a pointer to an array of fence handles to reset.

If any member of pFences currently has its payload imported with temporary permanence, that fence's prior permanent payload is first restored. The remaining operations described therefore operate on the restored payload.

When vkResetFences is executed on the host, it defines a fence unsignal operation for each fence, which resets the fence to the unsignaled state.

If any member of pFences is already in the unsignaled state when vkResetFences is executed, then vkResetFences has no effect on that fence.
Valid Usage

- VUID-vkResetFences-pFences-01123
  Each element of \texttt{pFences} must not be currently associated with any queue command that has not yet completed execution on that queue

Valid Usage (Implicit)

- VUID-vkResetFences-device-parameter
  \texttt{device must} be a valid \texttt{VkDevice} handle

- VUID-vkResetFences-pFences-parameter
  \texttt{pFences} must be a valid pointer to an array of \texttt{fenceCount} valid \texttt{VkFence} handles

- VUID-vkResetFences-fenceCount-arraylength
  \texttt{fenceCount} must be greater than 0

- VUID-vkResetFences-pFences-parent
  Each element of \texttt{pFences} must have been created, allocated, or retrieved from \texttt{device}

Host Synchronization

- Host access to each member of \texttt{pFences} must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_DEVICE_MEMORY

When a fence is submitted to a queue as part of a queue submission command, it defines a memory dependency on the batches that were submitted as part of that command, and defines a fence signal operation which sets the fence to the signaled state.

The first synchronization scope includes every batch submitted in the same queue submission command. Fence signal operations that are defined by \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} additionally include in the first synchronization scope all commands that occur earlier in submission order. Fence signal operations that are defined by \texttt{vkQueueSubmit} or \texttt{vkQueueSubmit2} or \texttt{vkQueueBindSparse} additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope only includes the fence signal operation.

The first access scope includes all memory access performed by the device.
The second **access scope** is empty.

To wait for one or more fences to enter the signaled state on the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkWaitForFences(
    VkDevice device,               // device
    uint32_t fenceCount,           // fenceCount
    const VkFence* pFences,        // pFences
    VkBool32 waitAll,              // waitAll
    uint64_t timeout);             // timeout
```

- **device** is the logical device that owns the fences.
- **fenceCount** is the number of fences to wait on.
- **pFences** is a pointer to an array of **fenceCount** fence handles.
- **waitAll** is the condition that **must** be satisfied to successfully unblock the wait. If *waitAll* is **VK_TRUE**, then the condition is that all fences in **pFences** are signaled. Otherwise, the condition is that at least one fence in **pFences** is signaled.
- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitForFences` is called, then `vkWaitForFences` returns immediately. If the condition is not satisfied at the time `vkWaitForFences` is called, then `vkWaitForFences` will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then `vkWaitForFences` does not wait, but simply returns the current state of the fences. **VK_TIMEOUT** will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, `vkWaitForFences` returns **VK_SUCCESS**. Otherwise, `vkWaitForFences` returns **VK_TIMEOUT** after the **timeout** has expired.

If device loss occurs (see **Lost Device**) before the timeout has expired, `vkWaitForFences` **must** return in finite time with either **VK_SUCCESS** or **VK_ERROR_DEVICE_LOST**.

**NOTE**

While we guarantee that `vkWaitForFences` **must** return in finite time, no guarantees are made that it returns immediately upon device loss. However, the application can reasonably expect that the delay will be on the order of seconds and that calling `vkWaitForFences` will not result in a permanently (or seemingly permanently) dead process.

**Valid Usage (Implicit)**

- VUID-vkWaitForFences-device-parameter
device must be a valid VkDevice handle

- VUID-vkWaitForFences-pFences-parameter
  pFences must be a valid pointer to an array of fenceCount valid VkFence handles

- VUID-vkWaitForFences-fenceCount-arraylength
  fenceCount must be greater than 0

- VUID-vkWaitForFences-pFences-parent
  Each element of pFences must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_TIMEOUT

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

An execution dependency is defined by waiting for a fence to become signaled, either via vkWaitForFences or by polling on vkGetFenceStatus.

The first synchronization scope includes only the fence signal operation.

The second synchronization scope includes the host operations of vkWaitForFences or vkGetFenceStatus indicating that the fence has become signaled.

NOTE

Signaling a fence and waiting on the host does not guarantee that the results of memory accesses will be visible to the host, as the access scope of a memory dependency defined by a fence only includes device access. A memory barrier or other memory dependency must be used to guarantee this. See the description of host access types for more information.

7.3.1. Alternate Methods to Signal Fences

Besides submitting a fence to a queue as part of a queue submission command, a fence may also be signaled when a particular event occurs on a device or display.

To create a fence that will be signaled when an event occurs on a device, call:
\[
\text{Provided by VK_EXT_display_control}
\]
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **device** is a `VkDeviceEventTypeEXT` value specifying when the fence will be signaled.

---

### Valid Usage (Implicit)

- **VUID-VkDeviceEventInfoEXT-sType-sType**  
  `sType must be VK_STRUCTURE_TYPE_DEVICE_EVENT_INFO_EXT`

- **VUID-VkDeviceEventInfoEXT-pNext-pNext**  
  `pNext must be NULL`

- **VUID-VkDeviceEventInfoEXT-deviceEvent-parameter**  
  `deviceEvent must be a valid VkDeviceEventTypeEXT value`

---

Possible values of `VkDeviceEventInfoEXT::device`, specifying when a fence will be signaled, are:

```
// Provided by VK_EXT_display_control
typedef enum VkDeviceEventTypeEXT {
    VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT = 0,
} VkDeviceEventTypeEXT;
```

- **VK_DEVICE_EVENT_TYPE_DISPLAY_HOTPLUG_EXT** specifies that the fence is signaled when a display is plugged into or unplugged from the specified device. Applications **can** use this notification to determine when they need to re-enumerate the available displays on a device.

To create a fence that will be signaled when an event occurs on a `VkDisplayKHR` object, call:

```
// Provided by VK_EXT_display_control
VkResult vkRegisterDisplayEventEXT(
    VkDevice device,  
    VkDisplayKHR display,  
    const VkDisplayEventInfoEXT* pDisplayEventInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkFence* pFence);
```

• **device** is a logical device associated with **display**

• **display** is the display on which the event **may** occur.

• **pDisplayEventInfo** is a pointer to a `VkDisplayEventInfoEXT` structure describing the event of interest to the application.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pFence** is a pointer to a handle in which the resulting fence object is returned.
Valid Usage (Implicit)

- VUID-vkRegisterDisplayEventEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkRegisterDisplayEventEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle

- VUID-vkRegisterDisplayEventEXT-pDisplayEventInfo-parameter
  `pDisplayEventInfo` must be a valid pointer to a valid `VkDisplayEventInfoEXT` structure

- VUID-vkRegisterDisplayEventEXT-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkRegisterDisplayEventEXT-pFence-parameter
  `pFence` must be a valid pointer to a `VkFence` handle

- VUID-vkRegisterDisplayEventEXT-commonparent
  Both of `device`, and `display` must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayEventInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayEventInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayEventTypeEXT displayEvent;
} VkDisplayEventInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayEvent` is a `VkDisplayEventTypeEXT` specifying when the fence will be signaled.

Valid Usage (Implicit)

- VUID-VkDisplayEventInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_EVENT_INFO_EXT`
Possible values of `VkDisplayEventInfoEXT::displayEvent`, specifying when a fence will be signaled, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayEventTypeEXT {
    VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT = 0,
} VkDisplayEventTypeEXT;
```

- `VK_DISPLAY_EVENT_TYPE_FIRST_PIXEL_OUT_EXT` specifies that the fence is signaled when the first pixel of the next display refresh cycle leaves the display engine for the display.

### 7.3.2. Importing Fence Payloads

Applications can import a fence payload into an existing fence using an external fence handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the fence will be restored to its permanent state the next time that fence is passed to `vkResetFences`.

**NOTE** Restoring a fence to its prior permanent payload is a distinct operation from resetting a fence payload. See `vkResetFences` for more detail.

Performing a subsequent temporary import on a fence before resetting it has no effect on this requirement; the next unsignal of the fence must still restore its last permanent state. A permanent payload import behaves as if the target fence was destroyed, and a new fence was created with the same handle but the imported payload. Because importing a fence payload temporarily or permanently detaches the existing payload from a fence, similar usage restrictions to those applied to `vkDestroyFence` are applied to any command that imports a fence payload. Which of these import types is used is referred to as the import operation's *permanence*. Each handle type supports either one or both types of permanence.

The implementation must perform the import operation by either referencing or copying the payload referred to by the specified external fence handle, depending on the handle's type. The import method used is referred to as the handle type's *transference*. When using handle types with reference transference, importing a payload to a fence adds the fence to the set of all fences sharing that payload. This set includes the fence from which the payload was exported. Fence signaling, waiting, and resetting operations performed on any fence in the set must behave as if the set were a single fence. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Fence signaling, waiting, and resetting operations performed on the target of copy imports must not affect any other fence or payload.

Export operations have the same transference as the specified handle type's import operations.
Additionally, exporting a fence payload to a handle with copy transference has the same side effects on the source fence’s payload as executing a fence reset operation. If the fence was using a temporarily imported payload, the fence’s prior permanent payload will be restored.

**NOTE**

The tables **Handle Types Supported by VkImportFenceWin32HandleInfoKHR** and **Handle Types Supported by VkImportFenceFdInfoKHR** define the permanence and transference of each handle type.

**External synchronization** allows implementations to modify an object’s internal state, i.e. payload, without internal synchronization. However, for fences sharing a payload across processes, satisfying the external synchronization requirements of **VkFence** parameters as if all fences in the set were the same object is sometimes infeasible. Satisfying valid usage constraints on the state of a fence would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific fence handle, not to its payload. For distinct fence objects which share a payload:

- If multiple commands which queue a signal operation, or which unsignal a fence, are called concurrently, behavior will be as if the commands were called in an arbitrary sequential order.

- If a queue submission command is called with a fence that is sharing a payload, and the payload is already associated with another queue command that has not yet completed execution, either one or both of the commands will cause the fence to become signaled when they complete execution.

- If a fence payload is reset while it is associated with a queue command that has not yet completed execution, the payload will become unsignaled, but may become signaled again when the command completes execution.

- In the preceding cases, any of the devices associated with the fences sharing the payload may be lost, or any of the queue submission or fence reset commands may return **VK_ERROR_INITIALIZATION_FAILED**.

Other than these non-deterministic results, behavior is well defined. In particular:

- The implementation must not crash or enter an internally inconsistent state where future valid Vulkan commands might cause undefined results,

- Timeouts on future wait commands on fences sharing the payload must be effective.

**NOTE**

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared fence for more than synchronizing access to the shared memory. For example, a process should not use a fence with shared payload to tell when commands it submitted to a queue have completed and objects used by those commands may be destroyed, since the other process can accidentally or maliciously cause the fence to signal before the commands actually complete.

When a fence is using an imported payload, its **VkExportFenceCreateInfo::handleTypes** value is specified when creating the fence from which the payload was exported, rather than specified when creating the fence. Additionally, **VkExternalFenceProperties::exportFromImportedHandleTypes** restricts which handle types can be exported from such a fence based on the specific handle type.
used to import the current payload. Passing a fence to `vkAcquireNextImageKHR` is equivalent to temporarily importing a fence payload to that fence.

**NOTE** Because the exportable handle types of an imported fence correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source fence is opaque to the application, applications have no way of determining whether any external handle types can be exported from a fence in this state. Therefore, applications must not attempt to export handles from fences using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a fence payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid fence which will not cause program termination, device loss, queue stalls, host thread stalls, or corruption of other resources when used as allowed according to its import parameters. If the external handle provided does not meet these requirements, the implementation must fail the fence payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

To import a fence payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_fence_win32
VkResult vkImportFenceWin32HandleKHR(
    VkDevice device,
    const VkImportFenceWin32HandleInfoKHR* pImportFenceWin32HandleInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceWin32HandleInfo` is a pointer to a `VkImportFenceWin32HandleInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportFenceWin32HandleKHR-fence-04448
  - `fence` must not be associated with any queue command that has not yet completed execution on that queue

**Valid Usage (Implicit)**

- VUID-vkImportFenceWin32HandleKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkImportFenceWin32HandleKHR-pImportFenceWin32HandleInfo-parameter
  pImportFenceWin32HandleInfo must be a valid pointer to a valid VkImportFenceWin32HandleInfoKHR structure

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE

The VkImportFenceWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_fence_win32
typedef struct VkImportFenceWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportFenceWin32HandleInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fence** is the fence into which the state will be imported.
- **flags** is a bitmask of VkFenceImportFlagBits specifying additional parameters for the fence payload import operation.
- **handleType** is a VkExternalFenceHandleTypeFlagBits value specifying the type of handle.
- **handle** is NULL or the external handle to import.
- **name** is NULL or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by handleType are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>Handle Type</td>
<td>Transference</td>
<td>Permanence Supported</td>
</tr>
<tr>
<td>-------------------------------------------------</td>
<td>--------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01457
  handleType **must** be a value included in the Handle Types Supported by VkImportFenceWin32HandleInfoKHR table

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01459
  If handleType is not VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_WIN32_BIT, name **must** be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01460
  If handle is NULL, name **must** name a valid synchronization primitive of the type specified by handleType

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01461
  If name is NULL, handle **must** be a valid handle of the type specified by handleType

- VUID-VkImportFenceWin32HandleInfoKHR-handleType-01462
  If handle is not NULL, name **must** be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-handle-01539
  If handle is not NULL, it **must** obey any requirements listed for handleType in external fence handle types compatibility

- VUID-VkImportFenceWin32HandleInfoKHR-name-01540
  If name is not NULL, it **must** obey any requirements listed for handleType in external fence handle types compatibility

**Valid Usage (Implicit)**

- VUID-VkImportFenceWin32HandleInfoKHR-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMPORT_FENCE_WIN32_HANDLE_INFO_KHR

- VUID-VkImportFenceWin32HandleInfoKHR-pNext-pNext
  pNext **must** be NULL

- VUID-VkImportFenceWin32HandleInfoKHR-fence-parameter
  fence **must** be a valid VkFence handle

- VUID-VkImportFenceWin32HandleInfoKHR-flags-parameter
  flags **must** be a valid combination of VkFenceImportFlagBits values

**Host Synchronization**

- Host access to fence **must** be externally synchronized
To import a fence payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_fence_fd
VkResult vkImportFenceFdKHR(
    VkDevice device,
    const VkImportFenceFdInfoKHR* pImportFenceFdInfo);
```

- `device` is the logical device that created the fence.
- `pImportFenceFdInfo` is a pointer to a `VkImportFenceFdInfoKHR` structure specifying the fence and import parameters.

Importing a fence payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same fence payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage**

- VUID-vkImportFenceFdKHR-fence-01463
  - `fence` must not be associated with any queue command that has not yet completed execution on that queue

**Valid Usage (Implicit)**

- VUID-vkImportFenceFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkImportFenceFdKHR-pImportFenceFdInfo-parameter
  - `pImportFenceFdInfo` must be a valid pointer to a valid `VkImportFenceFdInfoKHR` structure

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportFenceFdInfoKHR` structure is defined as:
typedef struct VkImportFenceFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkFence fence;
    VkFenceImportFlags flags;
    VkExternalFenceHandleTypeFlagBits handleType;
    int fd;
} VkImportFenceFdInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fence** is the fence into which the payload will be imported.
- **flags** is a bitmask of `VkFenceImportFlagBits` specifying additional parameters for the fence payload import operation.
- **handleType** is a `VkExternalFenceHandleTypeFlagBits` value specifying the type of `fd`.
- **fd** is the external handle to import.

The handle types supported by **handleType** are:

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

- **VUID-VkImportFenceFdInfoKHR-handleType-01464**
  
  **handleType** must be a value included in the **Handle Types Supported by VkImportFenceFdInfoKHR** table.

- **VUID-VkImportFenceFdInfoKHR-fd-01541**
  
  `fd` must obey any requirements listed for **handleType** in external fence handle types compatibility.

- **VUID-VkImportFenceFdInfoKHR-handleType-07306**
  
  If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain `VK_FENCE_IMPORT_TEMPORARY_BIT`

If **handleType** is `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkFence` will have a temporarily imported payload as if a valid file descriptor had been provided.
This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a -1 file descriptor when exporting a `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkFence` which is signaled.

### Valid Usage (Implicit)

- **VUID-VkImportFenceFdInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_FENCE_FD_INFO_KHR`
- **VUID-VkImportFenceFdInfoKHR-pNext-pNext**
  - `pNext` must be `NULL`
- **VUID-VkImportFenceFdInfoKHR-fence-parameter**
  - `fence` must be a valid `VkFence` handle
- **VUID-VkImportFenceFdInfoKHR-flags-parameter**
  - `flags` must be a valid combination of `VkFenceImportFlagBits` values
- **VUID-VkImportFenceFdInfoKHR-handleType-parameter**
  - `handleType` must be a valid `VkExternalFenceHandleTypeFlagBits` value

### Host Synchronization

- Host access to `fence` must be externally synchronized

Bits which can be set in

- `VkImportFenceWin32HandleInfoKHR::flags`
- `VkImportFenceFdInfoKHR::flags`

specifying additional parameters of a fence import operation are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkFenceImportFlagBits {
    VK_FENCE_IMPORT_TEMPORARY_BIT = 0x00000001,
    // Provided by VK_KHR_external_fence
    VK_FENCE_IMPORT_TEMPORARY_BIT_KHR = VK_FENCE_IMPORT_TEMPORARY_BIT,
} VkFenceImportFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlagBits VkFenceImportFlagBitsKHR;
```
• **VK_FENCE_IMPORT_TEMPORARY_BIT** specifies that the fence payload will be imported only temporarily, as described in Importing Fence Payloads, regardless of the permanence of handleType.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkFenceImportFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence
typedef VkFenceImportFlags VkFenceImportFlagsKHR;
```

**VkFenceImportFlags** is a bitmask type for setting a mask of zero or more **VkFenceImportFlagBits**.

### 7.4. Semaphores

Semaphores are a synchronization primitive that can be used to insert a dependency between queue operations or between a queue operation and the host. **Binary semaphores** have two states - signaled and unsignaled. **Timeline semaphores** have a strictly increasing 64-bit unsigned integer payload and are signaled with respect to a particular reference value. A semaphore can be signaled after execution of a queue operation is completed, and a queue operation can wait for a semaphore to become signaled before it begins execution. A timeline semaphore can additionally be signaled from the host with the `vkSignalSemaphore` command and waited on from the host with the `vkWaitSemaphores` command.

The internal data of a semaphore may include a reference to any resources and pending work associated with signal or unsignal operations performed on that semaphore object, collectively referred to as the semaphore's *payload*. Mechanisms to import and export that internal data to and from semaphores are provided below. These mechanisms indirectly enable applications to share semaphore state between two or more semaphores and other synchronization primitives across process and API boundaries.

Semaphores are represented by **VkSemaphore** handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSemaphore)
```

To create a semaphore, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSemaphore(
    VkDevice device,
    const VkSemaphoreCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSemaphore* pSemaphore);
```
• **device** is the logical device that creates the semaphore.

• **pCreateInfo** is a pointer to a **VkSemaphoreCreateInfo** structure containing information about how the semaphore is to be created.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pSemaphore** is a pointer to a handle in which the resulting semaphore object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateSemaphore-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkCreateSemaphore-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid **VkSemaphoreCreateInfo** structure

- VUID-vkCreateSemaphore-pAllocator-parameter
  
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkCreateSemaphore-pSemaphore-parameter
  
  **pSemaphore** must be a valid pointer to a **VkSemaphore** handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkSemaphoreCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreCreateFlags flags;
} VkSemaphoreCreateInfo;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **flags** is reserved for future use.
Valid Usage (Implicit)

- **VUID-VkSemaphoreCreateInfo-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_SEMAPHORE_CREATE_INFO*

- **VUID-VkSemaphoreCreateInfo-pNext-pNext**
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either `NULL` or a pointer to a valid instance of *VkExportSemaphoreCreateInfo*, *VkExportSemaphoreWin32HandleInfoKHR*, or *VkSemaphoreTypeCreateInfo*.

- **VUID-VkSemaphoreCreateInfo-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique.

- **VUID-VkSemaphoreCreateInfo-flags-zerobitmask**
  
  *flags* must be 0

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSemaphoreCreateFlags;
```

*VkSemaphoreCreateFlags* is a bitmask type for setting a mask, but is currently reserved for future use.

The *VkSemaphoreTypeCreateInfo* structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreTypeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreType semaphoreType;
    uint64_t initialValue;
} VkSemaphoreTypeCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreTypeCreateInfo VkSemaphoreTypeCreateInfoKHR;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphoreType** is a *VkSemaphoreType* value specifying the type of the semaphore.
- **initialValue** is the initial payload value if *semaphoreType* is *VK_SEMAPHORE_TYPE_TIMELINE*.

To create a semaphore of a specific type, add a *VkSemaphoreTypeCreateInfo* structure to the *VkSemaphoreCreateInfo::*pNext* chain.

If no *VkSemaphoreTypeCreateInfo* structure is included in the *pNext* chain of *VkSemaphoreCreateInfo*, then the created semaphore will have a default *VkSemaphoreType* of *VK_SEMAPHORE_TYPE_BINARY*. 

284
### Valid Usage

- **VUID-VkSemaphoreTypeCreateInfo-timelineSemaphore-03252**
  If the timelineSemaphore feature is not enabled, semaphoreType must not equal VK_SEMAPHORE_TYPE_TIMELINE

- **VUID-VkSemaphoreTypeCreateInfo-semaphoreType-03279**
  If semaphoreType is VK_SEMAPHORE_TYPE_BINARY, initialValue must be zero

### Valid Usage (Implicit)

- **VUID-VkSemaphoreTypeCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_TYPE_CREATE_INFO

- **VUID-VkSemaphoreTypeCreateInfo-semaphoreType-parameter**
  semaphoreType must be a valid VkSemaphoreType value

Possible values of VkSemaphoreTypeCreateInfo::semaphoreType, specifying the type of a semaphore, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreType {
    VK_SEMAPHORE_TYPE_BINARY = 0,
    VK_SEMAPHORE_TYPE_TIMELINE = 1,
} VkSemaphoreType;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreType VkSemaphoreTypeKHR;
```

- **VK_SEMAPHORE_TYPE_BINARY** specifies a binary semaphore type that has a boolean payload indicating whether the semaphore is currently signaled or unsignaled. When created, the semaphore is in the unsignaled state.

- **VK_SEMAPHORE_TYPE_TIMELINE** specifies a timeline semaphore type that has a strictly increasing 64-bit unsigned integer payload indicating whether the semaphore is signaled with respect to a particular reference value. When created, the semaphore payload has the value given by the initialValue field of VkSemaphoreTypeCreateInfo.

To create a semaphore whose payload can be exported to external handles, add a VkExportSemaphoreCreateInfo structure to the pNext chain of the VkSemaphoreCreateInfo.
The `VkExportSemaphoreCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportSemaphoreCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlags handleTypes;
} VkExportSemaphoreCreateInfo;
```

or the equivalent:

```c
// Provided by VK_KHR_external_semaphore
typedef VkExportSemaphoreCreateInfo VkExportSemaphoreCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleTypes` is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying one or more semaphore handle types the application can export from the resulting semaphore. The application can request multiple handle types for the same semaphore.

**Valid Usage**

- VUID-VkExportSemaphoreCreateInfo-handleTypes-01124
  The bits in `handleTypes` must be supported and compatible, as reported by `VkExternalSemaphoreProperties`

**Valid Usage (Implicit)**

- VUID-VkExportSemaphoreCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_CREATE_INFO`

- VUID-VkExportSemaphoreCreateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of `VkExternalSemaphoreHandleTypeFlagBits` values

To specify additional attributes of NT handles exported from a semaphore, add a `VkExportSemaphoreWin32HandleInfoKHR` structure to the `pNext` chain of the `VkSemaphoreCreateInfo` structure. The `VkExportSemaphoreWin32HandleInfoKHR` structure is defined as:
typedef struct VkExportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportSemaphoreWin32HandleInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- **dwAccess** is a `DWORD` specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the underlying synchronization primitive referenced by NT handles exported from the created semaphore.

If `VkExportSemaphoreCreateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportSemaphoreCreateInfo` is included in the `pNext` chain of `VkSemaphoreCreateInfo` with a Windows `handleType`, but either `VkExportSemaphoreWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to `NULL`, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”. Further, if the structure is not present, the access rights used depend on the handle type.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation **must** ensure the access rights allow both signal and wait operations on the semaphore.

For handles of the following types:

**VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT**

The access rights **must** be:

**GENERIC_ALL**

---

**Valid Usage**

- VUID-VkExportSemaphoreWin32HandleInfoKHR-handleTypes-01125
If `VkExportSemaphoreCreateInfo::handleTypes` does not include `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `VkExportSemaphoreWin32HandleInfoKHR` must not be included in the `pNext` chain of `VkSemaphoreCreateInfo`.

**Valid Usage (Implicit)**

- VUID-VkExportSemaphoreWin32HandleInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR`

- VUID-VkExportSemaphoreWin32HandleInfoKHR-pAttributes-parameter
  If `pAttributes` is not `NULL`, `pAttributes` must be a valid pointer to a valid `SECURITY_ATTRIBUTES` value

To export a Windows handle representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkGetSemaphoreWin32HandleKHR(
    VkDevice device, 
    const VkSemaphoreGetWin32HandleInfoKHR* pGetWin32HandleInfo, 
    HANDLE* pHandle);
```

- `device` is the logical device that created the semaphore being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkSemaphoreGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the semaphore state.

For handle types defined as NT handles, the handles returned by `vkGetSemaphoreWin32HandleKHR` are owned by the application. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

Exporting a Windows handle from a semaphore may have side effects depending on the transference of the specified handle type, as described in *Importing Semaphore Payloads*.

**Valid Usage (Implicit)**

- VUID-vkGetSemaphoreWin32HandleKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetSemaphoreWin32HandleKHR-pGetWin32HandleInfo-parameter
  `pGetWin32HandleInfo` must be a valid pointer to a valid `VkSemaphoreGetWin32HandleInfoKHR` structure

- VUID-vkGetSemaphoreWin32HandleKHR-pHandle-parameter
  `pHandle` must be a valid pointer to a `HANDLE` value
Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkSemaphoreGetWin32HandleInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_win32
typedef struct VkSemaphoreGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetWin32HandleInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `semaphore` is the semaphore from which state will be exported.
- `handleType` is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the handle returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

**Valid Usage**

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01126**
  `handleType` must have been included in `VkSemaphoreCreateInfo::handleTypes` when the `semaphore`'s current payload was created.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01127**
  If `handleType` is defined as an NT handle, `vkGetSemaphoreWin32HandleKHR` must be called no more than once for each valid unique combination of `semaphore` and `handleType`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-01128**
  `semaphore` must not currently have its payload replaced by an imported payload as described below in Importing Semaphore Payloads unless that imported payload's handle type was included in `VkSemaphoreGetWin32HandleInfoKHR::handleType-01129`.

- **VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01129**
  If `handleType` refers to a handle type with copy payload transference semantics, as defined
below in Importing Semaphore Payloads, there must be no queue waiting on semaphore

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01130
  If handleType refers to a handle type with copy payload transference semantics, semaphore must be signaled, or have an associated semaphore signal operation pending execution

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-01131
  handleType must be defined as an NT handle or a global share handle

Valid Usage (Implicit)

- VUID-VkSemaphoreGetWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_GET_WIN32_HANDLE_INFO_KHR

- VUID-VkSemaphoreGetWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkSemaphoreGetWin32HandleInfoKHR-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

- VUID-VkSemaphoreGetWin32HandleInfoKHR-handleType-parameter
  handleType must be a valid VkExternalSemaphoreHandleTypeFlagBits value

To export a POSIX file descriptor representing the payload of a semaphore, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkGetSemaphoreFdKHR(
    VkDevice device,
    const VkSemaphoreGetFdInfoKHR* pGetFdInfo,
    int* pFd);
```

- device is the logical device that created the semaphore being exported.
- pGetFdInfo is a pointer to a VkSemaphoreGetFdInfoKHR structure containing parameters of the export operation.
- pFd will return the file descriptor representing the semaphore payload.

Each call to vkGetSemaphoreFdKHR must create a new file descriptor and transfer ownership of it to the application. To avoid leaking resources, the application must release ownership of the file descriptor when it is no longer needed.

**NOTE** Ownership can be released in many ways. For example, the application can call close() on the file descriptor, or transfer ownership back to Vulkan by using the file descriptor to import a semaphore payload.

Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an execve system call is made.

Exporting a file descriptor from a semaphore may have side effects depending on the transference
of the specified handle type, as described in Importing Semaphore State.

### Valid Usage (Implicit)

- **VUID-vkGetSemaphoreFdKHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetSemaphoreFdKHR-pGetFdInfo-parameter**
  
  `pGetFdInfo` must be a valid pointer to a valid `VkSemaphoreGetFdInfoKHR` structure

- **VUID-vkGetSemaphoreFdKHR-pFd-parameter**
  
  `pFd` must be a valid pointer to an `int` value

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The `VkSemaphoreGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_semaphore_fd
typedef struct VkSemaphoreGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkSemaphoreGetFdInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **semaphore** is the semaphore from which state will be exported.
- **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of handle requested.

The properties of the file descriptor returned depend on the value of `handleType`. See `VkExternalSemaphoreHandleTypeFlagBits` for a description of the properties of the defined external semaphore handle types.

### Valid Usage

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-01132**
**Valid Usage (Implicit)**

- **VUID-VkSemaphoreGetFdInfoKHR-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_GET_FD_INFO_KHR`

- **VUID-VkSemaphoreGetFdInfoKHR-pNext-pNext**  
  `pNext` must be `NULL`

- **VUID-VkSemaphoreGetFdInfoKHR-semaphore-parameter**  
  `semaphore` must be a valid `VkSemaphore` handle

- **VUID-VkSemaphoreGetFdInfoKHR-handleType-parameter**  
  `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value

To destroy a semaphore, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySemaphore(
  VkDevice device,
  VkSemaphore semaphore,
  const VkAllocationCallbacks* pAllocator);
```
• **device** is the logical device that destroys the semaphore.

• **semaphore** is the handle of the semaphore to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroySemaphore-semaphore-05149
  All submitted batches that refer to **semaphore** must have completed execution

- VUID-vkDestroySemaphore-semaphore-01138
  If **VkAllocationCallbacks** were provided when **semaphore** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySemaphore-semaphore-01139
  If no **VkAllocationCallbacks** were provided when **semaphore** was created, **pAllocator** must be **NULL**

### Valid Usage (Implicit)

- VUID-vkDestroySemaphore-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroySemaphore-semaphore-parameter
  If **semaphore** is not **VK_NULL_HANDLE**, **semaphore** must be a valid **VkSemaphore** handle

- VUID-vkDestroySemaphore-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroySemaphore-semaphore-parent
  If **semaphore** is a valid handle, it must have been created, allocated, or retrieved from **device**

### Host Synchronization

- Host access to **semaphore** must be externally synchronized

### 7.4.1. Semaphore Signaling

When a batch is submitted to a queue via a **queue submission**, and it includes semaphores to be signaled, it defines a memory dependency on the batch, and defines **semaphore signal operations** which set the semaphores to the signaled state.

In case of semaphores created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** the semaphore is considered signaled with respect to the counter value set to be signaled as specified in **VkTimelineSemaphoreSubmitInfo** or **VkSemaphoreSignalInfo**.
The first synchronization scope includes every command submitted in the same batch. In the case of `vkQueueSubmit2`, the first synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` additionally include all commands that occur earlier in submission order. Semaphore signal operations that are defined by `vkQueueSubmit` or `vkQueueSubmit2` or `vkQueueBindSparse` additionally include in the first synchronization scope any semaphore and fence signal operations that occur earlier in signal operation order.

The second synchronization scope includes only the semaphore signal operation.

The first access scope includes all memory access performed by the device.

The second access scope is empty.

### 7.4.2. Semaphore Waiting

When a batch is submitted to a queue via a queue submission, and it includes semaphores to be waited on, it defines a memory dependency between prior semaphore signal operations and the batch, and defines semaphore wait operations.

Such semaphore wait operations set the semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` to the unsignaled state. In case of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` a prior semaphore signal operation defines a memory dependency with a semaphore wait operation if the value the semaphore is signaled with is greater than or equal to the value the semaphore is waited with, thus the semaphore will continue to be considered signaled with respect to the counter value waited on as specified in `VkTimelineSemaphoreSubmitInfo`.

The first synchronization scope includes all semaphore signal operations that operate on semaphores waited on in the same batch, and that happen-before the wait completes.

The second synchronization scope includes every command submitted in the same batch. In the case of `vkQueueSubmit`, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by the corresponding element of `pWaitDstStageMask`. In the case of `vkQueueSubmit2`, the second synchronization scope is limited to the pipeline stage specified by `VkSemaphoreSubmitInfo::stageMask`. Also, in the case of either `vkQueueSubmit2` or `vkQueueSubmit`, the second synchronization scope additionally includes all commands that occur later in submission order.

The first access scope is empty.

The second access scope includes all memory access performed by the device.

The semaphore wait operation happens-after the first set of operations in the execution dependency, and happens-before the second set of operations in the execution dependency.

**NOTE** Unlike timeline semaphores, fences or events, the act of waiting for a binary semaphore also unsignals that semaphore. Applications **must** ensure that between two such wait operations, the semaphore is signaled again, with execution dependencies used to ensure these occur in order. Binary semaphore waits and
signals should thus occur in discrete 1:1 pairs.

A common scenario for using `pWaitDstStageMask` with values other than `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` is when synchronizing a window system presentation operation against subsequent command buffers which render the next frame. In this case, a presentation image must not be overwritten until the presentation operation completes, but other pipeline stages can execute without waiting. A mask of `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` prevents subsequent color attachment writes from executing until the semaphore signals. Some implementations may be able to execute transfer operations and/or prerasterization work before the semaphore is signaled.

If an image layout transition needs to be performed on a presentable image before it is used in a framebuffer, that can be performed as the first operation submitted to the queue after acquiring the image, and should not prevent other work from overlapping with the presentation operation. For example, a `VkImageMemoryBarrier` could use:

- `srcStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `srcAccessMask = 0`
- `dstStageMask = VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT`
- `dstAccessMask = VK_ACCESS_COLOR_ATTACHMENT_READ_BIT | VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.`
- `oldLayout = VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`
- `newLayout = VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

Alternatively, `oldLayout` can be `VK_IMAGE_LAYOUT_UNDEFINED`, if the image’s contents need not be preserved.

This barrier accomplishes a dependency chain between previous presentation operations and subsequent color attachment output operations, with the layout transition performed in between, and does not introduce a dependency between previous work and any pre-rasterization shader stages. More precisely, the semaphore signals after the presentation operation completes, the semaphore wait stalls the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage, and there is a dependency from that same stage to itself with the layout transition performed in between.

### 7.4.3. Semaphore State Requirements for Wait Operations

Before waiting on a semaphore, the application must ensure the semaphore is in a valid state for a wait operation. Specifically, when a semaphore wait operation is submitted to a queue:

- A binary semaphore must be signaled, or have an associated semaphore signal operation that is pending execution.
- Any semaphore signal operations on which the pending binary semaphore signal operation
depends **must** also be completed or pending execution.

- **There must** be no other queue waiting on the same binary semaphore when the operation executes.

### 7.4.4. Host Operations on Semaphores

In addition to **semaphore signal operations** and **semaphore wait operations** submitted to device queues, timeline semaphores support the following host operations:

- Query the current counter value of the semaphore using the `vkGetSemaphoreCounterValue` command.
- Wait for a set of semaphores to reach particular counter values using the `vkWaitSemaphores` command.
- Signal the semaphore with a particular counter value from the host using the `vkSignalSemaphore` command.

To query the current counter value of a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` from the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkGetSemaphoreCounterValue(VkDevice device, VkSemaphore semaphore, uint64_t* pValue);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkGetSemaphoreCounterValueKHR(VkDevice device, VkSemaphore semaphore, uint64_t* pValue);
```

- **device** is the logical device that owns the semaphore.
- **semaphore** is the handle of the semaphore to query.
- **pValue** is a pointer to a 64-bit integer value in which the current counter value of the semaphore is returned.

**NOTE** If a **queue submission** command is pending execution, then the value returned by this command **may** immediately be out of date.

### Valid Usage

- **VUID-vkGetSemaphoreCounterValue-semaphore-03255**

  `semaphore must have been created with a VkSemaphoreType of`
VK_SEMAPHORE_TYPE_TIMELINE

Valid Usage (Implicit)

- VUID-vkGetSemaphoreCounterValue-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetSemaphoreCounterValue-semaphore-parameter
  `semaphore` must be a valid `VkSemaphore` handle

- VUID-vkGetSemaphoreCounterValue-pValue-parameter
  `pValue` must be a valid pointer to a `uint64_t` value

- VUID-vkGetSemaphoreCounterValue-semaphore-parent
  `semaphore` must have been created, allocated, or retrieved from `device`

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

To wait for a set of semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` to reach particular counter values on the host, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkWaitSemaphores(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkWaitSemaphoresKHR(
    VkDevice device,
    const VkSemaphoreWaitInfo* pWaitInfo,
    uint64_t timeout);
```

- `device` is the logical device that owns the semaphores.
- `pWaitInfo` is a pointer to a `VkSemaphoreWaitInfo` structure containing information about the
wait condition.

- **timeout** is the timeout period in units of nanoseconds. **timeout** is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which **may** be substantially longer than one nanosecond, and **may** be longer than the requested period.

If the condition is satisfied when `vkWaitSemaphores` is called, then `vkWaitSemaphores` returns immediately. If the condition is not satisfied at the time `vkWaitSemaphores` is called, then `vkWaitSemaphores` will block and wait until the condition is satisfied or the **timeout** has expired, whichever is sooner.

If **timeout** is zero, then `vkWaitSemaphores` does not wait, but simply returns information about the current state of the semaphores. **VK_TIMEOUT** will be returned in this case if the condition is not satisfied, even though no actual wait was performed.

If the condition is satisfied before the **timeout** has expired, `vkWaitSemaphores` returns **VK_SUCCESS**. Otherwise, `vkWaitSemaphores` returns **VK_TIMEOUT** after the **timeout** has expired.

If device loss occurs (see Lost Device) before the timeout has expired, `vkWaitSemaphores` **must** return in finite time with either **VK_SUCCESS** or **VK_ERROR_DEVICE_LOST**.

---

**Valid Usage (Implicit)**

- VUID-vkWaitSemaphores-device-parameter
device **must** be a valid **VkDevice** handle

- VUID-vkWaitSemaphores-pWaitInfo-parameter
pWaitInfo **must** be a valid pointer to a valid **VkSemaphoreWaitInfo** structure

---

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_TIMEOUT**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_DEVICE_LOST**

The **VkSemaphoreWaitInfo** structure is defined as:
typedef struct VkSemaphoreWaitInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphoreWaitFlags flags;
    uint32_t semaphoreCount;
    const VkSemaphore* pSemaphores;
    const uint64_t* pValues;
} VkSemaphoreWaitInfo;

or the equivalent

typedef VkSemaphoreWaitInfo VKSemaphoreWaitInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is a bitmask of VkSemaphoreWaitFlagBits specifying additional parameters for the semaphore wait operation.
• semaphoreCount is the number of semaphores to wait on.
• pSemaphores is a pointer to an array of semaphoreCount semaphore handles to wait on.
• pValues is a pointer to an array of semaphoreCount timeline semaphore values.

Valid Usage

• VUID-VkSemaphoreWaitInfo-pSemaphores-03256
  All of the elements of pSemaphores must reference a semaphore that was created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE

Valid Usage (Implicit)

• VUID-VkSemaphoreWaitInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SEMAPHORE_WAIT_INFO
• VUID-VkSemaphoreWaitInfo-pNext-pNext
  pNext must be NULL
• VUID-VkSemaphoreWaitInfo-flags-parameter
  flags must be a valid combination of VkSemaphoreWaitFlagBits values
• VUID-VkSemaphoreWaitInfo-pSemaphores-parameter
  pSemaphores must be a valid pointer to an array of semaphoreCount valid VkSemaphore handles
• VUID-VkSemaphoreWaitInfo-pValues-parameter
**pValues** must be a valid pointer to an array of `semaphoreCount uint64_t` values

- VUID-VkSemaphoreWaitInfo-semaphoreCount-arraylength
  `semaphoreCount` must be greater than 0

Bits which **can** be set in `VkSemaphoreWaitInfo::flags`, specifying additional parameters of a semaphore wait operation, are:

```cpp
// Provided by VK_VERSION_1_2
typedef enum VkSemaphoreWaitFlagBits {
    VK_SEMAPHORE_WAIT_ANY_BIT = 0x00000001,
    // Provided by VK_KHR_timeline_semaphore
    VK_SEMAPHORE_WAIT_ANY_BIT_KHR = VK_SEMAPHORE_WAIT_ANY_BIT,
} VkSemaphoreWaitFlagBits;
```

or the equivalent

```cpp
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlagBits VkSemaphoreWaitFlagBitsKHR;
```

- `VK_SEMAPHORE_WAIT_ANY_BIT` specifies that the semaphore wait condition is that at least one of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` has reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`. If `VK_SEMAPHORE_WAIT_ANY_BIT` is not set, the semaphore wait condition is that all of the semaphores in `VkSemaphoreWaitInfo::pSemaphores` have reached the value specified by the corresponding element of `VkSemaphoreWaitInfo::pValues`.

```cpp
// Provided by VK_VERSION_1_2
typedef VkFlags VkSemaphoreWaitFlags;
```

or the equivalent

```cpp
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreWaitFlags VkSemaphoreWaitFlagsKHR;
```

`VkSemaphoreWaitFlags` is a bitmask type for setting a mask of zero or more `VkSemaphoreWaitFlagBits`.

To signal a semaphore created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` with a particular counter value, on the host, call:

```cpp
// Provided by VK_VERSION_1_2
VkResult vkSignalSemaphore( VkDevice device, const VkSemaphoreSignalInfo* pSignalInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_timeline_semaphore
VkResult vkSignalSemaphoreKHR(
    VkDevice device,
    const VkSemaphoreSignalInfo* pSignalInfo);
```

- `device` is the logical device that owns the semaphore.
- `pSignalInfo` is a pointer to a `VkSemaphoreSignalInfo` structure containing information about the signal operation.

When `vkSignalSemaphore` is executed on the host, it defines and immediately executes a semaphore signal operation which sets the timeline semaphore to the given value.

The first synchronization scope is defined by the host execution model, but includes execution of `vkSignalSemaphore` on the host and anything that happened-before it.

The second synchronization scope is empty.

### Valid Usage (Implicit)

- VUID-vkSignalSemaphore-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkSignalSemaphore-pSignalInfo-parameter
  - `pSignalInfo` must be a valid pointer to a valid `VkSemaphoreSignalInfo` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkSemaphoreSignalInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSemaphoreSignalInfo {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    uint64_t value;
} VkSemaphoreSignalInfo;
```
or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkSemaphoreSignalInfo VkSemaphoreSignalInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is the handle of the semaphore to signal.
- **value** is the value to signal.

### Valid Usage

- **VUID-VkSemaphoreSignalInfo-semaphore-03257**
  
  `semaphore` must have been created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE`

- **VUID-VkSemaphoreSignalInfo-value-03258**
  
  `value` must have a value greater than the current value of the semaphore

- **VUID-VkSemaphoreSignalInfo-value-03259**
  
  `value` must be less than the value of any pending semaphore signal operations

- **VUID-VkSemaphoreSignalInfo-value-03260**
  
  `value` must have a value which does not differ from the current value of the semaphore or the value of any outstanding semaphore wait or signal operation on `semaphore` by more than `maxTimelineSemaphoreValueDifference`

### Valid Usage (Implicit)

- **VUID-VkSemaphoreSignalInfo-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_SEMAPHORE_SIGNAL_INFO`

- **VUID-VkSemaphoreSignalInfo-pNext-pNext**

  `pNext` must be `NULL`

- **VUID-VkSemaphoreSignalInfo-semaphore-parameter**

  `semaphore` must be a valid `VkSemaphore` handle

#### 7.4.5. Importing Semaphore Payloads

Applications can import a semaphore payload into an existing semaphore using an external semaphore handle. The effects of the import operation will be either temporary or permanent, as specified by the application. If the import is temporary, the implementation must restore the semaphore to its prior permanent state after submitting the next semaphore wait operation. Performing a subsequent temporary import on a semaphore before performing a semaphore wait has no effect on this requirement; the next wait submitted on the semaphore must still restore its last permanent state. A permanent payload import behaves as if the target semaphore was
destroyed, and a new semaphore was created with the same handle but the imported payload. Because importing a semaphore payload temporarily or permanently detaches the existing payload from a semaphore, similar usage restrictions to those applied to \texttt{vkDestroySemaphore} are applied to any command that imports a semaphore payload. Which of these import types is used is referred to as the import operation's \textit{permanence}. Each handle type supports either one or both types of permanence.

The implementation \textbf{must} perform the import operation by either referencing or copying the payload referred to by the specified external semaphore handle, depending on the handle's type. The import method used is referred to as the handle type's \textit{transference}. When using handle types with reference transference, importing a payload to a semaphore adds the semaphore to the set of all semaphores sharing that payload. This set includes the semaphore from which the payload was exported. Semaphore signaling and waiting operations performed on any semaphore in the set \textbf{must} behave as if the set were a single semaphore. Importing a payload using handle types with copy transference creates a duplicate copy of the payload at the time of import, but makes no further reference to it. Semaphore signaling and waiting operations performed on the target of copy imports \textbf{must} not affect any other semaphore or payload.

Export operations have the same transference as the specified handle type's import operations. Additionally, exporting a semaphore payload to a handle with copy transference has the same side effects on the source semaphore's payload as executing a semaphore wait operation. If the semaphore was using a temporarily imported payload, the semaphore's prior permanent payload will be restored.

\textbf{NOTE} The permanence and transference of handle types can be found in:

\begin{itemize}
  \item Handle Types Supported by \texttt{VkImportSemaphoreWin32HandleInfoKHR}
  \item Handle Types Supported by \texttt{VkImportSemaphoreFdInfoKHR}
\end{itemize}

\textbf{External synchronization} allows implementations to modify an object's internal state, i.e. payload, without internal synchronization. However, for semaphores sharing a payload across processes, satisfying the external synchronization requirements of \texttt{VkSemaphore} parameters as if all semaphores in the set were the same object is sometimes infeasible. Satisfying the \textit{wait operation state requirements} would similarly require impractical coordination or levels of trust between processes. Therefore, these constraints only apply to a specific semaphore handle, not to its payload. For distinct semaphore objects which share a payload, if the semaphores are passed to separate queue submission commands concurrently, behavior will be as if the commands were called in an arbitrary sequential order. If the \textit{wait operation state requirements} are violated for the shared payload by a queue submission command, or if a signal operation is queued for a shared payload that is already signaled or has a pending signal operation, effects \textbf{must} be limited to one or more of the following:

\begin{itemize}
  \item Returning \texttt{VK_ERROR_INITIALIZATION_FAILED} from the command which resulted in the violation.
  \item Losing the logical device on which the violation occurred immediately or at a future time, resulting in a \texttt{VK_ERROR_DEVICE_LOST} error from subsequent commands, including the one causing the violation.
  \item Continuing execution of the violating command or operation as if the semaphore wait
\end{itemize}
completed successfully after an implementation-dependent timeout. In this case, the state of the payload becomes undefined, and future operations on semaphores sharing the payload will be subject to these same rules. The semaphore must be destroyed or have its payload replaced by an import operation to again have a well-defined state.

These rules allow processes to synchronize access to shared memory without trusting each other. However, such processes must still be cautious not to use the shared semaphore for more than synchronizing access to the shared memory. For example, a process should not use a shared semaphore as part of an execution dependency chain that, when complete, leads to objects being destroyed, if it does not trust other processes sharing the semaphore payload.

When a semaphore is using an imported payload, its `VkExportSemaphoreCreateInfo::handleTypes` value is specified when creating the semaphore from which the payload was exported, rather than specified when creating the semaphore. Additionally, `VkExternalSemaphoreProperties::exportFromImportedHandleTypes` restricts which handle types can be exported from such a semaphore based on the specific handle type used to import the current payload. Passing a semaphore to `vkAcquireNextImageKHR` is equivalent to temporarily importing a semaphore payload to that semaphore.

Because the exportable handle types of an imported semaphore correspond to its current imported payload, and `vkAcquireNextImageKHR` behaves the same as a temporary import operation for which the source semaphore is opaque to the application, applications have no way of determining whether any external handle types can be exported from a semaphore in this state. Therefore, applications must not attempt to export external handles from semaphores using a temporarily imported payload from `vkAcquireNextImageKHR`.

When importing a semaphore payload, it is the responsibility of the application to ensure the external handles meet all valid usage requirements. However, implementations must perform sufficient validation of external handles to ensure that the operation results in a valid semaphore which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its import parameters, and excepting those side effects allowed for violations of the valid semaphore state for wait operations rules. If the external handle provided does not meet these requirements, the implementation must fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

In addition, when importing a semaphore payload that is not compatible with the payload type corresponding to the `VkSemaphoreType` the semaphore was created with, the implementation may fail the semaphore payload import operation with the error code `VK_ERROR_INVALID_EXTERNAL_HANDLE`.

As the introduction of the external semaphore handle type `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT` predates that of timeline semaphores, support for importing semaphore payloads from external handles of that type into semaphores created (implicitly or explicitly) with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY` is preserved for backwards compatibility. However, applications should prefer importing such handle types
To import a semaphore payload from a Windows handle, call:

```c
// Provided by VK_KHR_external_semaphore_win32
VkResult vkImportSemaphoreWin32HandleKHR(
    VkDevice device,
    const VkImportSemaphoreWin32HandleInfoKHR* pImportSemaphoreWin32HandleInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreWin32HandleInfo` is a pointer to a `VkImportSemaphoreWin32HandleInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release ownership using the `CloseHandle` system call when the handle is no longer needed.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

**Valid Usage (Implicit)**

- VUID-vkImportSemaphoreWin32HandleKHR-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreWin32HandleKHR-pImportSemaphoreWin32HandleInfo-parameter
  `pImportSemaphoreWin32HandleInfo` must be a valid pointer to a valid `VkImportSemaphoreWin32HandleInfoKHR` structure

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreWin32HandleInfoKHR` structure is defined as:
typedef struct VkImportSemaphoreWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportSemaphoreWin32HandleInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **semaphore** is the semaphore into which the payload will be imported.
- **flags** is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
- **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `handle`.
- **handle** is `NULL` or the external handle to import.
- **name** is `NULL` or a null-terminated UTF-16 string naming the underlying synchronization primitive to import.

The handle types supported by `handleType` are:

*Table 8. Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR`

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT</td>
<td>Reference</td>
<td>Temporary,Permanent</td>
</tr>
</tbody>
</table>

**Valid Usage**

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01140
  `handleType` must be a value included in the Handle Types Supported by `VkImportSemaphoreWin32HandleInfoKHR` table

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01466
  If `handleType` is not `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT`, `name` must be `NULL`
If handle is NULL, name must name a valid synchronization primitive of the type specified by handleType

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01468
  If name is NULL, handle must be a valid handle of the type specified by handleType

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-01469
  If handle is not NULL, name must be NULL

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handle-01542
  If handle is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility

- VUID-VkImportSemaphoreWin32HandleInfoKHR-name-01543
  If name is not NULL, it must obey any requirements listed for handleType in external semaphore handle types compatibility

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03261
  If handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreCreateInfo::flags field must match that of the semaphore from which handle or name was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-handleType-03262
  If handleType is VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT or VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field must match that of the semaphore from which handle or name was exported

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-03322
  If flags contains VK_SEMAPHORE_IMPORT_TEMPORARY_BIT, the VkSemaphoreTypeCreateInfo::semaphoreType field of the semaphore from which handle or name was exported must not be VK_SEMAPHORE_TYPE_TIMELINE

Valid Usage (Implicit)

- VUID-VkImportSemaphoreWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_WIN32_HANDLE_INFO_KHR

- VUID-VkImportSemaphoreWin32HandleInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkImportSemaphoreWin32HandleInfoKHR-semaphore-parameter
  semaphore must be a valid VkSemaphore handle

- VUID-VkImportSemaphoreWin32HandleInfoKHR-flags-parameter
  flags must be a valid combination of VkSemaphoreImportFlagBits values

Host Synchronization

- Host access to semaphore must be externally synchronized
To import a semaphore payload from a POSIX file descriptor, call:

```c
// Provided by VK_KHR_external_semaphore_fd
VkResult vkImportSemaphoreFdKHR(
    VkDevice device,
    const VkImportSemaphoreFdInfoKHR* pImportSemaphoreFdInfo);
```

- `device` is the logical device that created the semaphore.
- `pImportSemaphoreFdInfo` is a pointer to a `VkImportSemaphoreFdInfoKHR` structure specifying the semaphore and import parameters.

Importing a semaphore payload from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import.

Applications can import the same semaphore payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance.

### Valid Usage

- VUID-vkImportSemaphoreFdKHR-semaphore-01142
  semaphore must not be associated with any queue command that has not yet completed execution on that queue

### Valid Usage (Implicit)

- VUID-vkImportSemaphoreFdKHR-device-parameter
  device must be a valid `VkDevice` handle
- VUID-vkImportSemaphoreFdKHR-pImportSemaphoreFdInfo-parameter
  pImportSemaphoreFdInfo must be a valid pointer to a valid `VkImportSemaphoreFdInfoKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`

The `VkImportSemaphoreFdInfoKHR` structure is defined as:
typedef struct VkImportSemaphoreFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore semaphore;
    VkSemaphoreImportFlags flags;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
    int fd;
} VkImportSemaphoreFdInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **semaphore** is the semaphore into which the payload will be imported.
• **flags** is a bitmask of `VkSemaphoreImportFlagBits` specifying additional parameters for the semaphore payload import operation.
• **handleType** is a `VkExternalSemaphoreHandleTypeFlagBits` value specifying the type of `fd`.
• **fd** is the external handle to import.

The handle types supported by **handleType** are:

Table 9. Handle Types Supported by `VkImportSemaphoreFdInfoKHR`

<table>
<thead>
<tr>
<th>Handle Type</th>
<th>Transference</th>
<th>Permanence Supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT</td>
<td>Reference</td>
<td>Temporary, Permanent</td>
</tr>
<tr>
<td>VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT</td>
<td>Copy</td>
<td>Temporary</td>
</tr>
</tbody>
</table>

**Valid Usage**

• VUID-VkImportSemaphoreFdInfoKHR-handleType-01143
  **handleType** must be a value included in the **Handle Types Supported by VkImportSemaphoreFdInfoKHR** table

• VUID-VkImportSemaphoreFdInfoKHR-fd-01544
  **fd** must obey any requirements listed for **handleType** in **external semaphore handle types compatibility**

• VUID-VkImportSemaphoreFdInfoKHR-handleType-03263
  If **handleType** is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreCreateInfo::flags` field must match that of the semaphore from which **fd** was exported

• VUID-VkImportSemaphoreFdInfoKHR-handleType-07307
  If **handleType** refers to a handle type with copy payload transference semantics, **flags** must contain `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`

• VUID-VkImportSemaphoreFdInfoKHR-handleType-03264
If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field must match that of the semaphore from which `fd` was exported.

- VUID-VkImportSemaphoreFdInfoKHR-flags-03323

If `flags` contains `VK_SEMAPHORE_IMPORT_TEMPORARY_BIT`, the `VkSemaphoreTypeCreateInfo::semaphoreType` field of the semaphore from which `fd` was exported must not be `VK_SEMAPHORE_TYPE_TIMELINE`.

If `handleType` is `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT`, the special value `-1` for `fd` is treated like a valid sync file descriptor referring to an object that has already signaled. The import operation will succeed and the `VkSemaphore` will have a temporarily imported payload as if a valid file descriptor had been provided.

**NOTE**

This special behavior for importing an invalid sync file descriptor allows easier interoperability with other system APIs which use the convention that an invalid sync file descriptor represents work that has already completed and does not need to be waited for. It is consistent with the option for implementations to return a `-1` file descriptor when exporting a `VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT` from a `VkSemaphore` which is signaled.

### Valid Usage (Implicit)

- VUID-VkImportSemaphoreFdInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMPORT_SEMAPHORE_FD_INFO_KHR`.
- VUID-VkImportSemaphoreFdInfoKHR-pNext-pNext
  - `pNext` must be `NULL`.
- VUID-VkImportSemaphoreFdInfoKHR-semaphore-parameter
  - `semaphore` must be a valid `VkSemaphore` handle.
- VUID-VkImportSemaphoreFdInfoKHR-flags-parameter
  - `flags` must be a valid combination of `VkSemaphoreImportFlagBits` values.
- VUID-VkImportSemaphoreFdInfoKHR-handleType-parameter
  - `handleType` must be a valid `VkExternalSemaphoreHandleTypeFlagBits` value.

### Host Synchronization

- Host access to `semaphore` must be externally synchronized.

Bits which can be set in

- `VkImportSemaphoreWin32HandleInfoKHR::flags`
- `VkImportSemaphoreFdInfoKHR::flags`

specifying additional parameters of a semaphore import operation are:
typedef enum VkSemaphoreImportFlagBits {
    VK_SEMAPHORE_IMPORT_TEMPORARY_BIT = 0x00000001,
} VkSemaphoreImportFlagBits;

These bits have the following meanings:

- **VK_SEMAPHORE_IMPORT_TEMPORARY_BIT** specifies that the semaphore payload will be imported only temporarily, as described in Importing Semaphore Payloads, regardless of the permanence of `handleType`.

typedef VkFlags VkSemaphoreImportFlags;

VkSemaphoreImportFlags is a bitmask type for setting a mask of zero or more `VkSemaphoreImportFlagBits`.

## 7.5. Events

Events are a synchronization primitive that can be used to insert a fine-grained dependency between commands submitted to the same queue, or between the host and a queue. Events must not be used to insert a dependency between commands submitted to different queues. Events have two states - signaled and unsignaled. An application can signal or unsignal an event either on the host or on the device. A device can be made to wait for an event to become signaled before executing further operations. No command exists to wait for an event to become signaled on the host, but the current state of an event can be queried.

Events are represented by `VkEvent` handles:
To create an event, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateEvent(
    VkDevice
    const VkEventCreateInfo*
    const VkAllocationCallbacks*
    VkEvent*
);
```

- `device` is the logical device that creates the event.
- `pCreateInfo` is a pointer to a `VkEventCreateInfo` structure containing information about how the event is to be created.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pEvent` is a pointer to a handle in which the resulting event object is returned.

When created, the event object is in the unsignaled state.

**Valid Usage**

- VUID-vkCreateEvent-device-09672
  `device` must support at least one queue family with one of the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities

- VUID-vkCreateEvent-events-04468
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::events` is `VK_FALSE`, then the implementation does not support `events`, and `vkCreateEvent` must not be used

**Valid Usage (Implicit)**

- VUID-vkCreateEvent-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateEvent-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkEventCreateInfo` structure

- VUID-vkCreateEvent-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateEvent-pEvent-parameter
  `pEvent` must be a valid pointer to a `VkEvent` handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkEventCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkEventCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkEventCreateFlags flags;
} VkEventCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkEventCreateFlagBits defining additional creation parameters.

Valid Usage (Implicit)

- VUID-VkEventCreateInfo-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_EVENT_CREATE_INFO
- VUID-VkEventCreateInfo-pNext-pNext
  `pNext` must be NULL
- VUID-VkEventCreateInfo-flags-parameter
  `flags` must be a valid combination of VkEventCreateFlagBits values

```c
// Provided by VK_VERSION_1_0
typedef enum VkEventCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_EVENT_CREATE_DEVICE_ONLY_BIT = 0x00000001,
    // Provided by VK_KHR_synchronization2
    VK_EVENT_CREATE_DEVICE_ONLY_BIT_KHR = VK_EVENT_CREATE_DEVICE_ONLY_BIT,
} VkEventCreateFlagBits;
```

- VK_EVENT_CREATE_DEVICE_ONLY_BIT specifies that host event commands will not be used with this event.
typedef VkFlags VkEventCreateFlags;

VkEventCreateFlags is a bitmask type for setting a mask of VkEventCreateFlagBits.

To destroy an event, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyEvent(
    VkDevice device,
    VkEvent event,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the event.
- `event` is the handle of the event to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyEvent-event-01145
  All submitted commands that refer to `event` must have completed execution

- VUID-vkDestroyEvent-event-01146
  If `VkAllocationCallbacks` were provided when `event` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyEvent-event-01147
  If no `VkAllocationCallbacks` were provided when `event` was created, `pAllocator` must be `NULL`

### Valid Usage (Implicit)

- VUID-vkDestroyEvent-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkDestroyEvent-event-parameter
  If `event` is not `VK_NULL_HANDLE`, `event` must be a valid `VkEvent` handle

- VUID-vkDestroyEvent-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyEvent-event-parent
  If `event` is a valid handle, it must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to event **must** be externally synchronized

To query the state of an event from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetEventStatus(
    VkDevice device,
    VkEvent event);
```

- **device** is the logical device that owns the event.
- **event** is the handle of the event to query.

Upon success, `vkGetEventStatus` returns the state of the event object with the following return codes:

**Table 10. Event Object Status Codes**

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_EVENT_SET</td>
<td>The event specified by <code>event</code> is signaled.</td>
</tr>
<tr>
<td>VK_EVENT_RESET</td>
<td>The event specified by <code>event</code> is unsignaled.</td>
</tr>
</tbody>
</table>

If a `vkCmdSetEvent` or `vkCmdResetEvent` command is in a command buffer that is in the **pending state**, then the value returned by this command **may** immediately be out of date.

The state of an event **can** be updated by the host. The state of the event is immediately changed, and subsequent calls to `vkGetEventStatus` will return the new state. If an event is already in the requested state, then updating it to the same state has no effect.

Valid Usage

- VUID-vkGetEventStatus-event-03940
  event **must** not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`

Valid Usage (Implicit)

- VUID-vkGetEventStatus-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkGetEventStatus-event-parameter
  `event` **must** be a valid `VkEvent` handle
- VUID-vkGetEventStatus-event-parent
  `event` **must** have been created, allocated, or retrieved from `device`
Return Codes

**Success**
- `VK_EVENT_SET`
- `VK_EVENT_RESET`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To set the state of an event to signaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkSetEvent(
    VkDevice device,
    VkEvent event);
```

- `device` is the logical device that owns the event.
- `event` is the event to set.

When `vkSetEvent` is executed on the host, it defines an *event signal operation* which sets the event to the signaled state.

If `event` is already in the signaled state when `vkSetEvent` is executed, then `vkSetEvent` has no effect, and no event signal operation occurs.

**NOTE**
If a command buffer is waiting for an event to be signaled from the host, the application must signal the event before submitting the command buffer, as described in the *queue forward progress* section.

**Valid Usage**
- VUID-vkSetEvent-event-03941
  `event` must not have been created with `VK_EVENT_CREATE_DEVICE_ONLY_BIT`
- VUID-vkSetEvent-event-09543
  `event` must not be waited on by a command buffer in the *pending state*

**Valid Usage (Implicit)**
- VUID-vkSetEvent-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkSetEvent-event-parameter
**event** must be a valid `VkEvent` handle

- VUID-vkSetEvent-event-parent
  
  **event** must have been created, allocated, or retrieved from device

---

**Host Synchronization**

- Host access to **event** must be externally synchronized

---

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

---

To set the state of an event to unsignaled from the host, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetEvent(
    VkDevice device,
    VkEvent event);
```

- **device** is the logical device that owns the event.
- **event** is the event to reset.

When `vkResetEvent` is executed on the host, it defines an event unsignal operation which resets the event to the unsignaled state.

If **event** is already in the unsignaled state when `vkResetEvent` is executed, then `vkResetEvent` has no effect, and no event unsignal operation occurs.

---

**Valid Usage**

- VUID-vkResetEvent-event-03821
  
  There **must** be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents` that includes **event** in its `pEvents` parameter

- VUID-vkResetEvent-event-03822
  
  There **must** be an execution dependency between `vkResetEvent` and the execution of any `vkCmdWaitEvents2` that includes **event** in its `pEvents` parameter

- VUID-vkResetEvent-event-03823
  
  **event** **must** not have been created with `VK_EVENT_CREATEDEVICEONLY_BIT`
Valid Usage (Implicit)

• VUID-vkResetEvent-device-parameter
device must be a valid VkDevice handle
• VUID-vkResetEvent-event-parameter
event must be a valid VkEvent handle
• VUID-vkResetEvent-event-parent
  event must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to event must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The state of an event can also be updated on the device by commands inserted in command buffers.

To signal an event from a device, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetEvent2(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```
// Provided by VK_KHR_synchronization2
void vkCmdSetEvent2KHR(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    const VkDependencyInfo* pDependencyInfo);
```

• commandBuffer is the command buffer into which the command is recorded.
• event is the event that will be signaled.
• `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the first scopes of this operation.

When `vkCmdSetEvent2` is submitted to a queue, it defines the first half of memory dependencies defined by `pDependencyInfo`, as well as an event signal operation which sets the event to the signaled state. A memory dependency is defined between the event signal operation and commands that occur earlier in submission order.

The first synchronization scope and access scope are defined by the union of all the memory dependencies defined by `pDependencyInfo`, and are applied to all operations that occur earlier in submission order. Queue family ownership transfers and image layout transitions defined by `pDependencyInfo` are also included in the first scopes.

The second synchronization scope includes only the event signal operation, and any queue family ownership transfers and image layout transitions defined by `pDependencyInfo`.

The second access scope includes only queue family ownership transfers and image layout transitions.

Future `vkCmdWaitEvents2` commands rely on all values of each element in `pDependencyInfo` matching exactly with those used to signal the corresponding event. `vkCmdWaitEvents` must not be used to wait on the result of a signal operation defined by `vkCmdSetEvent2`.

The extra information provided by `vkCmdSetEvent2` compared to `vkCmdSetEvent` allows implementations to more efficiently schedule the operations required to satisfy the requested dependencies. With `vkCmdSetEvent`, the full dependency information is not known until `vkCmdWaitEvents` is recorded, forcing implementations to insert the required operations at that point and not before.

If `event` is already in the signaled state when `vkCmdSetEvent2` is executed on the device, then `vkCmdSetEvent2` has no effect, no event signal operation occurs, and no dependency is generated.

### Valid Usage

- **VUID-vkCmdSetEvent2-synchronization2-03824**  
The synchronization2 feature **must** be enabled

- **VUID-vkCmdSetEvent2-dependencyFlags-03825**  
The `dependencyFlags` member of `pDependencyInfo` **must** be 0

- **VUID-vkCmdSetEvent2-srcStageMask-09391**  
The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdSetEvent2-dstStageMask-09392**  
The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` **must** not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdSetEvent2-commandBuffer-03826**
The current device mask of `commandBuffer` must include exactly one physical device

- **VUID-vkCmdSetEvent2-srcStageMask-03827**
  The `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- **VUID-vkCmdSetEvent2-dstStageMask-03828**
  The `dstStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfo` must only include pipeline stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

### Valid Usage (Implicit)

- **VUID-vkCmdSetEvent2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetEvent2-event-parameter**
  `event` must be a valid `VkEvent` handle.

- **VUID-vkCmdSetEvent2-pDependencyInfo-parameter**
  `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure.

- **VUID-vkCmdSetEvent2-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetEvent2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.

- **VUID-vkCmdSetEvent2-renderpass**
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdSetEvent2-commonparent**
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkDependencyInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDependencyInfo {
    VkStructureType sType;
    const void* pNext;
    VkDependencyFlags dependencyFlags;
    uint32_t memoryBarrierCount;
    const VkMemoryBarrier2* pMemoryBarriers;
    uint32_t bufferMemoryBarrierCount;
    const VkBufferMemoryBarrier2* pBufferMemoryBarriers;
    uint32_t imageMemoryBarrierCount;
    const VkImageMemoryBarrier2* pImageMemoryBarriers;
} VkDependencyInfo;
```

or the equivalent:

```c
// Provided by VK_KHR_synchronization2
typedef VkDependencyInfo VkDependencyInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dependencyFlags` is a bitmask of `VkDependencyFlagBits` specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier2` structures defining memory dependencies between any memory accesses.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier2` structures defining memory dependencies between buffer ranges.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier2` structures defining memory dependencies between image subresources.
This structure defines a set of memory dependencies, as well as queue family ownership transfer operations and image layout transitions.

Each member of pMemoryBarriers, pBufferMemoryBarriers, and pImageMemoryBarriers defines a separate memory dependency.

### Valid Usage (Implicit)

- **VUID-VkDependencyInfo-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_DEPENDENCY_INFO

- **VUID-VkDependencyInfo-pNext-pNext**
  - pNext must be NULL

- **VUID-VkDependencyInfo-dependencyFlags-parameter**
  - dependencyFlags must be a valid combination of VkDependencyFlagBits values

- **VUID-VkDependencyInfo-pMemoryBarriers-parameter**
  - If memoryBarrierCount is not 0, pMemoryBarriers must be a valid pointer to an array of memoryBarrierCount valid VkMemoryBarrier2 structures

- **VUID-VkDependencyInfo-pBufferMemoryBarriers-parameter**
  - If bufferMemoryBarrierCount is not 0, pBufferMemoryBarriers must be a valid pointer to an array of bufferMemoryBarrierCount valid VkBufferMemoryBarrier2 structures

- **VUID-VkDependencyInfo-pImageMemoryBarriers-parameter**
  - If imageMemoryBarrierCount is not 0, pImageMemoryBarriers must be a valid pointer to an array of imageMemoryBarrierCount valid VkImageMemoryBarrier2 structures

To set the state of an event to signaled from a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **event** is the event that will be signaled.
- **stageMask** specifies the source stage mask used to determine the first synchronization scope.

vkCmdSetEvent behaves identically to vkCmdSetEvent2, except that it does not define an access scope, and must only be used with vkCmdWaitEvents, not vkCmdWaitEvents2.

### Valid Usage

- **VUID-vkCmdSetEvent-stageMask-04090**
  - If the geometryShader feature is not enabled, stageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT
If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `synchronization2` feature is not enabled, `stageMask` must not be 0.

If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

`stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`.

The current device mask of `commandBuffer` must include exactly one physical device.

---

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `event` must be a valid `VkEvent` handle.
- `stageMask` must be a valid combination of `VkPipelineStageFlags` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.
- This command must only be called outside of a render pass instance.
- Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Both</td>
<td>Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To unsignal the event from a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResetEvent2(
    VkCommandBuffer commandBuffer,  
    VkEvent event,                  
    VkPipelineStageFlags2 stageMask);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdResetEvent2KHR(
    VkCommandBuffer commandBuffer,  
    VkEvent event,                  
    VkPipelineStageFlags2 stageMask);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsigaled.
- `stageMask` is a `VkPipelineStageFlags2` mask of pipeline stages used to determine the first synchronization scope.

When `vkCmdResetEvent2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and defines an event unsignal operation which resets the event to the unsignaled state.
The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations by stageMask or stages that are logically earlier than stageMask.

The second synchronization scope includes only the event unsignal operation.

If event is already in the unsignaled state when vkCmdResetEvent2 is executed on the device, then this command has no effect, no event unsignal operation occurs, and no execution dependency is generated.

### Valid Usage

- **VUID-vkCmdResetEvent2-stageMask-03929**
  If the geometryShader feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03930**
  If the tessellationShader feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdResetEvent2-stageMask-03933**
  If the transformFeedback feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdResetEvent2-stageMask-07317**
  If the attachmentFragmentShadingRate feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdResetEvent2-stageMask-07947**
  If the rayTracingPipeline feature is not enabled, stageMask must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- **VUID-vkCmdResetEvent2-synchronization2-03829**
  The synchronization2 feature must be enabled

- **VUID-vkCmdResetEvent2-stageMask-03830**
  stageMask must not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdResetEvent2-event-03831**
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents that includes event in its pEvents parameter

- **VUID-vkCmdResetEvent2-event-03832**
  There must be an execution dependency between vkCmdResetEvent2 and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter

- **VUID-vkCmdResetEvent2-commandBuffer-03833**
  commandBuffer’s current device mask must include exactly one physical device
Valid Usage (Implicit)

- VUID-vkCmdResetEvent2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdResetEvent2-event-parameter
  `event` must be a valid `VkEvent` handle
- VUID-vkCmdResetEvent2-stageMask-parameter
  `stageMask` must be a valid combination of `VkPipelineStageFlagBits2` values
- VUID-vkCmdResetEvent2-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdResetEvent2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations
- VUID-vkCmdResetEvent2-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdResetEvent2-commonparent
  Both of `commandBuffer`, and `event` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To set the state of an event to unsignaled from a device, call:
void vkCmdResetEvent(
    VkCommandBuffer commandBuffer,
    VkEvent event,
    VkPipelineStageFlags stageMask);

- `commandBuffer` is the command buffer into which the command is recorded.
- `event` is the event that will be unsignaled.
- `stageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask used to determine when the `event` is unsignaled.

`vkCmdResetEvent` behaves identically to `vkCmdResetEvent2`.

### Valid Usage

- **VUID-vkCmdResetEvent-stageMask-04090**
  If the `geometryShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdResetEvent-stageMask-04091**
  If the `tessellationShader` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdResetEvent-stageMask-04094**
  If the `transformFeedback` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-vkCmdResetEvent-stageMask-07319**
  If the `attachmentFragmentShadingRate` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdResetEvent-stageMask-03937**
  If the `synchronization2` feature is not enabled, `stageMask` must not be 0.

- **VUID-vkCmdResetEvent-stageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `stageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-vkCmdResetEvent-stageMask-06458**
  Any pipeline stage included in `stageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages.

- **VUID-vkCmdResetEvent-stageMask-01153**
  `stageMask` must not include `VK_PIPELINE_STAGE_HOST_BIT`.

- **VUID-vkCmdResetEvent-event-03834**
  There must be an execution dependency between `vkCmdResetEvent` and the execution of any `vkCmdWaitEvents` that includes `event` in its `pEvents` parameter.
• VUID-vkCmdResetEvent-event-03835
  There must be an execution dependency between vkCmdResetEvent and the execution of any vkCmdWaitEvents2 that includes event in its pEvents parameter

• VUID-vkCmdResetEvent-commandBuffer-01157
  commandBuffer’s current device mask must include exactly one physical device

Valid Usage (Implicit)

• VUID-vkCmdResetEvent-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdResetEvent-event-parameter
  event must be a valid VkEvent handle

• VUID-vkCmdResetEvent-stageMask-parameter
  stageMask must be a valid combination of VkPipelineStageFlagBits values

• VUID-vkCmdResetEvent-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdResetEvent-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

• VUID-vkCmdResetEvent-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdResetEvent-commonparent
  Both of commandBuffer, and event must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</table>
To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWaitEvents2(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWaitEvents2KHR(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    const VkDependencyInfo* pDependencyInfos);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of `eventCount` events to wait on.
- `pDependencyInfos` is a pointer to an array of `eventCount` `VkDependencyInfo` structures, defining the second synchronization scope.

When `vkCmdWaitEvents2` is submitted to a queue, it inserts memory dependencies according to the elements of `pDependencyInfos` and each corresponding element of `pEvents`. `vkCmdWaitEvents2` must not be used to wait on event signal operations occurring on other queues, or signal operations executed by `vkCmdSetEvent`.

The first synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred earlier in submission order than the last event signal operation on element `i` of `pEvents`.

Signal operations for an event at index `i` are only included if:

- The event was signaled by a `vkCmdSetEvent2` command that occurred earlier in submission order with a `dependencyInfo` parameter exactly equal to the element of `pDependencyInfos` at index `i`; or
- The event was created without `VK_EVENT_CREATE_DEVICE_ONLY_BIT`, and the first synchronization scope defined by the element of `pDependencyInfos` at index `i` only includes host operations (`VK_PIPELINE_STAGE_2_HOST_BIT`).

The second synchronization scope and access scope of each memory dependency defined by any element `i` of `pDependencyInfos` are applied to operations that occurred later in submission order than `vkCmdWaitEvents2`.
vkCmdWaitEvents2 is used with vkCmdSetEvent2 to define a memory dependency between two sets of action commands, roughly in the same way as pipeline barriers, but split into two commands such that work between the two may execute unhindered.

Applications should be careful to avoid race conditions when using events. There is no direct ordering guarantee between vkCmdSetEvent2 and vkCmdResetEvent2, vkCmdResetEvent, or vkCmdSetEvent. Another execution dependency (e.g. a pipeline barrier or semaphore with VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT) is needed to prevent such a race condition.

**Valid Usage**

- **VUID-vkCmdWaitEvents2-synchronization2-03836**
  The synchronization2 feature must be enabled

- **VUID-vkCmdWaitEvents2-pEvents-03837**
  Members of pEvents must not have been signaled by vkCmdSetEvent

- **VUID-vkCmdWaitEvents2-pEvents-03838**
  For any element i of pEvents, if that event is signaled by vkCmdSetEvent2, that command's dependencyInfo parameter must be exactly equal to the ith element of pDependencyInfos

- **VUID-vkCmdWaitEvents2-pEvents-03839**
  For any element i of pEvents, if that event is signaled by vkSetEvent, barriers in the ith element of pDependencyInfos must include only host operations in their first synchronization scope

- **VUID-vkCmdWaitEvents2-pEvents-03840**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos include only host operations, the ith element of pEvents must be signaled before vkCmdWaitEvents2 is executed

- **VUID-vkCmdWaitEvents2-pEvents-03841**
  For any element i of pEvents, if barriers in the ith element of pDependencyInfos do not include host operations, the ith element of pEvents must be signaled by a corresponding vkCmdSetEvent2 that occurred earlier in submission order

- **VUID-vkCmdWaitEvents2-srcStageMask-03842**
  The srcStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- **VUID-vkCmdWaitEvents2-dstStageMask-03843**
  The dstStageMask member of any element of the pMemoryBarriers, pBufferMemoryBarriers, or pImageMemoryBarriers members of pDependencyInfos must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from

- **VUID-vkCmdWaitEvents2-dependencyFlags-03844**
If `vkCmdWaitEvents2` is being called inside a render pass instance, the `srcStageMask` member of any element of the `pMemoryBarriers`, `pBufferMemoryBarriers`, or `pImageMemoryBarriers` members of `pDependencyInfos` must not include `VK_PIPELINE_STAGE_2_HOST_BIT`

- **VUID-vkCmdWaitEvents2-commandBuffer-03846**
  `commandBuffer`’s current device mask must include exactly one physical device

### Valid Usage (Implicit)

- **VUID-vkCmdWaitEvents2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWaitEvents2-pEvents-parameter**
  `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- **VUID-vkCmdWaitEvents2-pDependencyInfos-parameter**
  `pDependencyInfos` must be a valid pointer to an array of `eventCount` valid `VkDependencyInfo` structures

- **VUID-vkCmdWaitEvents2-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdWaitEvents2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- **VUID-vkCmdWaitEvents2-eventCount-arraylength**
  `eventCount` must be greater than 0

- **VUID-vkCmdWaitEvents2-commonparent**
  Both of `commandBuffer`, and the elements of `pEvents` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

- **VUID-vkCmdWaitEvents2-commandBuffer-03846**
  `commandBuffer`’s current device mask must include exactly one physical device
To wait for one or more events to enter the signaled state on a device, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWaitEvents(
    VkCommandBuffer commandBuffer,
    uint32_t eventCount,
    const VkEvent* pEvents,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `eventCount` is the length of the `pEvents` array.
- `pEvents` is a pointer to an array of event object handles to wait on.
- `srcStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.
- `dstStageMask` is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of `VkMemoryBarrier` structures.
- `bufferMemoryBarrierCount` is the length of the `pBufferMemoryBarriers` array.
- `pBufferMemoryBarriers` is a pointer to an array of `VkBufferMemoryBarrier` structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of `VkImageMemoryBarrier` structures.

`vkCmdWaitEvents` is largely similar to `vkCmdWaitEvents2`, but can only wait on signal operations defined by `vkCmdSetEvent`. As `vkCmdSetEvent` does not define any access scopes, `vkCmdWaitEvents` defines the first access scope for each event signal operation in addition to its own access scopes.

**NOTE** Since `vkCmdSetEvent` does not have any dependency information beyond a stage mask, implementations do not have the same opportunity to perform availability and visibility operations or image layout transitions in advance as they do with `vkCmdSetEvent2` and `vkCmdWaitEvents2`.

When `vkCmdWaitEvents` is submitted to a queue, it defines a memory dependency between prior event signal operations on the same queue or the host, and subsequent commands. `vkCmdWaitEvents` must not be used to wait on event signal operations occurring on other queues.

The first synchronization scope only includes event signal operations that operate on members of `pEvents`, and the operations that happened-before the event signal operations. Event signal operations performed by `vkCmdSetEvent` that occur earlier in submission order are included in the
first synchronization scope, if the logically latest pipeline stage in their stageMask parameter is logically earlier than or equal to the logically latest pipeline stage in srcStageMask. Event signal operations performed by vkSetEvent are only included in the first synchronization scope if VK_PIPELINE_STAGE_HOST_BIT is included in srcStageMask.

The second synchronization scope includes all commands that occur later in submission order. The second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by dstStageMask.

The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by srcStageMask. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

Valid Usage

- VUID-vkCmdWaitEvents-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdWaitEvents-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdWaitEvents-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdWaitEvents-srcStageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdWaitEvents-srcStageMask-03937
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

- VUID-vkCmdWaitEvents-srcStageMask-07950
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdWaitEvents-srcAccessMask-06257
  If the rayQuery feature is not enabled and a memory barrier srcAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except
If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

If the tessellationShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

If the transformFeedback feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

If the attachmentFragmentShadingRate feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If the synchronization2 feature is not enabled, dstStageMask must not be 0

If the rayTracingPipeline feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

If the rayQuery feature is not enabled and a memory barrier dstAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

The srcAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

The dstAccessMask member of each element of pMemoryBarriers must only include access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types

For any element of pBufferMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family
index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02819
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-02820
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types

- VUID-vkCmdWaitEvents-srcStageMask-06459
  Any pipeline stage included in srcStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdWaitEvents-dstStageMask-06460
  Any pipeline stage included in dstStageMask must be supported by the capabilities of the queue family specified by the queueFamilyIndex member of the VkCommandPoolCreateInfo structure that was used to create the VkCommandPool that commandBuffer was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdWaitEvents-srcStageMask-01158
  srcStageMask must be the bitwise OR of the stageMask parameter used in previous calls to vkCmdSetEvent with any of the elements of pEvents and VK_PIPELINE_STAGE_HOST_BIT if any of the elements of pEvents was set using vkSetEvent

- VUID-vkCmdWaitEvents-srcQueueFamilyIndex-02803
  The srcQueueFamilyIndex and dstQueueFamilyIndex members of any element of pBufferMemoryBarriers or pImageMemoryBarriers must be equal

- VUID-vkCmdWaitEvents-commandBuffer-01167
  commandBuffer's current device mask must include exactly one physical device

- VUID-vkCmdWaitEvents-pEvents-03847
  Elements of pEvents must not have been signaled by vkCmdSetEvent2
Valid Usage (Implicit)

- VUID-vkCmdWaitEvents-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWaitEvents-pEvents-parameter
  `pEvents` must be a valid pointer to an array of `eventCount` valid `VkEvent` handles

- VUID-vkCmdWaitEvents-srcStageMask-parameter
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdWaitEvents-dstStageMask-parameter
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- VUID-vkCmdWaitEvents-pMemoryBarriers-parameter
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- VUID-vkCmdWaitEvents-pBufferMemoryBarriers-parameter
  If `bufferMemoryBarrierCount` is not 0, `pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures

- VUID-vkCmdWaitEvents-pImageMemoryBarriers-parameter
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures

- VUID-vkCmdWaitEvents-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWaitEvents-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdWaitEvents-eventCount-arraylength
  `eventCount` must be greater than 0

- VUID-vkCmdWaitEvents-commonparent
  Both of `commandBuffer`, and the elements of `pEvents` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

#### 7.6. Pipeline Barriers

To record a pipeline barrier, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdPipelineBarrier2(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdPipelineBarrier2KHR(
    VkCommandBuffer commandBuffer,
    const VkDependencyInfo* pDependencyInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pDependencyInfo` is a pointer to a `VkDependencyInfo` structure defining the scopes of this operation.

When `vkCmdPipelineBarrier2` is submitted to a queue, it defines memory dependencies between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

The first synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred earlier in submission order.

The second synchronization scope and access scope of each memory dependency defined by `pDependencyInfo` are applied to operations that occurred later in submission order.

If `vkCmdPipelineBarrier2` is recorded within a render pass instance, the synchronization scopes are limited to a subset of operations within the same subpass or render pass instance.
Valid Usage

• VUID-vkCmdPipelineBarrier2-None-07889
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include VK_DEPENDENCY_BY_REGION_BIT if this command does not, does not include VK_DEPENDENCY_VIEW_LOCAL_BIT if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

• VUID-vkCmdPipelineBarrier2-bufferMemoryBarrierCount-01178
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, it must not include any buffer memory barriers.

• VUID-vkCmdPipelineBarrier2-image-04073
  If vkCmdPipelineBarrier2 is called within a render pass instance using a VkRenderPass object, the image member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment.

• VUID-vkCmdPipelineBarrier2-oldLayout-01181
  If vkCmdPipelineBarrier2 is called within a render pass instance, the oldLayout and newLayout members of any image memory barrier included in this command must be equal.

• VUID-vkCmdPipelineBarrier2-srcQueueFamilyIndex-01182
  If vkCmdPipelineBarrier2 is called within a render pass instance, the srcQueueFamilyIndex and dstQueueFamilyIndex members of any memory barrier included in this command must be equal.

• VUID-vkCmdPipelineBarrier2-None-07890
  If vkCmdPipelineBarrier2 is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages.

• VUID-vkCmdPipelineBarrier2-dependencyFlags-07891
  If vkCmdPipelineBarrier2 is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT.

• VUID-vkCmdPipelineBarrier2-None-07892
  If vkCmdPipelineBarrier2 is called within a render pass instance, the source and destination stage masks of any memory barriers must only include graphics pipeline stages.

• VUID-vkCmdPipelineBarrier2-dependencyFlags-01186
  If vkCmdPipelineBarrier2 is called outside of a render pass instance, the dependency flags must not include VK_DEPENDENCY_VIEW_LOCAL_BIT.

• VUID-vkCmdPipelineBarrier2-None-07893
  If vkCmdPipelineBarrier2 is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags must include VK_DEPENDENCY_VIEW_LOCAL_BIT.
If none of the shaderTileImageColorReadAccess, shaderTileImageStencilReadAccess, or shaderTileImageDepthReadAccess features are enabled, and the dynamicRenderingLocalRead feature is not enabled, vkCmdPipelineBarrier2 must not be called within a render pass instance started with vkCmdBeginRendering.

If the dynamicRenderingLocalRead feature is not enabled, and vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, there must be no buffer or image memory barriers specified by this command.

If the dynamicRenderingLocalRead feature is not enabled, and vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, memory barriers specified by this command must only include VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, or VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT in their access masks.

If vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, and the image member of any image memory barrier is used as an attachment in the current render pass instance, it must be in the VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR or VK_IMAGE_LAYOUT_GENERAL layout.

If vkCmdPipelineBarrier2 is called within a render pass instance started with vkCmdBeginRendering, this command must only specify framebuffer-space stages in srcStageMask and dstStageMask.

The synchronization2 feature must be enabled.

The srcStageMask member of any element of the pMemoryBarriers member of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

The dstStageMask member of any element of the pMemoryBarriers member of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

If a buffer or image memory barrier does not specify an acquire operation, the respective srcStageMask member of the element of the pBufferMemoryBarriers or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

If a buffer or image memory barrier does not specify a release operation, the respective dstStageMask member of the element of the pBufferMemoryBarriers or pImageMemoryBarriers members of pDependencyInfo must only include pipeline stages valid for the queue family...
Valid Usage (Implicit)

- VUID-vkCmdPipelineBarrier2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdPipelineBarrier2-pDependencyInfo-parameter
  `pDependencyInfo` must be a valid pointer to a valid `VkDependencyInfo` structure
- VUID-vkCmdPipelineBarrier2-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdPipelineBarrier2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

To record a pipeline barrier, call:
// Provided by VK_VERSION_1_0
void vkCmdPipelineBarrier(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags srcStageMask,
    VkPipelineStageFlags dstStageMask,
    VkDependencyFlags dependencyFlags,
    uint32_t memoryBarrierCount,
    const VkMemoryBarrier* pMemoryBarriers,
    uint32_t bufferMemoryBarrierCount,
    const VkBufferMemoryBarrier* pBufferMemoryBarriers,
    uint32_t imageMemoryBarrierCount,
    const VkImageMemoryBarrier* pImageMemoryBarriers);

- `commandBuffer` is the command buffer into which the command is recorded.
- `srcStageMask` is a bitmask of VkPipelineStageFlagBits specifying the source stages.
- `dstStageMask` is a bitmask of VkPipelineStageFlagBits specifying the destination stages.
- `dependencyFlags` is a bitmask of VkDependencyFlagBits specifying how execution and memory dependencies are formed.
- `memoryBarrierCount` is the length of the `pMemoryBarriers` array.
- `pMemoryBarriers` is a pointer to an array of VkMemoryBarrier structures.
- `bufferMemoryBarrierCount` is the length of the ` pBufferMemoryBarriers` array.
- ` pBufferMemoryBarriers` is a pointer to an array of VkBufferMemoryBarrier structures.
- `imageMemoryBarrierCount` is the length of the `pImageMemoryBarriers` array.
- `pImageMemoryBarriers` is a pointer to an array of VkImageMemoryBarrier structures.

vkCmdPipelineBarrier operates almost identically to vkCmdPipelineBarrier2, except that the scopes and barriers are defined as direct parameters rather than being defined by a VkDependencyInfo.

When `vkCmdPipelineBarrier` is submitted to a queue, it defines a memory dependency between commands that were submitted to the same queue before it, and those submitted to the same queue after it.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the first synchronization scope includes all commands that occur earlier in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the first synchronization scope includes only commands that occur earlier in submission order within the same subpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by `srcStageMask`.

If `vkCmdPipelineBarrier` was recorded outside a render pass instance, the second synchronization scope includes all commands that occur later in submission order. If `vkCmdPipelineBarrier` was recorded inside a render pass instance, the second synchronization scope includes only commands that occur later in submission order within the same subpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by `dstStageMask`. 
The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by srcStageMask. Within that, the first access scope only includes the first access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the first access scope includes no accesses.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by dstStageMask. Within that, the second access scope only includes the second access scopes defined by elements of the pMemoryBarriers, pBufferMemoryBarriers and pImageMemoryBarriers arrays, which each define a set of memory barriers. If no memory barriers are specified, then the second access scope includes no accesses.

If dependencyFlags includes VK_DEPENDENCY_BY_REGION_BIT, then any dependency between framebuffer-space pipeline stages is framebuffer-local - otherwise it is framebuffer-global.

Valid Usage

- VUID-vkCmdPipelineBarrier-srcStageMask-04090
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdPipelineBarrier-srcStageMask-04091
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-vkCmdPipelineBarrier-srcStageMask-04094
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-vkCmdPipelineBarrier-srcStageMask-07319
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdPipelineBarrier-srcStageMask-03937
  If the synchronization2 feature is not enabled, srcStageMask must not be 0

- VUID-vkCmdPipelineBarrier-srcStageMask-07950
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdPipelineBarrier-srcAccessMask-06257
  If the rayQuery feature is not enabled and a memory barrier srcAccessMask includes VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR, srcStageMask must not include any of the VK_PIPELINE_STAGE_*.SHADER_BIT stages except VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

- VUID-vkCmdPipelineBarrier-dstStageMask-04090
  If the geometryShader feature is not enabled, dstStageMask must not contain VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT

- VUID-vkCmdPipelineBarrier-dstStageMask-04091
If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain
`VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or
`VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdPipelineBarrier-dstStageMask-04094
  If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain
  `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdPipelineBarrier-dstStageMask-07319
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain
  `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstStageMask-03937
  If the `synchronization2` feature is not enabled, `dstStageMask` must not be 0

- VUID-vkCmdPipelineBarrier-dstStageMask-07950
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain
  `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-dstAccessMask-06257
  If the `rayQuery` feature is not enabled and a memory barrier
  `dstAccessMask` includes
  `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `dstStageMask` must not include any of the
  `VK_PIPELINE_STAGE_*/SHADER_BIT_KHR` stages except
  `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`

- VUID-vkCmdPipelineBarrier-srcAccessMask-02815
  The `srcAccessMask` member of each element of `pMemoryBarriers` must only include access
  flags that are supported by one or more of the pipeline stages in `srcStageMask`, as specified
  in the table of supported access types

- VUID-vkCmdPipelineBarrier-dstAccessMask-02816
  The `dstAccessMask` member of each element of `pMemoryBarriers` must only include access
  flags that are supported by one or more of the pipeline stages in `dstStageMask`, as specified
  in the table of supported access types

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02817
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and
  `dstQueueFamilyIndex` members are equal, or if its `srcQueueFamilyIndex` is the queue family
  index that was used to create the command pool that `commandBuffer` was allocated from,
  then its `srcAccessMask` member must only contain access flags that are supported by one
  or more of the pipeline stages in `srcStageMask`, as specified in the table of supported access
  types

- VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-02818
  For any element of `pBufferMemoryBarriers`, if its `srcQueueFamilyIndex` and
  `dstQueueFamilyIndex` members are equal, or if its `dstQueueFamilyIndex` is the queue family
  index that was used to create the command pool that `commandBuffer` was allocated from,
  then its `dstAccessMask` member must only contain access flags that are supported by one
  or more of the pipeline stages in `dstStageMask`, as specified in the table of supported access
  types

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02819
  For any element of `pImageMemoryBarriers`, if its `srcQueueFamilyIndex` and
dstQueueFamilyIndex members are equal, or if its srcQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its srcAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in srcStageMask, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-02820
  For any element of pImageMemoryBarriers, if its srcQueueFamilyIndex and dstQueueFamilyIndex members are equal, or if its dstQueueFamilyIndex is the queue family index that was used to create the command pool that commandBuffer was allocated from, then its dstAccessMask member must only contain access flags that are supported by one or more of the pipeline stages in dstStageMask, as specified in the table of supported access types.

- VUID-vkCmdPipelineBarrier-None-07889
  If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, the render pass must have been created with at least one subpass dependency that expresses a dependency from the current subpass to itself, does not include VK_DEPENDENCY_BY_REGION_BIT if this command does not, does not include VK_DEPENDENCY_VIEW_LOCAL_BIT if this command does not, and has synchronization scopes and access scopes that are all supersets of the scopes defined in this command.

- VUID-vkCmdPipelineBarrier-bufferMemoryBarrierCount-01178
  If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, it must not include any buffer memory barriers.

- VUID-vkCmdPipelineBarrier-image-04073
  If vkCmdPipelineBarrier is called within a render pass instance using a VkRenderPass object, the image member of any image memory barrier included in this command must be an attachment used in the current subpass both as an input attachment, and as either a color, or depth/stencil attachment.

- VUID-vkCmdPipelineBarrier-oldLayout-01181
  If vkCmdPipelineBarrier is called within a render pass instance, the oldLayout and newLayout members of any image memory barrier included in this command must be equal.

- VUID-vkCmdPipelineBarrier-srcQueueFamilyIndex-01182
  If vkCmdPipelineBarrier is called within a render pass instance, the srcQueueFamilyIndex and dstQueueFamilyIndex members of any memory barrier included in this command must be equal.

- VUID-vkCmdPipelineBarrier-None-07890
  If vkCmdPipelineBarrier is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, destination stage masks of all memory barriers must only include framebuffer-space stages.

- VUID-vkCmdPipelineBarrier-dependencyFlags-07891
  If vkCmdPipelineBarrier is called within a render pass instance, and the source stage masks of any memory barriers include framebuffer-space stages, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT.

- VUID-vkCmdPipelineBarrier-None-07892
If `vkCmdPipelineBarrier` is called within a render pass instance, the source and destination stage masks of any memory barriers must only include graphics pipeline stages

- VUID-vkCmdPipelineBarrier-dependencyFlags-01186
  If `vkCmdPipelineBarrier` is called outside of a render pass instance, the dependency flags must not include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-07893
  If `vkCmdPipelineBarrier` is called inside a render pass instance, and there is more than one view in the current subpass, dependency flags must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`

- VUID-vkCmdPipelineBarrier-None-09553
  If none of the `shaderTileImageColorReadAccess`, `shaderTileImageStencilReadAccess`, or `shaderTileImageDepthReadAccess` features are enabled, and the `dynamicRenderingLocalRead` feature is not enabled, `vkCmdPipelineBarrier` must not be called within a render pass instance started with `vkCmdBeginRendering`

- VUID-vkCmdPipelineBarrier-None-09554
  If the `dynamicRenderingLocalRead` feature is not enabled, and `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, there must be no buffer or image memory barriers specified by this command

- VUID-vkCmdPipelineBarrier-None-09555
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, memory barriers specified by this command must only include `VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT`, `VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT`, `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT`, or `VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT` in their access masks

- VUID-vkCmdPipelineBarrier-image-09556
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, and the `image` member of any image memory barrier is used as an attachment in the current render pass instance, it must be in the `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` or `VK_IMAGE_LAYOUT_GENERAL` layout

- VUID-vkCmdPipelineBarrier-srcStageMask-09557
  If `vkCmdPipelineBarrier` is called within a render pass instance started with `vkCmdBeginRendering`, this command must only specify framebuffer-space stages in `srcStageMask` and `dstStageMask`

- VUID-vkCmdPipelineBarrier-srcStageMask-09558
  Any pipeline stage included in `srcStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdPipelineBarrier-dstStageMask-09559
  Any pipeline stage included in `dstStageMask` must be supported by the capabilities of the queue family specified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` structure that was used to create the `VkCommandPool` that `commandBuffer` was allocated from, as specified in the table of supported pipeline stages

- VUID-vkCmdPipelineBarrier-srcStageMask-09633
  If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any
element of `pImageMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal

- **VUID-vkCmdPipelineBarrier-srcStageMask-09634**
  If either `srcStageMask` or `dstStageMask` includes `VK_PIPELINE_STAGE_HOST_BIT`, for any element of `pBufferMemoryBarriers`, `srcQueueFamilyIndex` and `dstQueueFamilyIndex` must be equal

**Valid Usage (Implicit)**

- **VUID-vkCmdPipelineBarrier-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdPipelineBarrier-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdPipelineBarrier-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values

- **VUID-vkCmdPipelineBarrier-dependencyFlags-parameter**
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values

- **VUID-vkCmdPipelineBarrier-pMemoryBarriers-parameter**
  If `memoryBarrierCount` is not 0, `pMemoryBarriers` must be a valid pointer to an array of `memoryBarrierCount` valid `VkMemoryBarrier` structures

- **VUID-vkCmdPipelineBarrier-pBufferMemoryBarriers-parameter**
  If `bufferMemoryBarrierCount` is not 0, ` pBufferMemoryBarriers` must be a valid pointer to an array of `bufferMemoryBarrierCount` valid `VkBufferMemoryBarrier` structures

- **VUID-vkCmdPipelineBarrier-pImageMemoryBarriers-parameter**
  If `imageMemoryBarrierCount` is not 0, `pImageMemoryBarriers` must be a valid pointer to an array of `imageMemoryBarrierCount` valid `VkImageMemoryBarrier` structures

- **VUID-vkCmdPipelineBarrier-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdPipelineBarrier-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Both</td>
<td>Transfer, Graphics, Compute, Decode, Encode</td>
<td>Synchronization</td>
</tr>
</tbody>
</table>

Bits which **can** be set in `vkCmdPipelineBarrier::dependencyFlags`, specifying how execution and memory dependencies are formed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDependencyFlagBits {
    VK_DEPENDENCY_BY_REGION_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_DEVICE_GROUP_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_DEPENDENCY_VIEW_LOCAL_BIT = 0x00000002,
    // Provided by VK_EXT_attachment_feedback_loop_layout
    VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT = 0x00000008,
    // Provided by VK_KHR_multiview
    VK_DEPENDENCY_VIEW_LOCAL_BIT_KHR = VK_DEPENDENCY_VIEW_LOCAL_BIT,
    // Provided by VK_KHR_device_group
    VK_DEPENDENCY_DEVICE_GROUP_BIT_KHR = VK_DEPENDENCY_DEVICE_GROUP_BIT,
} VkDependencyFlagBits;
```

- `VK_DEPENDENCY_BY_REGION_BIT` specifies that dependencies will be framebuffer-local.
- `VK_DEPENDENCY_VIEW_LOCAL_BIT` specifies that dependencies will be view-local.
- `VK_DEPENDENCY_DEVICE_GROUP_BIT` specifies that dependencies are non-device-local.
- `VK_DEPENDENCY_FEEDBACK_LOOP_BIT_EXT` specifies that the render pass will write to and read from the same image using the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDependencyFlags;
```

`VkDependencyFlags` is a bitmask type for setting a mask of zero or more `VkDependencyFlagBits`.

### 7.7. Memory Barriers

`Memory barriers` are used to explicitly control access to buffer and image subresource ranges. Memory barriers are used to transfer ownership between queue families, change image layouts,
and define availability and visibility operations. They explicitly define the access types and buffer and image subresource ranges that are included in the access scopes of a memory dependency that is created by a synchronization command that includes them.

### 7.7.1. Global Memory Barriers

Global memory barriers apply to memory accesses involving all memory objects that exist at the time of its execution.

The VkMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
} VkMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkMemoryBarrier2KHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.
- **srcAccessMask** is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- **dstStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- **dstAccessMask** is a VkAccessFlags2 mask of access flags to be included in the second access scope.

This structure defines a memory dependency affecting all device memory.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by srcStageMask and srcAccessMask.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by dstStageMask and dstAccessMask.
Valid Usage

- VUID-VkMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or
  VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkMemoryBarrier2-srcStageMask-03933
  If the transformFeedback feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkMemoryBarrier2-srcStageMask-07317
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkMemoryBarrier2-srcStageMask-07947
  If the rayTracingPipeline feature is not enabled, srcStageMask must not contain
  VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkMemoryBarrier2-srcAccessMask-03900
  If srcAccessMask includes VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03901
  If srcAccessMask includes VK_ACCESS_2_INDEX_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03902
  If srcAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03903
  If srcAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03904
  If srcAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03905
  If srcAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03906
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03907
  If srcAccessMask includes VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of
  the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-07454
  If srcAccessMask includes VK_ACCESS_2_SHADER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03909
  If srcAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
  VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkMemoryBarrier2-srcAccessMask-03910
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03911
  If srcAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03912
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03913
  If srcAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT,
  VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or
  VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkMemoryBarrier2-srcAccessMask-03914
  If srcAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, srcStageMask must include
  VK_PIPELINE_STAGE_2_COPY_BIT,
  VK_PIPELINE_STAGE_2_BLIT_BIT,
  VK_PIPELINE_STAGE_2_RESOLVE_BIT,
  VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR,
  VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR,
If srcAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

If srcAccessMask includes VK_ACCESS_2_HOST_READ_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_HOST_BIT

If srcAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, srcStageMask must include
VK_PIPELINE_STAGE_2_HOST_BIT

Valid Usage (Implicit)

- VUID-VkMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_BARRIER_2

- VUID-VkMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

The VkMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
} VkMemoryBarrier;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcAccessMask` is a bitmask of VkAccessFlagBits specifying a source access mask.
- `dstAccessMask` is a bitmask of VkAccessFlagBits specifying a destination access mask.

The first access scope is limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to access types in the destination access mask specified by `dstAccessMask`. 
Valid Usage (Implicit)

- VUID-VkMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_BARRIER

- VUID-VkMemoryBarrier-pNext-pNext
  pNext must be NULL

- VUID-VkMemoryBarrier-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits values

- VUID-VkMemoryBarrier-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits values

7.7.2. Buffer Memory Barriers

Buffer memory barriers only apply to memory accesses involving a specific buffer range. That is, a memory dependency formed from a buffer memory barrier is scoped to access via the specified buffer range. Buffer memory barriers can also be used to define a queue family ownership transfer for the specified buffer range.

The VkBufferMemoryBarrier2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier2;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkBufferMemoryBarrier2 VkBufferMemoryBarrier2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcStageMask is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first synchronization scope.
• **srcAccessMask** is a *VkAccessFlags2* mask of access flags to be included in the *first access scope*.
• **dstStageMask** is a *VkPipelineStageFlags2* mask of pipeline stages to be included in the *second synchronization scope*.
• **dstAccessMask** is a *VkAccessFlags2* mask of access flags to be included in the *second access scope*.
• **srcQueueFamilyIndex** is the source queue family for a *queue family ownership transfer*.
• **dstQueueFamilyIndex** is the destination queue family for a *queue family ownership transfer*.
• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.
• **offset** is an offset in bytes into the backing memory for **buffer**; this is relative to the base offset as bound to the buffer (see *vkBindBufferMemory*).
• **size** is a size in bytes of the affected area of backing memory for **buffer**, or **VK_WHOLE_SIZE** to use the range from **offset** to the end of the buffer.

This structure defines a **memory dependency** limited to a range of a buffer, and can define a *queue family ownership transfer operation* for that range.

The first **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second **synchronization scope** and **access scope** described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both **access scopes** are limited to only memory accesses to **buffer** in the range defined by **offset** and **size**.

If **buffer** was created with **VK_SHARING_MODE_EXCLUSIVE**, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory barrier defines a *queue family ownership transfer operation*. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a *queue family release operation* for the specified buffer range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this barrier defines a *queue family acquire operation* for the specified buffer range, and the first synchronization scope does not apply to this operation.

A *queue family ownership transfer operation* is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in *Queue Family Ownership Transfer*. A *queue family release operation* is defined when **dstQueueFamilyIndex** is one of those values, and a *queue family acquire operation* is defined when **srcQueueFamilyIndex** is one of those values.

### Valid Usage

• **VUID-VkBufferMemoryBarrier2-srcStageMask-03929**
  If the **geometryShader** feature is not enabled, **srcStageMask** must not contain **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

• **VUID-VkBufferMemoryBarrier2-srcStageMask-03930**
  If the **tessellationShader** feature is not enabled, **srcStageMask** must not contain **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** or
If the `transformFeedback` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `rayTracingPipeline` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`.

If `srcAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT`, `VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`.

If `srcAccessMask` includes `VK_ACCESS_2_UNIFORM_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_SAMPLED_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_READ_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER Bit stages`.

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages.

If `srcAccessMask` includes `VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT`, `srcStageMask`
  must include `VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask`
  must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`, or one of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages

If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

If `srcAccessMask` includes `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT` or `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

If `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

If the `rayQuery` feature is not enabled and `srcAccessMask` includes `VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, `srcStageMask` must not include any of the `VK_PIPELINE_STAGE_*_SHADER_BIT` stages except `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`
If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04859
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04860
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-04861
  If `srcAccessMask` includes `VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07457
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-srcAccessMask-07458
  If `srcAccessMask` includes `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`, `srcStageMask` must include `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` or `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03929
  If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03930
  If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-03933
  If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-VkBufferMemoryBarrier2-dstStageMask-07317
  If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstStageMask-07947
  If the `rayTracingPipeline` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03900
  If `dstAccessMask` includes `VK_ACCESS_2_INDIRECT_COMMAND_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT`, `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR`, `VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT`, or `VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT`

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03901
  If `dstAccessMask` includes `VK_ACCESS_2_INDEX_READ_BIT`, `dstStageMask` must include `VK_PIPELINE_STAGE_2_INDEX_INPUT_BIT`, `VK_PIPELINE_STAGE_2_VERTEX_INPUT_BIT`, \ldots
• VUID-VkBufferMemoryBarrier2-dstAccessMask-03902
  If dstAccessMask includes VK_ACCESS_2_VERTEX_ATTRIBUTE_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_VERTEX_ATTRIBUTE_INPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03903
  If dstAccessMask includes VK_ACCESS_2_INPUT_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_FRAGMENT_SHADER_BIT, VK_PIPELINE_STAGE_2_SUBPASS_SHADER_BIT_HUAWEI, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03904
  If dstAccessMask includes VK_ACCESS_2_UNIFORM_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03905
  If dstAccessMask includes VK_ACCESS_2_SHADER_SAMPLED_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03906
  If dstAccessMask includes VK_ACCESS_2_SHADER_STORAGE_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03907
  If dstAccessMask includes VK_ACCESS_2_SHADER_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03908
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03909
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03910
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03912
  If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03913
  If dstAccessMask includes VK_ACCESS_2_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_EARLY_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_LATE_FRAGMENT_TESTS_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03914
  If dstAccessMask includes VK_ACCESS_2_TRANSFER_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03915
  If dstAccessMask includes VK_ACCESS_2_TRANSFER_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_COPY_BIT, VK_PIPELINE_STAGE_2_BLIT_BIT, VK_PIPELINE_STAGE_2_RESOLVE_BIT, VK_PIPELINE_STAGE_2_CLEAR_BIT, VK_PIPELINE_STAGE_2_ALL_TRANSFER_BIT, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, or VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03916
  If dstAccessMask includes VK_ACCESS_2_HOST_READ_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03917
  If dstAccessMask includes VK_ACCESS_2_HOST_WRITE_BIT, dstStageMask must include VK_PIPELINE_STAGE_2_HOST_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03920
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_WRITE_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-04747
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2政权_STAGE_2_TRANSFORM_FEEDBACK_COUNTER_READ_BIT_EXT, VK_PIPELINE_STAGE_2_DRAW_INDIRECT_BIT, VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

• VUID-VkBufferMemoryBarrier2-dstAccessMask-03922
  If dstAccessMask includes VK_ACCESS_2_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT,
VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03926
  If dstAccessMask includes VK_ACCESS_2_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_COLOR_ATTACHMENT_OUTPUT_BIT, VK_PIPELINE_STAGE_2_ALL_GRAPHICS_BIT, or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03927
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT, or one of the VK_PIPELINE_STAGE_*_SHADER_BIT stages

- VUID-VkBufferMemoryBarrier2-dstAccessMask-03928
  If dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR, VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR or VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-06256
  If the rayQuery feature is not enabled and dstAccessMask includes VK_ACCESS_2_ACCELERATION_STRUCTURE_READ_BIT_KHR, dstStageMask must not include any of the VK_PIPELINE_STAGE_*_SHADER_BIT stages except VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-07272
  If dstAccessMask includes VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_ALL_COMMANDS_BIT or VK_PIPELINE_STAGE_2_RAY_TRACING_SHADER_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04858
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04859
  If dstAccessMask includes VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04860
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-04861
  If dstAccessMask includes VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR, dstStageMask must include VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR

- VUID-VkBufferMemoryBarrier2-dstAccessMask-07457
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT

- VUID-VkBufferMemoryBarrier2-dstAccessMask-07458
  If dstAccessMask includes VK_ACCESS_2_MICROMAP_READ_BIT_EXT, dstStageMask must include VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT or
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_BUILD_BIT_KHR

- VUID-VkBufferMemoryBarrier2-offset-01187
  offset must be less than the size of buffer

- VUID-VkBufferMemoryBarrier2-size-01188
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0

- VUID-VkBufferMemoryBarrier2-size-01189
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to than the size of buffer minus offset

- VUID-VkBufferMemoryBarrier2-buffer-01931
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkBufferMemoryBarrier2-buffer-09095
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkBufferMemoryBarrier2-buffer-09096
  If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkBufferMemoryBarrier2-srcStageMask-03851
  If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal
Valid Usage (Implicit)

- VUID-VkBufferMemoryBarrier2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER_2

- VUID-VkBufferMemoryBarrier2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkExternalMemoryAcquireUnmodifiedEXT

- VUID-VkBufferMemoryBarrier2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferMemoryBarrier2-srcStageMask-parameter
  srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkBufferMemoryBarrier2-srcAccessMask-parameter
  srcAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkBufferMemoryBarrier2-dstStageMask-parameter
  dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-VkBufferMemoryBarrier2-dstAccessMask-parameter
  dstAccessMask must be a valid combination of VkAccessFlagBits2 values

- VUID-VkBufferMemoryBarrier2-buffer-parameter
  buffer must be a valid VkBuffer handle

The VkBufferMemoryBarrier structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferMemoryBarrier {
    VkStructureType sType;
    const void* pNext;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkBufferMemoryBarrier;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of VkAccessFlagBits specifying a source access mask.
- **dstAccessMask** is a bitmask of VkAccessFlagBits specifying a destination access mask.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
• **buffer** is a handle to the buffer whose backing memory is affected by the barrier.

• **offset** is an offset in bytes into the backing memory for *buffer*; this is relative to the base offset as bound to the buffer (see *vkBindBufferMemory*).

• **size** is a size in bytes of the affected area of backing memory for *buffer*, or *VK_WHOLE_SIZE* to use the range from *offset* to the end of the buffer.

The first **access scope** is limited to access to memory through the specified buffer range, via access types in the **source access mask** specified by *srcAccessMask*. If *srcAccessMask* includes *VK_ACCESS_HOST_WRITE_BIT*, a memory domain operation is performed where available memory in the host domain is also made available to the device domain.

The second **access scope** is limited to access to memory through the specified buffer range, via access types in the **destination access mask** specified by *dstAccessMask*. If *dstAccessMask* includes *VK_ACCESS_HOST_WRITE_BIT* or *VK_ACCESS_HOST_READ_BIT*, a memory domain operation is performed where available memory in the device domain is also made available to the host domain.

**NOTE**

When *VK_MEMORY_PROPERTY_HOST_COHERENT_BIT* is used, available memory in host domain is automatically made visible to host domain, and any host write is automatically made available to host domain.

If *srcQueueFamilyIndex* is not equal to *dstQueueFamilyIndex*, and *srcQueueFamilyIndex* is equal to the current queue family, then the memory barrier defines a **queue family release operation** for the specified buffer range, and the second synchronization scope of the calling command does not apply to this operation.

If *dstQueueFamilyIndex* is not equal to *srcQueueFamilyIndex*, and *dstQueueFamilyIndex* is equal to the current queue family, then the memory barrier defines a **queue family acquire operation** for the specified buffer range, and the first synchronization scope of the calling command does not apply to this operation.

### Valid Usage

- **VUID-VkBufferMemoryBarrier-offset-01187**
  
  *offset* must be less than the size of *buffer*

- **VUID-VkBufferMemoryBarrier-size-01188**
  
  If *size* is not equal to *VK_WHOLE_SIZE*, *size* must be greater than 0

- **VUID-VkBufferMemoryBarrier-size-01189**
  
  If *size* is not equal to *VK_WHOLE_SIZE*, *size* must be less than or equal to than the size of *buffer* minus *offset*

- **VUID-VkBufferMemoryBarrier-buffer-01931**
  
  If *buffer* is non-sparse then it must be bound completely and contiguously to a single *VkDeviceMemory* object

- **VUID-VkBufferMemoryBarrier-buffer-09095**
  
  If *buffer* was created with a sharing mode of *VK_SHARING_MODE_EXCLUSIVE*, and *srcQueueFamilyIndex* and *dstQueueFamilyIndex* are not equal, *srcQueueFamilyIndex* must be *VK_QUEUE_FAMILY_EXTERNAL*, *VK_QUEUE_FAMILY_FOREIGN_EXT*, or a valid queue family
If buffer was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT.

If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL.

If the VK_EXT_queue_family_foreign extension is not enabled, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

If the VK_EXT_queue_family_foreign extension is not enabled, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED.

If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL.

If the synchronization2 feature is not enabled, and buffer was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_BUFFER_MEMORY_BARRIER

pNext must be NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT
The sType value of each struct in the pNext chain must be unique

- VUID-VkBufferMemoryBarrier-buffer-parameter
  buffer must be a valid VkBuffer handle

VK_WHOLE_SIZE is a special value indicating that the entire remaining length of a buffer following a given offset should be used. It can be specified for VkBufferMemoryBarrier::size and other structures.

#define VK_WHOLE_SIZE (~0ULL)

7.7.3. Image Memory Barriers

Image memory barriers only apply to memory accesses involving a specific image subresource range. That is, a memory dependency formed from an image memory barrier is scoped to access via the specified image subresource range. Image memory barriers can also be used to define image layout transitions or a queue family ownership transfer for the specified image subresource range.

The VkImageMemoryBarrier2 structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkImageMemoryBarrier2 {
    VkStructureType sType;
    const void* pNext;
    VkPipelineStageFlags2 srcStageMask;
    VkAccessFlags2 srcAccessMask;
    VkPipelineStageFlags2 dstStageMask;
    VkAccessFlags2 dstAccessMask;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    uint32_t srcQueueFamilyIndex;
    uint32_t dstQueueFamilyIndex;
    VkImage image;
    VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier2;
```

or the equivalent

```
// Provided by VK_KHR_synchronization2
typedef VkImageMemoryBarrier2 VkImageMemoryBarrier2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcStageMask is a VkPipelineStageFlags2 mask of pipeline stages to be included in the first
synchronization scope.

- **srcAccessMask** is a VkAccessFlags2 mask of access flags to be included in the first access scope.
- **dstStageMask** is a VkPipelineStageFlags2 mask of pipeline stages to be included in the second synchronization scope.
- **dstAccessMask** is a VkAccessFlags2 mask of access flags to be included in the second access scope.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

This structure defines a memory dependency limited to an image subresource range, and can define a queue family ownership transfer operation and image layout transition for that subresource range.

The first synchronization scope and access scope described by this structure include only operations and memory accesses specified by **srcStageMask** and **srcAccessMask**.

The second synchronization scope and access scope described by this structure include only operations and memory accesses specified by **dstStageMask** and **dstAccessMask**.

Both access scopes are limited to only memory accesses to **image** in the subresource range defined by **subresourceRange**.

If **image** was created with VK_SHARING_MODE_EXCLUSIVE, and **srcQueueFamilyIndex** is not equal to **dstQueueFamilyIndex**, this memory barrier defines a queue family ownership transfer operation. When executed on a queue in the family identified by **srcQueueFamilyIndex**, this barrier defines a queue family release operation for the specified image subresource range, and the second synchronization scope does not apply to this operation. When executed on a queue in the family identified by **dstQueueFamilyIndex**, this barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization, the first synchronization scope does not apply to this operation.

A queue family ownership transfer operation is also defined if the values are not equal, and either is one of the special queue family values reserved for external memory ownership transfers, as described in Queue Family Ownership Transfer. A queue family release operation is defined when **dstQueueFamilyIndex** is one of those values, and a queue family acquire operation is defined when **srcQueueFamilyIndex** is one of those values.

If **oldLayout** is not equal to **newLayout**, then the memory barrier defines an image layout transition for the specified image subresource range. If this memory barrier defines a queue family ownership transfer operation, the layout transition is only executed once between the queues.

**NOTE** When the old and new layout are equal, the layout values are ignored - data is
preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

- VUID-VkImageMemoryBarrier2-srcStageMask-03929
  If the geometryShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-03930
  If the tessellationShader feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT

- VUID-VkImageMemoryBarrier2-srcStageMask-03933
  If the transformFeedback feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT

- VUID-VkImageMemoryBarrier2-srcStageMask-07317
  If the attachmentFragmentShadingRate feature is not enabled, srcStageMask must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageMemoryBarrier2-srcStageMask-07947

• VUID-VkImageMemoryBarrier2-oldLayout-01208
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier2-oldLayout-01209
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier2-oldLayout-01210
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier2-oldLayout-01211
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT

• VUID-VkImageMemoryBarrier2-oldLayout-01212
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

• VUID-VkImageMemoryBarrier2-oldLayout-01213
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `oldLayout` must be VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources affected by the barrier.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, `newLayout` must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set.
If the synchronization feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier2-synchronization2-07794
  If the synchronization feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier2-oldLayout-02088
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier2-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09121
  If the VK_EXT_queue_family_foreign extension is not enabled, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT

- VUID-VkImageMemoryBarrier2-None-09119
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier2-None-09120
  If the VK_KHR_external_memory extension is not enabled, and the value of VkApplicationInfo::apiVersion used to create the VkInstance is not greater than or equal to Version 1.1, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier2-srcQueueFamilyIndex-09121
  If the VK_EXT_queue_family_foreign extension is not enabled srcQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT
If the VK_EXT_queue_family_foreign extension is not enabled, dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_FOREIGN_EXT.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR then image must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR.

If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then image must have been created with either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage bits, and the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits, and the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit.

If the attachmentFeedbackLoopLayout feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT.
If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then `image` must have been created with either `VK_IMAGE_USAGE_STORAGE_BIT`, or with both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If the `dynamicRenderingLocalRead` feature is not enabled, `oldLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

If the `dynamicRenderingLocalRead` feature is not enabled, `newLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

`subresourceRange.baseMipLevel` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

If `subresourceRange.levelCount` is not `VK_REMAINING_MIP_LEVELS`, `subresourceRange.baseMipLevel + subresourceRange.levelCount` must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

`subresourceRange.baseArrayLayer` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

If `image` has a color format that is single-plane, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If `image` has a color format and is not disjoint, then the `aspectMask` member of `subresourceRange` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If `image` has a multi-planar format and the image is disjoint, then the `aspectMask` member of `subresourceRange` must include at least one multi-planar aspect mask bit or `VK_IMAGE_ASPECT_COLOR_BIT`.

If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is not enabled, then the `aspectMask` member of `subresourceRange` must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and
If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT.

If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL.

subresourceRange.aspectMask must be valid for the format the image was created with.

If either srcStageMask or dstStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, srcQueueFamilyIndex and dstQueueFamilyIndex must be equal.

If srcStageMask includes VK_PIPELINE_STAGE_2_HOST_BIT, and srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be one of VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_UNDEFINED, or VK_IMAGE_LAYOUT_GENERAL.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER_2.

Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryAcquireUnmodifiedEXT or VkSampleLocationsInfoEXT.

The sType value of each struct in the pNext chain must be unique.

srcStageMask must be a valid combination of VkPipelineStageFlagBits2 values.

dstStageMask must be a valid combination of VkPipelineStageFlagBits2 values.
The `VkImageMemoryBarrier` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageMemoryBarrier {
  VkStructureType sType;
  const void*pNext;
  VkAccessFlags srcAccessMask;
  VkAccessFlags dstAccessMask;
  VkImageLayout oldLayout;
  VkImageLayout newLayout;
  uint32_t srcQueueFamilyIndex;
  uint32_t dstQueueFamilyIndex;
  VkImage image;
  VkImageSubresourceRange subresourceRange;
} VkImageMemoryBarrier;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.
- **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.
- **oldLayout** is the old layout in an image layout transition.
- **newLayout** is the new layout in an image layout transition.
- **srcQueueFamilyIndex** is the source queue family for a queue family ownership transfer.
- **dstQueueFamilyIndex** is the destination queue family for a queue family ownership transfer.
- **image** is a handle to the image affected by this barrier.
- **subresourceRange** describes the image subresource range within image that is affected by this barrier.

The first access scope is limited to access to memory through the specified image subresource range, via access types in the source access mask specified by **srcAccessMask**. If **srcAccessMask** includes `VK_ACCESS_HOST_WRITE_BIT`, memory writes performed by that access type are also made visible, as that access type is not performed through a resource.
The second access scope is limited to access to memory through the specified image subresource range, via access types in the destination access mask specified by dstAccessMask. If dstAccessMask includes VK_ACCESS_HOST_WRITE_BIT or VK_ACCESS_HOST_READ_BIT, available memory writes are also made visible to accesses of those types, as those access types are not performed through a resource.

If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, and srcQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family release operation for the specified image subresource range, and the second synchronization scope of the calling command does not apply to this operation.

If dstQueueFamilyIndex is not equal to srcQueueFamilyIndex, and dstQueueFamilyIndex is equal to the current queue family, then the memory barrier defines a queue family acquire operation for the specified image subresource range, and the first synchronization scope of the calling command does not apply to this operation.

If the synchronization2 feature is not enabled or oldLayout is not equal to newLayout, oldLayout and newLayout define an image layout transition for the specified image subresource range.

NOTE

If the synchronization2 feature is enabled, when the old and new layout are equal, the layout values are ignored - data is preserved no matter what values are specified, or what layout the image is currently in.

If image has a multi-planar format and the image is disjoint, then including VK_IMAGE_ASPECT_COLOR_BIT in the aspectMask member of subresourceRange is equivalent to including VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, and (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

- VUID-VkImageMemoryBarrier-oldLayout-01208
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01209
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01210
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01211
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is
VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01212
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01213
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then image must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01197
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, oldLayout must be VK_IMAGE_LAYOUT_UNDEFINED or the current layout of the image subresources affected by the barrier

- VUID-VkImageMemoryBarrier-newLayout-01198
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, newLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkImageMemoryBarrier-oldLayout-01658
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-01659
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04065
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04066
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04067
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer
or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04068
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL then image must have been created with VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT set

- VUID-VkImageMemoryBarrier-synchronization2-07793
  If the synchronization2 feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier-synchronization2-07794
  If the synchronization2 feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03938
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL, image must have been created with VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-03939
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL, image must have been created with at least one of VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, VK_IMAGE_USAGE_SAMPLED_BIT, or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkImageMemoryBarrier-oldLayout-02088
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR then image must have been created with VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR set

- VUID-VkImageMemoryBarrier-image-09117
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier-image-09118
  If image was created with a sharing mode of VK_SHARING_MODE_EXCLUSIVE, and srcQueueFamilyIndex and dstQueueFamilyIndex are not equal, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_EXTERNAL, VK_QUEUE_FAMILY_FOREIGN_EXT, or a valid queue family

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-04070
  If srcQueueFamilyIndex is not equal to dstQueueFamilyIndex, at least one of srcQueueFamilyIndex or dstQueueFamilyIndex must not be VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT

- VUID-VkImageMemoryBarrier-None-09119
If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-None-09120
  If the `VK_KHR_external_memory` extension is not enabled, and the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is not greater than or equal to Version 1.1, `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09121
  If the `VK_KHR_external_memory` extension is not enabled `srcQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-dstQueueFamilyIndex-09122
  If the `VK_KHR_external_memory` extension is not enabled `dstQueueFamilyIndex` must not be `VK_QUEUE_FAMILY_EXTERNAL`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07120
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07121
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07122
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07123
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07124
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07125
  If `srcQueueFamilyIndex` and `dstQueueFamilyIndex` define a queue family ownership transfer or `oldLayout` and `newLayout` define an image layout transition, and `oldLayout` or `newLayout` is `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` then image must have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`

- VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-07006
If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then image must have been created with either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT usage bits, and the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits, and the VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT usage bit.

• VUID-VkImageMemoryBarrier-attachmentFeedbackLoopLayout-07313
  If the attachmentFeedbackLoopLayout feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT
  
• VUID-VkImageMemoryBarrier-srcQueueFamilyIndex-09550
  If srcQueueFamilyIndex and dstQueueFamilyIndex define a queue family ownership transfer or oldLayout and newLayout define an image layout transition, and oldLayout or newLayout is VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR then image must have been created with either VK_IMAGE_USAGE_STORAGE_BIT, or with both VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

• VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09551
  If the dynamicRenderingLocalRead feature is not enabled, oldLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkImageMemoryBarrier-dynamicRenderingLocalRead-09552
  If the dynamicRenderingLocalRead feature is not enabled, newLayout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkImageMemoryBarrier-subresourceRange-01486
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01724
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-subresourceRange-01725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageMemoryBarrier-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkImageMemoryBarrier-image-09241
  If image has a color format that is single-plane, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-VkImageMemoryBarrier-image-09242
If image has a color format and is not disjoint, then the aspectMask member of subresourceRange must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-01672
  If image has a multi-planar format and the image is disjoint, then the aspectMask member of subresourceRange must include at least one multi-planar aspect mask bit or VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageMemoryBarrier-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is not enabled, then the aspectMask member of subresourceRange must include both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-image-03319
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayouts feature is enabled, then the aspectMask member of subresourceRange must include either or both VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageMemoryBarrier-aspectMask-08702
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_DEPTH_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-aspectMask-08703
  If the aspectMask member of subresourceRange includes VK_IMAGE_ASPECT_STENCIL_BIT, oldLayout and newLayout must not be one of VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL

- VUID-VkImageMemoryBarrier-subresourceRange-09601
  subresourceRange.aspectMask must be valid for the format the image was created with

- VUID-VkImageMemoryBarrier-None-09052
  If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, at least one of srcQueueFamilyIndex and dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED

- VUID-VkImageMemoryBarrier-None-09053
  If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, srcQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

- VUID-VkImageMemoryBarrier-None-09054
  If the synchronization2 feature is not enabled, and image was created with a sharing mode of VK_SHARING_MODE_CONCURRENT, dstQueueFamilyIndex must be VK_QUEUE_FAMILY_IGNORED or VK_QUEUE_FAMILY_EXTERNAL

**Valid Usage (Implicit)**

- VUID-VkImageMemoryBarrier-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_BARRIER
To facilitate usage of images whose memory is initialized on the host, Vulkan allows image layout transitions to be performed by the host as well, albeit supporting limited layouts.

To perform an image layout transition on the host, call:

```c
// Provided by VK_EXT_host_image_copy
VkResult vkTransitionImageLayoutEXT(
    VkDevice device,
    uint32_t transitionCount,
    const VkHostImageLayoutTransitionInfoEXT* pTransitions);
```

- `device` is the device which owns `pTransitions[i].image`.
- `transitionCount` is the number of image layout transitions to perform.
- `pTransitions` is a pointer to an array of `VkHostImageLayoutTransitionInfoEXT` structures specifying the image and subresource ranges within them to transition.

**Valid Usage (Implicit)**

- VUID-vkTransitionImageLayoutEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkTransitionImageLayoutEXT-pTransitions-parameter
  `pTransitions` must be a valid pointer to an array of `transitionCount` valid `VkHostImageLayoutTransitionInfoEXT` structures

- VUID-vkTransitionImageLayoutEXT-transitionCount-arraylength
  `transitionCount` must be greater than 0
### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_MEMORY_MAP_FAILED

The `VkHostImageLayoutTransitionInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageLayoutTransitionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkImageLayout oldLayout;
    VkImageLayout newLayout;
    VkImageSubresourceRange subresourceRange;
} VkHostImageLayoutTransitionInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is a handle to the image affected by this layout transition.
- `oldLayout` is the old layout in an image layout transition.
- `newLayout` is the new layout in an image layout transition.
- `subresourceRange` describes the image subresource range within `image` that is affected by this layout transition.

`vkTransitionImageLayoutEXT` does not check whether the device memory associated with an image is currently in use before performing the layout transition. The application **must** guarantee that any previously submitted command that reads from or writes to this subresource has completed before the host performs the layout transition. The memory of `image` is accessed by the host as if **coherent**.

**NOTE**

Image layout transitions performed on the host do not require queue family ownership transfers as the physical layout of the image will not vary between queue families for the layouts supported by this function.

**NOTE**

If the device has written to the image memory, it is not automatically made available to the host. Before this command can be called, a memory barrier for this image **must** have been issued on the device with the second **synchronization scope**.
including `VK_PIPELINE_STAGE_HOST_BIT` and `VK_ACCESS_HOST_READ_BIT`.

Because queue submissions automatically make host memory visible to the device, there would not be a need for a memory barrier before using the results of this layout transition on the device.

**Valid Usage**

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09055
  image must have been created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01486
  subresourceRange.baseMipLevel must be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01724
  subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the `mipLevels` specified in `VkImageCreateInfo` when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01488
  subresourceRange.baseArrayLayer must be less than the `arrayLayers` specified in `VkImageCreateInfo` when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-01725
  subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when image was created

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01932
  If image is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09241
  If image has a color format that is single-plane, then the `aspectMask` member of subresourceRange must be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkHostImageLayoutTransitionInfoEXT-image-09242
  If image has a color format and is not disjoint, then the `aspectMask` member of subresourceRange must be `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkHostImageLayoutTransitionInfoEXT-image-01672
  If image has a multi-planar format and the image is disjoint, then the `aspectMask` member of subresourceRange must include at least one multi-planar aspect mask bit or `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03320
  If image has a depth/stencil format with both depth and stencil and the separateDepthStencilLayers feature is not enabled, then the `aspectMask` member of subresourceRange must include both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`

- VUID-VkHostImageLayoutTransitionInfoEXT-image-03319
If `image` has a depth/stencil format with both depth and stencil and the `separateDepthStencilLayouts` feature is enabled, then the `aspectMask` member of `subresourceRange` must include either or both `VK_IMAGE_ASPECT_DEPTH_BIT` and `VK_IMAGE_ASPECT_STENCIL_BIT`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08702**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_DEPTH_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-aspectMask-08703**
  If the `aspectMask` member of `subresourceRange` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, `oldLayout` and `newLayout` must not be one of `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-09601**
  `subresourceRange.aspectMask` must be valid for the `format` the `image` was created with.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09229**
  `oldLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or the current layout of the image subresources as specified in `subresourceRange`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-09230**
  If `oldLayout` is not `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`, it must be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopySrcLayouts`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-09057**
  `newLayout` must be one of the layouts in `VkPhysicalDeviceHostImageCopyPropertiesEXT::pCopyDstLayouts`.

### Valid Usage (Implicit)

- **VUID-VkHostImageLayoutTransitionInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_HOST_IMAGE_LAYOUT_TRANSITION_INFO_EXT`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkHostImageLayoutTransitionInfoEXT-image-parameter**
  `image` must be a valid `VkImage` handle.

- **VUID-VkHostImageLayoutTransitionInfoEXT-oldLayout-parameter**
  `oldLayout` must be a valid `VkImageLayout` value.

- **VUID-VkHostImageLayoutTransitionInfoEXT-newLayout-parameter**
  `newLayout` must be a valid `VkImageLayout` value.

- **VUID-VkHostImageLayoutTransitionInfoEXT-subresourceRange-parameter**
  `subresourceRange` must be a valid `VkImageSubresourceRange` structure.
7.7.4. Queue Family Ownership Transfer

Resources created with a VkSharingMode of VK_SHARING_MODE_EXCLUSIVE must have their ownership explicitly transferred from one queue family to another in order to access their content in a well-defined manner on a queue in a different queue family.

The special queue family index VK_QUEUE_FAMILY_IGNORED indicates that a queue family parameter or member is ignored.

```c
#define VK_QUEUE_FAMILY_IGNORED           (~0U)
```

Resources shared with external APIs or instances using external memory must also explicitly manage ownership transfers between local and external queues (or equivalent constructs in external APIs) regardless of the VkSharingMode specified when creating them.

The special queue family index VK_QUEUE_FAMILY_EXTERNAL represents any queue external to the resource's current Vulkan instance, as long as the queue uses the same underlying device group or physical device, and the same driver version as the resource's VkDevice, as indicated by VkPhysicalDeviceIDProperties::deviceUUID and VkPhysicalDeviceIDProperties::driverUUID.

```c
#define VK_QUEUE_FAMILY_EXTERNAL          (~1U)
```
or the equivalent

```c
#define VK_QUEUE_FAMILY_EXTERNAL_KHR      VK_QUEUE_FAMILY_EXTERNAL
```
The special queue family index VK_QUEUE_FAMILY_FOREIGN_EXT represents any queue external to the resource's current Vulkan instance, regardless of the queue's underlying physical device or driver version. This includes, for example, queues for fixed-function image processing devices, media codec devices, and display devices, as well as all queues that use the same underlying device group or physical device, and the same driver version as the resource's VkDevice.

```c
#define VK_QUEUE_FAMILY_FOREIGN_EXT       (~2U)
```

If memory dependencies are correctly expressed between uses of such a resource between two queues in different families, but no ownership transfer is defined, the contents of that resource are undefined for any read accesses performed by the second queue family.

**NOTE** If an application does not need the contents of a resource to remain valid when transferring from one queue family to another, then the ownership transfer should be skipped.

**NOTE** Applications should expect transfers to/from VK_QUEUE_FAMILY_FOREIGN_EXT to be more expensive than transfers to/from VK_QUEUE_FAMILY_EXTERNAL_KHR.
A queue family ownership transfer consists of two distinct parts:

1. Release exclusive ownership from the source queue family
2. Acquire exclusive ownership for the destination queue family

An application **must** ensure that these operations occur in the correct order by defining an execution dependency between them, e.g. using a semaphore.

A *release operation* is used to release exclusive ownership of a range of a buffer or image subresource range. A release operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the source queue family. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `dstAccessMask` is ignored for such a barrier, such that no visibility operation is executed - the value of this mask does not affect the validity of the barrier. The release operation happens-after the availability operation. `dstStageMask` is also ignored for such a barrier as defined by buffer memory ownership transfer and image memory ownership transfer.

An *acquire operation* is used to acquire exclusive ownership of a range of a buffer or image subresource range. An acquire operation is defined by executing a buffer memory barrier (for a buffer range) or an image memory barrier (for an image subresource range) using a pipeline barrier command, on a queue from the destination queue family. The buffer range or image subresource range specified in an acquire operation **must** match exactly that of a previous release operation. The `srcQueueFamilyIndex` parameter of the barrier **must** be set to the source queue family index, and the `dstQueueFamilyIndex` parameter to the destination queue family index. `srcAccessMask` is ignored for such a barrier, such that no availability operation is executed - the value of this mask does not affect the validity of the barrier. The acquire operation happens-before the visibility operation. `srcStageMask` is also ignored for such a barrier as defined by buffer memory ownership transfer and image memory ownership transfer. As the first synchronization scope for an acquire operation is empty there is no happens-before dependency. Such a dependency **can** be introduced by using `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`.

**NOTE**

Whilst it is not invalid to provide destination or source access masks for memory barriers used for release or acquire operations, respectively, they have no practical effect. Access after a release operation has undefined results, and so visibility for those accesses has no practical effect. Similarly, write access before an acquire operation will produce undefined results for future access, so availability of those writes has no practical use. In an earlier version of the specification, these were required to match on both sides - but this was subsequently relaxed. These masks **should** be set to 0.

**NOTE**

Since a release and acquire operation does not synchronize with second and first scopes respectively, the `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` stage must be used to wait for a release operation to complete. Typically, a release and acquire pair is performed by a `VkSemaphore` signal and wait in their respective queues. Signaling a semaphore with `vkQueueSubmit` waits for `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`. With `vkQueueSubmit2`, `stageMask` for the signal semaphore must be `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT`. Similarly, for the acquire operation, waiting for
a semaphore must use `VK_PIPELINE_STAGE_ALL_COMMANDS_BIT` to make sure the acquire operation is synchronized.

If the transfer is via an image memory barrier, and an image layout transition is desired, then the values of oldLayout and newLayout in the release operation's memory barrier must be equal to values of oldLayout and newLayout in the acquire operation's memory barrier. Although the image layout transition is submitted twice, it will only be executed once. A layout transition specified in this way happens-after the release operation and happens-before the acquire operation.

If the values of srcQueueFamilyIndex and dstQueueFamilyIndex are equal, no ownership transfer is performed, and the barrier operates as if they were both set to `VK_QUEUE_FAMILY_IGNORED`.

Queue family ownership transfers may perform read and write accesses on all memory bound to the image subresource or buffer range, so applications must ensure that all memory writes have been made available before a queue family ownership transfer is executed. Available memory is automatically made visible to queue family release and acquire operations, and writes performed by those operations are automatically made available.

Once a queue family has acquired ownership of a buffer range or image subresource range of a `VK_SHARING_MODE_EXCLUSIVE` resource, its contents are undefined to other queue families unless ownership is transferred. The contents of any portion of another resource which aliases memory that is bound to the transferred buffer or image subresource range are undefined after a release or acquire operation.

**NOTE**

Because events cannot be used directly for inter-queue synchronization, and because `vkCmdSetEvent` does not have the queue family index or memory barrier parameters needed by a release operation, the release and acquire operations of a queue family ownership transfer can only be performed using `vkCmdPipelineBarrier`.

An acquire operation may have a performance penalty when acquiring ownership of a subresource range from one of the special queue families reserved for external memory ownership transfers described above. The application can reduce the performance penalty in some cases by adding a `VkExternalMemoryAcquireUnmodifiedEXT` structure to the `pNext` chain of the acquire operation's memory barrier structure.

The `VkExternalMemoryAcquireUnmodifiedEXT` structure is defined as:

```c
// Provided by VK_EXT_external_memory_acquire_unmodified
typedef struct VkExternalMemoryAcquireUnmodifiedEXT {
    VkStructureType sType;
    const void*pNext;
    VkBool32 acquireUnmodifiedMemory;
} VkExternalMemoryAcquireUnmodifiedEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• acquireUnmodifiedMemory specifies, if VK_TRUE, that no range of VkDeviceMemory bound to the resource of the memory barrier's subresource range was modified at any time since the resource's most recent release of ownership to the queue family specified by the memory barrier's srcQueueFamilyIndex. If VK_FALSE, it specifies nothing.

If the application releases ownership of the subresource range to one of the special queue families reserved for external memory ownership transfers with a memory barrier structure, and later re-acquires ownership from the same queue family with a memory barrier structure, and if no range of VkDeviceMemory bound to the resource was modified at any time between the release operation and the acquire operation, then the application should add a VkExternalMemoryAcquireUnmodifiedEXT structure to the pNext chain of the acquire operation's memory barrier structure because this may reduce the performance penalty.

This struct is ignored if acquireUnmodifiedMemory is VK_FALSE. In particular, VK_FALSE does not specify that memory was modified.

This struct is ignored if the memory barrier's srcQueueFamilyIndex is not a special queue family reserved for external memory ownership transfers.

The method by which the application determines whether memory was modified between the release operation and acquire operation is outside the scope of Vulkan.

For any Vulkan operation that accesses a resource, the application must not assume the implementation accesses the resource's memory as read-only, even for apparently read-only operations such as transfer commands and shader reads.

The validity of VkExternalMemoryAcquireUnmodifiedEXT::acquireUnmodifiedMemory is independent of memory ranges outside the ranges of VkDeviceMemory bound to the resource. In particular, it is independent of any implementation-private memory associated with the resource.

Valid Usage

• VUID-VkExternalMemoryAcquireUnmodifiedEXT-acquireUnmodifiedMemory-08922 If acquireUnmodifiedMemory is VK_TRUE, and the memory barrier's srcQueueFamilyIndex is a special queue family reserved for external memory ownership transfers (as described in Queue Family Ownership Transfer), then each range of VkDeviceMemory bound to the resource must have remained unmodified during all time since the resource's most recent release of ownership to the queue family.

Valid Usage (Implicit)

• VUID-VkExternalMemoryAcquireUnmodifiedEXT-sType-sType sType must be VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_ACQUIRE_UNMODIFIED_EXT
7.8. Wait Idle Operations

To wait on the host for the completion of outstanding queue operations for a given queue, call:

```
// Provided by VK_VERSION_1_0
VkResult vkQueueWaitIdle(
    VkQueue queue);
```

- `queue` is the queue on which to wait.

`vkQueueWaitIdle` is equivalent to having submitted a valid fence to every previously executed queue submission command that accepts a fence, then waiting for all of those fences to signal using `vkWaitForFences` with an infinite timeout and `waitAll` set to `VK_TRUE`.

### Valid Usage (Implicit)

- `VUID-vkQueueWaitIdle-queue-parameter` `queue` must be a valid `VkQueue` handle

### Host Synchronization

- Host access to `queue` must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`

To wait on the host for the completion of outstanding queue operations for all queues on a given logical device, call:
// Provided by VK_VERSION_1_0
VkResult vkDeviceWaitIdle(
    VkDevice               device);

- `device` is the logical device to idle.

`vkDeviceWaitIdle` is equivalent to calling `vkQueueWaitIdle` for all queues owned by `device`.

**Valid Usage (Implicit)**

- VUID-vkDeviceWaitIdle-device-parameter
  
  `device` must be a valid `VkDevice` handle

**Host Synchronization**

- Host access to all `VkQueue` objects created from `device` must be externally synchronized

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

### 7.9. Host Write Ordering Guarantees

When batches of command buffers are submitted to a queue via a queue submission command, it defines a memory dependency with prior host operations, and execution of command buffers submitted to the queue.

The first synchronization scope includes execution of `vkQueueSubmit` on the host and anything that happened-before it, as defined by the host memory model.

**NOTE**

Some systems allow writes that do not directly integrate with the host memory model; these have to be synchronized by the application manually. One example of this is non-temporal store instructions on x86; to ensure these happen-before submission, applications should call `_mm_sfence()`.

The second synchronization scope includes all commands submitted in the same queue submission, and all commands that occur later in submission order.
The first access scope includes all host writes to mappable device memory that are available to the host memory domain.

The second access scope includes all memory access performed by the device.

### 7.10. Synchronization and Multiple Physical Devices

If a logical device includes more than one physical device, then fences, semaphores, and events all still have a single instance of the signaled state.

A fence becomes signaled when all physical devices complete the necessary queue operations.

Semaphore wait and signal operations all include a device index that is the sole physical device that performs the operation. These indices are provided in the `VkDeviceGroupSubmitInfo` and `VkDeviceGroupBindSparseInfo` structures. Semaphores are not exclusively owned by any physical device. For example, a semaphore can be signaled by one physical device and then waited on by a different physical device.

An event can only be waited on by the same physical device that signaled it (or the host).

### 7.11. Calibrated Timestamps

In order to be able to correlate the time a particular operation took place at on timelines of different time domains (e.g. a device operation vs. a host operation), Vulkan allows querying calibrated timestamps from multiple time domains.

To query calibrated timestamps from a set of time domains, call:

```c
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetCalibratedTimestampsKHR(
    VkDevice device, // Logical device used to perform the query.
    uint32_t timestampCount, // Number of timestamps to query.
    const VkCalibratedTimestampInfoKHR* pTimestampInfos, // Pointer to an array of VkCalibratedTimestampInfoKHR structures, describing the time domains the calibrated timestamps should be captured from.
    uint64_t* pTimestamps, // Pointer to an array of 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
    uint64_t* pMaxDeviation) // Pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.
```

- **device** is the logical device used to perform the query.
- **timestampCount** is the number of timestamps to query.
- **pTimestampInfos** is a pointer to an array of `timestampCount` `VkCalibratedTimestampInfoKHR` structures, describing the time domains the calibrated timestamps should be captured from.
- **pTimestamps** is a pointer to an array of `timestampCount` 64-bit unsigned integer values in which the requested calibrated timestamp values are returned.
- **pMaxDeviation** is a pointer to a 64-bit unsigned integer value in which the strictly positive maximum deviation, in nanoseconds, of the calibrated timestamp values is returned.

**NOTE** The maximum deviation may vary between calls to `vkGetCalibratedTimestampsKHR`
even for the same set of time domains due to implementation and platform specific
reasons. It is the application’s responsibility to assess whether the returned
maximum deviation makes the timestamp values suitable for any particular
purpose and can choose to re-issue the timestamp calibration call pursuing a lower
deviation value.

Calibrated timestamp values can be extrapolated to estimate future coinciding timestamp values,
however, depending on the nature of the time domains and other properties of the platform
extrapolating values over a sufficiently long period of time may no longer be accurate enough to fit
any particular purpose, so applications are expected to re-calibrate the timestamps on a regular
basis.

Valid Usage

• VUID-vkGetCalibratedTimestampsEXT-timeDomain-09246
  The timeDomain value of each VkCalibratedTimestampInfoKHR in pTimestampInfos must be
  unique

Valid Usage (Implicit)

• VUID-vkGetCalibratedTimestampsKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetCalibratedTimestampsKHR-pTimestampInfos-parameter
  pTimestampInfos must be a valid pointer to an array of timestampCount valid
  VkCalibratedTimestampInfoKHR structures

• VUID-vkGetCalibratedTimestampsKHR-pTimestamps-parameter
  pTimestamps must be a valid pointer to an array of timestampCount uint64_t values

• VUID-vkGetCalibratedTimestampsKHR-pMaxDeviation-parameter
  pMaxDeviation must be a valid pointer to a uint64_t value

• VUID-vkGetCalibratedTimestampsKHR-timestampCount-arraylength
  timestampCount must be greater than 0

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkCalibratedTimestampInfoKHR structure is defined as:
typedef struct VkCalibratedTimestampInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkTimeDomainKHR timeDomain;
} VkCalibratedTimestampInfoKHR;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **timeDomain** is a *VkTimeDomainKHR* value specifying the time domain from which the calibrated timestamp value should be returned.

### Valid Usage

- **VUID-VkCalibratedTimestampInfoEXT-timeDomain-02354**
  - *timeDomain* must be one of the *VkTimeDomainKHR* values returned by `vkGetPhysicalDeviceCalibrateableTimeDomainsKHR`

### Valid Usage (Implicit)

- **VUID-VkCalibratedTimestampInfoKHR-sType-sType**
  - *sType* must be `VK_STRUCTURE_TYPE_CALIBRATED_TIMESTAMP_INFO_KHR`

- **VUID-VkCalibratedTimestampInfoKHR-pNext-pNext**
  - *pNext* must be NULL

- **VUID-VkCalibratedTimestampInfoKHR-timeDomain-parameter**
  - *timeDomain* must be a valid *VkTimeDomainKHR* value

The set of supported time domains consists of:

typedef enum VkTimeDomainKHR {
    VK_TIME_DOMAIN_DEVICE_KHR = 0,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR = 1,
    VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR = 2,
    VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR = 3,
} VkTimeDomainKHR;

• **VK_TIME_DOMAIN_DEVICE_KHR** specifies the device time domain. Timestamp values in this time domain use the same units and are comparable with device timestamp values captured using `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2` and are defined to be incrementing according to the *timestampPeriod* of the device.

• **VK_TIME_DOMAIN_CLOCK_MONOTONIC_KHR** specifies the CLOCK_MONOTONIC time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are
comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

**NOTE**

An implementation supporting `VK_KHR_calibrated_timestamps` will use the same time domain for all its `VkQueue` so that timestamp values reported for `VK_TIME_DOMAIN_DEVICE_KHR` can be matched to any timestamp captured through `vkCmdWriteTimestamp` or `vkCmdWriteTimestamp2`.

- **VK_TIME_DOMAIN_CLOCK_MONOTONIC_RAW_KHR** specifies the CLOCK_MONOTONIC_RAW time domain available on POSIX platforms. Timestamp values in this time domain are in units of nanoseconds and are comparable with platform timestamp values captured using the POSIX clock_gettime API as computed by this example:

```c
struct timespec tv;
clock_gettime(CLOCK_MONOTONIC_RAW, &tv);
return tv.tv_nsec + tv.tv_sec*1000000000ull;
```

- **VK_TIME_DOMAIN_QUERY_PERFORMANCE_COUNTER_KHR** specifies the performance counter (QPC) time domain available on Windows. Timestamp values in this time domain are in the same units as those provided by the Windows QueryPerformanceCounter API and are comparable with platform timestamp values captured using that API as computed by this example:

```c
LARGE_INTEGER counter;
QueryPerformanceCounter(&counter);
return counter.QuadPart;
```
Chapter 8. Render Pass

Draw commands must be recorded within a render pass instance. Each render pass instance defines a set of image resources, referred to as attachments, used during rendering.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBeginRendering(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdBeginRenderingKHR(
    VkCommandBuffer commandBuffer,
    const VkRenderingInfo* pRenderingInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderingInfo` is a pointer to a `VkRenderingInfo` structure specifying details of the render pass instance to begin.

After beginning a render pass instance, the command buffer is ready to record draw commands.

If `pRenderingInfo->flags` includes `VK_RENDERING_RESUMING_BIT` then this render pass is resumed from a render pass instance that has been suspended earlier in submission order.

Valid Usage

- VUID-vkCmdBeginRendering-dynamicRendering-06446
  The dynamicRendering feature must be enabled

- VUID-vkCmdBeginRendering-commandBuffer-06068
  If `commandBuffer` is a secondary command buffer, and the nestedCommandBuffer feature is not enabled, `pRenderingInfo->flags` must not include `VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT`

- VUID-vkCmdBeginRendering-pRenderingInfo-09588
  If `pRenderingInfo->pDepthAttachment` is not NULL and `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageView` must be in the layout specified by `pRenderingInfo->pDepthAttachment->imageLayout`

- VUID-vkCmdBeginRendering-pRenderingInfo-09589
  If `pRenderingInfo->pDepthAttachment` is not NULL, `pRenderingInfo->pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->imageResolveMode` is not `VK_RESOLVE_MODE_NONE`, and `pRenderingInfo->pDepthAttachment->resolveImageView` is not `VK_NULL_HANDLE`, `pRenderingInfo->pDepthAttachment->resolveImageView` must be in
the layout specified by pRenderingInfo->pDepthAttachment->resolveImageLayout

• VUID-vkCmdBeginRendering-pRenderingInfo-09590
  If pRenderingInfo->pStencilAttachment is not NULL and pRenderingInfo->pStencilAttachment->imageView is not VK_NULL_HANDLE, pRenderingInfo->pStencilAttachment->imageView must be in the layout specified by pRenderingInfo->pStencilAttachment->imageLayout

• VUID-vkCmdBeginRendering-pRenderingInfo-09591
  If pRenderingInfo->pStencilAttachment is not NULL, pRenderingInfo->pStencilAttachment->imageView is not VK_NULL_HANDLE, pRenderingInfo->pStencilAttachment->imageResolveMode is not VK_RESOLVE_MODE_NONE, and pRenderingInfo->pStencilAttachment->resolveImageView is not VK_NULL_HANDLE, pRenderingInfo->pStencilAttachment->resolveImageView must be in the layout specified by pRenderingInfo->pStencilAttachment->resolveImageLayout

• VUID-vkCmdBeginRendering-pRenderingInfo-09592
  For any element of pRenderingInfo->pColorAttachments, if imageView is not VK_NULL_HANDLE, that image view must be in the layout specified by imageLayout

• VUID-vkCmdBeginRendering-pRenderingInfo-09593
  For any element of pRenderingInfo->pColorAttachments, if imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, and resolveImageView is not VK_NULL_HANDLE, resolveImageView must be in the layout specified by resolveImageLayout

Valid Usage (Implicit)

• VUID-vkCmdBeginRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginRendering-pRenderingInfo-parameter
  pRenderingInfo must be a valid pointer to a valid VkRenderingInfo structure

• VUID-vkCmdBeginRendering-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBeginRendering-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBeginRendering-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkRenderingInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkRenderingInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderingFlags flags;
    VkRect2D renderArea;
    uint32_t layerCount;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkRenderingAttachmentInfo* pColorAttachments;
    const VkRenderingAttachmentInfo* pDepthAttachment;
    const VkRenderingAttachmentInfo* pStencilAttachment;
} VkRenderingInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingInfo VkRenderingInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkRenderingFlagBits`.
- **renderArea** is the render area that is affected by the render pass instance.
- **layerCount** is the number of layers rendered to in each attachment when `viewMask` is `0`.
- **viewMask** is the view mask indicating the indices of attachment layers that will be rendered when it is not `0`.
- **colorAttachmentCount** is the number of elements in `pColorAttachments`.
- **pColorAttachments** is a pointer to an array of `colorAttachmentCount` `VkRenderingAttachmentInfo` structures describing any color attachments used.
- **pDepthAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a depth
attachment.

- **pStencilAttachment** is a pointer to a `VkRenderingAttachmentInfo` structure describing a stencil attachment.

If `viewMask` is not 0, multiview is enabled.

If there is an instance of `VkDeviceGroupRenderPassBeginInfo` included in the `pNext` chain and its `deviceRenderAreaCount` member is not 0, then `renderArea` is ignored, and the render area is defined per-device by that structure.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `imageView` member of any element of `pColorAttachments` is `VK_NULL_HANDLE`, writes to the corresponding location by a fragment are discarded.

### Valid Usage

- **VUID-VkRenderingInfo-viewMask-06069**
  If `viewMask` is 0, `layerCount` must not be 0

- **VUID-VkRenderingInfo-multisampledRenderToSingleSampled-06857**
  `imageView` members of `pDepthAttachment`, `pStencilAttachment`, and elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`

- **VUID-VkRenderingInfo-imageView-09429**
  `imageView` members of elements of `pColorAttachments` that are not `VK_NULL_HANDLE` must have been created with the same `sampleCount`

- **VUID-VkRenderingInfo-None-08994**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.width` must be greater than 0

- **VUID-VkRenderingInfo-None-08995**
  If `VkDeviceGroupRenderPassBeginInfo::deviceRenderAreaCount` is 0, `renderArea.extent.height` must be greater than 0

- **VUID-VkRenderingInfo-pNext-06077**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-06078**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0

- **VUID-VkRenderingInfo-pNext-07815**
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.width` and `renderArea.offset.x` must be less than or equal to `maxFramebufferWidth`
If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the sum of `renderArea.extent.height` and `renderArea.offset.y` must be less than or equal to `maxFramebufferHeight`.

If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to `renderArea.offset.x + renderArea.extent.width`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the width of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.x` and `extent.width` members of each element of `pDeviceRenderAreas`.

If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, the height of the `imageView` member of any element of `pColorAttachments`, `pDepthAttachment`, or `pStencilAttachment` that is not `VK_NULL_HANDLE` must be greater than or equal to the sum of the `offset.y` and `extent.height` members of each element of `pDeviceRenderAreas`.

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL` and the `imageView` member of either structure is not `VK_NULL_HANDLE`, the `imageView` member of each structure must be the same.

If neither `pDepthAttachment` or `pStencilAttachment` are `NULL`, and the `resolveMode` member of each is not `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of each structure must be the same.

If `colorAttachmentCount` is not 0 and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, that `imageView` must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

If `colorAttachmentCount` is not 0 and there is an element of `pColorAttachments` with its `imageView` member not `VK_NULL_HANDLE`, and its `resolveMode` member not set to `VK_RESOLVE_MODE_NONE`, the `resolveImageView` member of that element of `pColorAttachments` must have been created with `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

• VUID-VkRenderingInfo-pDepthAttachment-06547
If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` must have been created with a format that includes a depth component

- VUID-VkRenderingInfo-pDepthAttachment-06088
  If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->imageView` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pDepthAttachment-09477
  If `pDepthAttachment` is not `NULL` and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageView` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pStencilAttachment-06548
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` must have been created with a format that includes a stencil aspect

- VUID-VkRenderingInfo-pStencilAttachment-06089
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->imageView` must have been created with a stencil usage including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-pStencilAttachment-09478
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pStencilAttachment->resolveImageView` must have been created with `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

- VUID-VkRenderingInfo-colorAttachmentCount-06090
  If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, the layout member of that element of `pColorAttachments` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-colorAttachmentCount-06091
  If `colorAttachmentCount` is not `0` and the `imageView` member of an element of `pColorAttachments` is not `VK_NULL_HANDLE`, if the `resolveMode` member of that element of `pColorAttachments` is not `VK_RESOLVE_MODE_NONE`, its `resolveImageLayout` member must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06092
  If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->layout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pDepthAttachment-06093
  If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK_RESOLVE_MODE_NONE`, `pDepthAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- VUID-VkRenderingInfo-pStencilAttachment-06094
  If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` must not be
VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-06095
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06096
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06097
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-06098
  If pDepthAttachment is not NULL, pDepthAttachment->imageView is not VK_NULL_HANDLE, and pDepthAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pDepthAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

- VUID-VkRenderingInfo-pStencilAttachment-06099
  If pStencilAttachment is not NULL, pStencilAttachment->imageView is not VK_NULL_HANDLE, and pStencilAttachment->resolveMode is not VK_RESOLVE_MODE_NONE, pStencilAttachment->resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06100
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, the layout member of that element of pColorAttachments must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-colorAttachmentCount-06101
  If colorAttachmentCount is not 0 and the imageView member of an element of pColorAttachments is not VK_NULL_HANDLE, if the resolveMode member of that element of pColorAttachments is not VK_RESOLVE_MODE_NONE, its resolveImageLayout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderingInfo-pDepthAttachment-07732
  If pDepthAttachment is not NULL and pDepthAttachment->imageView is not VK_NULL_HANDLE, pDepthAttachment->layout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
If `pDepthAttachment` is not `NULL`, `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, and `pDepthAttachment->resolveMode` is not `VK.ResolveModeNone`, `pDepthAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->layout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

If `pStencilAttachment` is not `NULL`, `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, and `pStencilAttachment->resolveMode` is not `VK.ResolveModeNone`, `pStencilAttachment->resolveImageLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

If `pDepthAttachment` is not `NULL` and `pDepthAttachment->imageView` is not `VK_NULL_HANDLE`, `pDepthAttachment->resolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes`.

If `pStencilAttachment` is not `NULL` and `pStencilAttachment->imageView` is not `VK_NULL_HANDLE`, `pStencilAttachment->resolveMode` must be one of the bits set in `VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes`.

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone` is `VK_FALSE`, the `resolveMode` of both structures must be the same value.

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK.ResolveModeNone`, the `resolveMode` of both structures must be the same value.

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK.ResolveModeNone`, the `resolveMode` of both structures must be the same value.

If `pDepthAttachment` or `pStencilAttachment` are both not `NULL`, `pDepthAttachment->imageView` and `pStencilAttachment->imageView` are both not `VK_NULL_HANDLE`, and `VkPhysicalDeviceDepthStencilResolveProperties::independentResolve` is `VK_FALSE`, and the `resolveMode` of neither structure is `VK.ResolveModeNone`, the `resolveMode` of both structures must be the same value.

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \(\text{renderArea} + \frac{\text{renderAreaWidth}}{\text{shadingRateAttachment TexelSizeWidth}}\).
If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0 and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[rac{renderArea.y + renderArea.height}{shadingRateAttachmentTexelSize.height}\] for each element of `pDeviceRenderAreas`.

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a width greater than or equal to \[rac{pDeviceRenderAreas.x + pDeviceRenderAreas.width}{shadingRateAttachmentTexelSize.width}\] for each element of `pDeviceRenderAreas`.

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, the `pNext` chain contains a `VkDeviceGroupRenderPassBeginInfo` structure, its `deviceRenderAreaCount` member is not 0, and the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, `imageView` must have a height greater than or equal to \[rac{pDeviceRenderAreas.y + pDeviceRenderAreas.height}{shadingRateAttachmentTexelSize.height}\] for each element of `pDeviceRenderAreas`.

Layer count must be less than or equal to `maxFramebufferLayers`.

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is 0, `imageView` must have a `layerCount` that is either equal to 1 or greater than or equal to `layerCount`.

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, and `viewMask` is not 0, `imageView` must have a `layerCount` that either equal to 1 or greater than or equal to the index of the most significant bit in `viewMask`.

If the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure included in the `pNext` chain is not `VK_NULL_HANDLE`, it must not be equal to the `imageView` or `resolveImageView` member of `pDepthAttachment`, `pStencilAttachment`, or any
element of \textit{pColorAttachments}

- VUID-VkRenderingInfo-multiview-06127
  If the \textit{multiview} feature is not enabled, \textit{viewMask} \textbf{must} be 0

- VUID-VkRenderingInfo-viewMask-06128
  The index of the most significant bit in \textit{viewMask} \textbf{must} be less than \textit{maxMultiviewViewCount}

- VUID-VkRenderingInfo-None-09044
  Valid attachments specified by this structure \textbf{must} not be bound to memory locations that are bound to any other valid attachments specified by this structure

- VUID-VkRenderingInfo-flags-10012
  If \textit{flags} includes \texttt{VK_RENDERING_CONTENTS_INLINE_BIT_KHR} then at least one of the following features \textbf{must} be enabled
  - \texttt{maintenance7}
  - \texttt{nestedCommandBuffer}

- VUID-VkRenderingInfo-colorAttachmentCount-09479
  If \textit{colorAttachmentCount} is not 0 and the \textit{imageView} member of an element of \textit{pColorAttachments} is not \texttt{VK_NULL_HANDLE}, that \textit{imageView} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-colorAttachmentCount-09480
  If \textit{colorAttachmentCount} is not 0, and there is an element of \textit{pColorAttachments} with its \textit{imageView} member not set to \texttt{VK_NULL_HANDLE} and its \textit{resolveMode} member not set to \texttt{VK_RESOLVE_MODE_NONE}, the \textit{resolveImageView} member of that element of \textit{pColorAttachments} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-pDepthAttachment-09481
  If \textit{pDepthAttachment} is not NULL and \textit{pDepthAttachment->imageView} is not \texttt{VK_NULL_HANDLE}, \textit{pDepthAttachment->imageView} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-pDepthAttachment-09482
  If \textit{pDepthAttachment} is not NULL, \textit{pDepthAttachment->imageView} is not \texttt{VK_NULL_HANDLE}, and \textit{pDepthAttachment->resolveMode} is not \texttt{VK_RESOLVE_MODE_NONE}, \textit{pDepthAttachment->resolveImageView} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-pStencilAttachment-09483
  If \textit{pStencilAttachment} is not NULL and \textit{pStencilAttachment->imageView} is not \texttt{VK_NULL_HANDLE}, \textit{pStencilAttachment->imageView} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-pStencilAttachment-09484
  If \textit{pStencilAttachment} is not NULL, \textit{pStencilAttachment->imageView} is not \texttt{VK_NULL_HANDLE}, and \textit{pStencilAttachment->resolveMode} is not \texttt{VK_RESOLVE_MODE_NONE}, \textit{pStencilAttachment->resolveImageView} \textbf{must} have been created with the \textit{identity swizzle}

- VUID-VkRenderingInfo-imageView-09485
  If the \textit{imageView} member of a \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR} structure included in the \textit{pNext} chain is not \texttt{VK_NULL_HANDLE}, it \textbf{must} have been created with the \textit{identity swizzle}
**Valid Usage (Implicit)**

- **VUID-VkRenderingInfo-sType-sType**
  *sType* must be `VK_STRUCTURE_TYPE_RENDERING_INFO`

- **VUID-VkRenderingInfo-pNext-pNext**
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupRenderPassBeginInfo`, `VkMultiviewPerViewAttributesInfoNVX`, `VkRenderingFragmentDensityMapAttachmentInfoEXT`, or `VkRenderingFragmentShadingRateAttachmentInfoKHR`

- **VUID-VkRenderingInfo-sType-unique**
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkRenderingInfo-flags-parameter**
  *flags* must be a valid combination of `VkRenderingFlagBits` values

- **VUID-VkRenderingInfo-pColorAttachments-parameter**
  If *colorAttachmentCount* is not 0, *pColorAttachments* must be a valid pointer to an array of *colorAttachmentCount* valid `VkRenderingAttachmentInfo` structures

- **VUID-VkRenderingInfo-pDepthAttachment-parameter**
  If *pDepthAttachment* is not `NULL`, *pDepthAttachment* must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure

- **VUID-VkRenderingInfo-pStencilAttachment-parameter**
  If *pStencilAttachment* is not `NULL`, *pStencilAttachment* must be a valid pointer to a valid `VkRenderingAttachmentInfo` structure

Bits which can be set in `VkRenderingInfo::flags` describing additional properties of the render pass are:

```c
// Provided by VK_VERSION_1_3
typedef enum VkRenderingFlagBits {
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT = 0x00000001,
    VK_RENDERING_SUSPENDING_BIT = 0x00000002,
    VK_RENDERING_RESUMING_BIT = 0x00000004,
    // Provided by VK_KHR_maintenance7
    VK_RENDERING_CONTENTS_INLINE_BIT_KHR = 0x00000010,
    VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT_KHR = VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT,
    VK_RENDERING_SUSPENDING_BIT_KHR = VK_RENDERING_SUSPENDING_BIT,
    VK_RENDERING_RESUMING_BIT_KHR = VK_RENDERING_RESUMING_BIT,
    // Provided by VK_EXT_nested_command_buffer
    VK_RENDERING_CONTENTS_INLINE_BIT_EXT = VK_RENDERING_CONTENTS_INLINE_BIT_KHR,
} VkRenderingFlagBits;
```

or the equivalent
**VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** specifies that draw calls for the render pass instance will be recorded in secondary command buffers. If the `nestedCommandBuffer` feature is enabled, the draw calls can come from both inline and `vkCmdExecuteCommands`.

**VK_RENDERING_RESUMING_BIT** specifies that the render pass instance is resuming an earlier suspended render pass instance.

**VK_RENDERING_SUSPENDING_BIT** specifies that the render pass instance will be suspended.

**VK_RENDERING_CONTENTS_INLINE_BIT_KHR** specifies that draw calls for the render pass instance can be recorded inline within the current command buffer. This can be combined with the **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** bit to allow draw calls to be recorded both inline and in secondary command buffers.

The contents of `pRenderingInfo` must match between suspended render pass instances and the render pass instances that resume them, other than the presence or absence of the **VK_RENDERING_RESUMING_BIT**, **VK_RENDERING_SUSPENDING_BIT**, and **VK_RENDERING_CONTENTS_SECONDARY_COMMAND_BUFFERS_BIT** flags. No action or synchronization commands, or other render pass instances, are allowed between suspending and resuming render pass instances.

** VkRenderingFlags** is a bitmask type for setting a mask of zero or more `VkRenderingFlagBits`.

The `VkRenderingAttachmentInfo` structure is defined as:
// Provided by VK_VERSION_1_3
typedef struct VkRenderingAttachmentInfo {
    VkStructureType   sType;
    const void*     pNext;
    VkImageView   imageView;
    VkImageLayout imageLayout;
    VkResolveModeFlagBits resolveMode;
    VkImageView   resolveImageView;
    VkImageLayout resolveImageLayout;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkClearValue    clearValue;
} VkRenderingAttachmentInfo;

or the equivalent

// Provided by VK_KHR_dynamic_rendering
typedef VkRenderingAttachmentInfo VkRenderingAttachmentInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageView is the image view that will be used for rendering.
• imageLayout is the layout that imageView will be in during rendering.
• resolveMode is a VkResolveModeFlagBits value defining how data written to imageView will be resolved into resolveImageView.
• resolveImageView is an image view used to write resolved data at the end of rendering.
• resolveImageLayout is the layout that resolveImageView will be in during rendering.
• loadOp is a VkAttachmentLoadOp value defining the load operation for the attachment.
• storeOp is a VkAttachmentStoreOp value defining the store operation for the attachment.
• clearValue is a VkClearValue structure defining values used to clear imageView when loadOp is VK_ATTACHMENT_LOAD_OP_CLEAR.

Values in imageView are loaded and stored according to the values of loadOp and storeOp, within the render area for each device specified in VkRenderingInfo. If imageView is VK_NULL_HANDLE, other members of this structure are ignored; writes to this attachment will be discarded, and no load, store, or multisample resolve operations will be performed.

If resolveMode is VK_RESOLVE_MODE_NONE, then resolveImageView is ignored. If resolveMode is not VK_RESOLVE_MODE_NONE, and resolveImageView is not VK_NULL_HANDLE, a render pass multisample resolve operation is defined for the attachment subresource.

**NOTE** The resolve mode and store operation are independent; it is valid to write both resolved and unresolved values, and equally valid to discard the unresolved values.
while writing the resolved ones.

Store and resolve operations are only performed at the end of a render pass instance that does not specify the `VK_RENDERING_SUSPENDING_BIT_KHR` flag.

Load operations are only performed at the beginning of a render pass instance that does not specify the `VK_RENDERING_RESUMING_BIT_KHR` flag.

Image contents at the end of a suspended render pass instance remain defined for access by a resuming render pass instance.

### Valid Usage

- **VUID-VkRenderingAttachmentInfo-imageView-06129**
  If `imageView` is not `VK_NULL_HANDLE` and has a non-integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_AVERAGE_BIT`.

- **VUID-VkRenderingAttachmentInfo-imageView-06130**
  If `imageView` is not `VK_NULL_HANDLE` and has an integer color format, `resolveMode` must be `VK_RESOLVE_MODE_NONE` or `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT`.

- **VUID-VkRenderingAttachmentInfo-imageView-06861**
  `imageView` must not have a sample count of `VK_SAMPLE_COUNT_1_BIT` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`

- **VUID-VkRenderingAttachmentInfo-imageView-06862**
  `resolveImageView` must not be `VK_NULL_HANDLE` if all of the following hold:
  - `imageView` is not `VK_NULL_HANDLE`
  - `resolveMode` is not `VK_RESOLVE_MODE_NONE`

- **VUID-VkRenderingAttachmentInfo-imageView-06864**
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageView` must have a sample count of `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-VkRenderingAttachmentInfo-imageView-06865**
  If `imageView` is not `VK_NULL_HANDLE`, `resolveImageView` is not `VK_NULL_HANDLE`, and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `imageView` and `resolveImageView` must have the same `VkFormat`.

- **VUID-VkRenderingAttachmentInfo-imageView-06135**
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- **VUID-VkRenderingAttachmentInfo-imageView-06136**
  If `imageView` is not `VK_NULL_HANDLE` and `resolveMode` is not `VK_RESOLVE_MODE_NONE`, `resolveImageLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_STORAGE_OPTIMAL`, or `VK_IMAGE_LAYOUT_ATTACHMENTViewSet_OPTIMAL`.

• VUID-VkRenderingAttachmentInfo-imageView-06137
  If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

• VUID-VkRenderingAttachmentInfo-imageView-06142
  If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

• VUID-VkRenderingAttachmentInfo-imageView-06143
  If imageView is not VK_NULL_HANDLE, imageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR.

• VUID-VkRenderingAttachmentInfo-imageView-06144
  If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR.

• VUID-VkRenderingAttachmentInfo-imageView-06145
  If imageView is not VK_NULL_HANDLE, imageLayout must not be VK_IMAGE_LAYOUT_PRESENT_SRC_KHR.

• VUID-VkRenderingAttachmentInfo-imageView-06146
  If imageView is not VK_NULL_HANDLE and resolveMode is not VK_RESOLVE_MODE_NONE, resolveImageLayout must not be VK_IMAGE_LAYOUT_PRESENT_SRC_KHR.

---

Valid Usage (Implicit)

• VUID-VkRenderingAttachmentInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDERING_ATTACHMENT_INFO.

• VUID-VkRenderingAttachmentInfo-pNext-pNext
  pNext must be NULL.

• VUID-VkRenderingAttachmentInfo-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle.

• VUID-VkRenderingAttachmentInfo-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value.

• VUID-VkRenderingAttachmentInfo-resolveMode-parameter
  If resolveMode is not 0, resolveMode must be a valid VkResolveModeFlagBits value.

• VUID-VkRenderingAttachmentInfo-resolveImageView-parameter
  If resolveImageView is not VK_NULL_HANDLE, resolveImageView must be a valid VkImageView handle.

• VUID-VkRenderingAttachmentInfo-resolveImageLayout-parameter
  resolveImageLayout must be a valid VkImageLayout value.

• VUID-VkRenderingAttachmentInfo-loadOp-parameter
  loadOp must be a valid VkAttachmentLoadOp value.
The `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure is defined as:

```c
typedef struct VkRenderingFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkImageLayout imageLayout;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkRenderingFragmentShadingRateAttachmentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view that will be used as a fragment shading rate attachment.
- `imageLayout` is the layout that `imageView` will be in during rendering.
- `shadingRateAttachmentTexelSize` specifies the number of pixels corresponding to each texel in `imageView`.

This structure can be included in the `pNext` chain of `VkRenderingInfo` to define a fragment shading rate attachment. If `imageView` is `VK_NULL_HANDLE`, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

**Valid Usage**

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06147
  If `imageView` is not `VK_NULL_HANDLE`, `layout` must be `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06148
  If `imageView` is not `VK_NULL_HANDLE`, it must have been created with `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06149
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be a power of two value

- VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06150

---

421
If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06151**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06152**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be a power of two value.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06153**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.height`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06154**
  If `imageView` is not `VK_NULL_HANDLE`, `shadingRateAttachmentTexelSize.height` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.height`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06155**
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.width` and `shadingRateAttachmentTexelSize.height` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-06156**
  If `imageView` is not `VK_NULL_HANDLE`, the quotient of `shadingRateAttachmentTexelSize.height` and `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSizeAspectRatio`.

### Valid Usage (Implicit)

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR`.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageView-parameter**
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle.

- **VUID-VkRenderingFragmentShadingRateAttachmentInfoKHR-imageLayout-parameter**
  `imageLayout` must be a valid `VkImageLayout` value.

To query the render area granularity for a render pass instance, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetRenderingAreaGranularityKHR(
    VkDevice device,
    const VkRenderingAreaInfoKHR* pRenderingAreaInfo,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass instance.
- `pRenderingAreaInfo` is a pointer to a `VkRenderingAreaInfoKHR` structure specifying details of the
render pass instance to query the render area granularity for.

- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of each attachment used in the render pass instance.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of each attachment used in the render pass instance.

### Valid Usage (Implicit)

- VUID-vkGetRenderingAreaGranularityKHR-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetRenderingAreaGranularityKHR-pRenderingAreaInfo-parameter
  - `pRenderingAreaInfo` must be a valid pointer to a valid `VkRenderingAreaInfoKHR` structure

- VUID-vkGetRenderingAreaGranularityKHR-pGranularity-parameter
  - `pGranularity` must be a valid pointer to a `VkExtent2D` structure

The `VkRenderingAreaInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkRenderingAreaInfoKHR {
    VkStructureType   sType;
    const void*       pNext;
    uint32_t           viewMask;
    uint32_t           colorAttachmentCount;
    const VkFormat*    pColorAttachmentFormats;
    VkFormat           depthAttachmentFormat;
    VkFormat           stencilAttachmentFormat;
} VkRenderingAreaInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewMask` is the viewMask used for rendering.
- `colorAttachmentCount` is the number of entries in `pColorAttachmentFormats`
- `pColorAttachmentFormats` is a pointer to an array of `VkFormat` values defining the format of color attachments used in the render pass instance.
• **depthAttachmentFormat** is a **VkFormat** value defining the format of the depth attachment used in the render pass instance.

• **stencilAttachmentFormat** is a **VkFormat** value defining the format of the stencil attachment used in the render pass instance.

### Valid Usage (Implicit)

- **VUID-VkRenderingAreaInfoKHR-sType-sType**
  
  *sType must be** **Vk_STRUCTURE_TYPE_RENDERING_AREA_INFO_KHR***

- **VUID-VkRenderingAreaInfoKHR-pNext-pNext**
  
  *pNext must be **NULL***

To end a render pass instance, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdEndRendering(  
    VkCommandBuffer commandBuffer);
```

or the equivalent command

```c
// Provided by VK_KHR_dynamic_rendering
void vkCmdEndRenderingKHR(  
    VkCommandBuffer commandBuffer);
```

• **commandBuffer** is the command buffer in which to record the command.

If the value of **pRenderingInfo->flags** used to begin this render pass instance included **VK_RENDERING_SUSPENDING_BIT**, then this render pass is suspended and will be resumed later in submission order.

### Valid Usage

- **VUID-vkCmdEndRendering-None-06161**
  
  The current render pass instance **must** have been begun with **vkCmdBeginRendering**

- **VUID-vkCmdEndRendering-commandBuffer-06162**
  
  The current render pass instance **must** have been begun in **commandBuffer**

- **VUID-vkCmdEndRendering-None-06781**
  
  This command **must** not be recorded when transform feedback is active

- **VUID-vkCmdEndRendering-None-06999**
  
  If **vkCmdBeginQuery** was called within the render pass, the corresponding **vkCmdEndQuery** must have been called subsequently within the same subpass
Valid Usage (Implicit)

- VUID-vkCmdEndRendering-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndRendering-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndRendering-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdEndRendering-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdEndRendering-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

For more complex rendering graphs, it is possible to pre-define a static render pass object, which as well as allowing draw commands, allows the definition of framebuffer-local dependencies between multiple subpasses. These objects have a lot of setup cost compared to vkCmdBeginRendering, but use of subpass dependencies can confer important performance benefits on some devices.

8.1. Render Pass Objects

A render pass object represents a collection of attachments, subpasses, and dependencies between the subpasses, and describes how the attachments are used over the course of the subpasses.

Render passes are represented by VkRenderPass handles:
An attachment description describes the properties of an attachment including its format, sample count, and how its contents are treated at the beginning and end of each render pass instance.

A subpass represents a phase of rendering that reads and writes a subset of the attachments in a render pass. Rendering commands are recorded into a particular subpass of a render pass instance.

A subpass description describes the subset of attachments that is involved in the execution of a subpass. Each subpass can read from some attachments as input attachments, write to some as color attachments or depth/stencil attachments, and perform multisample resolve operations to resolve attachments. A subpass description can also include a set of preserve attachments, which are attachments that are not read or written by the subpass but whose contents must be preserved throughout the subpass.

A subpass uses an attachment if the attachment is a color, depth/stencil, resolve, depth/stencil resolve, fragment shading rate, or input attachment for that subpass (as determined by the pColorAttachments, pDepthStencilAttachment, pResolveAttachments, VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment, VkFragmentShadingRateAttachmentInfoKHR::pFragmentShadingRateAttachment->attachment, and pInputAttachments members of VkSubpassDescription, respectively). A subpass does not use an attachment if that attachment is preserved by the subpass. The first use of an attachment is in the lowest numbered subpass that uses that attachment. Similarly, the last use of an attachment is in the highest numbered subpass that uses that attachment.

The subpasses in a render pass all render to the same dimensions, and fragments for pixel (x,y,layer) in one subpass can only read attachment contents written by previous subpasses at that same (x,y,layer) location. For multi-pixel fragments, the pixel read from an input attachment is selected from the pixels covered by that fragment in an implementation-dependent manner. However, this selection must be made consistently for any fragment with the same shading rate for the lifetime of the VkDevice.

By describing a complete set of subpasses in advance, render passes provide the implementation an opportunity to optimize the storage and transfer of attachment data between subpasses.

NOTE

In practice, this means that subpasses with a simple framebuffer-space dependency may be merged into a single tiled rendering pass, keeping the attachment data on-chip for the duration of a render pass instance. However, it is also quite common for a render pass to only contain a single subpass.

Subpass dependencies describe execution and memory dependencies between subpasses.

A subpass dependency chain is a sequence of subpass dependencies in a render pass, where the source subpass of each subpass dependency (after the first) equals the destination subpass of the previous dependency.
Execution of subpasses may overlap or execute out of order with regards to other subpasses, unless otherwise enforced by an execution dependency. Each subpass only respects submission order for commands recorded in the same subpass, and the \texttt{vkCmdBeginRenderPass} and \texttt{vkCmdEndRenderPass} commands that delimit the render pass - commands within other subpasses are not included. This affects most other implicit ordering guarantees.

A render pass describes the structure of subpasses and attachments independent of any specific image views for the attachments. The specific image views that will be used for the attachments, and their dimensions, are specified in \texttt{VkFramebuffer} objects. Framebuffers are created with respect to a specific render pass that the framebuffer is compatible with (see Render Pass Compatibility). Collectively, a render pass and a framebuffer define the complete render target state for one or more subpasses as well as the algorithmic dependencies between the subpasses.

The various pipeline stages of the drawing commands for a given subpass may execute concurrently and/or out of order, both within and across drawing commands, whilst still respecting pipeline order. However for a given (x,y,layer,sample) sample location, certain per-sample operations are performed in rasterization order.

\texttt{VK_ATTACHMENT_UNUSED} is a constant indicating that a render pass attachment is not used.

\begin{verbatim}
#define VK_ATTACHMENT_UNUSED (~0U)
\end{verbatim}

### 8.2. Render Pass Creation

To create a render pass, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkCreateRenderPass(
    VkDevice device, 
    const VkRenderPassCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkRenderPass* pRenderPass);
\end{verbatim}

- \texttt{device} is the logical device that creates the render pass.
- \texttt{pCreateInfo} is a pointer to a \texttt{VkRenderPassCreateInfo} structure describing the parameters of the render pass.
- \texttt{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
- \texttt{pRenderPass} is a pointer to a \texttt{VkRenderPass} handle in which the resulting render pass object is returned.

### Valid Usage

- VUID-vkCreateRenderPass-device-10000
  \texttt{device} must support at least one queue family with the \texttt{VK_QUEUE_GRAPHICS_BIT} capability
Valid Usage (Implicit)

- **VUID-vkCreateRenderPass-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkCreateRenderPass-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkRenderPassCreateInfo` structure

- **VUID-vkCreateRenderPass-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateRenderPass-pRenderPass-parameter**
  - `pRenderPass` must be a valid pointer to a `VkRenderPass` handle

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkRenderPassCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency* pDependencies;
} VkRenderPassCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `attachmentCount` is the number of attachments used by this render pass.
- `pAttachments` is a pointer to an array of `attachmentCount` `VkAttachmentDescription` structures describing the attachments used by the render pass.
• `subpassCount` is the number of subpasses to create.
• `pSubpasses` is a pointer to an array of `subpassCount` `VkSubpassDescription` structures describing each subpass.
• `dependencyCount` is the number of memory dependencies between pairs of subpasses.
• `pDependencies` is a pointer to an array of `dependencyCount` `VkSubpassDependency` structures describing dependencies between pairs of subpasses.

**NOTE**
Care should be taken to avoid a data race here; if any subpasses access attachments with overlapping memory locations, and one of those accesses is a write, a subpass dependency needs to be included between them.

### Valid Usage

- **VUID-VkRenderPassCreateInfo-attachment-00834**
  If the `attachment` member of any element of `pInputAttachments`, `pColorAttachments`, `pResolveAttachments` or `pDepthStencilAttachment`, or any element of `pPreserveAttachments` in any element of `pSubpasses` is not `VK_ATTACHMENT_UNUSED`, then it must be less than `attachmentCount`.

- **VUID-VkRenderPassCreateInfo-pAttachments-00836**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-02511**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a `layout` equal to `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01566**
  For any member of `pAttachments` with a `loadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pAttachments-01567**
  For any member of `pAttachments` with a `stencilLoadOp` equal to `VK_ATTACHMENT_LOAD_OP_CLEAR`, the first use of that attachment must not specify a `layout` equal to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkRenderPassCreateInfo-pNext-01926**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `subpass` member of each element of its `pAspectReferences` member must be less than `subpassCount`.

- **VUID-VkRenderPassCreateInfo-pNext-01927**
  If the `pNext` chain includes a `VkRenderPassInputAttachmentAspectCreateInfo` structure, the `inputAttachmentIndex` member of each element of its `pAspectReferences` member must be less than the value of `inputAttachmentCount` in the element of `pSubpasses` identified by...
its subpass member

- **VUID-VkRenderPassCreateInfo-pNext-01963**
  If the pNext chain includes a VkRenderPassInputAttachmentAspectCreateInfo structure, for any element of the pInputAttachments member of any element of pSubpasses where the attachment member is not VK_ATTACHMENT_UNUSED, the aspectMask member of the corresponding element of VkRenderPassInputAttachmentAspectCreateInfo::pAspectReferences must only include aspects that are present in images of the format specified by the element of pAttachments at attachment.

- **VUID-VkRenderPassCreateInfo-pNext-01928**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and its subpassCount member is not zero, that member must be equal to the value of subpassCount.

- **VUID-VkRenderPassCreateInfo-pNext-01929**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, if its dependencyCount member is not zero, it must be equal to dependencyCount.

- **VUID-VkRenderPassCreateInfo-pNext-01930**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, for each non-zero element of pViewOffsets, the srcSubpass and dstSubpass members of pDependencies at the same index must not be equal.

- **VUID-VkRenderPassCreateInfo-pNext-02512**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, for any element of pDependencies with a dependencyFlags member that does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, the corresponding element of the pViewOffsets member of that VkRenderPassMultiviewCreateInfo instance must be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02513**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, elements of its pViewMasks member must either all be 0, or all not be 0.

- **VUID-VkRenderPassCreateInfo-pNext-02514**
  If the pNext chain includes a VkRenderPassMultiviewCreateInfo structure, and each element of its pViewMasks member is 0, its correlationMaskCount member must be 0.

- **VUID-VkRenderPassCreateInfo-pDependencies-00837**
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass.

- **VUID-VkRenderPassCreateInfo-pDependencies-00838**
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass.
Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO

- VUID-VkRenderPassCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkRenderPassInputAttachmentAspectCreateInfo or VkRenderPassMultiviewCreateInfo

- VUID-VkRenderPassCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkRenderPassCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkRenderPassCreateInfo-pAttachments-parameter
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription structures

- VUID-VkRenderPassCreateInfo-pSubpasses-parameter
  pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription structures

- VUID-VkRenderPassCreateInfo-pDependencies-parameter
  If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency structures

- VUID-VkRenderPassCreateInfo-subpassCount-arraylength
  subpassCount must be greater than 0

Bits which can be set in VkRenderPassCreateInfo::flags, describing additional properties of the render pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkRenderPassCreateFlagBits {
} VkRenderPassCreateFlagBits;
```

**NOTE** All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.
VkRenderPassCreateFlags is a bitmask type for setting a mask of zero or more VkRenderPassCreateFlagBits.

If the VkRenderPassCreateInfo::pNext chain includes a VkRenderPassMultiviewCreateInfo structure, then that structure includes an array of view masks, view offsets, and correlation masks for the render pass.

The VkRenderPassMultiviewCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassMultiviewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t subpassCount;
    const uint32_t* pViewMasks;
    uint32_t dependencyCount;
    const int32_t* pViewOffsets;
    uint32_t correlationMaskCount;
    const uint32_t* pCorrelationMasks;
} VkRenderPassMultiviewCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkRenderPassMultiviewCreateInfo VkRenderPassMultiviewCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **subpassCount** is zero or the number of subpasses in the render pass.
- **pViewMasks** is a pointer to an array of subpassCount view masks, where each mask is a bitfield of view indices describing which views rendering is broadcast to in each subpass, when multiview is enabled. If subpassCount is zero, each view mask is treated as zero.
- **dependencyCount** is zero or the number of dependencies in the render pass.
- **pViewOffsets** is a pointer to an array of dependencyCount view offsets, one for each dependency. If dependencyCount is zero, each dependency's view offset is treated as zero. Each view offset controls which views in the source subpass the views in the destination subpass depend on.
- **correlationMaskCount** is zero or the number of correlation masks.
- **pCorrelationMasks** is a pointer to an array of correlationMaskCount view masks indicating sets of views that may be more efficient to render concurrently.

When a subpass uses a non-zero view mask, multiview functionality is considered to be enabled.
Multiview is all-or-nothing for a render pass - that is, either all subpasses must have a non-zero view mask (though some subpasses may have only one view) or all must be zero. Multiview causes all drawing and clear commands in the subpass to behave as if they were broadcast to each view, where a view is represented by one layer of the framebuffer attachments. All draws and clears are broadcast to each view index whose bit is set in the view mask. The view index is provided in the ViewIndex shader input variable, and color, depth/stencil, and input attachments all read/write the layer of the framebuffer corresponding to the view index.

If the view mask is zero for all subpasses, multiview is considered to be disabled and all drawing commands execute normally, without this additional broadcasting.

Some implementations may not support multiview in conjunction with geometry shaders or tessellation shaders.

When multiview is enabled, the VK_DEPENDENCY_VIEW_LOCAL_BIT bit in a dependency can be used to express a view-local dependency, meaning that each view in the destination subpass depends on a single view in the source subpass. Unlike pipeline barriers, a subpass dependency can potentially have a different view mask in the source subpass and the destination subpass. If the dependency is view-local, then each view (dstView) in the destination subpass depends on the view dstView + pViewOffsets[dependency] in the source subpass. If there is not such a view in the source subpass, then this dependency does not affect that view in the destination subpass. If the dependency is not view-local, then all views in the destination subpass depend on all views in the source subpass, and the view offset is ignored. A non-zero view offset is not allowed in a self-dependency.

The elements of pCorrelationMasks are a set of masks of views indicating that views in the same mask may exhibit spatial coherency between the views, making it more efficient to render them concurrently. Correlation masks must not have a functional effect on the results of the multiview rendering.

When multiview is enabled, at the beginning of each subpass all non-render pass state is undefined. In particular, each time vkCmdBeginRenderPass or vkCmdNextSubpass is called the graphics pipeline must be bound, any relevant descriptor sets or vertex/index buffers must be bound, and any relevant dynamic state or push constants must be set before they are used.

---

**Valid Usage**

- VUID-VkRenderPassMultiviewCreateInfo-pCorrelationMasks-00841
  Each view index must not be set in more than one element of pCorrelationMasks

- VUID-VkRenderPassMultiviewCreateInfo-multiview-06555
  If the multiview feature is not enabled, each element of pViewMasks must be 0

- VUID-VkRenderPassMultiviewCreateInfo-pViewMasks-06697
  The index of the most significant bit in each element of pViewMasks must be less than maxMultiviewViewCount

---

**Valid Usage (Implicit)**

- VUID-VkRenderPassMultiviewCreateInfo-sType-sType

433
The `VkAttachmentDescription` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentDescription {
    VkAttachmentDescriptionFlags     flags;
    VkFormat                          format;
    VkSampleCountFlagBits            samples;
    VkAttachmentLoadOp               loadOp;
    VkAttachmentStoreOp              storeOp;
    VkAttachmentLoadOp               stencilLoadOp;
    VkAttachmentStoreOp              stencilStoreOp;
    VkImageLayout                    initialLayout;
    VkImageLayout                    finalLayout;
} VkAttachmentDescription;
```

- `flags` is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
- `format` is a `VkFormat` value specifying the format of the image view that will be used for the attachment.
- `samples` is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
- `loadOp` is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
- `storeOp` is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
- `stencilLoadOp` is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
- `stencilStoreOp` is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
- `initialLayout` is the layout the attachment image subresource will be in when a render pass instance begins.
- `finalLayout` is the layout the attachment image subresource will be transitioned to when a render pass instance ends.
If the attachment uses a color format, then `loadOp` and `storeOp` are used, and `stencilLoadOp` and `stencilStoreOp` are ignored. If the format has depth and/or stencil components, `loadOp` and `storeOp` apply only to the depth data, while `stencilLoadOp` and `stencilStoreOp` define how the stencil data is handled. `loadOp` and `stencilLoadOp` define the load operations for the attachment. `storeOp` and `stencilStoreOp` define the store operations for the attachment. If an attachment is not used by any subpass, `loadOp`, `storeOp`, `stencilStoreOp`, and `stencilLoadOp` will be ignored for that attachment, and no load or store ops will be performed. However, any transition specified by `initialLayout` and `finalLayout` will still be executed.

If `flags` includes `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, then the attachment is treated as if it shares physical memory with another attachment in the same render pass. This information limits the ability of the implementation to reorder certain operations (like layout transitions and the `loadOp`) such that it is not improperly reordered against other uses of the same physical memory via a different attachment. This is described in more detail below.

If a render pass uses multiple attachments that alias the same device memory, those attachments must each include the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit in their attachment description flags. Attachments aliasing the same memory occurs in multiple ways:

- Multiple attachments being assigned the same image view as part of framebuffer creation.
- Attachments using distinct image views that correspond to the same image subresource of an image.
- Attachments using views of distinct image subresources which are bound to overlapping memory ranges.

Multiple attachments that alias the same memory must not be used in a single subpass. A given attachment index must not be used multiple times in a single subpass, with one exception: two subpass attachments can use the same attachment index if at least one use is as an input attachment and neither use is as a resolve or preserve attachment. In other words, the same view can be used simultaneously as an input and color or depth/stencil attachment, but must not be used as multiple color or depth/stencil attachments nor as resolve or preserve attachments.

If a set of attachments alias each other, then all except the first to be used in the render pass must use an `initialLayout` of `VK_IMAGE_LAYOUT_UNDEFINED`, since the earlier uses of the other aliases make their contents undefined. Once an alias has been used and a different alias has been used after it, the first alias must not be used in any later subpasses. However, an application can assign the same image view to multiple aliasing attachment indices, which allows that image view to be used multiple times even if other aliases are used in between.

NOTE: Once an attachment needs the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` bit, there
should be no additional cost of introducing additional aliases, and using these additional aliases may allow more efficient clearing of the attachments on multiple uses via `VK_ATTACHMENT_LOAD_OP_CLEAR`.

---

## Valid Usage

- **VUID-VkAttachmentDescription-format-06699**
  
  If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

- **VUID-VkAttachmentDescription-finalLayout-00843**
  
  `finalLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

- **VUID-VkAttachmentDescription-format-03280**
  
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-03281**
  
  If `format` is a depth/stencil format, `initialLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-03282**
  
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUTDEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-03283**
  
  If `format` is a depth/stencil format, `finalLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-06487**
  
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-06488**
  
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`.

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03284**
  
  If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-separateDepthStencilLayouts-03285**
  
  If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.
• VUID-VkAttachmentDescription-format-03286
  If format is a color format, initialLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03287
  If format is a color format, finalLayout must not be
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL,
  or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06906
  If format is a depth/stencil format which includes both depth and stencil components,
  initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-06907
  If format is a depth/stencil format which includes both depth and stencil components,
  finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03290
  If format is a depth/stencil format which includes only the depth component,
  initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-format-03291
  If format is a depth/stencil format which includes only the depth component,
  finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
  VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription-synchronization2-06908
  If the synchronization2 feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-synchronization2-06909
  If the synchronization2 feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07309
  If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-attachmentFeedbackLoopLayout-07310
  If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription-samples-08745
  samples must be a valid VkSampleCountFlagBits value that is set in
  imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

• VUID-VkAttachmentDescription-dynamicRenderingLocalRead-09544
  If the dynamicRenderingLocalRead feature is not enabled, initialLayout must not be
If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

- **VUID-VkAttachmentDescription-format-06698**
  format must not be `VK_FORMAT_UNDEFINED`

- **VUID-VkAttachmentDescription-format-06700**
  If `format` includes a stencil component and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

- **VUID-VkAttachmentDescription-format-03292**
  If `format` is a depth/stencil format which includes only the stencil component, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-03293**
  If `format` is a depth/stencil format which includes only the stencil component, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-06242**
  If `format` is a depth/stencil format which includes both depth and stencil components, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription-format-06243**
  If `format` is a depth/stencil format which includes both depth and stencil components, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

**Valid Usage (Implicit)**

- **VUID-VkAttachmentDescription-flags-parameter**
  flags must be a valid combination of `VkAttachmentDescriptionFlagBits` values

- **VUID-VkAttachmentDescription-format-parameter**
  format must be a valid `VkFormat` value

- **VUID-VkAttachmentDescription-samples-parameter**
  samples must be a valid `VkSampleCountFlagBits` value

- **VUID-VkAttachmentDescription-loadOp-parameter**
  loadOp must be a valid `VkAttachmentLoadOp` value

- **VUID-VkAttachmentDescription-storeOp-parameter**
  storeOp must be a valid `VkAttachmentStoreOp` value

- **VUID-VkAttachmentDescription-stencilLoadOp-parameter**
  stencilLoadOp must be a valid `VkAttachmentLoadOp` value

- **VUID-VkAttachmentDescription-stencilStoreOp-parameter**
  stencilStoreOp must be a valid `VkAttachmentStoreOp` value
Bits which can be set in `VkAttachmentDescription::flags`, describing additional properties of the attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentDescriptionFlagBits {
    VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT = 0x00000001,
} VkAttachmentDescriptionFlagBits;
```

- `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` specifies that the attachment aliases the same device memory as other attachments.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkAttachmentDescriptionFlags;
```

`VkAttachmentDescriptionFlags` is a bitmask type for setting a mask of zero or more `VkAttachmentDescriptionFlagBits`.

The `VkRenderPassInputAttachmentAspectCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkRenderPassInputAttachmentAspectCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t aspectReferenceCount;
    const VkInputAttachmentAspectReference* pAspectReferences;
} VkRenderPassInputAttachmentAspectCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkRenderPassInputAttachmentAspectCreateInfo
VkRenderPassInputAttachmentAspectCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `aspectReferenceCount` is the number of elements in the `pAspectReferences` array.
- `pAspectReferences` is a pointer to an array of `aspectReferenceCount` `VkInputAttachmentAspectReference` structures containing a mask describing which aspect(s)
can be accessed for a given input attachment within a given subpass.

To specify which aspects of an input attachment can be read, add a `VkRenderPassInputAttachmentAspectCreateInfo` structure to the `pNext` chain of the `VkRenderPassCreateInfo` structure:

An application can access any aspect of an input attachment that does not have a specified aspect mask in the `pAspectReferences` array. Otherwise, an application must not access aspect(s) of an input attachment other than those in its specified aspect mask.

### Valid Usage (Implicit)

- VUID-VkRenderPassInputAttachmentAspectCreateInfo-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_INPUT_ATTACHMENT_ASPECT_CREATE_INFO`
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-pAspectReferences-parameter
  - `pAspectReferences` must be a valid pointer to an array of `aspectReferenceCount` valid `VkInputAttachmentAspectReference` structures
- VUID-VkRenderPassInputAttachmentAspectCreateInfo-aspectReferenceCount-arraylength
  - `aspectReferenceCount` must be greater than 0

The `VkInputAttachmentAspectReference` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkInputAttachmentAspectReference {
    uint32_t subpass;
    uint32_t inputAttachmentIndex;
    VkImageAspectFlags aspectMask;
} VkInputAttachmentAspectReference;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkInputAttachmentAspectReference VkInputAttachmentAspectReferenceKHR;
```

- `subpass` is an index into the `pSubpasses` array of the parent `VkRenderPassCreateInfo` structure.
- `inputAttachmentIndex` is an index into the `pInputAttachments` of the specified subpass.
- `aspectMask` is a mask of which aspect(s) can be accessed within the specified subpass.

This structure specifies an aspect mask for a specific input attachment of a specific subpass in the render pass.

`subpass` and `inputAttachmentIndex` index into the render pass as:

```c
pCreateInfo->pSubpasses[subpass].pInputAttachments[inputAttachmentIndex]
```
Valid Usage

- VUID-VkInputAttachmentAspectReference-aspectMask-01964
  aspectMask must not include VK_IMAGE_ASPECT_METADATA_BIT

- VUID-VkInputAttachmentAspectReference-aspectMask-02250
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

- VUID-VkInputAttachmentAspectReference-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-VkInputAttachmentAspectReference-aspectMask-requiredbitmask
  aspectMask must not be 0

The VkSubpassDescription structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDescription {
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference* pColorAttachments;
    const VkAttachmentReference* pResolveAttachments;
    const VkAttachmentReference* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription;
```

- **flags** is a bitmask of VkSubpassDescriptionFlagBits specifying usage of the subpass.

- **pipelineBindPoint** is a VkPipelineBindPoint value specifying the pipeline type supported for this subpass.

- **inputAttachmentCount** is the number of input attachments.

- **pInputAttachments** is a pointer to an array of VkAttachmentReference structures defining the input attachments for this subpass and their layouts.

- **colorAttachmentCount** is the number of color attachments.

- **pColorAttachments** is a pointer to an array of colorAttachmentCount VkAttachmentReference structures defining the color attachments for this subpass and their layouts.

- **pResolveAttachments** is NULL or a pointer to an array of colorAttachmentCount VkAttachmentReference structures defining the resolve attachments for this subpass and their layouts.
• `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference` structure specifying the depth/stencil attachment for this subpass and its layout.

• `preserveAttachmentCount` is the number of preserved attachments.

• `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Each element of the `pInputAttachments` array corresponds to an input attachment index in a fragment shader, i.e. if a shader declares an image variable decorated with a `InputAttachmentIndex` value of `X`, then it uses the attachment provided in `pInputAttachments[X]`. Input attachments must also be bound to the pipeline in a descriptor set. If the `attachment` member of any element of `pInputAttachments` is `VK_ATTACHMENT_UNUSED`, the application must not read from the corresponding input attachment index. Fragment shaders can use subpass input variables to access the contents of an input attachment at the fragment's (x, y, layer) framebuffer coordinates.

Each element of the `pColorAttachments` array corresponds to an output location in the shader, i.e. if the shader declares an output variable decorated with a `Location` value of `X`, then it uses the attachment provided in `pColorAttachments[X]`. If the `attachment` member of any element of `pColorAttachments` is `VK_ATTACHMENT_UNUSED`, or if Color Write Enable has been disabled for the corresponding attachment index, then writes to the corresponding location by a fragment shader are discarded.

If `pResolveAttachments` is not `NULL`, each of its elements corresponds to a color attachment (the element in `pColorAttachments` at the same index), and a multisample resolve operation is defined for each attachment unless the resolve attachment index is `VK_ATTACHMENT_UNUSED`.

Similarly, if `VkSubpassDescriptionDepthStencilResolve::pDepthStencilResolveAttachment` is not `NULL` and does not have the value `VK_ATTACHMENT_UNUSED`, it corresponds to the depth/stencil attachment in `pDepthStencilAttachment`, and multisample resolve operation for depth and stencil are defined by `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` and `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode`, respectively. If `VkSubpassDescriptionDepthStencilResolve::depthResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a depth aspect, no resolve operation is performed for the depth attachment. If `VkSubpassDescriptionDepthStencilResolve::stencilResolveMode` is `VK_RESOLVE_MODE_NONE` or the `pDepthStencilResolveAttachment` does not have a stencil aspect, no resolve operation is performed for the stencil attachment.

If the image subresource range referenced by the depth/stencil attachment is created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the multisample resolve operation uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` for the subpass.

If `pDepthStencilAttachment` is `NULL`, or if its attachment index is `VK_ATTACHMENT_UNUSED`, it indicates that no depth/stencil attachment will be used in the subpass.

The contents of an attachment within the render area become undefined at the start of a subpass \( S \) if all of the following conditions are true:
• The attachment is used as a color, depth/stencil, or resolve attachment in any subpass in the render pass.

• There is a subpass $S_1$ that uses or preserves the attachment, and a subpass dependency from $S_1$ to $S$.

• The attachment is not used or preserved in subpass $S$.

Once the contents of an attachment become undefined in subpass $S$, they remain undefined for subpasses in subpass dependency chains starting with subpass $S$ until they are written again. However, they remain valid for subpasses in other subpass dependency chains starting with subpass $S_1$ if those subpasses use or preserve the attachment.

**Valid Usage**

- **VUID-VkSubpassDescription-attachment-06912**
  If the attachment member of an element of $pInputAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{COLOR}_{ATTACHMENT}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06913**
  If the attachment member of an element of $pColorAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{SHADER}_{READ}_{ONLY}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06914**
  If the attachment member of an element of $pResolveAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{SHADER}_{READ}_{ONLY}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06915**
  If the attachment member of $pDepthStencilAttachment$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{COLOR}_{ATTACHMENT}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{SHADER}_{READ}_{ONLY}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06916**
  If the attachment member of an element of $pColorAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{ATTACHMENT}_{STENCIL}_{READ}_{ONLY}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{READ}_{ONLY}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06917**
  If the attachment member of an element of $pResolveAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{ATTACHMENT}_{STENCIL}_{READ}_{ONLY}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{READ}_{ONLY}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$

- **VUID-VkSubpassDescription-attachment-06918**
  If the attachment member of an element of $pInputAttachments$ is not $VK_{ATTACHMENT}_{UNUSED}$, its layout member must not be $VK_{IMAGE}_{LAYOUT}_{DEPTH}_{ATTACHMENT}_{OPTIMAL}$ or $VK_{IMAGE}_{LAYOUT}_{STENCIL}_{ATTACHMENT}_{OPTIMAL}$
If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR.

If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR.

pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS.

colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments.

If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR.

If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not be VK_ATTACHMENT_UNUSED.

If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT.

If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT.

If pResolveAttachments is not NULL, each resolve attachment that is not
VK_ATTACHMENT_UNUSED must have the same VkFormat as its corresponding color attachment

- VUID-VkSubpassDescription-pColorAttachments-09430
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

- VUID-VkSubpassDescription-pInputAttachments-02647
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pColorAttachments-02648
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pResolveAttachments-02649
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-02650
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription-pDepthStencilAttachment-01418
  If pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and any attachments in pColorAttachments are not VK_ATTACHMENT_UNUSED, they must have the same sample count

- VUID-VkSubpassDescription-attachment-00853
  Each element of pPreserveAttachments must not be VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription-pPreserveAttachments-00854
  Each element of pPreserveAttachments must not also be an element of any other member of the subpass description

- VUID-VkSubpassDescription-layout-02519
  If any attachment is used by more than one VkAttachmentReference member, then each use must use the same layout

- VUID-VkSubpassDescription-pDepthStencilAttachment-04438
  pDepthStencilAttachment and pColorAttachments must not contain references to the same attachment

Valid Usage (Implicit)

- VUID-VkSubpassDescription-flags-zerobitmask
  flags must be 0

- VUID-VkSubpassDescription-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value
• VUID-VkSubpassDescription-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference structures.

• VUID-VkSubpassDescription-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference structure.

• VUID-VkSubpassDescription-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values.

Bits which can be set in VkSubpassDescription::flags, specifying usage of the subpass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSubpassDescriptionFlagBits {
  } VkSubpassDescriptionFlagBits;
```

**NOTE**
All bits for this type are defined by extensions, and none of those extensions are enabled in this build of the specification.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSubpassDescriptionFlags;
```

VkSubpassDescriptionFlags is a bitmask type for setting a mask of zero or more VkSubpassDescriptionFlagBits.

The VkAttachmentReference structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAttachmentReference {
  uint32_t attachment;
  VkImageLayout layout;
} VkAttachmentReference;
```

- attachment is either an integer value identifying an attachment at the corresponding index in VkRenderPassCreateInfo::pAttachments, or VK_ATTACHMENT_UNUSED to signify that this attachment is not used.
• *layout* is a *VkImageLayout* value specifying the layout the attachment uses during the subpass.

### Valid Usage

- **VUID-VkAttachmentReference-layout-03077**
  
  If *attachment* is not *VK_ATTACHMENT_UNUSED*, *layout* must not be *VK_IMAGE_LAYOUT_UNDEFINED*, *VK_IMAGE_LAYOUT_PREINITIALIZED*, or *VK_IMAGE_LAYOUT_PRESENT_SRC_KHR*.

- **VUID-VkAttachmentReference-separateDepthStencilLayouts-03313**
  
  If the *separateDepthStencilLayouts* feature is not enabled, and *attachment* is not *VK_ATTACHMENT_UNUSED*, *layout* must not be *VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL*, *VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL*, *VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL*, or *VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL*.

- **VUID-VkAttachmentReference-synchronization2-06910**
  
  If the *synchronization2* feature is not enabled, *layout* must not be *VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR* or *VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR*.

- **VUID-VkAttachmentReference-attachmentFeedbackLoopLayout-07311**
  
  If the *attachmentFeedbackLoopLayout* feature is not enabled, *layout* must not be *VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT*.

- **VUID-VkAttachmentReference-dynamicRenderingLocalRead-09546**
  
  If the *dynamicRenderingLocalRead* feature is not enabled, *layout* must not be *VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR*.

### Valid Usage (Implicit)

- **VUID-VkAttachmentReference-layout-parameter**
  
  *layout* must be a valid *VkImageLayout* value.

*VK_SUBPASS_EXTERNAL* is a special subpass index value expanding synchronization scope outside a subpass. It is described in more detail by *VkSubpassDependency*.

```c
#define VK_SUBPASS_EXTERNAL (~0U)
```

The *VkSubpassDependency* structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkSubpassDependency {
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
} VkSubpassDependency;

• srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• dstSubpass is the subpass index of the second subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• srcStageMask is a bitmask of VkPipelineStageFlagBits specifying the source stage mask.
• dstStageMask is a bitmask of VkPipelineStageFlagBits specifying the destination stage mask
• srcAccessMask is a bitmask of VkAccessFlagBits specifying a source access mask.
• dstAccessMask is a bitmask of VkAccessFlagBits specifying a destination access mask.
• dependencyFlags is a bitmask of VkDependencyFlagBits.

If srcSubpass is equal to dstSubpass then the VkSubpassDependency does not directly define a dependency. Instead, it enables pipeline barriers to be used in a render pass instance within the identified subpass, where the scopes of one pipeline barrier must be a subset of those described by one subpass dependency. Subpass dependencies specified in this way that include framebuffer-space stages in the srcStageMask must only include framebuffer-space stages in dstStageMask, and must include VK_DEPENDENCY_BY_REGION_BIT. When a subpass dependency is specified in this way for a subpass that has more than one view in its view mask, its dependencyFlags must include VK_DEPENDENCY_VIEW_LOCAL_BIT.

If srcSubpass and dstSubpass are not equal, when a render pass instance which includes a subpass dependency is submitted to a queue, it defines a dependency between the subpasses identified by srcSubpass and dstSubpass.

If srcSubpass is equal to VK_SUBPASS_EXTERNAL, the first synchronization scope includes commands that occur earlier in submission order than the vkCmdBeginRenderPass used to begin the render pass instance. Otherwise, the first set of commands includes all commands submitted as part of the subpass instance identified by srcSubpass and any load, store, or multisample resolve operations on attachments used in srcSubpass. In either case, the first synchronization scope is limited to operations on the pipeline stages determined by the source stage mask specified by srcStageMask.

If dstSubpass is equal to VK_SUBPASS_EXTERNAL, the second synchronization scope includes commands that occur later in submission order than the vkCmdEndRenderPass used to end the render pass instance. Otherwise, the second set of commands includes all commands submitted as part of the subpass instance identified by dstSubpass and any load, store, and multisample resolve operations on attachments used in dstSubpass. In either case, the second synchronization scope is limited to operations on the pipeline stages determined by the destination stage mask specified by
The first access scope is limited to accesses in the pipeline stages determined by the source stage mask specified by `srcStageMask`. It is also limited to access types in the source access mask specified by `srcAccessMask`.

The second access scope is limited to accesses in the pipeline stages determined by the destination stage mask specified by `dstStageMask`. It is also limited to access types in the destination access mask specified by `dstAccessMask`.

The availability and visibility operations defined by a subpass dependency affect the execution of image layout transitions within the render pass.

For non-attachment resources, the memory dependency expressed by subpass dependency is nearly identical to that of a `VkMemoryBarrier` (with matching `srcAccessMask` and `dstAccessMask` parameters) submitted as a part of a `vkCmdPipelineBarrier` (with matching `srcStageMask` and `dstStageMask` parameters). The only difference being that its scopes are limited to the identified subpasses rather than potentially affecting everything before and after.

For attachments however, subpass dependencies work more like a `VkImageMemoryBarrier` defined similarly to the `VkMemoryBarrier` above, the queue family indices set to `VK_QUEUE_FAMILY_IGNORED`, and layouts as follows:

- The equivalent to `oldLayout` is the attachment's layout according to the subpass description for `srcSubpass`.
- The equivalent to `newLayout` is the attachment's layout according to the subpass description for `dstSubpass`.

### Valid Usage

- **VUID-VkSubpassDependency-srcStageMask-04090**
  If the geometryShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency-srcStageMask-04091**
  If the tessellationShader feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency-srcStageMask-04094**
  If the transformFeedback feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-VkSubpassDependency-srcStageMask-07319**
  If the attachmentFragmentShadingRate feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubpassDependency-srcStageMask-03937**
  If the synchronization2 feature is not enabled, `srcStageMask` must not be `0`. 

449
If the `rayTracingPipeline` feature is not enabled, `srcStageMask` must not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

If the `geometryShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

If the `tessellationShader` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

If the `transformFeedback` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

If the `attachmentFragmentShadingRate` feature is not enabled, `dstStageMask` must not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the `synchronization2` feature is not enabled, `dstStageMask` must not be 0.

If one of `srcSubpass` and `dstSubpass` is equal to `VK_SUBPASS_EXTERNAL`, `srcStageMask` must be less than or equal to `dstSubpass`, unless one of them is `VK_SUBPASS_EXTERNAL`, to avoid cyclic dependencies and ensure a valid execution order.

Any access flag included in `srcAccessMask` must be supported by one of the pipeline stages in `srcStageMask`, as specified in the table of supported access types.

Any access flag included in `dstAccessMask` must be supported by one of the pipeline stages in `dstStageMask`, as specified in the table of supported access types.

If `srcSubpass` equals `dstSubpass`, and `srcStageMask` and `dstStageMask` both include a framebuffer-space stage, `dstStageMask` must only contain framebuffer-space stages.

If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `srcSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, `dependencyFlags` must include `VK_DEPENDENCY_BY_REGION_BIT`.

If `dependencyFlags` includes `VK_DEPENDENCY_BY_REGION_BIT`, `srcSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.
If `dependencyFlags` includes `VK_DEPENDENCY_VIEW_LOCAL_BIT`, `dstSubpass` must not be equal to `VK_SUBPASS_EXTERNAL`.

- **VUID-VkSubpassDependency-srcSubpass-00872**
  If `srcSubpass` equals `dstSubpass` and that subpass has more than one bit set in the view mask, then `dependencyFlags` must include `VK_DEPENDENCY_VIEW_LOCAL_BIT`.

---

**Valid Usage (Implicit)**

- **VUID-VkSubpassDependency-srcStageMask-parameter**
  `srcStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-VkSubpassDependency-dstStageMask-parameter**
  `dstStageMask` must be a valid combination of `VkPipelineStageFlagBits` values.

- **VUID-VkSubpassDependency-srcAccessMask-parameter**
  `srcAccessMask` must be a valid combination of `VkAccessFlagBits` values.

- **VUID-VkSubpassDependency-dstAccessMask-parameter**
  `dstAccessMask` must be a valid combination of `VkAccessFlagBits` values.

- **VUID-VkSubpassDependency-dependencyFlags-parameter**
  `dependencyFlags` must be a valid combination of `VkDependencyFlagBits` values.

When multiview is enabled, the execution of the multiple views of one subpass may not occur simultaneously or even back-to-back, and rather may be interleaved with the execution of other subpasses. The load and store operations apply to attachments on a per-view basis. For example, an attachment using `VK_ATTACHMENT_LOAD_OP_CLEAR` will have each view cleared on first use, but the first use of one view may be temporally distant from the first use of another view.

---

A good mental model for multiview is to think of a multiview subpass as if it were a collection of individual (per-view) subpasses that are logically grouped together and described as a single multiview subpass in the API. Similarly, a multiview attachment can be thought of like several individual attachments that happen to be layers in a single image. A view-local dependency between two multiview subpasses acts like a set of one-to-one dependencies between corresponding pairs of per-view subpasses. A view-global dependency between two multiview subpasses acts like a set of $N \times M$ dependencies between all pairs of per-view subpasses in the source and destination. Thus, it is a more compact representation which also makes clear the commonality and reuse that is present between views in a subpass. This interpretation motivates the answers to questions like “when does the load op apply” - it is on the first use of each view of an attachment, as if each view was a separate attachment.

The content of each view follows the description in attachment content behavior. In particular, if an attachment is preserved, all views within the attachment are preserved.

If any two subpasses of a render pass activate transform feedback to the same bound transform...
feedback buffers, a subpass dependency **must** be included (either directly or via some intermediate subpasses) between them.

If there is no subpass dependency from `VK_SUBPASS_EXTERNAL` to the first subpass that uses an attachment, then an implicit subpass dependency exists from `VK_SUBPASS_EXTERNAL` to the first subpass it is used in. The implicit subpass dependency only exists if there exists an automatic layout transition away from `initialLayout`. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
  .srcSubpass = VK_SUBPASS_EXTERNAL,
  .dstSubpass = firstSubpass, // First subpass attachment is used in
  .srcStageMask = VK_PIPELINE_STAGE_NONE,
  .dstStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
  .srcAccessMask = 0,
  .dstAccessMask = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT |
                   VK_ACCESS_COLOR_ATTACHMENT_READ_BIT |
                   VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                   VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT |
                   VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
  .dependencyFlags = 0
};
```

Similarly, if there is no subpass dependency from the last subpass that uses an attachment to `VK_SUBPASS_EXTERNAL`, then an implicit subpass dependency exists from the last subpass it is used in to `VK_SUBPASS_EXTERNAL`. The implicit subpass dependency only exists if there exists an automatic layout transition into `finalLayout`. The subpass dependency operates as if defined with the following parameters:

```cpp
VkSubpassDependency implicitDependency = {
  .srcSubpass = lastSubpass, // Last subpass attachment is used in
  .dstSubpass = VK_SUBPASS_EXTERNAL,
  .srcStageMask = VK_PIPELINE_STAGE_ALL_COMMANDS_BIT,
  .dstStageMask = VK_PIPELINE_STAGE_NONE,
  .srcAccessMask = VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT |
                   VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT,
  .dstAccessMask = 0,
  .dependencyFlags = 0
};
```

As subpasses **may** overlap or execute out of order with regards to other subpasses unless a subpass dependency chain describes otherwise, the layout transitions required between subpasses **cannot** be known to an application. Instead, an application provides the layout that each attachment **must** be in at the start and end of a render pass, and the layout it **must** be in during each subpass it is used in. The implementation then **must** execute layout transitions between subpasses in order to guarantee that the images are in the layouts required by each subpass, and in the final layout at the end of the render pass.
Automatic layout transitions apply to the entire image subresource attached to the framebuffer. If multiview is not enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the number of layers specified by `VkFramebufferCreateInfo::layers`. If multiview is enabled and the attachment is a view of a 1D or 2D image, the automatic layout transitions apply to the layers corresponding to views which are used by some subpass in the render pass, even if that subpass does not reference the given attachment. If the attachment view is a 2D or 2D array view of a 3D image, even if the attachment view only refers to a subset of the slices of the selected mip level of the 3D image, automatic layout transitions apply to the entire subresource referenced which is the entire mip level in this case.

Automatic layout transitions away from the layout used in a subpass happen-after the availability operations for all dependencies with that subpass as the `srcSubpass`.

Automatic layout transitions into the layout used in a subpass happen-before the visibility operations for all dependencies with that subpass as the `dstSubpass`.

Automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses the attachment that will be transitioned. For attachments created with `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, automatic layout transitions away from `initialLayout` happen-after the availability operations for all dependencies with a `srcSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `dstSubpass` uses any aliased attachment.

Automatic layout transitions into `finalLayout` happen-before the visibility operations for all dependencies with a `dstSubpass` equal to `VK_SUBPASS_EXTERNAL`, where `srcSubpass` uses any aliased attachment.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the attachment, thus automatic layout transitions use the sample locations state specified in `VkRenderPassSampleLocationsBeginInfoEXT`.

Automatic layout transitions of an attachment referring to a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` use the sample locations the image subresource range referenced by the attachment was last rendered with. If the current render pass does not use the attachment as a depth/stencil attachment in any subpass that happens-before, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pAttachmentInitialSampleLocations` array for which the `attachmentIndex` member equals the attachment index of the attachment, if one is specified. Otherwise, the automatic layout transition uses the sample locations state specified in the `sampleLocationsInfo` member of the element of the `VkRenderPassSampleLocationsBeginInfoEXT::pPostSubpassSampleLocations` array for which the `subpassIndex` member equals the index of the subpass that last used the attachment as a depth/stencil attachment, if one is specified.

If no sample locations state has been specified for an automatic layout transition performed on an
attachment referring to a depth/stencil image created with 
`VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` the contents of the depth aspect of the 
depth/stencil attachment become undefined as if the layout of the attachment was transitioned 
from the `VK_IMAGE_LAYOUT_UNDEFINED` layout.

If two subpasses use the same attachment, and both subpasses use the attachment in a read-only 
layout, no subpass dependency needs to be specified between those subpasses. If an 
implementation treats those layouts separately, it **must** insert an implicit subpass dependency 
between those subpasses to separate the uses in each layout. The subpass dependency operates as if 
defined with the following parameters:

```c
// Used for input attachments
VkPipelineStageFlags inputAttachmentStages = VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT;
VkAccessFlags inputAttachmentDstAccess = VK_ACCESS_INPUT_ATTACHMENT_READ_BIT;

// Used for depth/stencil attachments
VkPipelineStageFlags depthStencilAttachmentStages = 
VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT | 
VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT;
VkAccessFlags depthStencilAttachmentDstAccess = 
VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT;

VkSubpassDependency implicitDependency = {
    .srcSubpass = firstSubpass;
    .dstSubpass = secondSubpass;
    .srcStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .dstStageMask = inputAttachmentStages | depthStencilAttachmentStages;
    .srcAccessMask = 0;
    .dstAccessMask = inputAttachmentDstAccess | depthStencilAttachmentDstAccess;
    .dependencyFlags = 0;
};
```

When drawing using **shader objects**, or when the graphics pipeline is created with 
`VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo` 
`::pDynamicStates`, the application **must** specify which types of attachments that are written to during 
a render pass will also be accessed as non-attachments in the render pass.

To **dynamically set** whether a pipeline **can** access a resource as a non-attachment while it is also 
used as an attachment that is written to, call:

```c
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
void vkCmdSetAttachmentFeedbackLoopEnableEXT(
    VkCommandBuffer commandBuffer, 
    VkImageAspectFlags aspectMask);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **aspectMask** specifies the types of attachments for which feedback loops will be enabled.
Attachment types whose aspects are not included in \texttt{aspectMask} will have feedback loops disabled.

For attachments that are written to in a render pass, only attachments with the aspects specified in \texttt{aspectMask} can be accessed as non-attachments by subsequent drawing commands.

**Valid Usage**

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopDynamicState-08862
  The \texttt{attachmentFeedbackLoopDynamicState} feature must be enabled

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-08863
  \texttt{aspectMask} must only include \texttt{VK_IMAGE_ASPECT_NONE}, \texttt{VK_IMAGE_ASPECT_COLOR_BIT}, \texttt{VK_IMAGE_ASPECT_DEPTH_BIT}, and \texttt{VK_IMAGE_ASPECT_STENCIL_BIT}

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-attachmentFeedbackLoopLayout-08864
  If the \texttt{attachmentFeedbackLoopLayout} feature is not enabled, \texttt{aspectMask} must be \texttt{VK_IMAGE_ASPECT_NONE}

**Valid Usage (Implicit)**

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-aspectMask-parameter
  \texttt{aspectMask} must be a valid combination of \texttt{VkImageAspectFlagBits} values

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetAttachmentFeedbackLoopEnableEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized
A more extensible version of render pass creation is also defined below.

To create a render pass, call:

```c
// Provided by VK_VERSION_1_2
VkResult vkCreateRenderPass2(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
VkResult vkCreateRenderPass2KHR(
    VkDevice device,
    const VkRenderPassCreateInfo2* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkRenderPass* pRenderPass);
```

- `device` is the logical device that creates the render pass.
- `pCreateInfo` is a pointer to a `VkRenderPassCreateInfo2` structure describing the parameters of the render pass.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pRenderPass` is a pointer to a `VkRenderPass` handle in which the resulting render pass object is returned.

This command is functionally identical to `vkCreateRenderPass`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage**

- VUID-vkCreateRenderPass2-device-10001
  - `device` must support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
Valid Usage (Implicit)

- VUID-vkCreateRenderPass2-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateRenderPass2-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkRenderPassCreateInfo2 structure

- VUID-vkCreateRenderPass2-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateRenderPass2-pRenderPass-parameter
pRenderPass must be a valid pointer to a VkRenderPass handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY

The VkRenderPassCreateInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassCreateInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkRenderPassCreateFlags flags;
    uint32_t attachmentCount;
    const VkAttachmentDescription2* pAttachments;
    uint32_t subpassCount;
    const VkSubpassDescription2* pSubpasses;
    uint32_t dependencyCount;
    const VkSubpassDependency2* pDependencies;
    uint32_t correlatedViewMaskCount;
    const uint32_t* pCorrelatedViewMasks;
} VkRenderPassCreateInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkRenderPassCreateInfo2 VkRenderPassCreateInfo2KHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **attachmentCount** is the number of attachments used by this render pass.

• **pAttachments** is a pointer to an array of `attachmentCount` `VkAttachmentDescription2` structures describing the attachments used by the render pass.

• **subpassCount** is the number of subpasses to create.

• **pSubpasses** is a pointer to an array of `subpassCount` `VkSubpassDescription2` structures describing each subpass.

• **dependencyCount** is the number of dependencies between pairs of subpasses.

• **pDependencies** is a pointer to an array of `dependencyCount` `VkSubpassDependency2` structures describing dependencies between pairs of subpasses.

• **correlatedViewMaskCount** is the number of correlation masks.

• **pCorrelatedViewMasks** is a pointer to an array of view masks indicating sets of views that may be more efficient to render concurrently.

Parameters defined by this structure with the same name as those in `VkRenderPassCreateInfo` have the identical effect to those parameters; the child structures are variants of those used in `VkRenderPassCreateInfo` which add **sType** and **pNext** parameters, allowing them to be extended.

If the `VkSubpassDescription2`::**viewMask** member of any element of **pSubpasses** is not zero, multiview functionality is considered to be enabled for this render pass.

**correlatedViewMaskCount** and **pCorrelatedViewMasks** have the same effect as `VkRenderPassMultiviewCreateInfo`::**correlationMaskCount** and `VkRenderPassMultiviewCreateInfo`::**pCorrelationMasks**, respectively.

### Valid Usage

• **VUID-VkRenderPassCreateInfo2-None-03049**
  If any two subpasses operate on attachments with overlapping ranges of the same `VkDeviceMemory` object, and at least one subpass writes to that area of `VkDeviceMemory`, a subpass dependency must be included (either directly or via some intermediate subpasses) between them

• **VUID-VkRenderPassCreateInfo2-attachment-03050**
  If the attachment member of any element of **pInputAttachments**, **pColorAttachments**, **pResolveAttachments** or **pDepthStencilAttachment**, or the attachment indexed by any element of **pPreserveAttachments** in any element of **pSubpasses** is bound to a range of a `VkDeviceMemory` object that overlaps with any other attachment in any subpass (including the same subpass), the `VkAttachmentDescription2` structures describing them must include `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` in **flags**

• **VUID-VkRenderPassCreateInfo2-attachment-03051**
  If the attachment member of any element of **pInputAttachments**, **pColorAttachments**,
pResolveAttachments or pDepthStencilAttachment, or any element of pPreserveAttachments in any element of pSubpasses is not VK_ATTACHMENT_UNUSED, then it must be less than attachmentCount

- VUID-VkRenderPassCreateInfo2-pSubpasses-06473
  If the pSubpasses pNext chain includes a VkSubpassDescriptionDepthStencilResolve structure and the pDepthStencilResolveAttachment member is not NULL and does not have the value VK_ATTACHMENT_UNUSED, then attachment must be less than attachmentCount

- VUID-VkRenderPassCreateInfo2-pAttachments-02522
  For any member of pAttachments with a loadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderPassCreateInfo2-pAttachments-02523
  For any member of pAttachments with a stencilLoadOp equal to VK_ATTACHMENT_LOAD_OP_CLEAR, the first use of that attachment must not specify a layout equal to
  VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL,
  VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL,
  or
  VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkRenderPassCreateInfo2-pDependencies-03054
  For any element of pDependencies, if the srcSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the srcStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the source subpass

- VUID-VkRenderPassCreateInfo2-pDependencies-03055
  For any element of pDependencies, if the dstSubpass is not VK_SUBPASS_EXTERNAL, all stage flags included in the dstStageMask member of that dependency must be a pipeline stage supported by the pipeline identified by the pipelineBindPoint member of the destination subpass

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-03056
  The set of bits included in any element of pCorrelatedViewMasks must not overlap with the set of bits included in any other element of pCorrelatedViewMasks

- VUID-VkRenderPassCreateInfo2-viewMask-03057
  If the VkSubpassDescription2::viewMask member of all elements of pSubpasses is 0, correlatedViewMaskCount must be 0

- VUID-VkRenderPassCreateInfo2-viewMask-03058
  The VkSubpassDescription2::viewMask member of all elements of pSubpasses must either all be 0, or all not be 0

- VUID-VkRenderPassCreateInfo2-viewMask-03059
  If the VkSubpassDescription2::viewMask member of all elements of pSubpasses is 0, the dependencyFlags member of any element of pDependencies must not include
  VK_DEPENDENCY_VIEW_LOCAL_BIT

- VUID-VkRenderPassCreateInfo2-pDependencies-03060
  For any element of pDependencies where its srcSubpass member equals its dstSubpass
member, if the viewMask member of the corresponding element of pSubpasses includes more than one bit, its dependencyFlags member must include VK_DEPENDENCY_VIEW_LOCAL_BIT

• VUID-VkRenderPassCreateInfo2-attachment-02525
  If the attachment member of any element of the pInputAttachments member of any element of pSubpasses is not VK_ATTACHMENT_UNUSED, the aspectMask member of that element of pInputAttachments must only include aspects that are present in images of the format specified by the element of pAttachments specified by attachment

• VUID-VkRenderPassCreateInfo2-srcSubpass-02526
  The srcSubpass member of each element of pDependencies must be less than subpassCount

• VUID-VkRenderPassCreateInfo2-dstSubpass-02527
  The dstSubpass member of each element of pDependencies must be less than subpassCount

• VUID-VkRenderPassCreateInfo2-pAttachments-04585
  If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must not be used as any other attachment in the render pass

• VUID-VkRenderPassCreateInfo2-pAttachments-09387
  If any element of pAttachments is used as a fragment shading rate attachment, the loadOp for that attachment must not be VK_ATTACHMENT_LOAD_OP_CLEAR

• VUID-VkRenderPassCreateInfo2-pAttachments-04586
  If any element of pAttachments is used as a fragment shading rate attachment in any subpass, it must have an image format whose potential format features contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkRenderPassCreateInfo2-attachment-06244
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED, the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, and the pNext chain of that structure does not include a VkAttachmentReferenceStencilLayout structure, then the element of pAttachments with an index equal to attachment must not have a format that includes both depth and stencil components

• VUID-VkRenderPassCreateInfo2-attachment-06245
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must have a format that includes only a stencil component

• VUID-VkRenderPassCreateInfo2-attachment-06246
  If the attachment member of the pDepthStencilAttachment member of an element of pSubpasses is not VK_ATTACHMENT_UNUSED and the layout member of that same structure is either VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, then the element of pAttachments with an index equal to attachment must not have a format that includes only a stencil component
Valid Usage (Implicit)

- VUID-VkRenderPassCreateInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_RENDER_PASS_CREATE_INFO_2

- VUID-VkRenderPassCreateInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkRenderPassCreateInfo2-flags-zerobitmask
  flags must be 0

- VUID-VkRenderPassCreateInfo2-pAttachments-parameter
  If attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkAttachmentDescription2 structures

- VUID-VkRenderPassCreateInfo2-pSubpasses-parameter
  pSubpasses must be a valid pointer to an array of subpassCount valid VkSubpassDescription2 structures

- VUID-VkRenderPassCreateInfo2-pDependencies-parameter
  If dependencyCount is not 0, pDependencies must be a valid pointer to an array of dependencyCount valid VkSubpassDependency2 structures

- VUID-VkRenderPassCreateInfo2-pCorrelatedViewMasks-parameter
  If correlatedViewMaskCount is not 0, pCorrelatedViewMasks must be a valid pointer to an array of correlatedViewMaskCount uint32_t values

- VUID-VkRenderPassCreateInfo2-subpassCount-arraylength
  subpassCount must be greater than 0

The VkAttachmentDescription2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkAttachmentDescriptionFlags flags;
    VkFormat format;
    VkSampleCountFlagBits samples;
    VkAttachmentLoadOp loadOp;
    VkAttachmentStoreOp storeOp;
    VkAttachmentLoadOp stencilLoadOp;
    VkAttachmentStoreOp stencilStoreOp;
    VkImageLayout initialLayout;
    VkImageLayout finalLayout;
} VkAttachmentDescription2;
```

or the equivalent
typedef VkAttachmentDescription2KHR

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkAttachmentDescriptionFlagBits` specifying additional properties of the attachment.
• **format** is a `VkFormat` value specifying the format of the image that will be used for the attachment.
• **samples** is a `VkSampleCountFlagBits` value specifying the number of samples of the image.
• **loadOp** is a `VkAttachmentLoadOp` value specifying how the contents of color and depth components of the attachment are treated at the beginning of the subpass where it is first used.
• **storeOp** is a `VkAttachmentStoreOp` value specifying how the contents of color and depth components of the attachment are treated at the end of the subpass where it is last used.
• **stencilLoadOp** is a `VkAttachmentLoadOp` value specifying how the contents of stencil components of the attachment are treated at the beginning of the subpass where it is first used.
• **stencilStoreOp** is a `VkAttachmentStoreOp` value specifying how the contents of stencil components of the attachment are treated at the end of the last subpass where it is used.
• **initialLayout** is the layout the attachment image subresource will be in when a render pass instance begins.
• **finalLayout** is the layout the attachment image subresource will be transitioned to when a render pass instance ends.

Parameters defined by this structure with the same name as those in `VkAttachmentDescription` have the identical effect to those parameters.

If the `separateDepthStencilLayouts` feature is enabled, and `format` is a depth/stencil format, `initialLayout` and `finalLayout` can be set to a layout that only specifies the layout of the depth aspect.

If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, then the `stencilInitialLayout` and `stencilFinalLayout` members specify the initial and final layouts of the stencil aspect of a depth/stencil format, and `initialLayout` and `finalLayout` only apply to the depth aspect. For depth-only formats, the `VkAttachmentDescriptionStencilLayout` structure is ignored. For stencil-only formats, the initial and final layouts of the stencil aspect are taken from the `VkAttachmentDescriptionStencilLayout` structure if present, or `initialLayout` and `finalLayout` if not present.

If `format` is a depth/stencil format, and either `initialLayout` or `finalLayout` does not specify a layout for the stencil aspect, then the application must specify the initial and final layouts of the stencil aspect by including a `VkAttachmentDescriptionStencilLayout` structure in the `pNext` chain.

`loadOp` and `storeOp` are ignored for fragment shading rate attachments. No access to the shading rate attachment is performed in `loadOp` and `storeOp`. Instead, access to
VK_ACCESS_FRAGMENT_SHADING_RATE_ATTACHMENT_READ_BIT_KHR is performed as fragments are rasterized.

**Valid Usage**

- **VUID-VkAttachmentDescription2-format-06699**
  If `format` includes a color or depth component and `loadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`

- **VUID-VkAttachmentDescription2-finalLayout-00843**
  `finalLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`

- **VUID-VkAttachmentDescription2-format-03280**
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03281**
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03282**
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03283**
  If `format` is a depth/stencil format, `finalLayout` must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-06487**
  If `format` is a color format, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-06488**
  If `format` is a color format, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03284**
  If the `separateDepthStencilLayouts` feature is not enabled, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-separateDepthStencilLayouts-03285**
  If the `separateDepthStencilLayouts` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`

- **VUID-VkAttachmentDescription2-format-03286**
  If `format` is a color format, `initialLayout` must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03287
If format is a color format, finalLayout must not be
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06906
If format is a depth/stencil format which includes both depth and stencil components,
initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-06907
If format is a depth/stencil format which includes both depth and stencil components,
finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03290
If format is a depth/stencil format which includes only the depth component,
initialLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-format-03291
If format is a depth/stencil format which includes only the depth component,
finalLayout must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkAttachmentDescription2-synchronization2-06908
If the synchronization2 feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription2-synchronization2-06909
If the synchronization2 feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

• VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07309
If the attachmentFeedbackLoopLayout feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription2-attachmentFeedbackLoopLayout-07310
If the attachmentFeedbackLoopLayout feature is not enabled, finalLayout must not be
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

• VUID-VkAttachmentDescription2-samples-08745
samples must be a valid VkSampleCountFlagBits value that is set in
imageCreateSampleCounts (as defined in Image Creation Limits) for the given format

• VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09544
If the dynamicRenderingLocalRead feature is not enabled, initialLayout must not be
VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

• VUID-VkAttachmentDescription2-dynamicRenderingLocalRead-09545
If the `dynamicRenderingLocalRead` feature is not enabled, `finalLayout` must not be `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR`.

- **VUID-VkAttachmentDescription2-pNext-06704**
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `initialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

- **VUID-VkAttachmentDescription2-pNext-06705**
  If the `pNext` chain includes a `VkAttachmentDescriptionStencilLayout` structure, `format` includes a stencil component, and `stencilLoadOp` is `VK_ATTACHMENT_LOAD_OP_LOAD`, then `VkAttachmentDescriptionStencilLayout::stencilInitialLayout` must not be `VK_IMAGE_LAYOUT_UNDEFINED`.

- **VUID-VkAttachmentDescription2-format-06249**
  If `format` is a depth/stencil format which includes both depth and stencil components, and `initialLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain must include a `VkAttachmentDescriptionStencilLayout` structure.

- **VUID-VkAttachmentDescription2-format-06250**
  If `format` is a depth/stencil format which includes both depth and stencil components, and `finalLayout` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, the `pNext` chain must include a `VkAttachmentDescriptionStencilLayout` structure.

- **VUID-VkAttachmentDescription2-format-06247**
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `initialLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription2-format-06248**
  If the `pNext` chain does not include a `VkAttachmentDescriptionStencilLayout` structure and `format` only includes a stencil component, `finalLayout` must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`.

- **VUID-VkAttachmentDescription2-format-09332**
  `format` must not be `VK_FORMAT_UNDEFINED`.

---

**Valid Usage (Implicit)**

- **VUID-VkAttachmentDescription2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_ATTACHMENT_DESCRIPTION_2`.

- **VUID-VkAttachmentDescription2-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkAttachmentDescriptionStencilLayout`.

- **VUID-VkAttachmentDescription2-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkAttachmentDescription2-flags-parameter**
  `flags` must be a valid combination of `VkAttachmentDescriptionFlagBits` values.
The `VkAttachmentDescriptionStencilLayout` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentDescriptionStencilLayout {
    VkStructureType     sType;
    void*                pNext;
    VkImageLayout        stencilInitialLayout;
    VkImageLayout        stencilFinalLayout;
} VkAttachmentDescriptionStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentDescriptionStencilLayout VkAttachmentDescriptionStencilLayoutKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **stencilInitialLayout** is the layout the stencil aspect of the attachment image subresource will be in when a render pass instance begins.
- **stencilFinalLayout** is the layout the stencil aspect of the attachment image subresource will be transitioned to when a render pass instance ends.
stencilInitialLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03309
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

Valid Usage (Implicit)

• VUID-VkAttachmentDescriptionStencilLayout-stencilFinalLayout-03310
  stencilFinalLayout must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

The VkSubpassDescription2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescription2 {
    VkStructureType sType;
    const void* pNext;
    VkSubpassDescriptionFlags flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t viewMask;
    uint32_t inputAttachmentCount;
    const VkAttachmentReference2* pInputAttachments;
    uint32_t colorAttachmentCount;
    const VkAttachmentReference2* pColorAttachments;
    const VkAttachmentReference2* pResolveAttachments;
    const VkAttachmentReference2* pDepthStencilAttachment;
    uint32_t preserveAttachmentCount;
    const uint32_t* pPreserveAttachments;
} VkSubpassDescription2;
```
or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDescription2 VkSubpassDescription2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSubpassDescriptionFlagBits` specifying usage of the subpass.
- `pipelineBindPoint` is a `VkPipelineBindPoint` value specifying the pipeline type supported for this subpass.
- `viewMask` is a bitfield of view indices describing which views rendering is broadcast to in this subpass, when multiview is enabled.
- `inputAttachmentCount` is the number of input attachments.
- `pInputAttachments` is a pointer to an array of `VkAttachmentReference2` structures defining the input attachments for this subpass and their layouts.
- `colorAttachmentCount` is the number of color attachments.
- `pColorAttachments` is a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the color attachments for this subpass and their layouts.
- `pResolveAttachments` is `NULL` or a pointer to an array of `colorAttachmentCount` `VkAttachmentReference2` structures defining the resolve attachments for this subpass and their layouts.
- `pDepthStencilAttachment` is a pointer to a `VkAttachmentReference2` structure specifying the depth/stencil attachment for this subpass and its layout.
- `preserveAttachmentCount` is the number of preserved attachments.
- `pPreserveAttachments` is a pointer to an array of `preserveAttachmentCount` render pass attachment indices identifying attachments that are not used by this subpass, but whose contents must be preserved throughout the subpass.

Parameters defined by this structure with the same name as those in `VkSubpassDescription` have the identical effect to those parameters.

`viewMask` has the same effect for the described subpass as `VkRenderPassMultiviewCreateInfo`::`pViewMasks` has on each corresponding subpass.

If a `VkFragmentShadingRateAttachmentInfoKHR` structure is included in the `pNext` chain, `pFragmentShadingRateAttachment` is not `NULL`, and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, the identified attachment defines a fragment shading rate attachment for that subpass.

### Valid Usage

- **VUID-VkSubpassDescription2-attachment-06912**
  If the `attachment` member of an element of `pInputAttachments` is not `VK_ATTACHMENT_UNUSED`, its `layout` member must not be `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` or
VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06913
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06914
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06915
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06916
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06917
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06918
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06919
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06920
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

• VUID-VkSubpassDescription2-attachment-06921
  If the attachment member of an element of pInputAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR

• VUID-VkSubpassDescription2-attachment-06922
  If the attachment member of an element of pColorAttachments is not VK_ATTACHMENT_UNUSED,
its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06923
  If the attachment member of an element of pResolveAttachments is not VK_ATTACHMENT_UNUSED, its layout member must not be VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkSubpassDescription2-attachment-06251
  If the attachment member of pDepthStencilAttachment is not VK_ATTACHMENT_UNUSED and its pNext chain includes a VkAttachmentReferenceStencilLayout structure, the layout member of pDepthStencilAttachment must not be VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL

- VUID-VkSubpassDescription2-pipelineBindPoint-04953
  pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-VkSubpassDescription2-colorAttachmentCount-03063
  colorAttachmentCount must be less than or equal to VkPhysicalDeviceLimits::maxColorAttachments

- VUID-VkSubpassDescription2-loadOp-03064
  If the first use of an attachment in this render pass is as an input attachment, and the attachment is not also used as a color or depth/stencil attachment in the same subpass, then loadOp must not be VK_ATTACHMENT_LOAD_OP_CLEAR

- VUID-VkSubpassDescription2-pResolveAttachments-03065
  If pResolveAttachments is not NULL, for each resolve attachment that does not have the value VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have the value VK_ATTACHMENT_UNUSED

- VUID-VkSubpassDescription2-pResolveAttachments-03066
  If pResolveAttachments is not NULL, for each resolve attachment that is not VK_ATTACHMENT_UNUSED, the corresponding color attachment must not have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription2-pResolveAttachments-03068
  Each element of pResolveAttachments must have the same VkFormat as its corresponding color attachment

- VUID-VkSubpassDescription2-pResolveAttachments-03067
  If pResolveAttachments is not NULL, each resolve attachment that is not VK_ATTACHMENT_UNUSED must have a sample count of VK_SAMPLE_COUNT_1_BIT

- VUID-VkSubpassDescription2-pInputAttachments-02897
  All attachments in pInputAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain at least
  VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or
  VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkSubpassDescription2-pColorAttachments-02898
  All attachments in pColorAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
• VUID-VkSubpassDescription2-pResolveAttachments-02899
  All attachments in pResolveAttachments that are not VK_ATTACHMENT_UNUSED must have image formats whose potential format features contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkSubpassDescription2-pDepthStencilAttachment-02900
  If pDepthStencilAttachment is not NULL and the attachment is not VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescription2-multisampledRenderToSingleSampled-06872
  All attachments in pDepthStencilAttachment or pColorAttachments that are not VK_ATTACHMENT_UNUSED must have the same sample count

• VUID-VkSubpassDescription2-attachment-03073
  Each element of pPreserveAttachments must not be VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescription2-pPreserveAttachments-03074
  Each element of pPreserveAttachments must not also be an element of any other member of the subpass description

• VUID-VkSubpassDescription2-layout-02528
  If any attachment is used by more than one VkAttachmentReference2 member, then each use must use the same layout

• VUID-VkSubpassDescription2-attachment-02799
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must be a valid combination of VkImageAspectFlagBits

• VUID-VkSubpassDescription2-attachment-02800
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must not be 0

• VUID-VkSubpassDescription2-attachment-02801
  If the attachment member of any element of pInputAttachments is not VK_ATTACHMENT_UNUSED, then the aspectMask member must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

• VUID-VkSubpassDescription2-pDepthStencilAttachment-04440
  An attachment must not be used in both pDepthStencilAttachment and pColorAttachments

• VUID-VkSubpassDescription2-multiview-06558
  If the multiview feature is not enabled, viewMask must be 0

• VUID-VkSubpassDescription2-viewMask-06706
  The index of the most significant bit in viewMask must be less than maxMultiviewViewCount

Valid Usage (Implicit)

• VUID-VkSubpassDescription2-sType-sType
sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_2

- VUID-VkSubpassDescription2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkFragmentShadingRateAttachmentInfoKHR or VkSubpassDescriptionDepthStencilResolve

- VUID-VkSubpassDescription2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSubpassDescription2-flags-zerobitmask
  flags must be 0

- VUID-VkSubpassDescription2-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkSubpassDescription2-pInputAttachments-parameter
  If inputAttachmentCount is not 0, pInputAttachments must be a valid pointer to an array of inputAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pColorAttachments-parameter
  If colorAttachmentCount is not 0, pColorAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pResolveAttachments-parameter
  If colorAttachmentCount is not 0, and pResolveAttachments is not NULL, pResolveAttachments must be a valid pointer to an array of colorAttachmentCount valid VkAttachmentReference2 structures

- VUID-VkSubpassDescription2-pDepthStencilAttachment-parameter
  If pDepthStencilAttachment is not NULL, pDepthStencilAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

- VUID-VkSubpassDescription2-pPreserveAttachments-parameter
  If preserveAttachmentCount is not 0, pPreserveAttachments must be a valid pointer to an array of preserveAttachmentCount uint32_t values

The VkSubpassDescriptionDepthStencilResolve structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDescriptionDepthStencilResolve {
    VkStructureType sType;
    const void* pNext;
    VkResolveModeFlagBits depthResolveMode;
    VkResolveModeFlagBits stencilResolveMode;
    const VkAttachmentReference2* pDepthStencilResolveAttachment;
} VkSubpassDescriptionDepthStencilResolve;
```

or the equivalent
// Provided by VK_KHR_depth_stencil_resolve

typedef VkSubpassDescriptionDepthStencilResolve
    VkSubpassDescriptionDepthStencilResolveKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• depthResolveMode is a VkResolveModeFlagBits value describing the depth resolve mode.
• stencilResolveMode is a VkResolveModeFlagBits value describing the stencil resolve mode.
• pDepthStencilResolveAttachment is NULL or a pointer to a VkAttachmentReference2 structure
defining the depth/stencil resolve attachment for this subpass and its layout.

If the pNext chain of VkSubpassDescription2 includes a VkSubpassDescriptionDepthStencilResolve
structure, then that structure describes multisample resolve operations for the depth/stencil
attachment in a subpass. If this structure is not included in the pNext chain of
VkSubpassDescription2, or if it is and either pDepthStencilResolveAttachment is NULL or its
attachment index is VK_ATTACHMENT_UNUSED, it indicates that no depth/stencil resolve attachment
will be used in the subpass.

Valid Usage

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03177
  If pDepthStencilResolveAttachment is not NULL and does not have the value
  VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not be NULL or have the value
  VK_ATTACHMENT_UNUSED

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03179
  If pDepthStencilResolveAttachment is not NULL and does not have the value
  VK_ATTACHMENT_UNUSED, pDepthStencilAttachment must not have a sample count of
  VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03180
  If pDepthStencilResolveAttachment is not NULL and does not have the value
  VK_ATTACHMENT_UNUSED, pDepthStencilResolveAttachment must have a sample count of
  VK_SAMPLE_COUNT_1_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-02651
  If pDepthStencilResolveAttachment is not NULL and does not have the value
  VK_ATTACHMENT_UNUSED then it must have an image format whose potential format features
  contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03181
  If pDepthStencilResolveAttachment is not NULL and does not have the value
  VK_ATTACHMENT_UNUSED and VkFormat of pDepthStencilResolveAttachment has a depth
  component, then the VkFormat of pDepthStencilAttachment must have a depth component
  with the same number of bits and numeric format

• VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03182
  If pDepthStencilResolveAttachment is not NULL and does not have the value
VK_ATTACHMENT_UNUSED, and VkFormat of pDepthStencilResolveAttachment has a stencil component, then the VkFormat of pDepthStencilAttachment must have a stencil component with the same number of bits and numeric format

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03178
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, depthResolveMode and stencilResolveMode must not both be VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-depthResolveMode-03183
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a depth component, then the value of depthResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedDepthResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-stencilResolveMode-03184
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED and the VkFormat of pDepthStencilResolveAttachment has a stencil component, then the value of stencilResolveMode must be one of the bits set in VkPhysicalDeviceDepthStencilResolveProperties::supportedStencilResolveModes or VK_RESOLVE_MODE_NONE

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03185
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE, and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_FALSE, then the values of depthResolveMode and stencilResolveMode must be identical

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-03186
  If pDepthStencilResolveAttachment is not NULL and does not have the value VK_ATTACHMENT_UNUSED, the VkFormat of pDepthStencilResolveAttachment has both depth and stencil components, VkPhysicalDeviceDepthStencilResolveProperties::independentResolve is VK_FALSE and VkPhysicalDeviceDepthStencilResolveProperties::independentResolveNone is VK_TRUE, then the values of depthResolveMode and stencilResolveMode must be identical or one of them must be VK_RESOLVE_MODE_NONE

**Valid Usage (Implicit)**

- VUID-VkSubpassDescriptionDepthStencilResolve-sType-sType
  sType must be VK_STRUCTURE_TYPE_SUBPASS_DESCRIPTION_DEPTH_STENCIL_RESOLVE

- VUID-VkSubpassDescriptionDepthStencilResolve-pDepthStencilResolveAttachment-parameter
  If pDepthStencilResolveAttachment is not NULL, pDepthStencilResolveAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

The VkFragmentShadingRateAttachmentInfoKHR structure is defined as:
typedef struct VkFragmentShadingRateAttachmentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkAttachmentReference2* pFragmentShadingRateAttachment;
    VkExtent2D shadingRateAttachmentTexelSize;
} VkFragmentShadingRateAttachmentInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pFragmentShadingRateAttachment` is `NULL` or a pointer to a `VkAttachmentReference2` structure defining the fragment shading rate attachment for this subpass.
- `shadingRateAttachmentTexelSize` specifies the size of the portion of the framebuffer corresponding to each texel in `pFragmentShadingRateAttachment`.

If no shading rate attachment is specified, or if this structure is not specified, the implementation behaves as if a valid shading rate attachment was specified with all texels specifying a single pixel per fragment.

**Valid Usage**

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04524**
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, its `layout` member must be equal to `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04525**
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be a power of two value.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04526**
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be less than or equal to `maxFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04527**
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not `VK_ATTACHMENT_UNUSED`, `shadingRateAttachmentTexelSize.width` must be greater than or equal to `minFragmentShadingRateAttachmentTexelSize.width`.

- **VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04528**
  If `pFragmentShadingRateAttachment` is not `NULL` and its `attachment` member is not...
VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be a power of two value

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04529
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSize.height

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04530
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, shadingRateAttachmentTexelSize.height must be greater than or equal to minFragmentShadingRateAttachmentTexelSize.height

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04531
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.width and shadingRateAttachmentTexelSize.height must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-04532
  If pFragmentShadingRateAttachment is not NULL and its attachment member is not VK_ATTACHMENT_UNUSED, the quotient of shadingRateAttachmentTexelSize.height and shadingRateAttachmentTexelSize.width must be less than or equal to maxFragmentShadingRateAttachmentTexelSizeAspectRatio

Valid Usage (Implicit)

- VUID-VkFragmentShadingRateAttachmentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAGMENT_SHADING_RATE_ATTACHMENT_INFO_KHR

- VUID-VkFragmentShadingRateAttachmentInfoKHR-pFragmentShadingRateAttachment-parameter
  If pFragmentShadingRateAttachment is not NULL, pFragmentShadingRateAttachment must be a valid pointer to a valid VkAttachmentReference2 structure

The VkAttachmentReference2 structure is defined as:
typedef struct VkAttachmentReference2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachment;
    VkImageLayout layout;
    VkImageAspectFlags aspectMask;
} VkAttachmentReference2;

or the equivalent

// Provided by VK_KHR_create_renderpass2
typedef VkAttachmentReference2 VkAttachmentReference2KHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **attachment** is either an integer value identifying an attachment at the corresponding index in `VkRenderPassCreateInfo2::pAttachments`, or `VK_ATTACHMENT_UNUSED` to signify that this attachment is not used.
- **layout** is a `VkImageLayout` value specifying the layout the attachment uses during the subpass.
- **aspectMask** is a mask of which aspect(s) can be accessed within the specified subpass as an input attachment.

Parameters defined by this structure with the same name as those in `VkAttachmentReference` have the identical effect to those parameters.

**aspectMask** is ignored when this structure is used to describe anything other than an input attachment reference.

If the `separateDepthStencilLayouts` feature is enabled, and **attachment** has a depth/stencil format, **layout** can be set to a layout that only specifies the layout of the depth aspect.

If **layout** only specifies the layout of the depth aspect of the attachment, the layout of the stencil aspect is specified by the **stencillayout** member of a `VkAttachmentReferenceStencilLayout` structure included in the **pNext** chain. Otherwise, **layout** describes the layout for all relevant image aspects.

**Valid Usage**

- VUID-VkAttachmentReference2-layout-03077
  If **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_UNDEFINED`, `VK_IMAGE_LAYOUT_PREINITIALIZED`, or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`

- VUID-VkAttachmentReference2-separateDepthStencilLayouts-03313
  If the `separateDepthStencilLayouts` feature is not enabled, and **attachment** is not `VK_ATTACHMENT_UNUSED`, **layout** must not be `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL,

- VUID-VkAttachmentReference2-synchronization2-06910
  If the synchronization2 feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR or VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR

- VUID-VkAttachmentReference2-attachmentFeedbackLoopLayout-07311
  If the attachmentFeedbackLoopLayout feature is not enabled, layout must not be VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

- VUID-VkAttachmentReference2-dynamicRenderingLocalRead-09546
  If the dynamicRenderingLocalRead feature is not enabled, layout must not be VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR

Valid Usage (Implicit)

- VUID-VkAttachmentReference2-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_2

- VUID-VkAttachmentReference2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAttachmentReferenceStencilLayout

- VUID-VkAttachmentReference2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAttachmentReference2-layout-parameter
  layout must be a valid VkImageLayout value

The VkAttachmentReferenceStencilLayout structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkAttachmentReferenceStencilLayout {
    VkStructureType sType;
    void* pNext;
    VkImageLayout stencilLayout;
} VkAttachmentReferenceStencilLayout;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkAttachmentReferenceStencilLayout VkAttachmentReferenceStencilLayoutKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stencilLayout is a VkImageLayout value specifying the layout the stencil aspect of the attachment uses during the subpass.
Valid Usage

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-03318
  stencilLayout must not be VK_IMAGE_LAYOUT_UNDEFINED, VK_IMAGE_LAYOUT_PREINITIALIZED, VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR

Valid Usage (Implicit)

- VUID-VkAttachmentReferenceStencilLayout-sType-sType
  sType must be VK_STRUCTURE_TYPE_ATTACHMENT_REFERENCE_STENCIL_LAYOUT

- VUID-VkAttachmentReferenceStencilLayout-stencilLayout-parameter
  stencilLayout must be a valid VkImageLayout value

The VkSubpassDependency2 structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassDependency2 {
    VkStructureType sType;
    const void* pNext;
    uint32_t srcSubpass;
    uint32_t dstSubpass;
    VkPipelineStageFlags srcStageMask;
    VkPipelineStageFlags dstStageMask;
    VkAccessFlags srcAccessMask;
    VkAccessFlags dstAccessMask;
    VkDependencyFlags dependencyFlags;
    int32_t viewOffset;
} VkSubpassDependency2;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassDependency2 VkSubpassDependency2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcSubpass is the subpass index of the first subpass in the dependency, or VK_SUBPASS_EXTERNAL.
• **dstSubpass** is the subpass index of the second subpass in the dependency, or `VK_SUBPASS_EXTERNAL`.

• **srcStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the source stage mask.

• **dstStageMask** is a bitmask of `VkPipelineStageFlagBits` specifying the destination stage mask.

• **srcAccessMask** is a bitmask of `VkAccessFlagBits` specifying a source access mask.

• **dstAccessMask** is a bitmask of `VkAccessFlagBits` specifying a destination access mask.

• **dependencyFlags** is a bitmask of `VkDependencyFlagBits`.

• **viewOffset** controls which views in the source subpass the views in the destination subpass depend on.

Parameters defined by this structure with the same name as those in `VkSubpassDependency` have the identical effect to those parameters.

**viewOffset** has the same effect for the described subpass dependency as `VkRenderPassMultiviewCreateInfo::pViewOffsets` has on each corresponding subpass dependency.

If a `VkMemoryBarrier2` is included in the `pNext` chain, `srcStageMask`, `dstStageMask`, `srcAccessMask`, and `dstAccessMask` parameters are ignored. The synchronization and access scopes instead are defined by the parameters of `VkMemoryBarrier2`.

---

### Valid Usage

- **VUID-VkSubpassDependency2-srcStageMask-04090**
  If the `geometryShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-04091**
  If the `tessellationShader` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-VkSubpassDependency2-srcStageMask-04094**
  If the `transformFeedback` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-VkSubpassDependency2-srcStageMask-07319**
  If the `attachmentFragmentShadingRate` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-VkSubpassDependency2-srcStageMask-03937**
  If the `synchronization2` feature is not enabled, `srcStageMask` **must** not be 0.

- **VUID-VkSubpassDependency2-srcStageMask-07950**
  If the `rayTracingPipeline` feature is not enabled, `srcStageMask` **must** not contain `VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR`.

- **VUID-VkSubpassDependency2-dstStageMask-04090**
  If the `geometryShader` feature is not enabled, `dstStageMask` **must** not contain `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.
If the tessellationShader feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or
VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT

If the transformFeedback feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

If the attachmentFragmentShadingRate feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

If the synchronization2 feature is not enabled, dstStageMask must not be 0

If the rayTracingPipeline feature is not enabled, dstStageMask must not contain
VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR

srcSubpass must be less than or equal to dstSubpass, unless one of them is
VK_SUBPASS_EXTERNAL, to avoid cyclic dependencies and ensure a valid execution order

srcSubpass and dstSubpass must not both be equal to VK_SUBPASS_EXTERNAL

If srcSubpass is equal to dstSubpass and srcStageMask includes a framebuffer-space stage,
dstStageMask must only contain framebuffer-space stages

Any access flag included in srcAccessMask must be supported by one of the pipeline stages
in srcStageMask, as specified in the table of supported access types

Any access flag included in dstAccessMask must be supported by one of the pipeline stages
in dstStageMask, as specified in the table of supported access types

If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, srcSubpass must not be equal to
VK_SUBPASS_EXTERNAL

If dependencyFlags includes VK_DEPENDENCY_VIEW_LOCAL_BIT, dstSubpass must not be equal to
VK_SUBPASS_EXTERNAL

If srcSubpass equals dstSubpass, and srcStageMask and dstStageMask both include a
framebuffer-space stage, then dependencyFlags must include VK_DEPENDENCY_BY_REGION_BIT

If viewOffset is not equal to 0, srcSubpass must not be equal to dstSubpass

If dependencyFlags does not include VK_DEPENDENCY_VIEW_LOCAL_BIT, viewOffset must be 0
Valid Usage (Implicit)

- **VUID-VkSubpassDependency2-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_SUBPASS_DEPENDENCY_2

- **VUID-VkSubpassDependency2-pNext-pNext**
  - pNext must be NULL or a pointer to a valid instance of VkMemoryBarrier2

- **VUID-VkSubpassDependency2-sType-unique**
  - The sType value of each struct in the pNext chain must be unique

- **VUID-VkSubpassDependency2-srcStageMask-parameter**
  - srcStageMask must be a valid combination of VkPipelineStageFlagBits values

- **VUID-VkSubpassDependency2-dstStageMask-parameter**
  - dstStageMask must be a valid combination of VkPipelineStageFlagBits values

- **VUID-VkSubpassDependency2-srcAccessMask-parameter**
  - srcAccessMask must be a valid combination of VkAccessFlagBits values

- **VUID-VkSubpassDependency2-dstAccessMask-parameter**
  - dstAccessMask must be a valid combination of VkAccessFlagBits values

- **VUID-VkSubpassDependency2-dependencyFlags-parameter**
  - dependencyFlags must be a valid combination of VkDependencyFlagBits values

To destroy a render pass, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyRenderPass(
    VkDevice device,       // device is the logical device that destroys the render pass.
    VkRenderPass renderPass,    // renderPass is the handle of the render pass to destroy.
    const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

Valid Usage

- **VUID-vkDestroyRenderPass-renderPass-00873**
  - All submitted commands that refer to renderPass must have completed execution

- **VUID-vkDestroyRenderPass-renderPass-00874**
  - If VkAllocationCallbacks were provided when renderPass was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyRenderPass-renderPass-00875**
  - If no VkAllocationCallbacks were provided when renderPass was created, pAllocator must be NULL
Valid Usage (Implicit)

- **VUID-vkDestroyRenderPass-device-parameter**
  - The `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyRenderPass-renderPass-parameter**
  - If `renderPass` is not `VK_NULL_HANDLE`, `renderPass` must be a valid `VkRenderPass` handle.

- **VUID-vkDestroyRenderPass-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyRenderPass-renderPass-parent**
  - If `renderPass` is a valid handle, it must have been created, allocated, or retrieved from `device`.

Host Synchronization

- Host access to `renderPass` must be externally synchronized.

8.3. Render Pass Compatibility

Framebuffers and graphics pipelines are created based on a specific render pass object. They must only be used with that render pass object, or one compatible with it.

Two attachment references are compatible if they have matching format and sample count, or are both `VK_ATTACHMENT_UNUSED` or the pointer that would contain the reference is `NULL`.

Two arrays of attachment references are compatible if all corresponding pairs of attachments are compatible. If the arrays are of different lengths, attachment references not present in the smaller array are treated as `VK_ATTACHMENT_UNUSED`.

Two render passes are compatible if their corresponding color, input, resolve, and depth/stencil attachment references are compatible and if they are otherwise identical except for:

- Initial and final image layout in attachment descriptions
- Load and store operations in attachment descriptions
- Image layout in attachment references

As an additional special case, if two render passes have a single subpass, the resolve attachment reference and depth/stencil resolve mode compatibility requirements are ignored.

A framebuffer is compatible with a render pass if it was created using the same render pass or a compatible render pass.
8.4. Framebuffers

Render passes operate in conjunction with framebuffers. Framebuffers represent a collection of specific memory attachments that a render pass instance uses.

Framebuffers are represented by VkFramebuffer handles:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkFramebuffer)
```

To create a framebuffer, call:

```
// Provided by VK_VERSION_1_0
VkResult vkCreateFramebuffer(
    VkDevice device,
    const VkFramebufferCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkFramebuffer* pFramebuffer);
```

- `device` is the logical device that creates the framebuffer.
- `pCreateInfo` is a pointer to a VkFramebufferCreateInfo structure describing additional information about framebuffer creation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pFramebuffer` is a pointer to a VkFramebuffer handle in which the resulting framebuffer object is returned.

**Valid Usage**

- VUID-vkCreateFramebuffer-device-10002
  `device` must support at least one queue family with the VK_QUEUE_GRAPHICS_BIT capability
- VUID-vkCreateFramebuffer-pCreateInfo-02777
  If `pCreateInfo->flags` does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and `attachmentCount` is not 0, each element of `pCreateInfo->pAttachments` must have been created on `device`

**Valid Usage (Implicit)**

- VUID-vkCreateFramebuffer-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkCreateFramebuffer-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid VkFramebufferCreateInfo structure
- VUID-vkCreateFramebuffer-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid
The `VkFramebufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFramebufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFramebufferCreateFlags flags;
    VkRenderPass renderPass;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
    uint32_t width;
    uint32_t height;
    uint32_t layers;
} VkFramebufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkFramebufferCreateFlagBits`
- `renderPass` is a render pass defining what render passes the framebuffer will be compatible with. See `Render Pass Compatibility` for details.
- `attachmentCount` is the number of attachments.
- `pAttachments` is a pointer to an array of `VkImageView` handles, each of which will be used as the corresponding attachment in a render pass instance. If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, this parameter is ignored.
- `width`, `height` and `layers` define the dimensions of the framebuffer. If the render pass uses multiview, then `layers` must be one and each attachment requires a number of layers that is greater than the maximum bit index set in the view mask in the subpasses in which it is used.

It is legal for a subpass to use no color or depth/stencil attachments, either because it has no attachment references or because all of them are `VK_ATTACHMENT_UNUSED`. This kind of subpass can
use shader side effects such as image stores and atomics to produce an output. In this case, the subpass continues to use the width, height, and layers of the framebuffer to define the dimensions of the rendering area, and the rasterizationSamples from each pipeline's VkPipelineMultisampleStateCreateInfo to define the number of samples used in rasterization; however, if VkPhysicalDeviceFeatures::variableMultisampleRate is VK_FALSE, then all pipelines to be bound with the subpass must have the same value for VkPipelineMultisampleStateCreateInfo::rasterizationSamples. In all such cases, rasterizationSamples must be a valid VkSampleCountFlagBits value that is set in VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts.

Valid Usage

- VUID-VkFramebufferCreateInfo-attachmentCount-00876
  attachmentCount must be equal to the attachment count specified in renderPass

- VUID-VkFramebufferCreateInfo-flags-02778
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT and attachmentCount is not 0, pAttachments must be a valid pointer to an array of attachmentCount valid VkImageView handles

- VUID-VkFramebufferCreateInfo-pAttachments-00877
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a color attachment or resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-02633
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-02634
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a depth/stencil resolve attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-00879
  If renderPass is not VK_NULL_HANDLE, flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as an input attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-VkFramebufferCreateInfo-pAttachments-00880
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a VkFormat value that matches the VkFormat specified by the corresponding VkAttachmentDescription in renderPass

- VUID-VkFramebufferCreateInfo-pAttachments-00881
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with a samples value that matches the samples value specified by the corresponding VkAttachmentDescription in renderPass

- VUID-VkFramebufferCreateInfo-flags-04533
If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` must have been created with a `VkImageCreateInfo`:

- `extent.width` greater than or equal to `width`
- `extent.height` greater than or equal to `height`

**VUID-VkFramebufferCreateInfo-flags-04534**

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, each element of `pAttachments` that is used as an input, color, resolve, or depth/stencil attachment by `renderPass` must have been created with a `VkImageCreateInfo`:

- `subresourceRange.layerCount` greater than or equal to `layers`

**VUID-VkFramebufferCreateInfo-flags-04535**

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than the index of the most significant bit set in any of those view masks

**VUID-VkFramebufferCreateInfo-flags-04537**

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment by `renderPass` must have a `layerCount` that is either 1, or greater than `layers`

**VUID-VkFramebufferCreateInfo-flags-04538**

If `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, and `renderPass` was not specified with non-zero view masks, each element of `pAttachments` that is used as a fragment shading rate attachment must have a width at least as large as ⌈ `width / texelWidth` ⌉, where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment

**VUID-VkFramebufferCreateInfo-flags-04539**

If `maintenance` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, `flags` does not include `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, an element of `pAttachments` that is used as a fragment shading rate attachment must have a height at least as large as ⌈ `height / texelWidth` ⌉.
texelHeight, where texelHeight is the largest value of shadingRateAttachmentTexelSize.height in a VkFragmentShadingRateAttachmentInfoKHR which references that attachment

- **VUID-VkFramebufferCreateInfo-pAttachments-00883**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must only specify a single mip level

- **VUID-VkFramebufferCreateInfo-pAttachments-00884**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with the identity swizzle

- **VUID-VkFramebufferCreateInfo-width-00885**
  width must be greater than 0

- **VUID-VkFramebufferCreateInfo-width-00886**
  width must be less than or equal to maxFramebufferWidth

- **VUID-VkFramebufferCreateInfo-height-00887**
  height must be greater than 0

- **VUID-VkFramebufferCreateInfo-height-00888**
  height must be less than or equal to maxFramebufferHeight

- **VUID-VkFramebufferCreateInfo-layers-00889**
  layers must be greater than 0

- **VUID-VkFramebufferCreateInfo-layers-00890**
  layers must be less than or equal to maxFramebufferLayers

- **VUID-VkFramebufferCreateInfo-renderPass-02531**
  If renderPass was specified with non-zero view masks, layers must be 1

- **VUID-VkFramebufferCreateInfo-pAttachments-00891**
  If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is a 2D or 2D array image view taken from a 3D image must not be a depth/stencil format

- **VUID-VkFramebufferCreateInfo-flags-03189**
  If the imagelessFramebuffer feature is not enabled, flags must not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT

- **VUID-VkFramebufferCreateInfo-flags-03190**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the pNext chain must include a VkFramebufferAttachmentsCreateInfo structure

- **VUID-VkFramebufferCreateInfo-flags-03191**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentImageInfoCount member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain must be equal to either zero or attachmentCount

- **VUID-VkFramebufferCreateInfo-flags-04541**
  If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the width member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure in the pNext chain that is used as an input, color, resolve or depth/stencil attachment in renderPass must be greater than or equal to width
If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as an input, color, resolve or depth/stencil attachment in `renderPass` must be greater than or equal to `height`.

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `width` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be greater than or equal to `⌈width / texelWidth⌉`, where `texelWidth` is the largest value of `shadingRateAttachmentTexelSize.width` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

If `maintenance7` is not enabled or the `robustFragmentShadingRateAttachmentAccess` limit is `VK_FALSE` or the `imageView` member of a `VkRenderingFragmentShadingRateAttachmentInfoKHR` structure was created with `VkImageSubresourceRange::baseMipLevel` greater than 0, and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `height` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be greater than or equal to `⌈height / texelHeight⌉`, where `texelHeight` is the largest value of `shadingRateAttachmentTexelSize.height` in a `VkFragmentShadingRateAttachmentInfoKHR` which references that attachment.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be either 1, or greater than or equal to `layers`.

If `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` and `renderPass` was specified with non-zero view masks, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure in the `pNext` chain that is used as a fragment shading rate attachment must be either 1, or greater than the index of the most significant bit set in any of those view masks.

If multiview is enabled for `renderPass` and `flags` includes `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT`, the `layerCount` member of any element of the `pAttachmentImageInfos` member of a `VkFramebufferAttachmentsCreateInfo` structure included in the `pNext` chain used as an input, color, resolve, or depth/stencil attachment in `renderPass` must be greater than the maximum bit index set in the view mask in the subpasses in which it is used in `renderPass`.  

489
If multiview is not enabled for renderPass and flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the layerCount member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain used as an input, color, resolve, or depth/stencil attachment in renderPass must be greater than or equal to layers.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a color attachment or resolve attachment by renderPass must include VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a depth/stencil resolve attachment by renderPass must include VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as an input attachment by renderPass must include VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, at least one element of the pViewFormats member of any element of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain must be equal to the corresponding value of VkAttachmentDescription::format used to create renderPass.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments must have been created with VkImageViewCreateInfo::viewType not equal to VK_IMAGE_VIEW_TYPE_3D.

If flags does not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of pAttachments that is used as a fragment shading rate attachment by renderPass must have been created with a usage value including VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If flags includes VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the usage member of any element
of the pAttachmentImageInfos member of a VkFramebufferAttachmentsCreateInfo structure included in the pNext chain that refers to an attachment used as a fragment shading rate attachment by renderPass must include VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

Valid Usage (Implicit)

- VUID-VkFramebufferCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_CREATE_INFO

- VUID-VkFramebufferCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkFramebufferAttachmentsCreateInfo

- VUID-VkFramebufferCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkFramebufferCreateInfo-flags-parameter
  flags must be a valid combination of VkFramebufferCreateFlagBits values

- VUID-VkFramebufferCreateInfo-renderPass-parameter
  renderPass must be a valid VkRenderPass handle

- VUID-VkFramebufferCreateInfo-commonparent
  Both of renderPass, and the elements of pAttachments that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkFramebufferAttachmentsCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentImageInfoCount;
    const VkFramebufferAttachmentImageInfo* pAttachmentImageInfos;
} VkFramebufferAttachmentsCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentsCreateInfo VkFramebufferAttachmentsCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentImageInfoCount is the number of attachments being described.
- pAttachmentImageInfos is a pointer to an array of VkFramebufferAttachmentImageInfo structures, each structure describing a number of parameters of the corresponding attachment
in a render pass instance.

Valid Usage (Implicit)

- VUID-VkFramebufferAttachmentsCreateInfo-sType-sType

  sType must be VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENTS_CREATE_INFO

- VUID-VkFramebufferAttachmentsCreateInfo-pAttachmentImageInfos-parameter

  If attachmentImageInfoCount is not 0, pAttachmentImageInfos must be a valid pointer to an array of attachmentImageInfoCount valid VkFramebufferAttachmentImageInfo structures

The VkFramebufferAttachmentImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkFramebufferAttachmentImageInfo {
    VkStructureType     sType;
    const void*          pNext;
    VkImageCreateFlags   flags;
    VkImageUsageFlags    usage;
    uint32_t             width;
    uint32_t             height;
    uint32_t             layerCount;
    uint32_t             viewFormatCount;
    const VkFormat*      pViewFormats;
} VkFramebufferAttachmentImageInfo;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkFramebufferAttachmentImageInfo VkFramebufferAttachmentImageInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkImageCreateFlagBits, matching the value of VkImageCreateInfo::flags used to create an image that will be used with this framebuffer.
- usage is a bitmask of VkImageUsageFlagBits, matching the value of VkImageCreateInfo::usage used to create an image used with this framebuffer.
- width is the width of the image view used for rendering.
- height is the height of the image view used for rendering.
- layerCount is the number of array layers of the image view used for rendering.
- viewFormatCount is the number of entries in the pViewFormats array, matching the value of VkImageFormatListCreateInfo::viewFormatCount used to create an image used with this framebuffer.
• `pViewFormats` is a pointer to an array of `VkFormat` values specifying all of the formats which can be used when creating views of the image, matching the value of `VkImageFormatListCreateInfo::pViewFormats` used to create an image used with this framebuffer.

Images that can be used with the framebuffer when beginning a render pass, as specified by `VkRenderPassAttachmentBeginInfo`, must be created with parameters that are identical to those specified here.

**Valid Usage**

- VUID-VkFramebufferAttachmentImageInfo-viewFormatCount-09536
  If `viewFormatCount` is not 0, each element of `pViewFormats` must not be `VK_FORMAT_UNDEFINED`

**Valid Usage (Implicit)**

- VUID-VkFramebufferAttachmentImageInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_ATTACHMENT_IMAGE_INFO`

- VUID-VkFramebufferAttachmentImageInfo-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkFramebufferAttachmentImageInfo-flags-parameter
  `flags` must be a valid combination of `VkImageCreateFlagBits` values

- VUID-VkFramebufferAttachmentImageInfo-usage-parameter
  `usage` must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkFramebufferAttachmentImageInfo-usage-requiredbitmask
  `usage` must not be 0

- VUID-VkFramebufferAttachmentImageInfo-pViewFormats-parameter
  If `viewFormatCount` is not 0, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid `VkFormat` values

Bits which can be set in `VkFramebufferCreateInfo::flags`, specifying options for framebuffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFramebufferCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT = 0x00000001,
    // Provided by VK_KHR_imageless_framebuffer
    VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT_KHR = VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT,
} VkFramebufferCreateFlagBits;
```

- `VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT` specifies that image views are not specified, and only attachment compatibility information will be provided via a `VkFramebufferAttachmentImageInfo` structure.
VkFramebufferCreateFlags is a bitmask type for setting a mask of zero or more VkFramebufferCreateFlagBits.

To destroy a framebuffer, call:

```c
void vkDestroyFramebuffer(
    VKDevice device,
    VkFramebuffer framebuffer,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the framebuffer.
- **framebuffer** is the handle of the framebuffer to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyFramebuffer-framebuffer-00892
  All submitted commands that refer to **framebuffer** must have completed execution

- VUID-vkDestroyFramebuffer-framebuffer-00893
  If **VkAllocationCallbacks** were provided when **framebuffer** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyFramebuffer-framebuffer-00894
  If no **VkAllocationCallbacks** were provided when **framebuffer** was created, **pAllocator** must be **NULL**

### Valid Usage (Implicit)

- VUID-vkDestroyFramebuffer-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyFramebuffer-framebuffer-parameter
  If **framebuffer** is not **VK_NULL_HANDLE**, **framebuffer** must be a valid **VkFramebuffer** handle

- VUID-vkDestroyFramebuffer-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyFramebuffer-framebuffer-parent
  If **framebuffer** is a valid handle, it must have been created, allocated, or retrieved from **device**
Host Synchronization

- Host access to framebuffer must be externally synchronized

### 8.5. Render Pass Load Operations

Render pass load operations define the initial values of an attachment during a render pass instance.

Load operations for attachments with a depth/stencil format execute in the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` pipeline stage. Load operations for attachments with a color format execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. The load operation for each sample in an attachment happens-before any recorded command which accesses the sample in that render pass instance via that attachment or an alias.

**NOTE**

Because load operations always happen first, external synchronization with attachment access only needs to synchronize the load operations with previous commands; not the operations within the render pass instance. This does not apply when using `VK_ATTACHMENT_LOAD_OP_NONE_KHR`.

Load operations only update values within the defined render area for the render pass instance. However, any writes performed by a load operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `maintenance` is not enabled on the device or `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOPOPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

**NOTE**

As entire subresources could be accessed by load operations, applications cannot safely access values outside of the render area during a render pass instance when a load operation that modifies values is used.

Load operations that can be used for a render pass are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentLoadOp {
  VK_ATTACHMENT_LOAD_OP_LOAD = 0,
  VK_ATTACHMENT_LOAD_OP_CLEAR = 1,
  VK_ATTACHMENT_LOAD_OP_DONT_CARE = 2,
  // Provided by VK_KHR_load_store_op_none
  VK_ATTACHMENT_LOAD_OP_NONE_KHR = 1000400000,
  // Provided by VK_EXT_load_store_op_none
  VK_ATTACHMENT_LOAD_OP_NONE_EXT = VK_ATTACHMENT_LOAD_OP_NONE_KHR,
} VkAttachmentLoadOp;
```
• **VK_ATTACHMENT_LOAD_OP_LOAD** specifies that the previous contents of the image within the render area will be preserved as the initial values. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_READ_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_READ_BIT**.

• **VK_ATTACHMENT_LOAD_OP_CLEAR** specifies that the contents within the render area will be cleared to a uniform value, which is specified when a render pass instance is begun. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**.

• **VK_ATTACHMENT_LOAD_OP_DONT_CARE** specifies that the previous contents within the area need not be preserved; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type **VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT**. For attachments with a color format, this uses the access type **VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT**.

• **VK_ATTACHMENT_LOAD_OP_NONE_KHR** specifies that the previous contents of the image will be undefined inside the render pass. No access type is used as the image is not accessed.

During a render pass instance, input and color attachments with color formats that have a component size of 8, 16, or 32 bits must be represented in the attachment's format throughout the instance. Attachments with other floating- or fixed-point color formats, or with depth components may be represented in a format with a precision higher than the attachment format, but must be represented with the same range. When such a component is loaded via the **loadOp**, it will be converted into an implementation-dependent format used by the render pass. Such components must be converted from the render pass format, to the format of the attachment, before they are resolved or stored at the end of a render pass instance via **storeOp**. Conversions occur as described in **Numeric Representation and Computation** and **Fixed-Point Data Conversions**.

8.6. **Render Pass Store Operations**

Render pass store operations define how values written to an attachment during a render pass instance are stored to memory.

Store operations for attachments with a depth/stencil format execute in the **VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT** pipeline stage. Store operations for attachments with a color format execute in the **VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT** pipeline stage. The store operation for each sample in an attachment happens-after any recorded command which accesses the sample via that attachment or an alias.

**NOTE** Because store operations always happen after other accesses in a render pass instance, external synchronization with attachment access in an earlier render pass only needs to synchronize with the store operations; not the operations within the render pass instance. This does not apply when using **VK_ATTACHMENT_STORE_OP_NONE**.

Store operations only update values within the defined render area for the render pass instance. However, any writes performed by a store operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if **separateDepthStencilAttachmentAccess** is **VK_FALSE**,
writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout, implementations must not access pixels outside of the render area.

NOTE As entire subresources could be accessed by store operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a store operation that modifies values is used.

Possible values of VkAttachmentDescription::storeOp and stencilStoreOp, specifying how the contents of the attachment are treated, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkAttachmentStoreOp {
    VK_ATTACHMENT_STORE_OP_STORE = 0,
    VK_ATTACHMENT_STORE_OP_DONT_CARE = 1,
    // Provided by VK_VERSION_1_3
    VK_ATTACHMENT_STORE_OP_NONE = 1000301000,
    // Provided by VK_KHR_dynamic_rendering, VK_KHR_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_KHR = VK_ATTACHMENT_STORE_OP_NONE,
    // Provided by VK_EXT_load_store_op_none
    VK_ATTACHMENT_STORE_OP_NONE_EXT = VK_ATTACHMENT_STORE_OP_NONE,
} VkAttachmentStoreOp;
```

- **VK_ATTACHMENT_STORE_OP_STORE** specifies the contents generated during the render pass and within the render area are written to memory. For attachments with a depth/stencil format, this uses the access type VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.

- **VK_ATTACHMENT_STORE_OP_DONT_CARE** specifies the contents within the render area are not needed after rendering, and may be discarded; the contents of the attachment will be undefined inside the render area. For attachments with a depth/stencil format, this uses the access type VK_ACCESS_DEPTH_STENCIL_ATTACHMENT_WRITE_BIT. For attachments with a color format, this uses the access type VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT.

- **VK_ATTACHMENT_STORE_OP_NONE** specifies the contents within the render area are not accessed by the store operation as long as no values are written to the attachment during the render pass. If values are written during the render pass, this behaves identically to VK_ATTACHMENT_STORE_OP_DONT_CARE and with matching access semantics.

NOTE VK_ATTACHMENT_STORE_OP_DONT_CARE can cause contents generated during previous render passes to be discarded before reaching memory, even if no write to the attachment occurs during the current render pass.

### 8.7. Render Pass Multisample Resolve Operations

Render pass multisample resolve operations combine sample values from a single pixel in a multisample attachment and store the result to the corresponding pixel in a single sample attachment.
Multisample resolve operations for attachments execute in the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` pipeline stage. A final resolve operation for all pixels in the render area happens after any recorded command which writes a pixel via the multisample attachment to be resolved or an explicit alias of it in the subpass that it is specified. Any single sample attachment specified for use in a multisample resolve operation may have its contents modified at any point once rendering begins for the render pass instance. Reads from the multisample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`. Access to the single sample attachment can be synchronized with `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT` and `VK_ACCESS_COLOR_ATTACHMENT_WRITE_BIT`. These pipeline stage and access types are used whether the attachments are color or depth/stencil attachments.

When using render pass objects, a subpass dependency specified with the above pipeline stages and access flags will ensure synchronization with multisample resolve operations for any attachments that were last accessed by that subpass. This allows later subpasses to read resolved values as input attachments.

Resolve operations only update values within the defined render area for the render pass instance. However, any writes performed by a resolve operation (as defined by its access masks) to a given attachment may read and write back any memory locations within the image subresource bound for that attachment. For depth/stencil images, if `separateDepthStencilAttachmentAccess` is `VK_FALSE`, writes to one aspect may also result in read-modify-write operations for the other aspect. If the subresource is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` layout, implementations must not access pixels outside of the render area.

As entire subresources could be accessed by multisample resolve operations, applications cannot safely access values outside of the render area via aliased resources during a render pass instance when a multisample resolve operation is performed.

Multisample values in a multisample attachment are combined according to the resolve mode used:
typedef enum VkResolveModeFlagBits {
    VK_RESOLVE_MODE_NONE = 0,
    VK_RESOLVE_MODE_SAMPLE_ZERO_BIT = 0x00000001,
    VK_RESOLVE_MODE_AVERAGE_BIT = 0x00000002,
    VK_RESOLVE_MODE_MIN_BIT = 0x00000004,
    VK_RESOLVE_MODE_MAX_BIT = 0x00000008,
} VkResolveModeFlagBits;

or the equivalent

// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlagBits VkResolveModeFlagBitsKHR;

• VK_RESOLVE_MODE_NONE indicates that no resolve operation is done.

• VK_RESOLVE_MODE_SAMPLE_ZERO_BIT indicates that result of the resolve operation is equal to the value of sample 0.

• VK_RESOLVE_MODE_AVERAGE_BIT indicates that result of the resolve operation is the average of the sample values.

• VK_RESOLVE_MODE_MIN_BIT indicates that result of the resolve operation is the minimum of the sample values.

• VK_RESOLVE_MODE_MAX_BIT indicates that result of the resolve operation is the maximum of the sample values.

If no resolve mode is otherwise specified, VK_RESOLVE_MODE_AVERAGE_BIT is used.

or the equivalent

// Provided by VK_VERSION_1_2
typedef VkFlags VkResolveModeFlags;

or the equivalent

// Provided by VK_KHR_depth_stencil_resolve
typedef VkResolveModeFlags VkResolveModeFlagsKHR;
8.8. Render Pass Commands

An application records the commands for a render pass instance one subpass at a time, by beginning a render pass instance, iterating over the subpasses to record commands for that subpass, and then ending the render pass instance.

To begin a render pass instance, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginRenderPass(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `contents` is a `VkSubpassContents` value specifying how the commands in the first subpass will be provided.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- VUID-vkCmdBeginRenderPass-initialLayout-00895
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`.

- VUID-vkCmdBeginRenderPass-initialLayout-01758
  If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL`, and `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`. 
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If any of the `stencilInitialLayout` or `stencilFinalLayout` member of the `VkAttachmentDescriptionStencilLayout` structures or the `stencilLayout` member of the `VkAttachmentReferenceStencilLayout` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_SAMPLED_BIT` or `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a `usage` value including `VK_IMAGE_USAGE_TRANSFER_SRC_BIT`

If the `initialLayout` member of any of the `VkAttachmentDescription` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is not `VK_IMAGE_LAYOUT_UNDEFINED`, then each such `initialLayout` must be equal to the current
The `srcStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

The `dstStageMask` members of any element of the `pDependencies` member of `VkRenderPassCreateInfo` used to create `renderPass` must be supported by the capabilities of the queue family identified by the `queueFamilyIndex` member of the `VkCommandPoolCreateInfo` used to create the command pool which `commandBuffer` was allocated from.

For any attachment in `framebuffer` that is used by `renderPass` and is bound to memory locations that are also bound to another attachment used by `renderPass`, and if at least one of those uses causes either attachment to be written to, both attachments must have had the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT` set.

If any attachments specified in `framebuffer` are used by `renderPass` and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT` and either the `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_SAMPLED_BIT` usage bits.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view...
of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including either VK_IMAGE_USAGE_STORAGE_BIT, or both VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT and either of VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass-contents-09640
  If contents is VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR, then at least one of the following features must be enabled:
  - maintenance
  - nestedCommandBuffer

### Valid Usage (Implicit)

- VUID-vkCmdBeginRenderPass-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginRenderPass-pRenderPassBegin-parameter
  pRenderPassBegin must be a valid pointer to a valid VkRenderPassBeginInfo structure

- VUID-vkCmdBeginRenderPass-contents-parameter
  contents must be a valid VkSubpassContents value

- VUID-vkCmdBeginRenderPass-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginRenderPass-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginRenderPass-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBeginRenderPass-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginRenderPass-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Alternatively to begin a render pass, call:

```cpp
// Provided by VK_VERSION_1_2
void vkCmdBeginRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

or the equivalent command

```cpp
// Provided by VK_KHR_create_renderpass2
void vkCmdBeginRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkRenderPassBeginInfo* pRenderPassBegin,
    const VkSubpassBeginInfo* pSubpassBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pRenderPassBegin` is a pointer to a `VkRenderPassBeginInfo` structure specifying the render pass to begin an instance of, and the framebuffer the instance uses.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.

After beginning a render pass instance, the command buffer is ready to record the commands for the first subpass of that render pass.

**Valid Usage**

- VUID-vkCmdBeginRenderPass2-framebuffer-02779
  Both the framebuffer and renderPass members of `pRenderPassBegin` must have been created on the same `VkDevice` that `commandBuffer` was allocated on.

- VUID-vkCmdBeginRenderPass2-initialLayout-03094
  If any of the initialLayout or finalLayout member of the `VkAttachmentDescription` structures or the layout member of the `VkAttachmentReference` structures specified when creating the render pass specified in the renderPass member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` then the corresponding attachment image view
of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03096
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-02844
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-stencilInitialLayout-02845
  If any of the stencilInitialLayout or stencilFinalLayout member of the VkAttachmentDescriptionStencilLayout structures or the stencilLayout member of the VkAttachmentReferenceStencilLayout structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03097
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_SAMPLED_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

- VUID-vkCmdBeginRenderPass2-initialLayout-03098
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL then the corresponding attachment image view of
the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_SRC_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03099
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including VK_IMAGE_USAGE_TRANSFER_DST_BIT

• VUID-vkCmdBeginRenderPass2-initialLayout-03100
  If the initialLayout member of any of the VkAttachmentDescription structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is not VK_IMAGE_LAYOUT_UNDEFINED, then each such initialLayout must be equal to the current layout of the corresponding attachment image subresource of the framebuffer specified in the framebuffer member of pRenderPassBegin

• VUID-vkCmdBeginRenderPass2-srcStageMask-06453
  The srcStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

• VUID-vkCmdBeginRenderPass2-dstStageMask-06454
  The dstStageMask members of any element of the pDependencies member of VkRenderPassCreateInfo used to create renderPass must be supported by the capabilities of the queue family identified by the queueFamilyIndex member of the VkCommandPoolCreateInfo used to create the command pool which commandBuffer was allocated from

• VUID-vkCmdBeginRenderPass2-framebuffer-02533
  For any attachment in framebuffer that is used by renderPass and is bound to memory locations that are also bound to another attachment used by renderPass, and if at least one of those uses causes either attachment to be written to, both attachments must have had the VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT set

• VUID-vkCmdBeginRenderPass2-framebuffer-09046
  If any attachments specified in framebuffer are used by renderPass and are bound to overlapping memory locations, there must be only one that is used as a color attachment, depth/stencil, or resolve attachment in any subpass

• VUID-vkCmdBeginRenderPass2-initialLayout-07002
  If any of the initialLayout or finalLayout member of the VkAttachmentDescription structures or the layout member of the VkAttachmentReference structures specified when creating the render pass specified in the renderPass member of pRenderPassBegin is VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT then the corresponding attachment image view of the framebuffer specified in the framebuffer member of pRenderPassBegin must have been created with a usage value including either the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT or VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT and either the VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT or VK_IMAGE_USAGE_SAMPLED_BIT usage bits
If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value the `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` usage bit.

If any of the `initialLayout` or `finalLayout` member of the `VkAttachmentDescription` structures or the `layout` member of the `VkAttachmentReference` structures specified when creating the render pass specified in the `renderPass` member of `pRenderPassBegin` is `VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR` then the corresponding attachment image view of the framebuffer specified in the `framebuffer` member of `pRenderPassBegin` must have been created with a usage value including either `VK_IMAGE_USAGE_STORAGE_BIT`, or both `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` and either of `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` or `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginRenderPass2-commandBuffer-parameter**
  
  `commandBuffer must be a valid VkCommandBuffer handle`

- **VUID-vkCmdBeginRenderPass2-pRenderPassBegin-parameter**
  
  `pRenderPassBegin must be a valid pointer to a valid VkRenderPassBeginInfo structure`

- **VUID-vkCmdBeginRenderPass2-pSubpassBeginInfo-parameter**
  
  `pSubpassBeginInfo must be a valid pointer to a valid VkSubpassBeginInfo structure`

- **VUID-vkCmdBeginRenderPass2-commandBuffer-recording**
  
  `commandBuffer must be in the recording state`

- **VUID-vkCmdBeginRenderPass2-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdBeginRenderPass2-renderpass**
  
  This command must only be called outside of a render pass instance.

- **VUID-vkCmdBeginRenderPass2-videocoding**
  
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdBeginRenderPass2-bufferlevel**
  
  `commandBuffer must be a primary VkCommandBuffer`

**Host Synchronization**

- Host access to `commandBuffer must be externally synchronized`

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
The `VkRenderPassBeginInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkRenderPass renderPass;
    VkFramebuffer framebuffer;
    VkRect2D renderArea;
    uint32_t clearValueCount;
    const VkClearValue* pClearValues;
} VkRenderPassBeginInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPass` is the render pass to begin an instance of.
- `framebuffer` is the framebuffer containing the attachments that are used with the render pass.
- `renderArea` is the render area that is affected by the render pass instance, and is described in more detail below.
- `clearValueCount` is the number of elements in `pClearValues`.
- `pClearValues` is a pointer to an array of `clearValueCount` `VkClearValue` structures containing clear values for each attachment, if the attachment uses a `loadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR` or if the attachment has a depth/stencil format and uses a `stencilLoadOp` value of `VK_ATTACHMENT_LOAD_OP_CLEAR`. The array is indexed by attachment number. Only elements corresponding to cleared attachments are used. Other elements of `pClearValues` are ignored.

`renderArea` is the render area that is affected by the render pass instance. The effects of attachment load, store and multisample resolve operations are restricted to the pixels whose x and y coordinates fall within the render area on all attachments. The render area extends to all layers of `framebuffer`. The application must ensure (using scissor if necessary) that all rendering is contained within the render area. The render area must be contained within the framebuffer dimensions.
NOTE

There **may** be a performance cost for using a render area smaller than the framebuffer, unless it matches the render area granularity for the render pass.

---

**Valid Usage**

- **VUID-VkRenderPassBeginInfo-clearValueCount-00902**
  
  `clearValueCount` must be greater than the largest attachment index in `renderPass` specifying a `loadOp` (or `stencilLoadOp`, if the attachment has a depth/stencil format) of `VK_ATTACHMENT_LOAD_OP_CLEAR`.

- **VUID-VkRenderPassBeginInfo-clearValueCount-04962**
  
  If `clearValueCount` is not 0, `pClearValues` must be a valid pointer to an array of `clearValueCount` `VkClearValue` unions.

- **VUID-VkRenderPassBeginInfo-renderPass-00904**
  
  `renderPass` must be compatible with the `renderPass` member of the `VkFramebufferCreateInfo` structure specified when creating `framebuffer`.

- **VUID-VkRenderPassBeginInfo-None-08996**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` must be greater than 0.

- **VUID-VkRenderPassBeginInfo-None-08997**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` must be greater than 0.

- **VUID-VkRenderPassBeginInfo-pNext-02850**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.x` must be greater than or equal to 0.

- **VUID-VkRenderPassBeginInfo-pNext-02851**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.offset.y` must be greater than or equal to 0.

- **VUID-VkRenderPassBeginInfo-pNext-02852**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.width` must be less than or equal to `VkFramebufferCreateInfo::width` the framebuffer was created with.

- **VUID-VkRenderPassBeginInfo-pNext-02853**
  
  If the `pNext` chain does not contain `VkDeviceGroupRenderPassBeginInfo` or its `deviceRenderAreaCount` member is equal to 0, `renderArea.extent.height` must be less than or equal to `VkFramebufferCreateInfo::height` the framebuffer was created with.

- **VUID-VkRenderPassBeginInfo-pNext-02856**
  
  If the `pNext` chain contains `VkDeviceGroupRenderPassBeginInfo`, `offset.x + extent.width`
of each element of pDeviceRenderAreas must be less than or equal to 
VkFramebufferCreateInfo::width the framebuffer was created with

- VUID-VkRenderPassBeginInfo-pNext-02857
  If the pNext chain contains VkDeviceGroupRenderPassBeginInfo, offset.y + extent.height of each element of pDeviceRenderAreas must be less than or equal to 
  VkFramebufferCreateInfo::height the framebuffer was created with

- VUID-VkRenderPassBeginInfo-framebuffer-03207
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that did not include VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, and the pNext chain includes a 
  VkRenderPassAttachmentBeginInfo structure, its attachmentCount must be zero

- VUID-VkRenderPassBeginInfo-framebuffer-03208
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, the attachmentCount of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be equal 
  to the value of VkFramebufferAttachmentsCreateInfo::attachmentImageInfoCount used to create 
  framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-02780
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must have been 
  created on the same VkDevice as framebuffer and renderPass

- VUID-VkRenderPassBeginInfo-framebuffer-03209
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a 
  VkImageView of an image created with a value of VkImageCreateInfo::flags equal to the 
  flags member of the corresponding element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-04627
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a 
  VkImageView with an inherited usage equal to the usage member of the corresponding 
  element of VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03211
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a 
  VkImageView with a width equal to the width member of the corresponding element of 
  VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos used to create framebuffer

- VUID-VkRenderPassBeginInfo-framebuffer-03212
  If framebuffer was created with a VkFramebufferCreateInfo::flags value that included 
  VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT, each element of the pAttachments member of a 
  VkRenderPassAttachmentBeginInfo structure included in the pNext chain must be a
\textbf{VkImageView} with a height equal to the \texttt{height} member of the corresponding element of \texttt{VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos} used to create \texttt{framebuffer}

- VUID-VkRenderPassBeginInfo-framebuffer-03213
  If \texttt{framebuffer} was created with a \texttt{VkFramebufferCreateInfo::flags} value that included \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of the \texttt{pAttachments} member of a \texttt{VkRenderPassAttachmentBeginInfo} structure included in the \texttt{pNext} chain \textbf{must} be a \texttt{VkImageView} of an image created with a value of \texttt{VkImageViewCreateInfo::subresourceRange.layerCount} equal to the \texttt{layerCount} member of the corresponding element of \texttt{VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos} used to create \texttt{framebuffer}

- VUID-VkRenderPassBeginInfo-framebuffer-03214
  If \texttt{framebuffer} was created with a \texttt{VkFramebufferCreateInfo::flags} value that included \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of the \texttt{pAttachments} member of a \texttt{VkRenderPassAttachmentBeginInfo} structure included in the \texttt{pNext} chain \textbf{must} be a \texttt{VkImageView} of an image created with a value of \texttt{VkImageFormatListCreateInfo::viewFormatCount} equal to the \texttt{viewFormatCount} member of the corresponding element of \texttt{VkFramebufferAttachmentsCreateInfo::pAttachmentImageInfos} used to create \texttt{framebuffer}

- VUID-VkRenderPassBeginInfo-framebuffer-03215
  If \texttt{framebuffer} was created with a \texttt{VkFramebufferCreateInfo::flags} value that included \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of the \texttt{pAttachments} member of a \texttt{VkRenderPassAttachmentBeginInfo} structure included in the \texttt{pNext} chain \textbf{must} be a \texttt{VkImageView} of an image created with a value of \texttt{VkImageCreateInfo::samples} equal to the corresponding value of \texttt{VkAttachmentDescription::samples} in \texttt{renderPass}

- VUID-VkRenderPassBeginInfo-framebuffer-09047
  If \texttt{framebuffer} was created with a \texttt{VkFramebufferCreateInfo::flags} value that included \texttt{VK_FRAMEBUFFER_CREATE_IMAGELESS_BIT}, each element of the \texttt{pAttachments} member of a \texttt{VkRenderPassAttachmentBeginInfo} structure included in the \texttt{pNext} chain \textbf{must} be a \texttt{VkImageView} of an image created with a value of \texttt{VkImageCreateInfo::samples} equal to the corresponding value of \texttt{VkAttachmentDescription::samples} in \texttt{renderPass}

\section*{Valid Usage (Implicit)}

- VUID-VkRenderPassBeginInfo-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_RENDER_PASS_BEGIN_INFO}

- VUID-VkRenderPassBeginInfo-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either
The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment may occur. This information can be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VK_EXT_sample_locations
    VkRenderPassSampleLocationsBeginInfoEXT {
        VkStructureType sType;
        const void* pNext;
        uint32_t attachmentInitialSampleLocationsCount;
        const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
        uint32_t postSubpassSampleLocationsCount;
        const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
    } VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `attachmentInitialSampleLocationsCount` can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.

The `VkDeviceGroupRenderPassBeginInfo`, `VkRenderPassAttachmentBeginInfo`, or `VkRenderPassSampleLocationsBeginInfoEXT` structures may be valid if the sType value of each struct in the `pNext` chain must be unique.

- VUID-VkRenderPassBeginInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.
- VUID-VkRenderPassBeginInfo-renderPass-parameter
  `renderPass` must be a valid `VkRenderPass` handle.
- VUID-VkRenderPassBeginInfo-framebuffer-parameter
  `framebuffer` must be a valid `VkFramebuffer` handle.
- VUID-VkRenderPassBeginInfo-commonparent
  Both of `framebuffer`, and `renderPass` must have been created, allocated, or retrieved from the same `VkDevice`.

The image layout of the depth aspect of a depth/stencil attachment referring to an image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource, thus preserving the contents of such depth/stencil attachments across subpass boundaries requires the application to specify these sample locations whenever a layout transition of the attachment may occur. This information can be provided by adding a `VkRenderPassSampleLocationsBeginInfoEXT` structure to the `pNext` chain of `VkRenderPassBeginInfo`.

The `VkRenderPassSampleLocationsBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VK_EXT_sample_locations
    VkRenderPassSampleLocationsBeginInfoEXT {
        VkStructureType sType;
        const void* pNext;
        uint32_t attachmentInitialSampleLocationsCount;
        const VkAttachmentSampleLocationsEXT* pAttachmentInitialSampleLocations;
        uint32_t postSubpassSampleLocationsCount;
        const VkSubpassSampleLocationsEXT* pPostSubpassSampleLocations;
    } VkRenderPassSampleLocationsBeginInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentInitialSampleLocationsCount` is the number of elements in the `pAttachmentInitialSampleLocations` array.
- `pAttachmentInitialSampleLocations` is a pointer to an array of `VkAttachmentSampleLocationsEXT` structures specifying the attachment indices and their corresponding sample location state. Each element of `attachmentInitialSampleLocationsCount` can specify the sample location state to use in the automatic layout transition performed to transition a depth/stencil attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.
- `postSubpassSampleLocationsCount` is the number of elements in the `pPostSubpassSampleLocations` array.
array.

- `pPostSubpassSampleLocations` is a pointer to an array of `VkSubpassSampleLocationsEXT` structures specifying the subpass indices and their corresponding sample location state. Each element of `pPostSubpassSampleLocations` can specify the sample location state to use in the automatic layout transition performed to transition the depth/stencil attachment used by the specified subpass to the image layout specified in a dependent subpass or to the final layout of the attachment in case the specified subpass is the last subpass using that attachment. In addition, if `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, each element of `pPostSubpassSampleLocations` must specify the sample location state that matches the sample locations used by all pipelines that will be bound to a command buffer during the specified subpass. If `variableSampleLocations` is `VK_TRUE`, the sample locations used for rasterization do not depend on `pPostSubpassSampleLocations`.

### Valid Usage (Implicit)

- `VUID-VkRenderPassSampleLocationsBeginInfoEXT-sType-sType` must be `VK_STRUCTURE_TYPE_RENDER_PASS_SAMPLE_LOCATIONS_BEGIN_INFO_EXT`.
- `VUID-VkRenderPassSampleLocationsBeginInfoEXT-pAttachmentInitialSampleLocations-parameter` If `attachmentInitialSampleLocationsCount` is not 0, `pAttachmentInitialSampleLocations` must be a valid pointer to an array of `attachmentInitialSampleLocationsCount` valid `VkAttachmentSampleLocationsEXT` structures.
- `VUID-VkRenderPassSampleLocationsBeginInfoEXT-pPostSubpassSampleLocations-parameter` If `postSubpassSampleLocationsCount` is not 0, `pPostSubpassSampleLocations` must be a valid pointer to an array of `postSubpassSampleLocationsCount` valid `VkSubpassSampleLocationsEXT` structures.

The `VkAttachmentSampleLocationsEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkAttachmentSampleLocationsEXT {
    uint32_t attachmentIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkAttachmentSampleLocationsEXT;
```

- `attachmentIndex` is the index of the attachment for which the sample locations state is provided.
- `sampleLocationsInfo` is the sample locations state to use for the layout transition of the given attachment from the initial layout of the attachment to the image layout specified for the attachment in the first subpass using it.

If the image referenced by the framebuffer attachment at index `attachmentIndex` was not created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` then the values specified in `sampleLocationsInfo` are ignored.
Valid Usage

• VUID-VkAttachmentSampleLocationsEXT-attachmentIndex-01531
  attachmentIndex must be less than the attachmentCount specified in
  VkRenderPassCreateInfo the render pass specified by VkRenderPassBeginInfo::renderPass
  was created with

Valid Usage (Implicit)

• VUID-VkAttachmentSampleLocationsEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSubpassSampleLocationsEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSubpassSampleLocationsEXT {
    uint32_t subpassIndex;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkSubpassSampleLocationsEXT;
```

• subpassIndex is the index of the subpass for which the sample locations state is provided.
• sampleLocationsInfo is the sample locations state to use for the layout transition of the
depth/stencil attachment away from the image layout the attachment is used with in the
subpass specified in subpassIndex.

If the image referenced by the depth/stencil attachment used in the subpass identified by
subpassIndex was not created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT or if
the subpass does not use a depth/stencil attachment, and
VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations is VK_TRUE then the
values specified in sampleLocationsInfo are ignored.

Valid Usage

• VUID-VkSubpassSampleLocationsEXT-subpassIndex-01532
  subpassIndex must be less than the subpassCount specified in VkRenderPassCreateInfo the
  render pass specified by VkRenderPassBeginInfo::renderPass was created with

Valid Usage (Implicit)

• VUID-VkSubpassSampleLocationsEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSubpassBeginInfo structure is defined as:

```c
514
```
typedef struct VkSubpassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    VkSubpassContents contents;
} VkSubpassBeginInfo;

or the equivalent

typedef VkSubpassBeginInfo VkSubpassBeginInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **contents** is a `VkSubpassContents` value specifying how the commands in the next subpass will be provided.

### Valid Usage

- VUID-VkSubpassBeginInfo-contents-09382
  If `contents` is `VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR`, then at least one of the following features **must** be enabled:
  - `maintenance7`
  - `nestedCommandBuffer`

### Valid Usage (Implicit)

- VUID-VkSubpassBeginInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_SUBPASS_BEGIN_INFO`

- VUID-VkSubpassBeginInfo-pNext-pNext
  **pNext** must be `NULL`

- VUID-VkSubpassBeginInfo-contents-parameter
  **contents** must be a valid `VkSubpassContents` value

Possible values of `vkCmdBeginRenderPass::contents`, specifying how the commands in the first subpass will be provided, are:
typedef enum VkSubpassContents {
    VK_SUBPASS_CONTENTS_INLINE = 0,
    VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS = 1,
    // Provided by VK_KHR_maintenance7
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR = 1000451000,
    // Provided by VK_EXT_nested_command_buffer
    VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_EXT = VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR,
} VkSubpassContents;

• VK_SUBPASS_CONTENTS_INLINE specifies that the contents of the subpass will be recorded inline in the primary command buffer, and secondary command buffers must not be executed within the subpass.

• VK_SUBPASS_CONTENTS_SECONDARY_COMMAND_BUFFERS specifies that the contents are recorded in secondary command buffers that will be called from the primary command buffer, and vkCmdExecuteCommands is the only valid command in the command buffer until vkCmdNextSubpass or vkCmdEndRenderPass.

• VK_SUBPASS_CONTENTS_INLINE_AND_SECONDARY_COMMAND_BUFFERS_KHR specifies that the contents of the subpass can be recorded both inline and in secondary command buffers executed from this command buffer with vkCmdExecuteCommands.

If the pNext chain of VkRenderPassBeginInfo or VkRenderingInfo includes a VkDeviceGroupRenderPassBeginInfo structure, then that structure includes a device mask and set of render areas for the render pass instance.

The VkDeviceGroupRenderPassBeginInfo structure is defined as:

```
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupRenderPassBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceMask;
    uint32_t deviceRenderAreaCount;
    const VkRect2D* pDeviceRenderAreas;
} VkDeviceGroupRenderPassBeginInfo;
```

or the equivalent

```
// Provided by VK_KHR_device_group
typedef VkDeviceGroupRenderPassBeginInfo VkDeviceGroupRenderPassBeginInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• deviceMask is the device mask for the render pass instance.
• `deviceRenderAreaCount` is the number of elements in the `pDeviceRenderAreas` array.

• `pDeviceRenderAreas` is a pointer to an array of `VkRect2D` structures defining the render area for each physical device.

The `deviceMask` serves several purposes. It is an upper bound on the set of physical devices that can be used during the render pass instance, and the initial device mask when the render pass instance begins. In addition, commands transitioning to the next subpass in a render pass instance and commands ending the render pass instance, and, accordingly render pass load, store, and multisample resolve operations and subpass dependencies corresponding to the render pass instance, are executed on the physical devices included in the device mask provided here.

If `deviceRenderAreaCount` is not zero, then the elements of `pDeviceRenderAreas` override the value of `VkRenderPassBeginInfo::renderArea`, and provide a render area specific to each physical device. These render areas serve the same purpose as `VkRenderPassBeginInfo::renderArea`, including controlling the region of attachments that are cleared by `VK_ATTACHMENT_LOAD_OP_CLEAR` and that are resolved into resolve attachments.

If this structure is not present, the render pass instance’s device mask is the value of `VkDeviceGroupCommandBufferBeginInfo::deviceMask`. If this structure is not present or if `deviceRenderAreaCount` is zero, `VkRenderPassBeginInfo::renderArea` is used for all physical devices.

---

**Valid Usage**

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00905
  `deviceMask` must be a valid device mask value

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00906
  `deviceMask` must not be zero

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceMask-00907
  `deviceMask` must be a subset of the command buffer’s initial device mask

- VUID-VkDeviceGroupRenderPassBeginInfo-deviceRenderAreaCount-00908
  `deviceRenderAreaCount` must either be zero or equal to the number of physical devices in the logical device

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06166
  The `offset.x` member of any element of `pDeviceRenderAreas` must be greater than or equal to 0

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06167
  The `offset.y` member of any element of `pDeviceRenderAreas` must be greater than or equal to 0

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06168
  The sum of the `offset.x` and `extent.width` members of any element of `pDeviceRenderAreas` must be less than or equal to `maxFramebufferWidth`

- VUID-VkDeviceGroupRenderPassBeginInfo-offset-06169
  The sum of the `offset.y` and `extent.height` members of any element of `pDeviceRenderAreas` must be less than or equal to `maxFramebufferHeight`

- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08998
The \textit{extent.width} member of any element of \texttt{pDeviceRenderAreas} must be greater than 0

- VUID-VkDeviceGroupRenderPassBeginInfo-extent-08999
  The \textit{extent.height} member of any element of \texttt{pDeviceRenderAreas} must be greater than 0

\section*{Valid Usage (Implicit)}

- VUID-VkDeviceGroupRenderPassBeginInfo-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DEVICE_GROUP_RENDER_PASS_BEGIN_INFO}

- VUID-VkDeviceGroupRenderPassBeginInfo-pDeviceRenderAreas-parameter
  If \texttt{deviceRenderAreaCount} is not 0, \texttt{pDeviceRenderAreas} must be a valid pointer to an array of \texttt{deviceRenderAreaCount} \texttt{VkRect2D} structures

The \texttt{VkRenderPassAttachmentBeginInfo} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_2
typedef struct VkRenderPassAttachmentBeginInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkImageView* pAttachments;
} VkRenderPassAttachmentBeginInfo;
\end{verbatim}

or the equivalent

\begin{verbatim}
// Provided by VK_KHR_imageless_framebuffer
typedef VkRenderPassAttachmentBeginInfo VkRenderPassAttachmentBeginInfoKHR;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{attachmentCount} is the number of attachments.
- \texttt{pAttachments} is a pointer to an array of \texttt{VkImageView} handles, each of which will be used as the corresponding attachment in the render pass instance.

\section*{Valid Usage}

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03218
  Each element of \texttt{pAttachments} must only specify a single mip level

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-03219
  Each element of \texttt{pAttachments} must have been created with the \texttt{identity swizzle}

- VUID-VkRenderPassAttachmentBeginInfo-pAttachments-04114
  Each element of \texttt{pAttachments} must have been created with \texttt{VkImageViewCreateInfo} ::viewType not equal to \texttt{VK_IMAGE_VIEW_TYPE_3D}
To query the render area granularity, call:

```c
// Provided by VK_VERSION_1_0
void vkGetRenderAreaGranularity(
    VkDevice device,
    VkRenderPass renderPass,
    VkExtent2D* pGranularity);
```

- `device` is the logical device that owns the render pass.
- `renderPass` is a handle to a render pass.
- `pGranularity` is a pointer to a `VkExtent2D` structure in which the granularity is returned.

The conditions leading to an optimal `renderArea` are:

- the `offset.x` member in `renderArea` is a multiple of the `width` member of the returned `VkExtent2D` (the horizontal granularity).
- the `offset.y` member in `renderArea` is a multiple of the `height` member of the returned `VkExtent2D` (the vertical granularity).
- either the `extent.width` member in `renderArea` is a multiple of the horizontal granularity or `offset.x+extent.width` is equal to the `width` of the framebuffer in the `VkRenderPassBeginInfo`.
- either the `extent.height` member in `renderArea` is a multiple of the vertical granularity or `offset.y+extent.height` is equal to the `height` of the framebuffer in the `VkRenderPassBeginInfo`.

Subpass dependencies are not affected by the render area, and apply to the entire image subresources attached to the framebuffer as specified in the description of automatic layout transitions. Similarly, pipeline barriers are valid even if their effect extends outside the render area.
To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdNextSubpass(
    VkCommandBuffer commandBuffer,
    VkSubpassContents contents);
```

- `commandBuffer` is the command buffer in which to record the command.
- `contents` specifies how the commands in the next subpass will be provided, in the same fashion as the corresponding parameter of `vkCmdBeginRenderPass`.

The subpass index for a render pass begins at zero when `vkCmdBeginRenderPass` is recorded, and increments each time `vkCmdNextSubpass` is recorded.

After transitioning to the next subpass, the application can record the commands for that subpass.

### Valid Usage

- VUID-vkCmdNextSubpass-None-00909
  The current subpass index must be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass-None-02349
  This command must not be recorded when transform feedback is active

### Valid Usage (Implicit)

- VUID-vkCmdNextSubpass-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdNextSubpass-contents-parameter
  `contents` must be a valid `VkSubpassContents` value
- VUID-vkCmdNextSubpass-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdNextSubpass-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdNextSubpass-renderpass
  This command must only be called inside of a render pass instance
To transition to the next subpass in the render pass instance after recording the commands for a subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdNextSubpass2(  
  VkCommandBuffer commandBuffer,  
  const VkSubpassBeginInfo* pSubpassBeginInfo,  
  const VkSubpassEndInfo* pSubpassEndInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdNextSubpass2KHR(  
  VkCommandBuffer commandBuffer,  
  const VkSubpassBeginInfo* pSubpassBeginInfo,  
  const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pSubpassBeginInfo` is a pointer to a `VkSubpassBeginInfo` structure containing information about the subpass which is about to begin rendering.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the previous subpass will be ended.
vkCmdNextSubpass2 is semantically identical to vkCmdNextSubpass, except that it is extensible, and that contents is provided as part of an extensible structure instead of as a flat parameter.

Valid Usage

- VUID-vkCmdNextSubpass2-None-03102
  The current subpass index must be less than the number of subpasses in the render pass minus one
- VUID-vkCmdNextSubpass2-None-02350
  This command must not be recorded when transform feedback is active

Valid Usage (Implicit)

- VUID-vkCmdNextSubpass2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdNextSubpass2-pSubpassBeginInfo-parameter
  pSubpassBeginInfo must be a valid pointer to a valid VkSubpassBeginInfo structure
- VUID-vkCmdNextSubpass2-pSubpassEndInfo-parameter
  pSubpassEndInfo must be a valid pointer to a valid VkSubpassEndInfo structure
- VUID-vkCmdNextSubpass2-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdNextSubpass2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdNextSubpass2-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdNextSubpass2-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdNextSubpass2-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndRenderPass(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.

Ending a render pass instance performs any multisample resolve operations on the final subpass.

**Valid Usage**

- VUID-vkCmdEndRenderPass-None-00910
  The current subpass index must be equal to the number of subpasses in the render pass minus one

- VUID-vkCmdEndRenderPass-None-02351
  This command must not be recorded when transform feedback is active

- VUID-vkCmdEndRenderPass-None-06170
  The current render pass instance must not have been begun with `vkCmdBeginRendering`

- VUID-vkCmdEndRenderPass-None-07004
  If `vkCmdBeginQuery`* was called within a subpass of the render pass, the corresponding `vkCmdEndQuery`* must have been called subsequently within the same subpass

**Valid Usage (Implicit)**

- VUID-vkCmdEndRenderPass-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndRenderPass-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdEndRenderPass-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdEndRenderPass-renderpass
This command **must** only be called inside of a render pass instance

- VUID-vkCmdEndRenderPass-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdEndRenderPass-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action State Synchronization</td>
</tr>
</tbody>
</table>

To record a command to end a render pass instance after recording the commands for the last subpass, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdEndRenderPass2(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_create_renderpass2
void vkCmdEndRenderPass2KHR(
    VkCommandBuffer commandBuffer,
    const VkSubpassEndInfo* pSubpassEndInfo);
```

- `commandBuffer` is the command buffer in which to end the current render pass instance.
- `pSubpassEndInfo` is a pointer to a `VkSubpassEndInfo` structure containing information about how the last subpass will be ended.

`vkCmdEndRenderPass2` is semantically identical to `vkCmdEndRenderPass`, except that it is extensible.
**Valid Usage**

- VUID-vkCmdEndRenderPass2-None-03103
  The current subpass index **must** be equal to the number of subpasses in the render pass minus one.

- VUID-vkCmdEndRenderPass2-None-02352
  This command **must** not be recorded when transform feedback is active.

- VUID-vkCmdEndRenderPass2-None-06171
  The current render pass instance **must** not have been begun with `vkCmdBeginRendering`.

- VUID-vkCmdEndRenderPass2-None-07005
  If `vkCmdBeginQuery*` was called within a subpass of the render pass, the corresponding `vkCmdEndQuery*` **must** have been called subsequently within the same subpass.

**Valid Usage (Implicit)**

- VUID-vkCmdEndRenderPass2-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- VUID-vkCmdEndRenderPass2-pSubpassEndInfo-parameter
  `pSubpassEndInfo` **must** be a valid pointer to a valid `VkSubpassEndInfo` structure.

- VUID-vkCmdEndRenderPass2-commandBuffer-recording
  `commandBuffer` **must** be in the recording state.

- VUID-vkCmdEndRenderPass2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations.

- VUID-vkCmdEndRenderPass2-renderpass
  This command **must** only be called inside of a render pass instance.

- VUID-vkCmdEndRenderPass2-videocoding
  This command **must** only be called outside of a video coding scope.

- VUID-vkCmdEndRenderPass2-bufferlevel
  `commandBuffer` **must** be a primary `VkCommandBuffer`.

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.
Command Properties

<table>
<thead>

The `VkSubpassEndInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSubpassEndInfo {
    VkStructureType sType;
    const void* pNext;
} VkSubpassEndInfo;
```

or the equivalent

```c
// Provided by VK_KHR_create_renderpass2
typedef VkSubpassEndInfo VkSubpassEndInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

Valid Usage (Implicit)

- VUID-VkSubpassEndInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBPASS_END_INFO`
- VUID-VkSubpassEndInfo-pNext-pNext
  `pNext` must be `NULL`

8.9. Common Render Pass Data Races (Informative)

Due to the complexity of how rendering is performed, there are several ways an application can accidentally introduce a data race, usually by doing something that may seem benign but actually cannot be supported. This section indicates a number of the more common cases as guidelines to help avoid them.

8.9.1. Sampling From a Read-only Attachment

Vulkan includes read-only layouts for depth/stencil images, that allow the images to be both read during a render pass for the purposes of depth/stencil tests, and read as a non-attachment.
However, because **VK_ATTACHMENT_STORE_OP_STORE** and **VK_ATTACHMENT_STORE_OP_DONT_CARE** may perform write operations, even if no recorded command writes to an attachment, reading from an image while also using it as an attachment with these store operations can result in a data race. If the reads from the non-attachment are performed in a fragment shader where the accessed samples match those covered by the fragment shader, no data race will occur as store operations are guaranteed to operate after fragment shader execution for the set of samples the fragment covers. Notably, input attachments can also be used for this case. Reading other samples or in any other shader stage can result in unexpected behavior due to the potential for a data race, and validation errors should be generated for doing so. In practice, many applications have shipped reading samples outside of the covered fragment without any observable issue, but there is no guarantee that this will always work, and it is not advisable to rely on this in new or re-worked code bases. As **VK_ATTACHMENT_STORE_OP_NONE** is guaranteed to perform no writes, applications wishing to read an image as both an attachment and a non-attachment should make use of this store operation, coupled with a load operation that also performs no writes.

### 8.9.2. Non-overlapping Access Between Resources

When relying on non-overlapping accesses between attachments and other resources, it is important to note that **load** and **store** operations have fairly wide alignment requirements - potentially affecting entire subresources and adjacent depth/stencil aspects. This makes it invalid to access a non-attachment subresource that is simultaneously being used as an attachment where either access performs a write operation.

The only exception to this is if a subresource is in the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** image layout, in which case the overlap is defined to occur at a per-pixel granularity, and applications can read data from pixels outside the render area without introducing a data race.

### 8.9.3. Depth/Stencil and Input Attachments

When rendering to only the depth OR stencil aspect of an image, an input attachment accessing the other aspect will not cause a data race only under very specific conditions. To avoid a data race, the aspect not being written **must** be in a read-only layout, and writes to it **must** be disabled in the draw state. For example, to read from stencil while writing depth, the attachment **must** be in **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** (or equivalent), and the stencil write mask **must** be set to 0. Similarly to read from depth while writing stencil, the attachment **must** be in **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** (or equivalent), and depth write enable **must** be set to **VK_FALSE**.

### 8.9.4. Synchronization Options

There are several synchronization options available to synchronize between accesses to resources within a render pass. Some of the options are outlined below:

- A **VkSubpassDependency** in a render pass object can synchronize attachment writes and multisample resolve operations from a prior subpass for subsequent input attachment reads.
- A **vkCmdPipelineBarrier** inside a subpass can synchronize prior attachment writes in the subpass with subsequent input attachment reads.
• A `vkCmdPipelineBarrier` inside a subpass can synchronize prior attachment writes in the subpass with subsequent non-attachment reads if the attachment is in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout.
Chapter 9. Shaders

A shader specifies programmable operations that execute for each vertex, control point, tessellated vertex, primitive, fragment, or workgroup in the corresponding stage(s) of the graphics and compute pipelines.

Graphics pipelines include vertex shader execution as a result of primitive assembly, followed, if enabled, by tessellation control and evaluation shaders operating on patches, geometry shaders, if enabled, operating on primitives, and fragment shaders, if present, operating on fragments generated by Rasterization. In this specification, vertex, tessellation control, tessellation evaluation and geometry shaders are collectively referred to as pre-rasterization shader stages and occur in the logical pipeline before rasterization. The fragment shader occurs logically after rasterization.

Only the compute shader stage is included in a compute pipeline. Compute shaders operate on compute invocations in a workgroup.

Shaders can read from input variables, and read from and write to output variables. Input and output variables can be used to transfer data between shader stages, or to allow the shader to interact with values that exist in the execution environment. Similarly, the execution environment provides constants describing capabilities.

Shader variables are associated with execution environment-provided inputs and outputs using built-in decorations in the shader. The available decorations for each stage are documented in the following subsections.

9.1. Shader Objects

Shaders may be compiled and linked into pipeline objects as described in Pipelines chapter, or if the shaderObject feature is enabled they may be compiled into individual per-stage shader objects which can be bound on a command buffer independently from one another. Unlike pipelines, shader objects are not intrinsically tied to any specific set of state. Instead, state is specified dynamically in the command buffer.

Each shader object represents a single compiled shader stage, which may optionally be linked with one or more other stages.

Shader objects are represented by VkShaderEXT handles:

// Provided by VK_EXT_shader_object
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderEXT)

9.1.1. Shader Object Creation

Shaders may be created from shader code provided as SPIR-V, or in an opaque, implementation-defined binary format specific to the physical device.

To create one or more shader objects, call:
// Provided by VK_EXT_shader_object
VkResult vkCreateShadersEXT(
    VkDevice device,
    uint32_t createInfoCount,
    const VkShaderCreateInfoEXT* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkShaderEXT* pShaders);

- `device` is the logical device that creates the shader objects.
- `createInfoCount` is the length of the `pCreateInfos` and `pShaders` arrays.
- `pCreateInfos` is a pointer to an array of `VkShaderCreateInfoEXT` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles in which the resulting shader objects are returned.

When this function returns, whether or not it succeeds, it is guaranteed that every element of `pShaders` will have been overwritten by either `VK_NULL_HANDLE` or a valid `VkShaderEXT` handle.

This means that whenever shader creation fails, the application can determine which shader the returned error pertains to by locating the first `VK_NULL_HANDLE` element in `pShaders`. It also means that an application can reliably clean up from a failed call by iterating over the `pShaders` array and destroying every element that is not `VK_NULL_HANDLE`.

## Valid Usage

- **VUID-vkCreateShadersEXT-device-09669**
  device must support at least one queue family with one of the `VK_QUEUE_COMPUTE_BIT` or `VK_QUEUE_GRAPHICS_BIT` capabilities

- **VUID-vkCreateShadersEXT-stage-09670**
  If the `stage` member of any element of `pCreateInfos` is `VK_SHADER_STAGE_COMPUTE_BIT`, device must support at least one queue family with the `VK_QUEUE_COMPUTE_BIT` capability

- **VUID-vkCreateShadersEXT-stage-09671**
  If the `stage` member of any element of `pCreateInfos` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSellation_CONTROL_BIT`, `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, device must support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability

- **VUID-vkCreateShadersEXT-None-08400**
  The shaderObject feature must be enabled

- **VUID-vkCreateShadersEXT-pCreateInfos-08402**
  If the `flags` member of any element of `pCreateInfos` includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, the `flags` member of all other elements of `pCreateInfos` whose `stage` is `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSellation_CONTROL_BIT`, `VK_SHADER_STAGE_TESSellation_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT` must also include
For each element of `pCreateInfos` whose `flags` member includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, if there is any other element of `pCreateInfos` whose `stage` is logically later than the `stage` of the former and whose `flags` member also includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, the `nextStage` of the former must be equal to the `stage` of the element with the logically earliest `stage` following the `stage` of the former whose `flags` member also includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`.

The `stage` member of each element of `pCreateInfos` whose `flags` member includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` must be unique.

The `codeType` member of all elements of `pCreateInfos` whose `flags` member includes `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` must be the same.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the type of subdivision, it must match the subdivision type specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the orientation of triangles, it must match the triangle orientation specified in the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying `PointMode`, the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage must also contain an `OpExecutionMode` instruction specifying `PointMode`.

If `pCreateInfos` contains elements with both `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` and `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, both elements’ `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`, both elements’ `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` stage’s `pCode` contains an `OpExecutionMode` instruction specifying the spacing of segments on the edges of tessellated primitives, it must match the segment spacing specified in the...
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage

• VUID-vkCreateShadersEXT-pCreateInfos-08871
  If pCreateInfos contains elements with both VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT and VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, both elements’ flags include VK_SHADER_CREATE_LINK_STAGE_BIT_EXT, both elements’ codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT stage's pCode contains an OpExecutionMode instruction specifying the output patch size, it must match the output patch size specified in the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage.

Valid Usage (Implicit)

• VUID-vkCreateShadersEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreateShadersEXT-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkShaderCreateInfoEXT structures

• VUID-vkCreateShadersEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateShadersEXT-pShaders-parameter
  pShaders must be a valid pointer to an array of createInfoCount VkShaderEXT handles

• VUID-vkCreateShadersEXT-createInfoCount-arraylength
  createInfoCount must be greater than 0

Return Codes

Success

• VK_SUCCESS
• VK_INCOMPATIBLE_SHADER_BINARY_EXT

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED

The VkShaderCreateInfoEXT structure is defined as:
// Provided by VK_EXT_shader_object

typedef struct VkShaderCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkShaderCreateFlagsEXT flags;
    VkShaderStageFlagBits stage;
    VkShaderStageFlags nextStage;
    VkShaderCodeTypeEXT codeType;
    size_t codeSize;
    const void* pCode;
    const char* pName;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
    const VkSpecializationInfo* pSpecializationInfo;
} VkShaderCreateInfoEXT;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of *VkShaderCreateFlagBitsEXT* describing additional parameters of the shader.

• **stage** is a *VkShaderStageFlagBits* value specifying a single shader stage.

• **nextStage** is a bitmask of *VkShaderStageFlagBits* specifying zero or stages which may be used as a logically next bound stage when drawing with the shader bound.

• **codeType** is a *VkShaderCodeTypeEXT* value specifying the type of the shader code pointed to be *pCode*.

• **codeSize** is the size in bytes of the shader code pointed to be *pCode*.

• **pCode** is a pointer to the shader code to use to create the shader.

• **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.

• **setLayoutCount** is the number of descriptor set layouts pointed to by *pSetLayouts*.

• **pSetLayouts** is a pointer to an array of *VkDescriptorSetLayout* objects used by the shader stage.

• **pushConstantRangeCount** is the number of push constant ranges pointed to by *pPushConstantRanges*.

• **pPushConstantRanges** is a pointer to an array of *VkPushConstantRange* structures used by the shader stage.

• **pSpecializationInfo** is a pointer to a *VkSpecializationInfo* structure, as described in Specialization Constants, or NULL.
Valid Usage

- **VUID-VkShaderCreateInfoEXT-codeSize-08735**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `codeSize` must be a multiple of 4

- **VUID-VkShaderCreateInfoEXT-pCode-08736**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

- **VUID-VkShaderCreateInfoEXT-pCode-08737**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08738**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must declare the Shader capability for SPIR-V code

- **VUID-VkShaderCreateInfoEXT-pCode-08739**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, `pCode` must not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix

- **VUID-VkShaderCreateInfoEXT-pCode-08740**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderCreateInfoEXT-pCode-08741**
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `pCode` declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

- **VUID-VkShaderCreateInfoEXT-flags-08412**
  If `stage` is not `VK_SHADER_STAGE_TASK_BIT_EXT`, `VK_SHADER_STAGE_MESH_BIT_EXT`, `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, or `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` must not include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08486**
  If `stage` is not `VK_SHADER_STAGE_FRAGMENT_BIT`, `flags` must not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-08487**
  If the attachmentFragmentShadingRate feature is not enabled, `flags` must not include `VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT`

- **VUID-VkShaderCreateInfoEXT-flags-09404**
If flags includes `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`, the subgroupSizeControl feature must be enabled

- VUID-VkShaderCreateInfoEXT-flags-09405
  If flags includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the computeFullSubgroups feature must be enabled

- VUID-VkShaderCreateInfoEXT-flags-08992
  If flags includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, stage must be `VK_SHADER_STAGE_COMPUTE_BIT`

- VUID-VkShaderCreateInfoEXT-flags-08485
  If stage is not `VK_SHADER_STAGE_COMPUTE_BIT`, flags must not include `VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT`

- VUID-VkShaderCreateInfoEXT-flags-08416
  If flags includes both `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT`, the local workgroup size in the X dimension of the shader must be a multiple of `maxSubgroupSize`

- VUID-VkShaderCreateInfoEXT-flags-08417
  If flags includes `VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT` but not `VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT` and no `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the pNext chain, the local workgroup size in the X dimension of the shader must be a multiple of `subgroupSize`

- VUID-VkShaderCreateInfoEXT-stage-08418
  stage must not be `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`

- VUID-VkShaderCreateInfoEXT-stage-08419
  If the tessellationShader feature is not enabled, stage must not be `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkShaderCreateInfoEXT-stage-08420
  If the geometryShader feature is not enabled, stage must not be `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08427
  If stage is `VK_SHADER_STAGE_VERTEX_BIT`, nextStage must not include any bits other than `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_GEOMETRY_BIT`, and `VK_SHADER_STAGE_FRAGMENT_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08428
  If the tessellationShader feature is not enabled, nextStage must not include `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08429
  If the geometryShader feature is not enabled, nextStage must not include `VK_SHADER_STAGE_GEOMETRY_BIT`

- VUID-VkShaderCreateInfoEXT-nextStage-08430
  If stage is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, nextStage must not include any bits
other than VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08431
  If stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, nextStage must not include any
  bits other than VK_SHADER_STAGE_GEOMETRY_BIT and VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08433
  If stage is VK_SHADER_STAGE_GEOMETRY_BIT, nextStage must not include any bits other than
  VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkShaderCreateInfoEXT-nextStage-08434
  If stage is VK_SHADER_STAGE_FRAGMENT_BIT or VK_SHADER_STAGE_COMPUTE_BIT, nextStage must
  be 0

• VUID-VkShaderCreateInfoEXT-pName-08440
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pName must be the name of an OpEntryPoint in
  pCode with an execution model that matches stage

• VUID-VkShaderCreateInfoEXT-pCode-08492
  If codeType is VK_SHADER_CODE_TYPE_BINARY_EXT, pCode must be aligned to 16 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08493
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, pCode must be aligned to 4 bytes

• VUID-VkShaderCreateInfoEXT-pCode-08448
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any
  variable in its interface that is declared with the ClipDistance BuiltIn decoration, that
  variable must not have an array size greater than VkPhysicalDeviceLimits ::maxClipDistances

• VUID-VkShaderCreateInfoEXT-pCode-08449
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any
  variable in its interface that is declared with the CullDistance BuiltIn decoration, that
  variable must not have an array size greater than VkPhysicalDeviceLimits ::maxCullDistances

• VUID-VkShaderCreateInfoEXT-pCode-08450
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes
  variables in its interface that are declared with the ClipDistance BuiltIn decoration and
  variables in its interface that are declared with the CullDistance BuiltIn decoration, those
  variables must not have array sizes which sum to more than VkPhysicalDeviceLimits ::maxCombinedClipAndCullDistances

• VUID-VkShaderCreateInfoEXT-pCode-08451
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and the identified entry point includes any
  variable in its interface that is declared with the SampleMask BuiltIn decoration, that
  variable must not have an array size greater than VkPhysicalDeviceLimits ::maxSampleMaskWords

• VUID-VkShaderCreateInfoEXT-pCode-08452
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_VERTEX_BIT, the
  identified entry point must not include any input variable in its interface that is
  decorated with CullDistance

• VUID-VkShaderCreateInfoEXT-pCode-08453
If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

- VUID-VkShaderCreateInfoEXT-pCode-08454
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryOutputVertices`.

- VUID-VkShaderCreateInfoEXT-pCode-08455
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than 0 and less than or equal to `VkPhysicalDeviceLimits::maxGeometryShaderInvocations`.

- VUID-VkShaderCreateInfoEXT-pCode-08456
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive.

- VUID-VkShaderCreateInfoEXT-pCode-08457
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is a pre-rasterization shader stage, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive.

- VUID-VkShaderCreateInfoEXT-pCode-08458
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, the identified entry point **must** not include any output variables in its interface decorated with `CullDistance`.

- VUID-VkShaderCreateInfoEXT-pCode-08459
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`.

- VUID-VkShaderCreateInfoEXT-pCode-08460
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, the shader code in `pCode` **must** be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in `pSpecializationInfo`, if any, and then converting all specialization constants into fixed constants.

- VUID-VkShaderCreateInfoEXT-codeType-08872
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `pCode` **must** contain an `OpExecutionMode` instruction specifying the type of subdivision.

- VUID-VkShaderCreateInfoEXT-codeType-08873
  If `codeType` is `VK_SHADER_CODE_TYPE_SPIRV_EXT`, and `stage` is
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, pCode must contain an OpExecutionMode instruction specifying the orientation of triangles generated by the tessellator

- VUID-VkShaderCreateInfoEXT-codeType-08874
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, pCode must contain an OpExecutionMode instruction specifying the spacing of segments on the edges of tessellated primitives

- VUID-VkShaderCreateInfoEXT-codeType-08875
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and stage is VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, pCode must contain an OpExecutionMode instruction specifying the output patch size

- VUID-VkShaderCreateInfoEXT-pPushConstantRanges-10063
  Any two elements of pPushConstantRanges must not include the same stage in stageFlags

- VUID-VkShaderCreateInfoEXT-codeType-10064
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and if a push constant block is declared in a shader, then an element of pPushConstantRanges::stageFlags must match pname::stage

- VUID-VkShaderCreateInfoEXT-codeType-10065
  If codeType is VK_SHADER_CODE_TYPE_SPIRV_EXT, and if a push constant block is declared in a shader, the block must be contained inside the element of pPushConstantRanges that matches the stage

---

Valid Usage (Implicit)

- VUID-VkShaderCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_CREATE_INFO_EXT

- VUID-VkShaderCreateInfoEXT-pNext-pNext
 pNext must be NULL or a pointer to a valid instance of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo

- VUID-VkShaderCreateInfoEXT-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkShaderCreateInfoEXT-flags-parameter
  flags must be a valid combination of VkShaderCreateFlagBitsEXT values

- VUID-VkShaderCreateInfoEXT-stage-parameter
  stage must be a valid VkShaderStageFlagBits value

- VUID-VkShaderCreateInfoEXT-nextStage-parameter
  nextStage must be a valid combination of VkShaderStageFlagBits values

- VUID-VkShaderCreateInfoEXT-codeType-parameter
  codeType must be a valid VkShaderCodeTypeEXT value

- VUID-VkShaderCreateInfoEXT-pCode-parameter
  pCode must be a valid pointer to an array of codeSize bytes

- VUID-VkShaderCreateInfoEXT-pName-parameter
  If pName is not NULL, pName must be a null-terminated UTF-8 string
• **VUID-VkShaderCreateInfoEXT-pSetLayouts-parameter**
  If `setLayoutCount` is not 0, and `pSetLayouts` is not NULL, `pSetLayouts` **must** be a valid pointer to an array of `setLayoutCount` valid `VkDescriptorSetLayout` handles.

• **VUID-VkShaderCreateInfoEXT-pPushConstantRanges-parameter**
  If `pushConstantRangeCount` is not 0, and `pPushConstantRanges` is not NULL, `pPushConstantRanges` **must** be a valid pointer to an array of `pushConstantRangeCount` valid `VkPushConstantRange` structures.

• **VUID-VkShaderCreateInfoEXT-pSpecializationInfo-parameter**
  If `pSpecializationInfo` is not NULL, `pSpecializationInfo` **must** be a valid pointer to a valid `VkSpecializationInfo` structure.

• **VUID-VkShaderCreateInfoEXT-codeSize-arraylength**
  `codeSize` **must** be greater than 0.

---

```c
// Provided by VK_EXT_shader_object
typedef VkFlags VkShaderCreateFlagsEXT;
```

`VkShaderCreateFlagsEXT` is a bitmask type for setting a mask of zero or more `VkShaderCreateFlagBitsEXT`.

Possible values of the `flags` member of `VkShaderCreateInfoEXT` specifying how a shader object is created, are:

```c
// Provided by VK_EXT_shader_object
typedef enum VkShaderCreateFlagBitsEXT {
    VK_SHADER_CREATE_LINK_STAGE_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or VK_VERSION_1_3
    VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_shader_object with VK_EXT_subgroup_size_control or VK_VERSION_1_3
    VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_shader_object with VK_KHR_device_group or VK_VERSION_1_1
    VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT = 0x00000010,
    // Provided by VK_KHR_fragment_shading_rate with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT = 0x00000020,
    // Provided by VK_EXT_fragment_density_map with VK_EXT_shader_object
    VK_SHADER_CREATE_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT = 0x00000040,
} VkShaderCreateFlagBitsEXT;
```

• **`VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`** specifies that a shader is linked to all other shaders created in the same `vkCreateShadersEXT` call whose `VkShaderCreateInfoEXT` structures' `flags` include `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT`.

• **`VK_SHADER_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT`** specifies that the `SubgroupSize` **may** vary...
in a compute shader.

- **VK_SHADER_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** specifies that the subgroup sizes **must** be launched with all invocations active in a compute shader.

- **VK_SHADER_CREATE_DISPATCH_BASE_BIT_EXT** specifies that a compute shader **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.

- **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** specifies that a fragment shader **can** be used with a fragment shading rate attachment.

**NOTE**

The behavior of **VK_SHADER_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_EXT** differs subtly from the behavior of **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** in that the shader bit allows, but does not require the shader to be used with that type of attachment. This means that the application need not create multiple shaders when it does not know in advance whether the shader will be used with or without the attachment type, or when it needs the same shader to be compatible with usage both with and without. This may come at some performance cost on some implementations, so applications **should** still only set bits that are actually necessary.

Shader objects **can** be created using different types of shader code. Possible values of `VkShaderCreateInfoEXT::codeType`, are:

```
// Provided by VK_EXT_shader_object
typedef enum VkShaderCodeTypeEXT {
  VK_SHADER_CODE_TYPE_BINARY_EXT = 0,
  VK_SHADER_CODE_TYPE_SPIRV_EXT = 1,
} VkShaderCodeTypeEXT;
```

- **VK_SHADER_CODE_TYPE_BINARY_EXT** specifies shader code in an opaque, implementation-defined binary format specific to the physical device.

- **VK_SHADER_CODE_TYPE_SPIRV_EXT** specifies shader code in SPIR-V format.

### 9.1.2. Binary Shader Code

Binary shader code **can** be retrieved from a shader object using the command:

```
// Provided by VK_EXT_shader_object
VkResult vkGetShaderBinaryDataEXT(
  VkDevice
  device,
  VkShaderEXT
  shader,
  size_t*
  pDataSize,
  void*
  pData);
```

- **device** is the logical device that shader object was created from.
- **shader** is the shader object to retrieve binary shader code from.
• `pDataSize` is a pointer to a `size_t` value related to the size of the binary shader code, as described below.

• `pData` is either `NULL` or a pointer to a buffer.

If `pData` is `NULL`, then the size of the binary shader code of the shader object, in bytes, is returned in `pDataSize`. Otherwise, `pDataSize` must point to a variable set by the application to the size of the buffer, in bytes, pointed to by `pData`, and on return the variable is overwritten with the amount of data actually written to `pData`. If `pDataSize` is less than the size of the binary shader code, nothing is written to `pData`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`.

**NOTE**
The behavior of this command when `pDataSize` is too small differs from how some other getter-type commands work in Vulkan. Because shader binary data is only usable in its entirety, it would never be useful for the implementation to return partial data. Because of this, nothing is written to `pData` unless `pDataSize` is large enough to fit the data in its entirety.

Binary shader code retrieved using `vkGetShaderBinaryDataEXT` can be passed to a subsequent call to `vkCreateShadersEXT` on a compatible physical device by specifying `VK_SHADER_CODE_TYPE_BINARY_EXT` in the `codeType` member of `VkShaderCreateInfoEXT`.

The shader code returned by repeated calls to this function with the same `VkShaderEXT` is guaranteed to be invariant for the lifetime of the `VkShaderEXT` object.

### Valid Usage

- **VUID-vkGetShaderBinaryDataEXT-None-08461**
  The `shaderObject` feature must be enabled

- **VUID-vkGetShaderBinaryDataEXT-None-08499**
  If `pData` is not `NULL`, it must be aligned to 16 bytes

### Valid Usage (Implicit)

- **VUID-vkGetShaderBinaryDataEXT-device-parameter**
  The `device` must be a valid `VkDevice` handle

- **VUID-vkGetShaderBinaryDataEXT-shader-parameter**
  The `shader` must be a valid `VkShaderEXT` handle

- **VUID-vkGetShaderBinaryDataEXT-pDataSize-parameter**
  The `pDataSize` must be a valid pointer to a `size_t` value

- **VUID-vkGetShaderBinaryDataEXT-pData-parameter**
  If the value referenced by `pDataSize` is not 0, and `pData` is not `NULL`, `pData` must be a valid pointer to an array of `pDataSize` bytes

- **VUID-vkGetShaderBinaryDataEXT-shader-parent**
  The `shader` must have been created, allocated, or retrieved from `device`
### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

### 9.1.3. Binary Shader Compatibility

Binary shader compatibility means that binary shader code returned from a call to `vkGetShaderBinaryDataEXT` can be passed to a later call to `vkCreateShadersEXT`, potentially on a different logical and/or physical device, and that this will result in the successful creation of a shader object functionally equivalent to the shader object that the code was originally queried from.

Binary shader code queried from `vkGetShaderBinaryDataEXT` is not guaranteed to be compatible across all devices, but implementations are required to provide some compatibility guarantees. Applications may determine binary shader compatibility using either (or both) of two mechanisms.

Guaranteed compatibility of shader binaries is expressed through a combination of the `shaderBinaryUUID` and `shaderBinaryVersion` members of the `VkPhysicalDeviceShaderObjectPropertiesEXT` structure queried from a physical device. Binary shaders retrieved from a physical device with a certain `shaderBinaryUUID` are guaranteed to be compatible with all other physical devices reporting the same `shaderBinaryUUID` and the same or higher `shaderBinaryVersion`.

Whenever a new version of an implementation incorporates any changes that affect the output of `vkGetShaderBinaryDataEXT`, the implementation should either increment `shaderBinaryVersion` if binary shader code retrieved from older versions remains compatible with the new implementation, or else replace `shaderBinaryUUID` with a new value if backward compatibility has been broken. Binary shader code queried from a device with a matching `shaderBinaryUUID` and lower `shaderBinaryVersion` relative to the device on which `vkCreateShadersEXT` is being called may be suboptimal for the new device in ways that do not change shader functionality, but it is still guaranteed to be usable to successfully create the shader object(s).

**NOTE** Implementations are encouraged to share `shaderBinaryUUID` between devices and driver versions to the maximum extent their hardware naturally allows, and are strongly discouraged from ever changing the `shaderBinaryUUID` for the same hardware except unless absolutely necessary.

In addition to the shader compatibility guarantees described above, it is valid for an application to call `vkCreateShadersEXT` with binary shader code created on a device with a different or unknown `shaderBinaryUUID` and/or higher `shaderBinaryVersion`. In this case, the implementation may use any unspecified means of its choosing to determine whether the provided binary shader code is usable.
If it is, `vkCreateShadersEXT` must return `VK_SUCCESS`, and the created shader object is guaranteed to be valid. Otherwise, in the absence of some error, `vkCreateShadersEXT` must return `VK_INCOMPATIBLE_SHADER_BINARY_EXT` to indicate that the provided binary shader code is not compatible with the device.

### 9.1.4. Binding Shader Objects

Once shader objects have been created, they can be bound to the command buffer using the command:

```c
// Provided by VK_EXT_shader_object
void vkCmdBindShadersEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_shader_object
    uint32_t stageCount,            // Provided by VK_EXT_shader_object
    const VkShaderStageFlagBits* pStages,  // Provided by VK_EXT_shader_object
    const VkShaderEXT* pShaders);  // Provided by VK_EXT_shader_object
```

- `commandBuffer` is the command buffer that the shader object will be bound to.
- `stageCount` is the length of the `pStages` and `pShaders` arrays.
- `pStages` is a pointer to an array of `VkShaderStageFlagBits` values specifying one stage per array index that is affected by the corresponding value in the `pShaders` array.
- `pShaders` is a pointer to an array of `VkShaderEXT` handles and/or `VK_NULL_HANDLE` values describing the shader binding operations to be performed on each stage in `pStages`.

When binding linked shaders, an application may bind them in any combination of one or more calls to `vkCmdBindShadersEXT` (i.e., shaders that were created linked together do not need to be bound in the same `vkCmdBindShadersEXT` call).

Any shader object bound to a particular stage may be unbound by setting its value in `pShaders` to `VK_NULL_HANDLE`. If `pShaders` is `NULL`, `vkCmdBindShadersEXT` behaves as if `pShaders` was an array of `stageCount` `VK_NULL_HANDLE` values (i.e., any shaders bound to the stages specified in `pStages` are unbound).

---

**Valid Usage**

- **VUID-vkCmdBindShadersEXT-None-08462**
  The `shaderObject` feature must be enabled
- **VUID-vkCmdBindShadersEXT-pStages-08463**
  Every element of `pStages` must be unique
- **VUID-vkCmdBindShadersEXT-pStages-08464**
  `pStages` must not contain `VK_SHADER_STAGE_ALL_GRAPHICS` or `VK_SHADER_STAGE_ALL`
- **VUID-vkCmdBindShadersEXT-pStages-08465**
  `pStages` must not contain `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`

---

543
VK_SHADER_STAGE_CALLABLE_BIT_KHR

- VUID-vkCmdBindShadersEXT-pShaders-08469
  For each element of pStages, if pShaders is not NULL, and the element of the pShaders array with the same index is not VK_NULL_HANDLE, it must have been created with a stage equal to the corresponding element of pStages.

- VUID-vkCmdBindShadersEXT-pShaders-08474
  If the tessellationShader feature is not enabled, and pStages contains VK_SHADER_STAGE_TESSellation_CONTROL_BIT or VK_SHADER_STAGE_TESSellation_EVALUATION_BIT, and pShaders is not NULL, the same index or indices in pShaders must be VK_NULL_HANDLE.

- VUID-vkCmdBindShadersEXT-pShaders-08475
  If the geometryShader feature is not enabled, and pStages contains VK_SHADER_STAGE_GEOMETRY_BIT, and pShaders is not NULL, the same index in pShaders must be VK_NULL_HANDLE.

- VUID-vkCmdBindShadersEXT-pShaders-08476
  If pStages contains VK_SHADER_STAGE_COMPUTE_BIT, the VkCommandPool that commandBuffer was allocated from must support compute operations.

- VUID-vkCmdBindShadersEXT-pShaders-08477
  If pStages containsVK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSellation_CONTROL_BIT, VK_SHADER_STAGE_TESSellation_EVALUATION_BIT, VK_SHADER_STAGE_GEOMETRY_BIT, or VK_SHADER_STAGE_FRAGMENT_BIT, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

Valid Usage (Implicit)

- VUID-vkCmdBindShadersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdBindShadersEXT-pStages-parameter
  pStages must be a valid pointer to an array of stageCount valid VkShaderStageFlagBits values.

- VUID-vkCmdBindShadersEXT-pShaders-parameter
  If pShaders is not NULL, pShaders must be a valid pointer to an array of stageCount valid or VK_NULL_HANDLE VkShaderEXT handles.

- VUID-vkCmdBindShadersEXT-commandBuffer-recording
  commandBuffer must be in the recording state.

- VUID-vkCmdBindShadersEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindShadersEXT-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindShadersEXT-stageCount-arraylength
  stageCount must be greater than 0.
• VUID-vkCmdBindShadersEXT-commonparent
  Both of commandBuffer, and the elements of pShaders that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

**9.1.5. Setting State**

Whenever shader objects are used to issue drawing commands, the appropriate dynamic state setting commands must have been called to set the relevant state in the command buffer prior to drawing:

- vkCmdSetViewportWithCount
- vkCmdSetScissorWithCount
- vkCmdSetRasterizerDiscardEnable
- vkCmdSetVertexInputEXT
- vkCmdSetPrimitiveTopology
- vkCmdSetPatchControlPointsEXT, if primitiveTopology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST
- vkCmdSetPrimitiveRestartEnable

If a shader is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT stage, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetTessellationDomainOriginEXT

If rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

- vkCmdSetRasterizationSamplesEXT
- vkCmdSetSampleMaskEXT
- vkCmdSetAlphaToCoverageEnableEXT
• vkCmdSetAlphaToOneEnableEXT, if the alphaToOne feature is enabled on the device
• vkCmdSetPolygonModeEXT
• vkCmdSetLineWidth, if polygonMode is VK_POLYGON_MODE_LINE, or if primitiveTopology is a line topology, or if a shader which outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage
• vkCmdSetCullMode
• vkCmdSetFrontFace
• vkCmdSetDepthTestEnable
• vkCmdSetDepthWriteEnable
• vkCmdSetDepthCompareOp, if depthTestEnable is VK_TRUE
• vkCmdSetDepthBoundsTestEnable, if the depthBounds feature is enabled on the device
• vkCmdSetDepthBounds, if depthBoundsTestEnable is VK_TRUE
• vkCmdSetDepthBiasEnable
• vkCmdSetDepthBias or vkCmdSetDepthBias2EXT, if depthBiasEnable is VK_TRUE
• vkCmdSetDepthClampEnableEXT, if the depthClamp feature is enabled on the device
• vkCmdSetStencilTestEnable
• vkCmdSetStencilOp, if stencilTestEnable is VK_TRUE
• vkCmdSetStencilCompareMask, if stencilTestEnable is VK_TRUE
• vkCmdSetStencilWriteMask, if stencilTestEnable is VK_TRUE
• vkCmdSetStencilReference, if stencilTestEnable is VK_TRUE

If a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following commands must have been called in the command buffer prior to drawing:

• vkCmdSetLogicOpEnableEXT, if the logicOp feature is enabled on the device
• vkCmdSetLogicOpEXT, if logicOpEnable is VK_TRUE
• vkCmdSetColorBlendEnableEXT and vkCmdSetColorWriteMaskEXT, if color attachments are bound, with values set for every color attachment in the render pass instance active at draw time
• vkCmdSetColorBlendEquationEXT or vkCmdSetColorBlendAdvancedEXT, if color attachments are bound, for every attachment whose index in pColorBlendEnables is a pointer to a value of VK_TRUE
• vkCmdSetBlendConstants, if any index in pColorBlendEnables is VK_TRUE, and the same index in pColorBlendEquations is a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

If the pipelineFragmentShadingRate feature is enabled on the device, and a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command must have been called in the command buffer prior to drawing:
• `vkCmdSetFragmentShadingRateKHR`

If the `geometryStreams` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following command must have been called in the command buffer prior to drawing:

• `vkCmdSetRasterizationStreamEXT`

If the `VK_EXT_discard_rectangles` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands must have been called in the command buffer prior to drawing:

• `vkCmdSetDiscardRectangleEnableEXT`
• `vkCmdSetDiscardRectangleModeEXT`, if `discardRectangleEnable` is `VK_TRUE`
• `vkCmdSetDiscardRectangleEXT`, if `discardRectangleEnable` is `VK_TRUE`

If the `depthClipEnable` feature is enabled on the device, the following command must have been called in the command buffer prior to drawing:

• `vkCmdSetDepthClipEnableEXT`

If the `VK_EXT_sample_locations` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, the following commands must have been called in the command buffer prior to drawing:

• `vkCmdSetSampleLocationsEnableEXT`
• `vkCmdSetSampleLocationsEXT`, if `sampleLocationsEnable` is `VK_TRUE`

If the `VK_EXT_provoking_vertex` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, and a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, the following command must have been called in the command buffer prior to drawing:

• `vkCmdSetProvokingVertexModeEXT`

If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled on the device, and `rasterizerDiscardEnable` is `VK_FALSE`, and if `polygonMode` is `VK_POLYGON_MODE_LINE` or a shader is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and `primitiveTopology` is a line topology or a shader which outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, the following commands must have been called in the command buffer prior to drawing:

• `vkCmdSetLineRasterizationModeEXT`
• `vkCmdSetLineStippleEnableEXT`
• `vkCmdSetLineStippleKHR`, if `stippledLineEnable` is `VK_TRUE`

If the `colorWriteEnable` feature is enabled on the device, and a shader is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and `rasterizerDiscardEnable` is `VK_FALSE`, the following command must have been called in the command buffer prior to drawing:

• `vkCmdSetColorWriteEnableEXT`, with values set for every color attachment in the render pass instance active at draw time
If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and rasterizerDiscardEnable is VK_FALSE, the following command must have been called in the command buffer prior to drawing:

- vkCmdSetAttachmentFeedbackLoopEnableEXT

State can be set either at any time before or after shader objects are bound, but all required state must be set prior to issuing drawing commands.

### 9.1.6. Interaction With Pipelines

Calling vkCmdBindShadersEXT causes the pipeline bind points corresponding to each stage in pStages to be disturbed, meaning that any pipelines that had previously been bound to those pipeline bind points are no longer bound.

If VK_PIPELINE_BIND_POINT_GRAPHICS is disturbed (i.e., if pStages contains any graphics stage), any graphics pipeline state that the previously bound pipeline did not specify as dynamic becomes undefined, and must be set in the command buffer before issuing drawing commands using shader objects.

Calls to vkCmdBindPipeline likewise disturb the shader stage(s) corresponding to pipelineBindPoint, meaning that any shaders that had previously been bound to any of those stages are no longer bound, even if the pipeline was created without shaders for some of those stages.

### 9.1.7. Shader Object Destruction

To destroy a shader object, call:

```c
// Provided by VK_EXT_shader_object
void vkDestroyShaderEXT(
    VkDevice device,
    VkShaderEXT shader,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the shader object.
- `shader` is the handle of the shader object to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Destroying a shader object used by one or more command buffers in the recording or executable state causes those command buffers to move into the invalid state.

### Valid Usage

- VUID-vkDestroyShaderEXT-None-08481
  The shaderObject feature must be enabled
- VUID-vkDestroyShaderEXT-shader-08482
  All submitted commands that refer to shader must have completed execution
• VUID-vkDestroyShaderEXT-pAllocator-08483
If VkAllocationCallbacks were provided when shader was created, a compatible set of callbacks must be provided here.

• VUID-vkDestroyShaderEXT-pAllocator-08484
If no VkAllocationCallbacks were provided when shader was created, pAllocator must be NULL.

Valid Usage (Implicit)

• VUID-vkDestroyShaderEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyShaderEXT-shader-parameter
If shader is not VK_NULL_HANDLE, shader must be a valid VkShaderEXT handle.

• VUID-vkDestroyShaderEXT-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

• VUID-vkDestroyShaderEXT-shader-parent
If shader is a valid handle, it must have been created, allocated, or retrieved from device.

Host Synchronization

• Host access to shader must be externally synchronized.

9.2. Shader Modules

Shader modules contain shader code and one or more entry points. Shaders are selected from a shader module by specifying an entry point as part of pipeline creation. The stages of a pipeline can use shaders that come from different modules. The shader code defining a shader module must be in the SPIR-V format, as described by the Vulkan Environment for SPIR-V appendix.

Shader modules are represented by VkShaderModule handles:

    // Provided by VK_VERSION_1_0
    VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkShaderModule)

To create a shader module, call:
// Provided by VK_VERSION_1_0

VkResult vkCreateShaderModule(VkDevice device,
                                  const VkShaderModuleCreateInfo* pCreateInfo,
                                  const VkAllocationCallbacks* pAllocator,
                                  VkShaderModule* pShaderModule);

- `device` is the logical device that creates the shader module.
- `pCreateInfo` is a pointer to a `VkShaderModuleCreateInfo` structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pShaderModule` is a pointer to a `VkShaderModule` handle in which the resulting shader module object is returned.

Once a shader module has been created, any entry points it contains can be used in pipeline shader stages as described in Compute Pipelines and Graphics Pipelines.

**NOTE**
If the maintenance feature is enabled, shader module creation can be omitted entirely. Instead, applications should provide the `VkShaderModuleCreateInfo` structure directly in to pipeline creation by chaining it to `VkPipelineShaderStageCreateInfo`. This avoids the overhead of creating and managing an additional object.

**Valid Usage**
- VUID-vkCreateShaderModule-pCreateInfo-06904
  If `pCreateInfo` is not `NULL`, `pCreateInfo->pNext` must be `NULL`

**Valid Usage (Implicit)**
- VUID-vkCreateShaderModule-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateShaderModule-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkShaderModuleCreateInfo` structure
- VUID-vkCreateShaderModule-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateShaderModule-pShaderModule-parameter
  `pShaderModule` must be a valid pointer to a `VkShaderModule` handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkShaderModuleCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkShaderModuleCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkShaderModuleCreateFlags flags;
    size_t codeSize;
    const uint32_t* pCode;
} VkShaderModuleCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `codeSize` is the size, in bytes, of the code pointed to by `pCode`.
- `pCode` is a pointer to code that is used to create the shader module. The type and format of the code is determined from the content of the memory addressed by `pCode`.

**Valid Usage**

- VUID-VkShaderModuleCreateInfo-codeSize-08735
  `codeSize` must be a multiple of 4

- VUID-VkShaderModuleCreateInfo-pCode-08736
  `pCode` must point to valid SPIR-V code, formatted and packed as described by the Khronos SPIR-V Specification

- VUID-VkShaderModuleCreateInfo-pCode-08737
  `pCode` must adhere to the validation rules described by the Validation Rules within a Module section of the SPIR-V Environment appendix

- VUID-VkShaderModuleCreateInfo-pCode-08738
  `pCode` must declare the Shader capability for SPIR-V code

- VUID-VkShaderModuleCreateInfo-pCode-08739
  `pCode` must not declare any capability that is not supported by the API, as described by the Capabilities section of the SPIR-V Environment appendix
• VUID-VkShaderModuleCreateInfo-pCode-08740
  and pCode declares any of the capabilities listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

• VUID-VkShaderModuleCreateInfo-pCode-08741
  pCode must not declare any SPIR-V extension that is not supported by the API, as described by the Extension section of the SPIR-V Environment appendix

• VUID-VkShaderModuleCreateInfo-pCode-08742
  and pCode declares any of the SPIR-V extensions listed in the SPIR-V Environment appendix, one of the corresponding requirements must be satisfied

• VUID-VkShaderModuleCreateInfo-codeSize-01085
  codeSize must be greater than 0

Valid Usage (Implicit)

• VUID-VkShaderModuleCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHADER_MODULE_CREATE_INFO

• VUID-VkShaderModuleCreateInfo-flags-zerobitmask
  flags must be 0

• VUID-VkShaderModuleCreateInfo-pCode-parameter
  pCode must be a valid pointer to an array of codeSize/4 uint32_t values

// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderModuleCreateFlags;

VkShaderModuleCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a shader module, call:

// Provided by VK_VERSION_1_0
void vkDestroyShaderModule(
  VkDevice device,
  VkShaderModule shaderModule,
  const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the shader module.

• shaderModule is the handle of the shader module to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

A shader module can be destroyed while pipelines created using its shaders are still in use.
Valid Usage

• VUID-vkDestroyShaderModule-shaderModule-01092
  If VkAllocationCallbacks were provided when shaderModule was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyShaderModule-shaderModule-01093
  If no VkAllocationCallbacks were provided when shaderModule was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyShaderModule-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyShaderModule-shaderModule-parameter
  If shaderModule is not VK_NULL_HANDLE, shaderModule must be a valid VkShaderModule handle

• VUID-vkDestroyShaderModule-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyShaderModule-shaderModule-parent
  If shaderModule is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to shaderModule must be externally synchronized

9.3. Binding Shaders

Before a shader can be used it must be first bound to the command buffer.

Calling vkCmdBindPipeline binds all stages corresponding to the VkPipelineBindPoint. Calling vkCmdBindShadersEXT binds all stages in pStages

The following table describes the relationship between shader stages and pipeline bind points:
<table>
<thead>
<tr>
<th>Shader stage</th>
<th>Pipeline bind point</th>
<th>behavior controlled</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SHADER_STAGE_VERTEX_BIT</td>

### 9.4. Shader Execution

At each stage of the pipeline, multiple invocations of a shader may execute simultaneously. Further, invocations of a single shader produced as the result of different commands may execute simultaneously. The relative execution order of invocations of the same shader type is undefined. Shader invocations may complete in a different order than that in which the primitives they originated from were drawn or dispatched by the application. However, fragment shader outputs are written to attachments in rasterization order.

The relative execution order of invocations of different shader types is largely undefined. However, when invoking a shader whose inputs are generated from a previous pipeline stage, the shader invocations from the previous stage are guaranteed to have executed far enough to generate input values for all required inputs.

### 9.4.1. Shader Termination

A shader invocation that is terminated has finished executing instructions.

Executing OpReturn in the entry point, or executing OpTerminateInvocation in any function will
terminate an invocation. Implementations may also terminate a shader invocation when OpKill is executed in any function; otherwise it becomes a helper invocation.

In addition to the above conditions, helper invocations may be terminated when all non-helper invocations in the same derivative group either terminate or become helper invocations.

A shader stage for a given command completes execution when all invocations for that stage have terminated.

### 9.5. Shader Memory Access Ordering

The order in which image or buffer memory is read or written by shaders is largely undefined. For some shader types (vertex, tessellation evaluation, and in some cases, fragment), even the number of shader invocations that may perform loads and stores is undefined.

In particular, the following rules apply:

- **Vertex** and tessellation evaluation shaders will be invoked at least once for each unique vertex, as defined in those sections.
- **Fragment** shaders will be invoked zero or more times, as defined in that section.
- The relative execution order of invocations of the same shader type is undefined. A store issued by a shader when working on primitive B might complete prior to a store for primitive A, even if primitive A is specified prior to primitive B. This applies even to fragment shaders; while fragment shader outputs are always written to the framebuffer in rasterization order, stores executed by fragment shader invocations are not.
- The relative execution order of invocations of different shader types is largely undefined.

The above limitations on shader invocation order make some forms of synchronization between shader invocations within a single set of primitives unimplementable. For example, having one invocation poll memory written by another invocation assumes that the other invocation has been launched and will complete its writes in finite time.

The Memory Model appendix defines the terminology and rules for how to correctly communicate between shader invocations, such as when a write is Visible-To a read, and what constitutes a Data Race.

Applications must not cause a data race.

The SPIR-V SubgroupMemory, CrossWorkgroupMemory, and AtomicCounterMemory memory semantics are ignored. Sequentially consistent atomics and barriers are not supported and SequentiallyConsistent is treated as AcquireRelease. SequentiallyConsistent should not be
9.6. Shader Inputs and Outputs

Data is passed into and out of shaders using variables with input or output storage class, respectively. User-defined inputs and outputs are connected between stages by matching their Location decorations. Additionally, data can be provided by or communicated to special functions provided by the execution environment using BuiltIn decorations.

In many cases, the same BuiltIn decoration can be used in multiple shader stages with similar meaning. The specific behavior of variables decorated as BuiltIn is documented in the following sections.

9.7. Vertex Shaders

Each vertex shader invocation operates on one vertex and its associated vertex attribute data, and outputs one vertex and associated data. Graphics pipelines must include a vertex shader, and the vertex shader stage is always the first shader stage in the graphics pipeline.

9.7.1. Vertex Shader Execution

A vertex shader must be executed at least once for each vertex specified by a drawing command. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view. During execution, the shader is presented with the index of the vertex and instance for which it has been invoked. Input variables declared in the vertex shader are filled by the implementation with the values of vertex attributes associated with the invocation being executed.

If the same vertex is specified multiple times in a drawing command (e.g. by including the same index value multiple times in an index buffer) the implementation may reuse the results of vertex shading if it can statically determine that the vertex shader invocations will produce identical results.

NOTE

It is implementation-dependent when and if results of vertex shading are reused, and thus how many times the vertex shader will be executed. This is true also if the vertex shader contains stores or atomic operations (see vertexPipelineStoresAndAtomics).

9.8. Tessellation Control Shaders

The tessellation control shader is used to read an input patch provided by the application and to produce an output patch. Each tessellation control shader invocation operates on an input patch (after all control points in the patch are processed by a vertex shader) and its associated data, and outputs a single control point of the output patch and its associated data, and can also output additional per-patch data. The input patch is sized according to the patchControlPoints member of VkPipelineTessellationStateCreateInfo, as part of input assembly.

The input patch can also be dynamically sized with patchControlPoints parameter of
vkCmdSetPatchControlPointsEXT.

To **dynamically set** the number of control points per patch, call:

```c
// Provided by VK_EXT_shader_object
void vkCmdSetPatchControlPointsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t patchControlPoints);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `patchControlPoints` specifies the number of control points per patch.

This command sets the number of control points per patch for subsequent drawing commands when drawing using **shader objects**. Otherwise, this state is specified by the `VkPipelineTessellationStateCreateInfo::patchControlPoints` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetPatchControlPointsEXT-None-09422
  At least one of the following **must** be true:
    - The **shaderObject** feature is enabled
- VUID-vkCmdSetPatchControlPointsEXT-patchControlPoints-04874
  `patchControlPoints` **must** be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

**Valid Usage (Implicit)**

- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-recording
  `commandBuffer` **must** be in the **recording** state
- VUID-vkCmdSetPatchControlPointsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetPatchControlPointsEXT-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally
The size of the output patch is controlled by the `OpExecutionMode OutputVertices` specified in the tessellation control or tessellation evaluation shaders, which **must** be specified in at least one of the shaders. The size of the input and output patches **must** each be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`.

### 9.8.1. Tessellation Control Shader Execution

A tessellation control shader is invoked at least once for each output vertex in a patch. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

Inputs to the tessellation control shader are generated by the vertex shader. Each invocation of the tessellation control shader **can** read the attributes of any incoming vertices and their associated data. The invocations corresponding to a given patch execute logically in parallel, with undefined relative execution order. However, the `OpControlBarrier` instruction **can** be used to provide limited control of the execution order by synchronizing invocations within a patch, effectively dividing tessellation control shader execution into a set of phases. Tessellation control shaders will read undefined values if one invocation reads a per-vertex or per-patch output written by another invocation at any point during the same phase, or if two invocations attempt to write different values to the same per-patch output in a single phase.

### 9.9. Tessellation Evaluation Shaders

The Tessellation Evaluation Shader operates on an input patch of control points and their associated data, and a single input barycentric coordinate indicating the invocation’s relative position within the subdivided patch, and outputs a single vertex and its associated data.

### 9.9.1. Tessellation Evaluation Shader Execution

A tessellation evaluation shader is invoked at least once for each unique vertex generated by the tessellator. If the subpass includes multiple views in its view mask, the shader **may** be invoked separately for each view.

### 9.10. Geometry Shaders

The geometry shader operates on a group of vertices and their associated data assembled from a
single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive.

9.10.1. Geometry Shader Execution

A geometry shader is invoked at least once for each primitive produced by the tessellation stages, or at least once for each primitive generated by primitive assembly when tessellation is not in use. A shader can request that the geometry shader runs multiple instances. A geometry shader is invoked at least once for each instance. If the subpass includes multiple views in its view mask, the shader may be invoked separately for each view.

9.11. Fragment Shaders

Fragment shaders are invoked as a fragment operation in a graphics pipeline. Each fragment shader invocation operates on a single fragment and its associated data. With few exceptions, fragment shaders do not have access to any data associated with other fragments and are considered to execute in isolation of fragment shader invocations associated with other fragments.

9.12. Compute Shaders

Compute shaders are invoked via vkCmdDispatch and vkCmdDispatchIndirect commands. In general, they have access to similar resources as shader stages executing as part of a graphics pipeline.

Compute workloads are formed from groups of work items called workgroups and processed by the compute shader in the current compute pipeline. A workgroup is a collection of shader invocations that execute the same shader, potentially in parallel. Compute shaders execute in global workgroups which are divided into a number of local workgroups with a size that can be set by assigning a value to the LocalSize or LocalSizeId execution mode or via an object decorated by the WorkgroupSize decoration. An invocation within a local workgroup can share data with other members of the local workgroup through shared variables and issue memory and control flow barriers to synchronize with other members of the local workgroup.

9.13. Ray Generation Shaders

A ray generation shader is similar to a compute shader. Its main purpose is to execute ray tracing queries using pipeline trace ray instructions (such as OpTraceRayKHR) and process the results.

9.13.1. Ray Generation Shader Execution

One ray generation shader is executed per ray tracing dispatch. Its location in the shader binding table (see Shader Binding Table for details) is passed directly into vkCmdTraceRaysKHR using the pRaygenShaderBindingTable parameter or .

Intersection shaders enable the implementation of arbitrary, application defined geometric
primitives. An intersection shader for a primitive is executed whenever its axis-aligned bounding box is hit by a ray.

Like other ray tracing shader domains, an intersection shader operates on a single ray at a time. It also operates on a single primitive at a time. It is therefore the purpose of an intersection shader to compute the ray-primitive intersections and report them. To report an intersection, the shader calls the `OpReportIntersectionKHR` instruction.

An intersection shader communicates with any-hit and closest shaders by generating attribute values that they can read. Intersection shaders cannot read or modify the ray payload.

### 9.14.1. Intersection Shader Execution

The order in which intersections are found along a ray, and therefore the order in which intersection shaders are executed, is unspecified.

The intersection shader of the closest AABB which intersects the ray is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

### 9.15. Any-Hit Shaders

The any-hit shader is executed after the intersection shader reports an intersection that lies within the current \([t_{\text{min}}, t_{\text{max}}]\) of the ray. The main use of any-hit shaders is to programmatically decide whether or not an intersection will be accepted. The intersection will be accepted unless the shader calls the `OpIgnoreIntersectionKHR` instruction. Any-hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload.

### 9.15.1. Any-Hit Shader Execution

The order in which intersections are found along a ray, and therefore the order in which any-hit shaders are executed, is unspecified.

The any-hit shader of the closest hit is guaranteed to be executed at some point during traversal, unless the ray is forcibly terminated.

### 9.16. Closest Hit Shaders

Closest hit shaders have read-only access to the attributes generated by the corresponding intersection shader, and can read or modify the ray payload. They also have access to a number of system-generated values. Closest hit shaders can call pipeline trace ray instructions to recursively trace rays.

### 9.16.1. Closest Hit Shader Execution

Exactly one closest hit shader is executed when traversal is finished and an intersection has been found and accepted.
**9.17. Miss Shaders**

Miss shaders **can** access the ray payload and **can** trace new rays through the pipeline trace ray instructions, but **cannot** access attributes since they are not associated with an intersection.

**9.17.1. Miss Shader Execution**

A miss shader is executed instead of a closest hit shader if no intersection was found during traversal.

**9.18. Callable Shaders**

Callable shaders **can** access a callable payload that works similarly to ray payloads to do subroutine work.

**9.18.1. Callable Shader Execution**

A callable shader is executed by calling `OpExecuteCallableKHR` from an allowed shader stage.

**9.19. Interpolation Decorations**

Variables in the **Input** storage class in a fragment shader's interface are interpolated from the values specified by the primitive being rasterized.

**NOTE**  
Interpolation decorations can be present on input and output variables in prerasterization shaders but have no effect on the interpolation performed.

An undecorated input variable will be interpolated with perspective-correct interpolation according to the primitive type being rasterized. **Lines** and **polygons** are interpolated in the same way as the primitive's clip coordinates. If the **NoPerspective** decoration is present, linear interpolation is instead used for **lines** and **polygons**. For points, as there is only a single vertex, input values are never interpolated and instead take the value written for the single vertex.

If the **Flat** decoration is present on an input variable, the value is not interpolated, and instead takes its value directly from the **provoking vertex**. Fragment shader inputs that are signed or unsigned integers, integer vectors, or any double-precision floating-point type **must** be decorated with **Flat**.

Interpolation of input variables is performed at an implementation-defined position within the fragment area being shaded. The position is further constrained as follows:

- If the **Centroid** decoration is used, the interpolation position used for the variable **must** also fall within the bounds of the primitive being rasterized.
- If the **Sample** decoration is used, the interpolation position used for the variable **must** be at the position of the sample being shaded by the current fragment shader invocation.
- If a sample count of 1 is used, the interpolation position **must** be at the center of the fragment area.
NOTE

As *Centroid* restricts the possible interpolation position to the covered area of the primitive, the position can be forced to vary between neighboring fragments when it otherwise would not. Derivatives calculated based on these differing locations can produce inconsistent results compared to undecorated inputs. It is recommended that input variables used in derivative calculations are not decorated with *Centroid*.

If the *PerVertexKHR* decoration is present on an input variable, the value is not interpolated, and instead values from all input vertices are available in an array. Each index of the array corresponds to one of the vertices of the primitive that produced the fragment.

### 9.20. Static Use

A SPIR-V module declares a global object in memory using the *OpVariable* instruction, which results in a pointer $x$ to that object. A specific entry point in a SPIR-V module is said to *statically use* that object if that entry point's call tree contains a function containing a instruction with $x$ as an *id* operand. A shader entry point also *statically uses* any variables explicitly declared in its interface.

### 9.21. Scope

A *scope* describes a set of shader invocations, where each such set is a *scope instance*. Each invocation belongs to one or more scope instances, but belongs to no more than one scope instance for each scope.

The operations available between invocations in a given scope instance vary, with smaller scopes generally able to perform more operations, and with greater efficiency.

#### 9.21.1. Cross Device

All invocations executed in a Vulkan instance fall into a single *cross device scope instance*.

Whilst the *CrossDevice* scope is defined in SPIR-V, it is disallowed in Vulkan. API synchronization commands can be used to communicate between devices.

#### 9.21.2. Device

All invocations executed on a single device form a *device scope instance*.

If the *vulkanMemoryModel* and *vulkanMemoryModelDeviceScope* features are enabled, this scope is represented in SPIR-V by the *Device Scope*, which can be used as a *Memory Scope* for barrier and atomic operations.

If both the *shaderDeviceClock* and *vulkanMemoryModelDeviceScope* features are enabled, using the *Device Scope* with the *OpReadClockKHR* instruction will read from a clock that is consistent across invocations in the same device scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.
Invocations executing on different devices in a device group operate in separate device scope instances.

### 9.21.3. Queue Family

Invocations executed by queues in a given queue family form a *queue family scope instance*.

This scope is identified in SPIR-V as the `QueueFamily` Scope if the `vulkanMemoryModel` feature is enabled, or if not, the `Device` Scope, which can be used as a `Memory` Scope for barrier and atomic operations.

If the `shaderDeviceClock` feature is enabled, but the `vulkanMemoryModelDeviceScope` feature is not enabled, using the `Device` Scope with the `OpReadClockKHR` instruction will read from a clock that is consistent across invocations in the same queue family scope instance.

There is no method to synchronize the execution of these invocations within SPIR-V, and this can only be done with API synchronization primitives.

Each invocation in a queue family scope instance must be in the same `device scope instance`.

### 9.21.4. Command

Any shader invocations executed as the result of a single command such as `vkCmdDispatch` or `vkCmdDraw` form a *command scope instance*. For indirect drawing commands with `drawCount` greater than one, invocations from separate draws are in separate command scope instances. For ray tracing shaders, an invocation group is an implementation-dependent subset of the set of shader invocations of a given shader stage which are produced by a single trace rays command.

There is no specific `Scope` for communication across invocations in a command scope instance. As this has a clear boundary at the API level, coordination here can be performed in the API, rather than in SPIR-V.

Each invocation in a command scope instance must be in the same `queue-family scope instance`.

For shaders without defined `workgroups`, this set of invocations forms an *invocation group* as defined in the SPIR-V specification.

### 9.21.5. Primitive

Any fragment shader invocations executed as the result of rasterization of a single primitive form a *primitive scope instance*.

There is no specific `Scope` for communication across invocations in a primitive scope instance.

Any generated `helper invocations` are included in this scope instance.

Each invocation in a primitive scope instance must be in the same `command scope instance`.

Any input variables decorated with `Flat` are uniform within a primitive scope instance.
9.21.6. Shader Call

Any shader-call-related invocations that are executed in one or more ray tracing execution models form a shader call scope instance.

The ShaderCallKHR Scope can be used as Memory Scope for barrier and atomic operations.

Each invocation in a shader call scope instance must be in the same queue family scope instance.

9.21.7. Workgroup

A local workgroup is a set of invocations that can synchronize and share data with each other using memory in the Workgroup storage class.

The Workgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations.

Each invocation in a local workgroup must be in the same command scope instance.

Only compute shaders have defined workgroups - other shader types cannot use workgroup functionality. For shaders that have defined workgroups, this set of invocations forms an invocation group as defined in the SPIR-V specification.

When variables declared with the Workgroup storage class are explicitly laid out (hence they are also decorated with Block), the amount of storage consumed is the size of the largest Block variable, not counting any padding at the end. The amount of storage consumed by the non-Block variables declared with the Workgroup storage class is implementation-dependent. However, the amount of storage consumed may not exceed the largest block size that would be obtained if all active non-Block variables declared with Workgroup storage class were assigned offsets in an arbitrary order by successively taking the smallest valid offset according to the Standard Storage Buffer Layout rules, and with Boolean values considered as 32-bit integer values for the purpose of this calculation. (This is equivalent to using the GLSL std430 layout rules.)

9.21.8. Subgroup

A subgroup (see the subsection “Control Flow” of section 2 of the SPIR-V 1.3 Revision 1 specification) is a set of invocations that can synchronize and share data with each other efficiently.

The Subgroup Scope can be used as both an Execution Scope and Memory Scope for barrier and atomic operations. Other subgroup features allow the use of group operations with subgroup scope.

If the shaderSubgroupClock feature is enabled, using the Subgroup Scope with the OpReadClockKHR instruction will read from a clock that is consistent across invocations in the same subgroup.

For shaders that have defined workgroups, each invocation in a subgroup must be in the same local workgroup.

In other shader stages, each invocation in a subgroup must be in the same device scope instance.

Only shader stages that support subgroup operations have defined subgroups.
In shaders, there are two kinds of uniformity that are of primary interest to applications: uniform within an invocation group (a.k.a. dynamically uniform), and uniform within a subgroup scope.

While one could make the assumption that being uniform in invocation group implies being uniform in subgroup scope, it is not necessarily the case for shader stages without defined workgroups.

For shader stages with defined workgroups however, the relationship between invocation group and subgroup scope is well defined as a subgroup is a subset of the workgroup, and the workgroup is the invocation group. If a value is uniform in invocation group, it is by definition also uniform in subgroup scope. This is important if writing code like:

```glsl
uniform texture2D Textures[];
uint dynamicallyUniformValue = gl_WorkGroupID.x;
vec4 value = texelFetch(Textures[dynamicallyUniformValue], coord, 0);
```

// subgroupUniformValue is guaranteed to be uniform within the subgroup.  
// This value also happens to be dynamically uniform.
vec4 subgroupUniformValue = subgroupBroadcastFirst(
dynamicallyUniformValue);
```

In shader stages without defined workgroups, this gets complicated. Due to scoping rules, there is no guarantee that a subgroup is a subset of the invocation group, which in turn defines the scope for dynamically uniform. In graphics, the invocation group is a single draw command, except for multi-draw situations, and indirect draws with drawCount > 1, where there are multiple invocation groups, one per `DrawIndex`.

```glsl
// Assume SubgroupSize = 8, where 3 draws are packed together.
// Two subgroups were generated.
uniform texture2D Textures[];

// DrawIndex builtin is dynamically uniform
uint dynamicallyUniformValue = gl_DrawID;

// Subgroup 0: { 0, 0, 0, 0, 1, 1, 1, 1 }
//              | DrawID = 2 | DrawID = 1 | }
// Subgroup 1: { 2, 2, 2, 2, 1, 1, 1, 1 }

uint notActuallyDynamicallyUniformAnymore =
    subgroupBroadcastFirst(dynamicallyUniformValue);

// Subgroup 0: { 0, 0, 0, 0, 0, 0, 0, 0 }
//              | gl_DrawID = 2 | gl_DrawID = 1 | }
// Subgroup 1: { 2, 2, 2, 2, 2, 2, 2, 2 }
```

```565```
// Bug. gl_DrawID = 1's invocation group observes both index 0 and 2.
vec4 value = texelFetch(Textures[notActuallyDynamicallyUniformAnymore],
  coord, 0);

Another problematic scenario is when a shader attempts to help the compiler notice
that a value is uniform in subgroup scope to potentially improve performance.

layout(location = 0) flat in dynamicallyUniformIndex;
// Vertex shader might have emitted a value that depends only on
// gl_DrawID,
// making it dynamically uniform.
// Give knowledge to compiler that the flat input is dynamically
// uniform,
// as this is not a guarantee otherwise.

uint uniformIndex = subgroupBroadcastFirst(dynamicallyUniformIndex);
// Hazard: If different draw commands are packed into one subgroup, the
uniformIndex is wrong.

DrawData d = UBO.perDrawData[uniformIndex];

For implementations where subgroups are packed across draws, the
implementation must make sure to handle descriptor indexing correctly. From the
specification's point of view, a dynamically uniform index does not require
NonUniform decoration, and such an implementation will likely either promote
descriptor indexing into NonUniform on its own, or handle non-uniformity implicitly.

9.21.9. Quad

A quad scope instance is formed of four shader invocations.

In a fragment shader, each invocation in a quad scope instance is formed of invocations in
neighboring framebuffer locations \((x_i, y_i)\), where:

- \(i\) is the index of the invocation within the scope instance.
- \(w\) and \(h\) are the number of pixels the fragment covers in the \(x\) and \(y\) axes.
- \(w\) and \(h\) are identical for all participating invocations.
- \((x_0) = (x_1 - w) = (x_2) = (x_3 - w)\)
- \((y_0) = (y_1) = (y_2 - h) = (y_3 - h)\)
- Each invocation has the same layer and sample indices.

In all shaders, each invocation in a quad scope instance is formed of invocations in adjacent
subgroup invocation indices \((s_i)\), where:

- \(i\) is the index of the invocation within the quad scope instance.
- \((s_0) = (s_1 - 1) = (s_2 - 2) = (s_3 - 3)\)
• \( s_0 \) is an integer multiple of 4.

Each invocation in a quad scope instance must be in the same subgroup.

In a fragment shader, each invocation in a quad scope instance must be in the same primitive scope instance.

Fragment and compute shaders have defined quad scope instances. If the \text{quadOperationsInAllStages} limit is supported, any shader stages that support subgroup operations also have defined quad scope instances.

### 9.21.10. Invocation

The smallest scope is a single invocation; this is represented by the Invocation Scope in SPIR-V.

Fragment shader invocations must be in a primitive scope instance.

Invocations in shaders that have defined workgroups must be in a local workgroup.

Invocations in shaders that have a defined subgroup scope must be in a subgroup.

Invocations in shaders that have a defined quad scope must be in a quad scope instance.

All invocations in all stages must be in a command scope instance.

### 9.22. Group Operations

Group operations are executed by multiple invocations within a scope instance; with each invocation involved in calculating the result. This provides a mechanism for efficient communication between invocations in a particular scope instance.

Group operations all take a Scope defining the desired scope instance to operate within. Only the Subgroup scope can be used for these operations; the \text{subgroupSupportedOperations} limit defines which types of operation can be used.

#### 9.22.1. Basic Group Operations

Basic group operations include the use of \text{OpGroupNonUniformElect}, \text{OpControlBarrier}, \text{OpMemoryBarrier}, and atomic operations.

\text{OpGroupNonUniformElect} can be used to choose a single invocation to perform a task for the whole group. Only the invocation with the lowest id in the group will return true.

The Memory Model appendix defines the operation of barriers and atomics.

#### 9.22.2. Vote Group Operations

The vote group operations allow invocations within a group to compare values across a group. The types of votes enabled are:

• Do all active group invocations agree that an expression is true?
• Do any active group invocations evaluate an expression to true?
• Do all active group invocations have the same value of an expression?

NOTE These operations are useful in combination with control flow in that they allow for developers to check whether conditions match across the group and choose potentially faster code-paths in these cases.

9.22.3. Arithmetic Group Operations

The arithmetic group operations allow invocations to perform scans and reductions across a group. The operators supported are add, mul, min, max, and, or, xor.

For reductions, every invocation in a group will obtain the cumulative result of these operators applied to all values in the group. For exclusive scans, each invocation in a group will obtain the cumulative result of these operators applied to all values in invocations with a lower index in the group. Inclusive scans are identical to exclusive scans, except the cumulative result includes the operator applied to the value in the current invocation.

The order in which these operators are applied is implementation-dependent.

9.22.4. Ballot Group Operations

The ballot group operations allow invocations to perform more complex votes across the group. The ballot functionality allows all invocations within a group to provide a boolean value and get as a result what each invocation provided as their boolean value. The broadcast functionality allows values to be broadcast from an invocation to all other invocations within the group.

9.22.5. Shuffle Group Operations

The shuffle group operations allow invocations to read values from other invocations within a group.

9.22.6. Shuffle Relative Group Operations

The shuffle relative group operations allow invocations to read values from other invocations within the group relative to the current invocation in the group. The relative operations supported allow data to be shifted up and down through the invocations within a group.

9.22.7. Clustered Group Operations

The clustered group operations allow invocations to perform an operation among partitions of a group, such that the operation is only performed within the group invocations within a partition. The partitions for clustered group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time. The operations supported are add, mul, min, max, and, or, xor.

568
9.22.8. Rotate Group Operations

The rotate group operations allow invocations to read values from other invocations within the group relative to the current invocation and modulo the size of the group. Clustered rotate group operations perform the same operation within individual partitions of a group.

The partitions for clustered rotate group operations are consecutive power-of-two size groups of invocations and the cluster size must be known at pipeline creation time.

9.23. Quad Group Operations

Quad group operations (OpGroupNonUniformQuad*) are a specialized type of group operations that only operate on quad scope instances. Whilst these instructions do include a Scope parameter, this scope is always overridden; only the quad scope instance is included in its execution scope.

Fragment shaders that statically execute either OpGroupNonUniformQuadBroadcast or OpGroupNonUniformQuadSwap must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

The index used to select participating invocations is i, as described for a quad scope instance, defined as the quad index in the SPIR-V specification.

For OpGroupNonUniformQuadBroadcast this value is equal to Index. For OpGroupNonUniformQuadSwap, it is equal to the implicit Index used by each participating invocation.

9.24. Derivative Operations

Derivative operations calculate the partial derivative for an expression P as a function of an invocation's x and y coordinates.

Derivative operations operate on a set of invocations known as a derivative group as defined in the SPIR-V specification.

A derivative group in a fragment shader is equivalent to the quad scope instance if the QuadDerivativesKHR execution mode is specified, otherwise it is equivalent to the primitive scope instance.

Derivatives are calculated assuming that P is piecewise linear and continuous within the derivative group.

The following control-flow restrictions apply to derivative operations:

- If the QuadDerivativesKHR execution mode is specified, dynamic instances of any derivative operations must be executed in control flow that is uniform within the current quad scope instance.

- If the QuadDerivativesKHR execution mode is not specified:
  - dynamic instances of explicit derivative instructions (OpDPdx*, OpDPdy*, and OpFwidth*) must be executed in control flow that is uniform within a derivative group.
dynamic instances of implicit derivative operations can be executed in control flow that is not uniform within the derivative group, but results are undefined.

Fragment shaders that statically execute derivative operations must launch sufficient invocations to ensure their correct operation; additional helper invocations are launched for framebuffer locations not covered by rasterized fragments if necessary.

Derivative operations calculate their results as the difference between the result of \( P \) across invocations in the quad. For fine derivative operations (\texttt{OpDPdxFine} and \texttt{OpDPdyFine}), the values of \( \text{DPdx}(P_i) \) are calculated as

\[
\text{DPdx}(P_0) = \text{DPdx}(P_1) = P_1 - P_0
\]

\[
\text{DPdx}(P_2) = \text{DPdx}(P_3) = P_3 - P_2
\]

and the values of \( \text{DPdy}(P_i) \) are calculated as

\[
\text{DPdy}(P_0) = \text{DPdy}(P_2) = P_2 - P_0
\]

\[
\text{DPdy}(P_1) = \text{DPdy}(P_3) = P_3 - P_1
\]

where \( i \) is the index of each invocation as described in \texttt{Quad}.

Coarse derivative operations (\texttt{OpDPdxCoarse} and \texttt{OpDPdyCoarse}), calculate their results in roughly the same manner, but may only calculate two values instead of four (one for each of \( \text{DPdx} \) and \( \text{DPdy} \)), reusing the same result no matter the originating invocation. If an implementation does this, it should use the fine derivative calculations described for \( P_0 \).

Derivative values are calculated between fragments rather than pixels. If the fragment shader invocations involved in the calculation cover multiple pixels, these operations cover a wider area, resulting in larger derivative values. This in turn will result in a coarser LOD being selected for image sampling operations using derivatives.

Applications may want to account for this when using multi-pixel fragments; if pixel derivatives are desired, applications should use explicit derivative operations and divide the results by the size of the fragment in each dimension as follows:

\[
\text{DPdx}(P_n)' = \text{DPdx}(P_n) / w
\]

\[
\text{DPdy}(P_n)' = \text{DPdy}(P_n) / h
\]

where \( w \) and \( h \) are the size of the fragments in the quad, and \( \text{DPdx}(P_n)' \) and \( \text{DPdy}(P_n)' \).
are the pixel derivatives.

The results for \( \text{OpDPdx} \) and \( \text{OpDPdy} \) may be calculated as either fine or coarse derivatives, with implementations favoring the most efficient approach. Implementations must choose coarse or fine consistently between the two.

Executing \( \text{OpFwidthFine} \), \( \text{OpFwidthCoarse} \), or \( \text{OpFwidth} \) is equivalent to executing the corresponding \( \text{OpDPdx}^* \) and \( \text{OpDPdy}^* \) instructions, taking the absolute value of the results, and summing them.

Executing an \( \text{OpImage*Sample*ImplicitLod} \) instruction is equivalent to executing \( \text{OpDPdx}(\text{Coordinate}) \) and \( \text{OpDPdy}(\text{Coordinate}) \), and passing the results as the \( \text{Grad} \) operands \( dx \) and \( dy \).

**NOTE**

It is expected that using the \( \text{ImplicitLod} \) variants of sampling functions will be substantially more efficient than using the \( \text{ExplicitLod} \) variants with explicitly generated derivatives.

### 9.25. Helper Invocations

When performing derivative or quad group operations in a fragment shader, additional invocations may be spawned in order to ensure correct results. These additional invocations are known as helper invocations and can be identified by a non-zero value in the \( \text{HelperInvocation} \) built-in. Stores and atomics performed by helper invocations must not have any effect on memory except for the \( \text{Function} \), \( \text{Private} \) and \( \text{Output} \) storage classes, and values returned by atomic instructions in helper invocations are undefined.

**NOTE**

While storage to \( \text{Output} \) storage class has an effect even in helper invocations, it does not mean that helper invocations have an effect on the framebuffer. \( \text{Output} \) variables in fragment shaders can be read from as well, and they behave more like \( \text{Private} \) variables for the duration of the shader invocation.

If the \( \text{MaximallyReconvergesKHR} \) execution mode is applied to the entry point, helper invocations must remain active for all instructions for the lifetime of the quad scope instance they are a part of. If the \( \text{MaximallyReconvergesKHR} \) execution mode is not applied to the entry point, helper invocations may be considered inactive for group operations other than derivative and quad group operations. All invocations in a quad scope instance may become permanently inactive at any point once the only remaining invocations in that quad scope instance are helper invocations.

A cooperative matrix type is a SPIR-V type where the storage for and computations performed on the matrix are spread across the invocations in a scope instance. These types give the implementation freedom in how to optimize matrix multiplies.

SPIR-V defines the types and instructions, but does not specify rules about what sizes/combinations are valid, and it is expected that different implementations may support different sizes.

To enumerate the supported cooperative matrix types and operations, call:
// Provided by VK_KHR_cooperative_matrix

VkResult vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkCooperativeMatrixPropertiesKHR* pProperties);

- `physicalDevice` is the physical device.
- `pPropertyCount` is a pointer to an integer related to the number of cooperative matrix properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkCooperativeMatrixPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of cooperative matrix properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of cooperative matrix properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available cooperative matrix properties were returned.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkCooperativeMatrixPropertiesKHR` structures

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

Each `VkCooperativeMatrixPropertiesKHR` structure describes a single supported combination of types for a matrix multiply/add operation ( `OpCooperativeMatrixMulAddKHR` ). The multiply can be
A matrix multiply with these dimensions is known as an \( M \times N \times K \) matrix multiply.

The \texttt{VkCooperativeMatrixPropertiesKHR} structure is defined as:

```c
// Provided by VK_KHR_cooperative_matrix
typedef struct VkCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t MSize;
    uint32_t NSize;
    uint32_t KSize;
    VkComponentTypeKHR AType;
    VkComponentTypeKHR BType;
    VkComponentTypeKHR CType;
    VkComponentTypeKHR ResultType;
    VkBool32 saturatingAccumulation;
    VkScopeKHR scope;
} VkCooperativeMatrixPropertiesKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{MSize} is the number of rows in matrices \( A \), \( C \), and \( \text{Result} \).
- \texttt{KSize} is the number of columns in matrix \( A \) and rows in matrix \( B \).
- \texttt{NSize} is the number of columns in matrices \( B \), \( C \), \( \text{Result} \).
- \texttt{AType} is the component type of matrix \( A \), of type \texttt{VkComponentTypeKHR}.
- \texttt{BType} is the component type of matrix \( B \), of type \texttt{VkComponentTypeKHR}.
- \texttt{ CType} is the component type of matrix \( C \), of type \texttt{VkComponentTypeKHR}.
- \texttt{ResultType} is the component type of matrix \( \text{Result} \), of type \texttt{VkComponentTypeKHR}.
- \texttt{saturatingAccumulation} indicates whether the \texttt{SaturatingAccumulation} operand to \texttt{OpCooperativeMatrixMulAddKHR} must be present or not. If it is \texttt{VK_TRUE}, the \texttt{SaturatingAccumulation} operand must be present. If it is \texttt{VK_FALSE}, the \texttt{SaturatingAccumulation} operand must not be present.
- \texttt{scope} is the scope of all the matrix types, of type \texttt{VkScopeKHR}.
If some types are preferred over other types (e.g. for performance), they **should** appear earlier in the list enumerated by `vkGetPhysicalDeviceCooperativeMatrixPropertiesKHR`.

At least one entry in the list **must** have power of two values for all of `MSize`, `KSize`, and `NSize`.

**scope** **must** be `VK_SCOPE_SUBGROUP_KHR`.

---

### Valid Usage (Implicit)

- **VUID-VkCooperativeMatrixPropertiesKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_COOPERATIVE_MATRIX_PROPERTIES_KHR`
- **VUID-VkCooperativeMatrixPropertiesKHR-pNext-pNext**
  - `pNext` **must** be `NULL`

**Possible values for `VkScopeKHR` include:**

```c
// Provided by VK_KHR_cooperative_matrix
typedef enum VkScopeKHR {
    VK_SCOPE_DEVICE_KHR = 1,
    VK_SCOPE_WORKGROUP_KHR = 2,
    VK_SCOPE_SUBGROUP_KHR = 3,
    VK_SCOPE_QUEUE_FAMILY_KHR = 5,
} VkScopeKHR;
```

- **`VK_SCOPE_DEVICE_KHR`** corresponds to SPIR-V **Device** scope.
- **`VK_SCOPE_WORKGROUP_KHR`** corresponds to SPIR-V **Workgroup** scope.
- **`VK_SCOPE_SUBGROUP_KHR`** corresponds to SPIR-V **Subgroup** scope.
- **`VK_SCOPE_QUEUE_FAMILY_KHR`** corresponds to SPIR-V **QueueFamily** scope.

All enum values match the corresponding SPIR-V value.

**Possible values for `VkComponentTypeKHR` include:**
// Provided by VK_KHR_cooperative_matrix

typedef enum VkComponentTypeKHR {
    VK_COMPONENT_TYPE_FLOAT16_KHR = 0,
    VK_COMPONENT_TYPE_FLOAT32_KHR = 1,
    VK_COMPONENT_TYPE_FLOAT64_KHR = 2,
    VK_COMPONENT_TYPE_SINT8_KHR = 3,
    VK_COMPONENT_TYPE_SINT16_KHR = 4,
    VK_COMPONENT_TYPE_SINT32_KHR = 5,
    VK_COMPONENT_TYPE_SINT64_KHR = 6,
    VK_COMPONENT_TYPE_UINT8_KHR = 7,
    VK_COMPONENT_TYPE_UINT16_KHR = 8,
    VK_COMPONENT_TYPE_UINT32_KHR = 9,
    VK_COMPONENT_TYPE_UINT64_KHR = 10,
} VkComponentTypeKHR;

• VK_COMPONENT_TYPE_FLOAT16_KHR corresponds to SPIR-V OpTypeFloat 16.
• VK_COMPONENT_TYPE_FLOAT32_KHR corresponds to SPIR-V OpTypeFloat 32.
• VK_COMPONENT_TYPE_FLOAT64_KHR corresponds to SPIR-V OpTypeFloat 64.
• VK_COMPONENT_TYPE_SINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.
• VK_COMPONENT_TYPE_SINT16_KHR corresponds to SPIR-V OpTypeInt 16 0/1.
• VK_COMPONENT_TYPE_SINT32_KHR corresponds to SPIR-V OpTypeInt 32 0/1.
• VK_COMPONENT_TYPE_SINT64_KHR corresponds to SPIR-V OpTypeInt 64 0/1.
• VK_COMPONENT_TYPE_UINT8_KHR corresponds to SPIR-V OpTypeInt 8 0/1.
• VK_COMPONENT_TYPE_UINT16_KHR corresponds to SPIR-V OpTypeInt 16 0/1.
• VK_COMPONENT_TYPE_UINT32_KHR corresponds to SPIR-V OpTypeInt 32 0/1.
• VK_COMPONENT_TYPE_UINT64_KHR corresponds to SPIR-V OpTypeInt 64 0/1.
Chapter 10. Pipelines

The following figure shows a block diagram of the Vulkan pipelines. Some Vulkan commands specify geometric objects to be drawn or computational work to be performed, while others specify state controlling how objects are handled by the various pipeline stages, or control data transfer between memory organized as images and buffers. Commands are effectively sent through a processing pipeline, either a graphics pipeline, a ray tracing pipeline, or a compute pipeline.

The first stage of the graphics pipeline (Input Assembler) assembles vertices to form geometric primitives such as points, lines, and triangles, based on a requested primitive topology. In the next stage (Vertex Shader) vertices can be transformed, computing positions and attributes for each vertex. If tessellation and/or geometry shaders are supported, they can then generate multiple primitives from a single input primitive, possibly changing the primitive topology or generating additional attribute data in the process.

The final resulting primitives are clipped to a clip volume in preparation for the next stage, Rasterization. The rasterizer produces a series of fragments associated with a region of the framebuffer, from a two-dimensional description of a point, line segment, or triangle. These fragments are processed by fragment operations to determine whether generated values will be written to the framebuffer. Fragment shading determines the values to be written to the framebuffer attachments. Framebuffer operations then read and write the color and depth/stencil attachments of the framebuffer for a given subpass of a render pass instance. The attachments can be used as input attachments in the fragment shader in a later subpass of the same render pass.

The compute pipeline is a separate pipeline from the graphics pipeline, which operates on one-, two-, or three-dimensional workgroups which can read from and write to buffer and image memory.

This ordering is meant only as a tool for describing Vulkan, not as a strict rule of how Vulkan is implemented, and we present it only as a means to organize the various operations of the pipelines. Actual ordering guarantees between pipeline stages are explained in detail in the synchronization chapter.
Each pipeline is controlled by a monolithic object created from a description of all of the shader stages and any relevant fixed-function stages. Linking the whole pipeline together allows the optimization of shaders based on their input/outputs and eliminates expensive draw time state validation.

A pipeline object is bound to the current state using `vkCmdBindPipeline`. Any pipeline object state that is specified as dynamic is not applied to the current state when the pipeline object is bound, but is instead set by dynamic state setting commands.

No state, including dynamic state, is inherited from one command buffer to another.

Compute, ray tracing, and graphics pipelines are each represented by `VkPipeline` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipeline)
```

## 10.1. Multiple Pipeline Creation

Multiple pipelines can be created in a single call by commands such as `vkCreateRayTracingPipelinesKHR`, `vkCreateComputePipelines`, and `vkCreateGraphicsPipelines`.

The creation commands are passed an array `pCreateInfos` of `Vk*PipelineCreateInfo` structures specifying parameters of each pipeline to be created, and return a corresponding array of handles in `pPipelines`. Each element index `i` of `pPipelines` is created based on the corresponding element `i` of `pCreateInfos`.

Applications can group together similar pipelines to be created in a single call, and implementations are encouraged to look for reuse opportunities when creating a group.
When attempting to create many pipelines in a single command, it is possible that creation may fail for a subset of them. In this case, the corresponding elements of the `pPipelines` will be set to `VK_NULL_HANDLE`. If creation fails for a pipeline despite valid arguments (for example, due to out of memory errors), the `VkResult` code returned by the pipeline creation command will indicate why. The implementation will attempt to create all pipelines, and only return `VK_NULL_HANDLE` values for those that actually failed.

If creation fails for a pipeline that has the `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT` set in its `Vk*PipelineCreateInfo`, pipelines at an index in the `pPipelines` array greater than or equal to that of the failing pipeline will be set to `VK_NULL_HANDLE`.

If creation fails for multiple pipelines, the returned `VkResult` must be the return value of any one of the pipelines which did not succeed. An application can reliably clean up from a failed call by iterating over the `pPipelines` array and destroying every element that is not `VK_NULL_HANDLE`.

If the entire command fails and no pipelines are created, all elements of `pPipelines` will be set to `VK_NULL_HANDLE`.

### 10.2. Compute Pipelines

Compute pipelines consist of a single static compute shader stage and the pipeline layout.

The compute pipeline represents a compute shader and is created by calling `vkCreateComputePipelines` with `module` and `pName` selecting an entry point from a shader module, where that entry point defines a valid compute shader, in the `VkPipelineShaderStageCreateInfo` structure contained within the `VkComputePipelineCreateInfo` structure.

To create compute pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateComputePipelines(
    VkDevice device,                     // device
    VkPipelineCache pipelineCache,       // pipelineCache
    uint32_t createInfoCount,            // createInfoCount
    const VkComputePipelineCreateInfo* pCreateInfos,  // pCreateInfos
    const VkAllocationCallbacks* pAllocator,   // pAllocator
    VkPipeline* pPipelines);             // pPipelines
```

- `device` is the logical device that creates the compute pipelines.
- `pipelineCache` is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- `createInfoCount` is the length of the `pCreateInfos` and `pPipelines` arrays.
- `pCreateInfos` is a pointer to an array of `VkComputePipelineCreateInfo` structures.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelines` is a pointer to an array of `VkPipeline` handles in which the resulting compute
pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateComputePipelines-device-09661
device must support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability

- VUID-vkCreateComputePipelines-flags-00695
If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element

- VUID-vkCreateComputePipelines-flags-00696
If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set

- VUID-vkCreateComputePipelines-pipelineCache-02873
If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized

Valid Usage (Implicit)

- VUID-vkCreateComputePipelines-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateComputePipelines-pipelineCache-parameter
If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkCreateComputePipelines-pCreateInfos-parameter
pCreateInfos must be a valid pointer to an array of createInfoCount valid VkComputePipelineCreateInfo structures

- VUID-vkCreateComputePipelines-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateComputePipelines-pPipelines-parameter
pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles

- VUID-vkCreateComputePipelines-createInfoCount-arraylength
createInfoCount must be greater than 0

- VUID-vkCreateComputePipelines-pipelineCache-parent
If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkComputePipelineCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkComputePipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    VkPipelineShaderStageCreateInfo stage;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkComputePipelineCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- `stage` is a `VkPipelineShaderStageCreateInfo` structure describing the compute shader.
- `layout` is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- `basePipelineHandle` is a pipeline to derive from.
- `basePipelineIndex` is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in Pipeline Derivatives.

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.

**Valid Usage**

- VUID-VkComputePipelineCreateInfo-None-09497
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` must be a valid combination of `VkPipelineCreateFlagBits` values
If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid compute `VkPipeline` handle.

If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter.

If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, `basePipelineIndex` **must** be -1 or `basePipelineHandle` **must** be `VK_NULL_HANDLE.

If a push constant block is declared in a shader, a push constant range in `layout` **must** match the shader stage.

If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage.

If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the shader stage.

If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the descriptor type.

If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` **must** match the descriptor count.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

`flags` **must** not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.
If the `pipelineCreationCacheControl` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

The `stage` member of `stage` must be `VK_SHADER_STAGE_COMPUTE_BIT`.

The shader code for the entry point identified by `stage` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

The number of resources in `layout` accessible to the compute shader stage must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be 1.

`flags` must not include `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`.

If `VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount` is not 0, it must be 1.

`flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT`.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_COMPUTE_PIPELINE_CREATE_INFO`.
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineCreateFlags2CreateInfoKHR` or `VkPipelineCreationFeedbackCreateInfo`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- `stage` must be a valid `VkPipelineShaderStageCreateInfo` structure.
- `layout` must be a valid `VkPipelineLayout` handle.
- Both of `basePipelineHandle`, and `layout` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The `VkPipelineShaderStageCreateInfo` structure is defined as:
// Provided by VK_VERSION_1_0
typedef struct VkPipelineShaderStageCreateInfo {
        VkStructureType sType;
        const void* pNext;
        VkPipelineShaderStageCreateFlags flags;
        VkShaderStageFlagBits stage;
        VkShaderModule module;
        const char* pName;
        const VkSpecializationInfo* pSpecializationInfo;
    } VkPipelineShaderStageCreateInfo;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkPipelineShaderStageCreateFlagBits specifying how the pipeline shader stage will be generated.
- **stage** is a VkShaderStageFlagBits value specifying a single pipeline stage.
- **module** is optionally a VkShaderModule object containing the shader code for this stage.
- **pName** is a pointer to a null-terminated UTF-8 string specifying the entry point name of the shader for this stage.
- **pSpecializationInfo** is a pointer to a VkSpecializationInfo structure, as described in Specialization Constants, or NULL.

If **module** is not VK_NULL_HANDLE, the shader code used by the pipeline is defined by **module**. If **module** is VK_NULL_HANDLE, the shader code is defined by the chained VkShaderModuleCreateInfo if present.

### Valid Usage

- VUID-VkPipelineShaderStageCreateInfo-stage-00704
  If the geometryShader feature is not enabled, **stage** must not be VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-VkPipelineShaderStageCreateInfo-stage-00705
  If the tessellationShader feature is not enabled, **stage** must not be VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT or VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-VkPipelineShaderStageCreateInfo-stage-00706
  stage must not be VK_SHADER_STAGE_ALL_GRAPHICS, or VK_SHADER_STAGE_ALL

- VUID-VkPipelineShaderStageCreateInfo-pName-00707
  **pName** must be the name of an OpEntryPoint in **module** with an execution model that matches **stage**

- VUID-VkPipelineShaderStageCreateInfo-maxClipDistances-00708
  If the identified entry point includes any variable in its interface that is declared with the ClipDistance BuiltIn decoration, that variable must not have an array size greater than
VkPhysicalDeviceLimits::maxClipDistances

- **VUID-VkPipelineShaderStageCreateInfo-maxCullDistances-00709**
  If the identified entry point includes any variable in its interface that is declared with the `CullDistance BuiltIn` decoration, that variable **must** not have an array size greater than VkPhysicalDeviceLimits::maxClipDistances

- **VUID-VkPipelineShaderStageCreateInfo-maxCombinedClipAndCullDistances-00710**
  If the identified entry point includes variables in its interface that are declared with the `ClipDistance BuiltIn` decoration and variables in its interface that are declared with the `CullDistance BuiltIn` decoration, those variables **must** not have array sizes which sum to more than VkPhysicalDeviceLimits::maxCombinedClipAndCullDistances

- **VUID-VkPipelineShaderStageCreateInfo-maxSampleMaskWords-00711**
  If the identified entry point includes any variable in its interface that is declared with the `SampleMask BuiltIn` decoration, that variable **must** not have an array size greater than VkPhysicalDeviceLimits::maxSampleMaskWords

- **VUID-VkPipelineShaderStageCreateInfo-stage-00713**
  If `stage` is `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT` or `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, and the identified entry point has an `OpExecutionMode` instruction specifying a patch size with `OutputVertices`, the patch size **must** be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTessellationPatchSize

- **VUID-VkPipelineShaderStageCreateInfo-stage-00714**
  If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying a maximum output vertex count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxGeometryOutputVertices

- **VUID-VkPipelineShaderStageCreateInfo-stage-00715**
  If `stage` is `VK_SHADER_STAGE_GEOMETRY_BIT`, the identified entry point **must** have an `OpExecutionMode` instruction specifying an invocation count that is greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxGeometryShaderInvocations

- **VUID-VkPipelineShaderStageCreateInfo-stage-02596**
  If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `Layer` for any primitive, it **must** write the same value to `Layer` for all vertices of a given primitive

- **VUID-VkPipelineShaderStageCreateInfo-stage-02597**
  If `stage` is either `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, or `VK_SHADER_STAGE_GEOMETRY_BIT`, and the identified entry point writes to `ViewportIndex` for any primitive, it **must** write the same value to `ViewportIndex` for all vertices of a given primitive

- **VUID-VkPipelineShaderStageCreateInfo-stage-06685**
  If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to `FragDepth` in any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of `FragDepth`

- **VUID-VkPipelineShaderStageCreateInfo-stage-06686**
  If `stage` is `VK_SHADER_STAGE_FRAGMENT_BIT`, and the identified entry point writes to
In any execution path, all execution paths that are not exclusive to helper invocations **must** either discard the fragment, or write or initialize the value of FragStencilRefEXT

- **VUID-VkPipelineShaderStageCreateInfo-flags-02784**
  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set, the `subgroupSizeControl` feature **must** be enabled

- **VUID-VkPipelineShaderStageCreateInfo-flags-02785**
  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the `computeFullSubgroups` feature **must** be enabled

- **VUID-VkPipelineShaderStageCreateInfo-flags-08988**
  If `flags` includes `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`, stage **must** be `VK_SHADER_STAGE_COMPUTE_BIT`

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02754**
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, `flags` **must** not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02755**
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the `subgroupSizeControl` feature **must** be enabled, and stage **must** be a valid bit specified in `requiredSubgroupSizeStages`

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02756**
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and stage is `VK_SHADER_STAGE_COMPUTE_BIT`, the local workgroup size of the shader **must** be less than or equal to the product of `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize` and `maxComputeWorkgroupSubgroups`

- **VUID-VkPipelineShaderStageCreateInfo-pNext-02757**
  If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain and `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of ` VkPipelineShaderStageRequiredSubgroupSizeCreateInfo::requiredSubgroupSize`

- **VUID-VkPipelineShaderStageCreateInfo-flags-02758**
  If `flags` has both the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flags set, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `maxSubgroupSize`

- **VUID-VkPipelineShaderStageCreateInfo-flags-02759**
  If `flags` has the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag set and `flags` does not have the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain, the local workgroup size in the X dimension of the pipeline **must** be a multiple of `subgroupSize`

- **VUID-VkPipelineShaderStageCreateInfo-module-08987**
  If `module` uses the `OpTypeCooperativeMatrixKHR` instruction with a `Scope` equal to `Subgroup`,
then the local workgroup size in the X dimension of the pipeline must be a multiple of subgroupSize.

- VUID-VkPipelineShaderStageCreateInfo-stage-08771
  module must be a valid VkShaderModule if none of the following features are enabled:
  - VUID-VkPipelineShaderStageCreateInfo-stage-06845
    If module is VK_NULL_HANDLE] there must be a valid VkShaderModuleCreateInfo structure in the pNext chain
  - VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-06849
    The shader code used by the pipeline must be valid as described by the Khronos SPIR-V Specification after applying the specializations provided in pSpecializationInfo, if any, and then converting all specialization constants into fixed constants.

## Valid Usage (Implicit)

- VUID-VkPipelineShaderStageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_CREATE_INFO

- VUID-VkPipelineShaderStageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineShaderStageRequiredSubgroupSizeCreateInfo or VkShaderModuleCreateInfo

- VUID-VkPipelineShaderStageCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPipelineShaderStageCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineShaderStageCreateFlagBits values

- VUID-VkPipelineShaderStageCreateInfo-stage-parameter
  stage must be a valid VkShaderStageFlagBits value

- VUID-VkPipelineShaderStageCreateInfo-module-parameter
  If module is not VK_NULL_HANDLE, module must be a valid VkShaderModule handle

- VUID-VkPipelineShaderStageCreateInfo-pName-parameter
  pName must be a null-terminated UTF-8 string

- VUID-VkPipelineShaderStageCreateInfo-pSpecializationInfo-parameter
  If pSpecializationInfo is not NULL, pSpecializationInfo must be a valid pointer to a valid VkSpecializationInfo structure

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineShaderStageCreateFlags;

VkPipelineShaderStageCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineShaderStageCreateFlagBits.
Possible values of the flags member of VkPipelineShaderStageCreateInfo specifying how a pipeline shader stage is created, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineShaderStageCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT = 0x00000001,
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT = 0x00000002,
} VkPipelineShaderStageCreateFlagBits;
```

- **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT** specifies that the SubgroupSize **may** vary in the shader stage.
- **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT** specifies that the subgroup sizes **must** be launched with all invocations active in the compute stage.

**NOTE**

If **VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT_EXT** and **VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT_EXT** are specified and minSubgroupSize does not equal maxSubgroupSize and no required subgroup size is specified, then the only way to guarantee that the 'X' dimension of the local workgroup size is a multiple of SubgroupSize is to make it a multiple of maxSubgroupSize. Under these conditions, you are guaranteed full subgroups but not any particular subgroup size.

Bits which **can** be set by commands and structures, specifying one or more shader stages, are:
typedef enum VkShaderStageFlagBits {
    VK_SHADER_STAGE_VERTEX_BIT = 0x00000001,
    VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT = 0x00000002,
    VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT = 0x00000004,
    VK_SHADER_STAGE_GEOMETRY_BIT = 0x00000008,
    VK_SHADER_STAGE_FRAGMENT_BIT = 0x00000010,
    VK_SHADER_STAGE_COMPUTE_BIT = 0x00000020,
    VK_SHADER_STAGE_ALL_GRAPHICS = 0x0000001F,
    VK_SHADER_STAGE_ALL = 0x7FFFFFFF,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_RAYGEN_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_ANY_HIT_BIT_KHR = 0x00000200,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_MISS_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_INTERSECTION_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_SHADER_STAGE_CALLABLE_BIT_KHR = 0x00002000,
} VkShaderStageFlagBits;

• VK_SHADER_STAGE_VERTEX_BIT specifies the vertex stage.
• VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT specifies the tessellation control stage.
• VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT specifies the tessellation evaluation stage.
• VK_SHADER_STAGE_GEOMETRY_BIT specifies the geometry stage.
• VK_SHADER_STAGE_FRAGMENT_BIT specifies the fragment stage.
• VK_SHADER_STAGE_COMPUTE_BIT specifies the compute stage.
• VK_SHADER_STAGE_ALL_GRAPHICS is a combination of bits used as shorthand to specify all graphics stages defined above (excluding the compute stage).
• VK_SHADER_STAGE_ALL is a combination of bits used as shorthand to specify all shader stages supported by the device, including all additional stages which are introduced by extensions.
• VK_SHADER_STAGE_RAYGEN_BIT_KHR specifies the ray generation stage.
• VK_SHADER_STAGE_ANY_HIT_BIT_KHR specifies the any-hit stage.
• VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR specifies the closest hit stage.
• VK_SHADER_STAGE_MISS_BIT_KHR specifies the miss stage.
• VK_SHADER_STAGE_INTERSECTION_BIT_KHR specifies the intersection stage.
• VK_SHADER_STAGE_CALLABLE_BIT_KHR specifies the callable stage.

**NOTE**  
VK_SHADER_STAGE_ALL_GRAPHICS only includes the original five graphics stages included in Vulkan 1.0, and not any stages added by extensions. Thus, it may not
have the desired effect in all cases.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkShaderStageFlags;
```

`VkShaderStageFlags` is a bitmask type for setting a mask of zero or more `VkShaderStageFlagBits`.

The `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPipelineShaderStageRequiredSubgroupSizeCreateInfo {
    VkStructureType sType;
    void* pNext;
    uint32_t requiredSubgroupSize;
} VkPipelineShaderStageRequiredSubgroupSizeCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_shader_object
typedef VkPipelineShaderStageRequiredSubgroupSizeCreateInfo
    VkShaderRequiredSubgroupSizeCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `requiredSubgroupSize` is an unsigned integer value specifying the required subgroup size for the newly created pipeline shader stage.

If a `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure is included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, it specifies that the pipeline shader stage being compiled has a required subgroup size.

If a `VkShaderRequiredSubgroupSizeCreateInfoEXT` structure is included in the `pNext` chain of `VkShaderCreateInfoEXT`, it specifies that the shader being compiled has a required subgroup size.

### Valid Usage

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02760
  - `requiredSubgroupSize` must be a power-of-two integer
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02761
  - `requiredSubgroupSize` must be greater or equal to `minSubgroupSize`
- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-requiredSubgroupSize-02762
**Valid Usage (Implicit)**

- VUID-VkPipelineShaderStageRequiredSubgroupSizeCreateInfo-sType-sType must be

```
VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_REQUIRED_SUBGROUP_SIZE_CREATE_INFO
```

### 10.3. Graphics Pipelines

Graphics pipelines consist of multiple shader stages, multiple fixed-function pipeline stages, and a pipeline layout.

To create graphics pipelines, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateGraphicsPipelines(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkGraphicsPipelineCreateInfo* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the graphics pipelines.
- **pipelineCache** is either `VK_NULL_HANDLE`, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the `pCreateInfos` and `pPipelines` arrays.
- **pCreateInfos** is a pointer to an array of `VkGraphicsPipelineCreateInfo` structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of `VkPipeline` handles in which the resulting graphics pipeline objects are returned.

The `VkGraphicsPipelineCreateInfo` structure includes an array of `VkPipelineShaderStageCreateInfo` structures for each of the desired active shader stages, as well as creation information for all relevant fixed-function stages, and a pipeline layout.

Pipelines are created and returned as described for Multiple Pipeline Creation.

**Valid Usage**

- VUID-vkCreateGraphicsPipelines-device-09662

  **device** must support at least one queue family with the `VK_QUEUE_GRAPHICS_BIT` capability
If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element.

If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized.

An implicit cache may be provided by the implementation or a layer. For this reason, it is still valid to set VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT on flags for any element of pCreateInfos while passing VK_NULL_HANDLE for pipelineCache.

Valid Usage (Implicit)

device must be a valid VkDevice handle.

pipelineCache must be a valid VkPipelineCache handle.

pCreateInfos must be a valid pointer to an array of createInfoCount valid VkGraphicsPipelineCreateInfo structures.

pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles.

createInfoCount must be greater than 0.

pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device.
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkGraphicsPipelineCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VK_VERSION_1_0
VkGraphicsPipelineCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineVertexInputStateCreateInfo* pVertexInputState;
    const VkPipelineInputAssemblyStateCreateInfo* pInputAssemblyState;
    const VkPipelineTessellationStateCreateInfo* pTessellationState;
    const VkPipelineViewportStateCreateInfo* pViewportState;
    const VkPipelineRasterizationStateCreateInfo* pRasterizationState;
    const VkPipelineMultisampleStateCreateInfo* pMultisampleState;
    const VkPipelineDepthStencilStateCreateInfo* pDepthStencilState;
    const VkPipelineColorBlendStateCreateInfo* pColorBlendState;
    const VkPipelineDynamicStateCreateInfo* pDynamicState;
    VkPipelineLayout layout;
    VkRenderPass renderPass;
    uint32_t subpass;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkGraphicsPipelineCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkPipelineCreateFlagBits specifying how the pipeline will be generated.
- `stageCount` is the number of entries in the `pStages` array.
- `pStages` is a pointer to an array of stageCount VkPipelineShaderStageCreateInfo structures describing the set of the shader stages to be included in the graphics pipeline.
- `pVertexInputState` is a pointer to a VkPipelineVertexInputStateCreateInfo structure.
- `pInputAssemblyState` is a pointer to a VkPipelineInputAssemblyStateCreateInfo structure which determines input assembly behavior for vertex shading, as described in Drawing Commands. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with both VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE, and VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY
dynamic states set and dynamicPrimitiveTopologyUnrestricted is VK_TRUE.

- **pTessellationState** is a pointer to a VkPipelineTessellationStateCreateInfo structure defining tessellation state used by tessellation shaders.
- **pViewportState** is a pointer to a VkPipelineViewportStateCreateInfo structure defining viewport state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with both VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, and VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic states set.
- **pRasterizationState** is a pointer to a VkPipelineRasterizationStateCreateInfo structure defining rasterization state. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT, VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE, VK_DYNAMIC_STATE_POLYGON_MODE_EXT, VK_DYNAMIC_STATE_CULL_MODE, VK_DYNAMIC_STATE_FRONT_FACE, VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE, VK_DYNAMIC_STATE_DEPTH_BIAS, and VK_DYNAMIC_STATE_LINE_WIDTH dynamic states set.
- **pMultisampleState** is a pointer to a VkPipelineMultisampleStateCreateInfo structure defining multisample state used when rasterization is enabled. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, and VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE.Enable_EXT dynamic states set, and either alphaToOne is disabled on the device or VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is set, in which case VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is assumed to be VK_FALSE.
- **pDepthStencilState** is a pointer to a VkPipelineDepthStencilStateCreateInfo structure defining depth/stencil state used when rasterization is enabled for depth or stencil attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE, VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE, VK_DYNAMIC_STATE_STENCIL_OP, and VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic states set.
- **pColorBlendState** is a pointer to a VkPipelineColorBlendStateCreateInfo structure defining color blend state used when rasterization is enabled for any color attachments accessed during rendering. If the VK_EXT_extended_dynamic_state3 extension is enabled, it can be NULL if the pipeline is created with all of VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT, VK_DYNAMIC_STATE_LOGIC_OP_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT, VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT, VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic states set.
- **pDynamicState** is a pointer to a VkPipelineDynamicStateCreateInfo structure defining which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **renderPass** is a handle to a render pass object describing the environment in which the pipeline will be used. The pipeline must only be used with a render pass instance compatible with the one provided. See Render Pass Compatibility for more information.
- **subpass** is the index of the subpass in the render pass where this pipeline will be used.
• **basePipelineHandle** is a pipeline to derive from.

• **basePipelineIndex** is an index into the `pCreateInfos` parameter to use as a pipeline to derive from.

The parameters `basePipelineHandle` and `basePipelineIndex` are described in more detail in [Pipeline Derivatives](#).

**NOTE**

With `VK_EXT_extended_dynamic_state3`, it is possible that many of the `VkGraphicsPipelineCreateInfo` members above can be `NULL` because all their state is dynamic and therefore ignored. This is optional so the application can still use a valid pointer if it needs to set the `pNext` or `flags` fields to specify state for other extensions.

The state required for a graphics pipeline is divided into vertex input state, pre-rasterization shader state, fragment shader state, and fragment output state.

**Vertex Input State**

Vertex input state is defined by:

- `VkPipelineVertexInputStateCreateInfo`
- `VkPipelineInputAssemblyStateCreateInfo`

This state **must** be specified to create a complete graphics pipeline.

**Pre-Rasterization Shader State**

Pre-rasterization shader state is defined by:

- `VkPipelineShaderStageCreateInfo` entries for:
  - Vertex shaders
  - Tessellation control shaders
  - Tessellation evaluation shaders
  - Geometry shaders
- Within the `VkPipelineLayout`, the full pipeline layout **must** be specified.
- `VkPipelineViewportStateCreateInfo`
- `VkPipelineRasterizationStateCreateInfo`
- `VkPipelineTessellationStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineDiscardRectangleStateCreateInfoEXT`
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`

This state **must** be specified to create a complete graphics pipeline.

**Fragment Shader State**
Fragment shader state is defined by:

- A `VkPipelineShaderStageCreateInfo` entry for the fragment shader
- Within the `VkPipelineLayout`, the full pipeline layout must be specified.
- `VkPipelineMultisampleStateCreateInfo` if sample shading is enabled or `renderpass` is not `VK_NULL_HANDLE`
- `VkPipelineDepthStencilStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- The `viewMask` parameter of `VkPipelineRenderingCreateInfo` (formats are ignored)
- `VkPipelineFragmentShadingRateStateCreateInfoKHR`
- Inclusion/omission of the `VK_PIPELINE_RASTERIZATION_STATE_CREATE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR` flag
- `VkRenderingInputAttachmentIndexInfoKHR`

If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state must be specified to create a complete graphics pipeline.

**Fragment Output State**

Fragment output state is defined by:

- `VkPipelineColorBlendStateCreateInfo`
- `VkRenderPass` and `subpass` parameter
- `VkPipelineMultisampleStateCreateInfo`
- `VkPipelineRenderingCreateInfo`
- Inclusion/omission of the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` and `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` flags
- `VkRenderingAttachmentLocationInfoKHR`

If `rasterizerDiscardEnable` is set to `VK_FALSE` or `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` is used, this state must be specified to create a complete graphics pipeline.

**Dynamic State**

Dynamic state values set via `pDynamicState` must be ignored if the state they correspond to is not otherwise statically set by one of the state subsets used to create the pipeline. For example, if a pipeline only included pre-rasterization shader state, then any dynamic state value corresponding to depth or stencil testing has no effect.

**Complete Graphics Pipelines**

A complete graphics pipeline always includes pre-rasterization shader state, with other subsets included depending on that state as specified in the above sections.

If the `pNext` chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure, `VkPipelineCreateFlags2CreateInfoKHR::flags` from that structure is used instead of `flags` from this structure.
Valid Usage

- **VUID-VkGraphicsPipelineCreateInfo-None-09497**
  If the `pNext` chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, `flags` **must** be a valid combination of `VkPipelineCreateFlagBits` values.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07984**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineIndex` is -1, `basePipelineHandle` **must** be a valid graphics `VkPipeline` handle.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07985**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be a valid index into the calling command's `pCreateInfos` parameter.

- **VUID-VkGraphicsPipelineCreateInfo-flags-07986**
  If `flags` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, and `basePipelineHandle` is `VK_NULL_HANDLE`, `basePipelineIndex` **must** be `-1`.

- **VUID-VkGraphicsPipelineCreateInfo-layout-07987**
  If a push constant block is declared in a shader, a push constant range in `layout` **must** match the shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-layout-10069**
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in `layout` that matches the stage.

- **VUID-VkGraphicsPipelineCreateInfo-layout-07988**
  If a `resource variables` is declared in a shader, a descriptor slot in `layout` **must** match the shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-layout-07990**
  If a `resource variables` is declared in a shader as an array, a descriptor slot in `layout` **must** match the descriptor count.

- **VUID-VkGraphicsPipelineCreateInfo-layout-07991**
  If the pipeline requires pre-rasterization shader state the `stage` member of one element of `pStages` **must** be `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00729**
  If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation control shader stage, it **must** include a tessellation evaluation shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-00730**
  If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation evaluation shader stage, it **must** include a tessellation control shader stage.

- **VUID-VkGraphicsPipelineCreateInfo-pStages-09022**
  If the pipeline requires pre-rasterization shader state and `pStages` includes a tessellation control shader stage, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or...
the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state is not set, pTessellationState must be a valid pointer to a valid VkPipelineTessellationStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pTessellationState-09023
  If pTessellationState is not NULL it must be a pointer to a valid VkPipelineTessellationStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-pStages-00732
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage must contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00733
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, and the shader code of both stages contain an OpExecutionMode instruction specifying the type of subdivision in the pipeline, they must both specify the same subdivision mode

- VUID-VkGraphicsPipelineCreateInfo-pStages-00734
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, the shader code of at least one stage must contain an OpExecutionMode instruction specifying the output patch size in the pipeline

- VUID-VkGraphicsPipelineCreateInfo-pStages-00735
  If the pipeline requires pre-rasterization shader state and pStages includes tessellation shader stages, and the shader code of both contain an OpExecutionMode instruction specifying the out patch size in the pipeline, they must both specify the same patch size

- VUID-VkGraphicsPipelineCreateInfo-pStages-08888
  If the pipeline is being created with pre-rasterization shader state and vertex input state and pStages includes tessellation shader stages, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, the topology member of pInputAssembly must be VK_PRIMITIVE_TOPOLOGY_PATCH_LIST

- VUID-VkGraphicsPipelineCreateInfo-topology-08889
  If the pipeline is being created with pre-rasterization shader state and vertex input state and the topology member of pInputAssembly is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, and either VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or dynamicPrimitiveTopologyUnrestricted is VK_FALSE, then pStages must include tessellation shader stages

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07723
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry Execution Model, uses the PointMode Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to if maintenance5 is not enabled

- VUID-VkGraphicsPipelineCreateInfo-topology-08773
  If the pipeline is being created with a Vertex Execution Model and no TessellationEvaluation or Geometry Execution Model, and the topology member of pInputAssembly is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, and either
VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY dynamic state is not enabled or
dynamicPrimitiveTopologyUnrestricted is VK_FALSE, a PointSize decorated variable must be
written to if maintenance5 is not enabled

- VUID-VkGraphicsPipelineCreateInfo-maintenance5-08775
  If maintenance5 is enabled and a PointSize decorated variable is written to, all execution
  paths must write to a PointSize decorated variable

- VUID-VkGraphicsPipelineCreateInfo-TessellationEvaluation-07724
  If the pipeline is being created with a TessellationEvaluation Execution Model, no Geometry
  Execution Model, uses the PointMode Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to

- VUID-VkGraphicsPipelineCreateInfo-shaderTessellationAndGeometryPointSize-08776
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints
  Execution Mode, and shaderTessellationAndGeometryPointSize is enabled, a PointSize decorated variable must be written to for every vertex emitted if maintenance5 is not enabled

- VUID-VkGraphicsPipelineCreateInfo-Geometry-07726
  If the pipeline is being created with a Geometry Execution Model, uses the OutputPoints
  Execution Mode, and shaderTessellationAndGeometryPointSize is not enabled, a PointSize decorated variable must not be written to

- VUID-VkGraphicsPipelineCreateInfo-pStages-00738
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry
  shader stage, and does not include any tessellation shader stages, its shader code must
  contain an OpExecutionMode instruction specifying an input primitive type that is compatible
  with the primitive topology specified in pInputAssembly

- VUID-VkGraphicsPipelineCreateInfo-pStages-00739
  If the pipeline requires pre-rasterization shader state and pStages includes a geometry
  shader stage, and also includes tessellation shader stages, its shader code must contain an OpExecutionMode instruction specifying an input primitive type that is compatible with the primitive topology that is output by the tessellation stages

- VUID-VkGraphicsPipelineCreateInfo-pStages-00740
  If the pipeline requires pre-rasterization shader state and fragment shader state, it
  includes both a fragment shader and a geometry shader, and the fragment shader code
  reads from an input variable that is decorated with PrimitiveId, then the geometry shader
  code must write to a matching output variable, decorated with PrimitiveId, in all
  execution paths

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06038
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with fragment
  shader state the fragment shader must not read from any input attachment that is
  defined as VK_ATTACHMENT_UNUSED in subpass

- VUID-VkGraphicsPipelineCreateInfo-pStages-00742
  If the pipeline requires pre-rasterization shader state and multiple pre-rasterization
  shader stages are included in pStages, the shader code for the entry points identified by
  those pStages and the rest of the state identified by this structure must adhere to the
pipeline linking rules described in the Shader Interfaces chapter

• VUID-VkGraphicsPipelineCreateInfo-None-04889
  If the pipeline requires pre-rasterization shader state and fragment shader state, the fragment shader and last pre-rasterization shader stage and any relevant state must adhere to the pipeline linking rules described in the Shader Interfaces chapter

• VUID-VkGraphicsPipelineCreateInfo-renderPass-06041
  If renderPass is not VK_NULL_HANDLE, and the pipeline is being created with fragment output interface state, then for each color attachment in the subpass, if the potential format features of the format of the corresponding attachment description do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-renderPass-07609
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, the pColorBlendState pointer is not NULL, the attachmentCount member of pColorBlendState is not ignored, and the subpass uses color attachments, the attachmentCount member of pColorBlendState must be equal to the colorAttachmentCount used to create subpass

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04130
  If the pipeline requires pre-rasterization shader state, and pViewportState->pViewports is not dynamic, then pViewportState->pViewports must be a valid pointer to an array of pViewportState->viewportCount valid VkViewport structures

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04131
  If the pipeline requires pre-rasterization shader state, and pViewportState->pScissors is not dynamic, then pViewportState->pScissors must be a valid pointer to an array of pViewportState->scissorCount VkRect2D structures

• VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00749
  If the pipeline requires pre-rasterization shader state, and the wideLines feature is not enabled, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_LINE_WIDTH, the lineWidth member of pRasterizationState must be 1.0

• VUID-VkGraphicsPipelineCreateInfo-rasterizerDiscardEnable-09024
  If the pipeline requires pre-rasterization shader state, and the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state is enabled or the rasterizerDiscardEnable member of pRasterizationState is VK_FALSE, and related dynamic state is not set, pViewportState must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pViewportState-09025
  If pViewportState is not NULL it must be a valid pointer to a valid VkPipelineViewportStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09026
  If the pipeline requires fragment output interface state, and the VK_EXT_extended_dynamic_state3 extension is not enabled or any of the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT, VK_DYNAMIC_STATE_SAMPLE_MASK_EXT, or VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT dynamic states is not set, or alphaToOne is enabled on the device and VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT is not set,
pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-pMultisampleState-09027**
  If pMultisampleState is not NULL it must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-alphaToCoverageEnable-08891**
  If the pipeline is being created with fragment shader state, the VkPipelineMultisampleStateCreateInfo::alphaToCoverageEnable is not ignored and is VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09028**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment shader state, and subpass uses a depth/stencil attachment, and related dynamic state is not set, pDepthStencilState must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-pDepthStencilState-09029**
  If pDepthStencilState is not NULL it must be a valid pointer to a valid VkPipelineDepthStencilStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-renderPass-09030**
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with fragment output interface state, and subpass uses color attachments, and related dynamic state is not set, pColorBlendState must be a valid pointer to a valid VkPipelineColorBlendStateCreateInfo structure

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-00754**
  If the pipeline requires pre-rasterization shader state, the depthBiasClamp feature is not enabled, no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BIAS, and the depthBiasEnable member of pRasterizationState is VK_TRUE, the depthBiasClamp member of pRasterizationState must be 0.0

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-02510**
  If the pipeline requires fragment shader state, the VK_EXT_depth_range_unrestricted extension is not enabled and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DEPTH_BOUNDS, and the depthBoundsTestEnable member of pDepthStencilState is VK_TRUE, the minDepthBounds and maxDepthBounds members of pDepthStencilState must be between 0.0 and 1.0, inclusive

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07610**
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07611**
If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07612
  If the pipeline requires fragment shader state or fragment output interface state, and rasterizationSamples and sampleLocationsInfo are not dynamic, and VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable included in the pNext chain of pMultisampleState is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT is used, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples

- VUID-VkGraphicsPipelineCreateInfo-sampleLocationsEnable-01524
  If the pipeline requires fragment shader state, and the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT structure included in the pNext chain of pMultisampleState is VK_TRUE, the fragment shader code must not statically use the extended instruction InterpolateAtSample

- VUID-VkGraphicsPipelineCreateInfo-subpass-00758
  If the pipeline requires fragment output interface state, rasterizationSamples is not dynamic, and subpass does not use any color and/or depth/stencil attachments, then the rasterizationSamples member of pMultisampleState must follow the rules for a zero-attachment subpass

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06046
  If renderPass is not VK_NULL_HANDLE, subpass must be a valid subpass within renderPass

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06047
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with prerasterization shader state, subpass viewMask is not 0, and multiviewTessellationShader is not enabled, then pStages must not include tessellation shaders

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06048
  If renderPass is not VK_NULL_HANDLE, the pipeline is being created with prerasterization shader state, subpass viewMask is not 0, and multiviewGeometryShader is not enabled, then pStages must not include a geometry shader

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06050
  If renderPass is not VK_NULL_HANDLE and the pipeline is being created with prerasterization shader state, and subpass viewMask is not 0, then all of the shaders in the pipeline must not include variables decorated with the Layer built-in decoration in their interfaces

- VUID-VkGraphicsPipelineCreateInfo-flags-00764
  flags must not contain the VK_PIPELINE_CREATE_DISPATCH_BASE flag

- VUID-VkGraphicsPipelineCreateInfo-pStages-01565
If the pipeline requires fragment shader state and an input attachment was referenced by an aspectMask at renderPass creation time, the fragment shader must only read from the aspects that were specified for that input attachment.

- VUID-VkGraphicsPipelineCreateInfo-layout-01688
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04058
  If the pipeline requires pre-rasterization shader state, and no element of the pDynamicStates member of pDynamicState is VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT, and if pNext chain includes a VkPipelineDiscardRectangleStateCreateInfoEXT structure, and if its discardRectangleCount member is not 0, then its pDiscardRectangles member must be a valid pointer to an array of discardRectangleCount VkRect2D structures

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07855
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-07856
  If VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT is included in the pDynamicStates array then the implementation must support at least specVersion 2 of the VK_EXT_discard_rectangles extension

- VUID-VkGraphicsPipelineCreateInfo-pStages-02097
  If the pipeline requires vertex input state, and pVertexInputState is not dynamic, then pVertexInputState must be a valid pointer to a valid VkPipelineVertexInputStateCreateInfo structure

- VUID-VkGraphicsPipelineCreateInfo-Input-07904
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, then all variables with the Input storage class decorated with Location in the Vertex Execution Model OpEntryPoint must contain a location in VkVertexInputAttributeDescription::location

- VUID-VkGraphicsPipelineCreateInfo-Input-08733
  If the pipeline requires vertex input state and pVertexInputState is not dynamic, then the numeric type associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be the same as VkVertexInputAttributeDescription::format

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08929
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then the scalar width associated with all Input variables of the corresponding Location in the Vertex Execution Model OpEntryPoint must be 64-bit

- VUID-VkGraphicsPipelineCreateInfo-pVertexInputState-08930
  If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and the scalar width associated with a Location decorated Input variable in the Vertex Execution Model OpEntryPoint is 64-bit, then the corresponding VkVertexInputAttributeDescription::format must have a 64-bit component
If the pipeline is being created with vertex input state and pVertexInputState is not dynamic, and VkVertexInputAttributeDescription::format has a 64-bit component, then all Input variables at the corresponding Location in the Vertex Execution Model OpEntryPoint must not use components that are not present in the format.

If the pipeline requires vertex input state, and related dynamic state is not set, pInputAssemblyState must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

If pInputAssemblyState is not NULL it must be a valid pointer to a valid VkPipelineInputAssemblyStateCreateInfo structure.

If the pipeline requires pre-rasterization shader state, the Xfb execution mode can be specified by no more than one shader stage in pStages.

If the pipeline requires pre-rasterization shader state, and any shader stage in pStages specifies Xfb execution mode it must be the last pre-rasterization shader stage.

If the pipeline requires pre-rasterization shader state, and a VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream value other than zero is specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance must be decorated with identical Stream values that match the rasterizationStream.

If the pipeline requires pre-rasterization shader state, and a VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream is zero, or not specified, all variables in the output interface of the entry point being compiled decorated with Position, PointSize, ClipDistance, or CullDistance must be decorated with a Stream value of zero, or must not specify the Stream decoration.

If the pipeline requires pre-rasterization shader state, and the last pre-rasterization shader stage is a geometry shader, and that geometry shader uses the GeometryStreams capability, then VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams feature must be enabled.

If the pipeline requires pre-rasterization shader state and at least one of fragment output interface state or fragment shader state, and pMultisampleState is not NULL, the lineRasterizationMode member of a VkPipelineRasterizationLineStateCreateInfoKHR structure included in the pNext chain of pRasterizationState is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR or VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the alphaToCoverageEnable, alphaToOneEnable, and sampleShadingEnable members of pMultisampleState must all be VK_FALSE.
If the pipeline requires pre-rasterization shader state, the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfoKHR` must be in the range `[1, 256]

- **VUID-VkGraphicsPipelineCreateInfo-stippledLineEnable-02767**
  If the pipeline requires pre-rasterization shader state, the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, and no element of the `pDynamicStates` member of `pDynamicState` is `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT`, then the `lineStippleFactor` member of `VkPipelineRasterizationLineStateCreateInfoKHR` must be in the range `[1, 256]

- **VUID-VkGraphicsPipelineCreateInfo-flags-03372**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03373**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03374**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03375**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03376**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03377**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-flags-03577**
  flags must not include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03378**
  If the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` is less than Version 1.3 there must be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CULL_MODE`, `VK_DYNAMIC_STATE_FRONT_FACE`, `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`, `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`, `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, or `VK_DYNAMIC_STATE_STENCIL_OP`

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03379**
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03380**
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` is included in the `pDynamicStates` array then `scissorCount` must be zero

- **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04132**
  If the pipeline requires pre-rasterization shader state, and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` is included in the `pDynamicStates` array then `viewportCount` must be zero
• **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04133**  
  If the pipeline requires pre-rasterization shader state, and **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** is included in the **pDynamicStates** array then **VK_DYNAMIC_STATE_SCISSOR** must not be present.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04868**  
  If the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** is less than Version 1.3 there must be no element of the **pDynamicStates** member of **pDynamicState** set to **VK_DYNAMIC_STATEDEPTH_BIAS_ENABLE**, **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE**, or **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE**.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04869**  
  If the extendedDynamicState2LogicOp feature is not enabled, there must be no element of the **pDynamicStates** member of **pDynamicState** set to **VK_DYNAMIC_STATE_LOGIC_OP_EXT**.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04870**  
  If the extendedDynamicState2PatchControlPoints feature is not enabled, there must be no element of the **pDynamicStates** member of **pDynamicState** set to **VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT**.

• **VUID-VkGraphicsPipelineCreateInfo-pipelineCreationCacheControl-02878**  
  If the pipelineCreationCacheControl feature is not enabled, **flags must** not include **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT** or **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT**.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04494**  
  If the pipeline requires pre-rasterization shader state or fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in **pDynamicState->pDynamicStates**, **VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width** must be greater than or equal to 1.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04495**  
  If the pipeline requires pre-rasterization shader state or fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in **pDynamicState->pDynamicStates**, **VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height** must be greater than or equal to 1.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04496**  
  If the pipeline requires pre-rasterization shader state or fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in **pDynamicState->pDynamicStates**, **VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width** must be a power-of-two value.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04497**  
  If the pipeline requires pre-rasterization shader state or fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in **pDynamicState->pDynamicStates**, **VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height** must be a power-of-two value.

• **VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04498**  
  If the pipeline requires pre-rasterization shader state or fragment shader state and **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** is not included in **pDynamicState-> pDynamicStates**.
pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width must be less than or equal to 4

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04499
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must be less than or equal to 4

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04500
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the pipelineFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.width and VkPipelineFragmentShadingRateStateCreateInfoKHR::fragmentSize.height must both be equal to 1

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06567
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-06568
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be a valid VkFragmentShadingRateCombinerOpKHR value

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04501
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the primitiveFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[0] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-04502
  If the pipeline requires pre-rasterization shader state or fragment shader state and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, and the attachmentFragmentShadingRate feature is not enabled, VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps[1] must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04503
  If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT is not included in pDynamicState->pDynamicStates, and VkPipelineViewportStateCreateInfo::viewportCount is greater than 1, entry points specified in pStages must not write to the PrimitiveShadingRateKHR built-in

- VUID-VkGraphicsPipelineCreateInfo-primitiveFragmentShadingRateWithMultipleViewports-04504
If the pipeline requires pre-rasterization shader state and the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, and entry points specified in pStages write to the ViewportIndex built-in, they must not also write to the PrimitiveShadingRateKHR built-in

- VUID-VkGraphicsPipelineCreateInfo-fragmentShadingRateNonTrivialCombinerOps-04506
  If the pipeline requires pre-rasterization shader state or fragment shader state, the fragmentShadingRateNonTrivialCombinerOps limit is not supported, and VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR is not included in pDynamicState->pDynamicStates, elements of VkPipelineFragmentShadingRateStateCreateInfoKHR::combinerOps must be VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-03578
  All elements of the pDynamicStates member of pDynamicState must not be VK_DYNAMIC_STATERAY_TRACING_PIPELINE_STACK_SIZE_KHR

- VUID-VkGraphicsPipelineCreateInfo-pDynamicStates-04800
  If the colorWriteEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATECOLOR_WRITE_ENABLE_EXT

- VUID-VkGraphicsPipelineCreateInfo-dynamicRendering-06576
  If the dynamicRendering feature is not enabled and the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, renderPass must not be VK_NULL_HANDLE

- VUID-VkGraphicsPipelineCreateInfo-multiview-06577
  If the multiview feature is not enabled, the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, VkPipelineRenderingCreateInfo::viewMask must be 0

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06578
  If the pipeline requires pre-rasterization shader state, fragment shader state, or fragment output interface state, and renderPass is VK_NULL_HANDLE, the index of the most significant bit in VkPipelineRenderingCreateInfo::viewMask must be less than maxMultiviewViewCount

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06579
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, and VkPipelineRenderingCreateInfo::colorAttachmentCount is not 0, VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid pointer to an array of colorAttachmentCount valid VkFormat values

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06580
  If the pipeline requires fragment output interface state, and renderPass is VK_NULL_HANDLE, each element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats must be a valid VkFormat value

- VUID-VkGraphicsPipelineCreateInfo-renderPass-06582
  If the pipeline requires fragment output interface state, renderPass is VK_NULL_HANDLE, and any element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats is not VK_FORMAT_UNDEFINED, that format must be a format with potential format features that include VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT
If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::depthAttachmentFormat` must be a valid `VkFormat` value.

If the pipeline requires fragment output interface state, and `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` must be a valid `VkFormat` value.

If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format with potential format features that include `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a depth component.

If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, it must be a format that includes a stencil component.

If the pipeline requires fragment output interface state, `renderPass` is `VK_NULL_HANDLE`, `VkPipelineRenderingCreateInfo::depthAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, and `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` is not `VK_FORMAT_UNDEFINED`, `depthAttachmentFormat` must equal `stencilAttachmentFormat`.

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment shader state and fragment output interface state, and either of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` or `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` are not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled or any of the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`, `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`, `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`, `VK_DYNAMIC_STATE_STENCIL_OPS_ENABLE` dynamic states are not set, `pDepthStencilState` must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.

If `pDepthStencilState` is not `NULL` it must be a valid pointer to a valid `VkPipelineDepthStencilStateCreateInfo` structure.
If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with fragment output interface state, and any element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` is not `VK_FORMAT_UNDEFINED`, and the `VK_EXT_extended_dynamic_state3` extension is not enabled, or any of the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`, `VK_DYNAMIC_STATE_LOGIC_OP_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, or `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic states are not set, `pColorBlendState` must be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure.

If `pColorBlendState` is not `NULL` it must be a valid pointer to a valid `VkPipelineColorBlendStateCreateInfo` structure.

If `renderPass` is `VK_NULL_HANDLE`, `pColorBlendState` is not dynamic, and the pipeline is being created with fragment output interface state, `pColorBlendState->attachmentCount` must be equal to `VkPipelineRenderingCreateInfo::colorAttachmentCount`.

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not 0, and the `multiviewTessellationShader` feature is not enabled, then `pStages` must not include tessellation shaders.

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, `VkPipelineRenderingCreateInfo::viewMask` is not 0, and the `multiviewGeometryShader` feature is not enabled, then `pStages` must not include a geometry shader.

If `renderPass` is `VK_NULL_HANDLE`, the pipeline is being created with pre-rasterization shader state, and `VkPipelineRenderingCreateInfo::viewMask` is not 0, all of the shaders in the pipeline must not include variables decorated with the `Layer` built-in decoration in their interfaces.

If the `dynamicRenderingLocalRead` feature is not enabled, the pipeline requires fragment shader state, and `renderPass` is `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include the `InputAttachment` capability.

If the pipeline requires fragment shader state and `renderPass` is not `VK_NULL_HANDLE`, fragment shaders in `pStages` must not include any of the `TileImageColorReadAccessEXT`, `TileImageDepthReadAccessEXT`, or `TileImageStencilReadAccessEXT` capabilities.

If the pipeline requires fragment output interface state and `renderPass` is `VK_NULL_HANDLE`, for each color attachment format defined by the `pColorAttachmentFormats` member of `VkPipelineRenderingCreateInfo`, if its potential format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the
blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-VkGraphicsPipelineCreateInfo-pipelineStageCreationFeedbackCount-06594
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

• VUID-VkGraphicsPipelineCreateInfo-pStages-06600
  If the pipeline requires pre-rasterization shader state or fragment shader state, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

• VUID-VkGraphicsPipelineCreateInfo-pStageCount-09587
  If the pipeline does not require pre-rasterization shader state or fragment shader state, stageCount must be zero

• VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-06601
  If the pipeline requires pre-rasterization shader state, and related dynamic state is not set, pRasterizationState must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09039
  If related dynamic state is not set, then pMultisampleState must be a valid pointer to a valid VkPipelineMultisampleStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pRasterizationState-09040
  If pRasterizationState is not NULL it must be a valid pointer to a valid VkPipelineRasterizationStateCreateInfo structure

• VUID-VkGraphicsPipelineCreateInfo-pStageCount-06894
  If the pipeline requires fragment shader state or pre-rasterization shader state, elements of pStages must not have stage set to VK_SHADER_STAGE_FRAGMENT_BIT

• VUID-VkGraphicsPipelineCreateInfo-pStageCount-06895
  If the pipeline requires fragment shader state but not pre-rasterization shader state, elements of pStages must not have stage set to a shader stage which participates in pre-rasterization

• VUID-VkGraphicsPipelineCreateInfo-pStageCount-06896
  If the pipeline requires pre-rasterization shader state, all elements of pStages must have a stage set to a shader stage which participates in fragment shader state or pre-
rasterization shader state

- **VUID-VkGraphicsPipelineCreateInfo-stage-06897**
  If the pipeline requires fragment shader state and/or pre-rasterization shader state, any value of stage must not be set in more than one element of pStages.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3TessellationDomainOrigin-07370**
  If the extendedDynamicState3TessellationDomainOrigin feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3DepthClampEnable-07371**
  If the extendedDynamicState3DepthClampEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3PolygonMode-07372**
  If the extendedDynamicState3PolygonMode feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_POLYGON_MODE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RasterizationSamples-07373**
  If the extendedDynamicState3RasterizationSamples feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3SampleMask-07374**
  If the extendedDynamicState3SampleMask feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SAMPLE_MASK_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToCoverageEnable-07375**
  If the extendedDynamicState3AlphaToCoverageEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3AlphaToOneEnable-07376**
  If the extendedDynamicState3AlphaToOneEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3LogicOpEnable-07377**
  If the extendedDynamicState3LogicOpEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEnable-07378**
  If the extendedDynamicState3ColorBlendEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT.

- **VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ColorBlendEquation-07379**
  If the extendedDynamicState3ColorBlendEquation feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT.
If the `extendedDynamicState3ColorWriteMask` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`.

If the `extendedDynamicState3RasterizationStream` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT`.

If the `extendedDynamicState3ConservativeRasterizationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT`.

If the `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT`.

If the `extendedDynamicState3DepthClipEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT`.

If the `extendedDynamicState3SampleLocationsEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT`.

If the `extendedDynamicState3ColorBlendAdvanced` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`.

If the `extendedDynamicState3ProvokingVertexMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT`.

If the `extendedDynamicState3LineRasterizationMode` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT`.

If the `extendedDynamicState3LineStippleEnable` feature is not enabled, there **must** be no element of the `pDynamicStates` member of `pDynamicState` set to...
If the `extendedDynamicState3DepthClipNegativeOneToOne` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT`.

If the `extendedDynamicState3ViewportWScalingEnable` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV`.

If the `extendedDynamicState3ViewportSwizzle` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV`.

If the `extendedDynamicState3CoverageToColorEnable` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV`.

If the `extendedDynamicState3CoverageToColorLocation` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV`.

If the `extendedDynamicState3CoverageModulationMode` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV`.

If the `extendedDynamicState3CoverageModulationTableEnable` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV`.

If the `extendedDynamicState3CoverageModulationTable` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV`.

If the `extendedDynamicState3CoverageReductionMode` feature is not enabled, there must not be any element of the `pDynamicStates` member of `pDynamicState` set to `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV`.
VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3RepresentativeFragmentTestEnable-07399
  If the extendedDynamicState3RepresentativeFragmentTestEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV.

• VUID-VkGraphicsPipelineCreateInfo-extendedDynamicState3ShadingRateImageEnable-07400
  If the extendedDynamicState3ShadingRateImageEnable feature is not enabled, there must be no element of the pDynamicStates member of pDynamicState set to VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV.

• VUID-VkGraphicsPipelineCreateInfo-flags-07401
  flags must not include VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT.

• VUID-VkGraphicsPipelineCreateInfo-pStages-08711
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable member of VkPipelineDepthStencilStateCreateInfo must be VK_FALSE.

• VUID-VkGraphicsPipelineCreateInfo-pStages-08712
  If pStages includes a fragment shader stage, VK_DYNAMIC_STATE_STENCIL_WRITE_MASK is not set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the value of VkStencilOpState::writeMask for both front and back in VkPipelineDepthStencilStateCreateInfo must be 0.

• VUID-VkGraphicsPipelineCreateInfo-renderPass-08744
  If renderPass is VK_NULL_HANDLE, the pipeline requires fragment output state or fragment shader state, the pipeline enables sample shading, rasterizationSamples is not dynamic, and the pNext chain includes a VkPipelineRenderingCreateInfo structure, rasterizationSamples must be a valid VkSampleCountFlagBits value that is set in imageCreateSampleCounts (as defined in Image Creation Limits) for every element of depthAttachmentFormat, stencilAttachmentFormat and the pColorAttachmentFormats array which is not VK_FORMAT_UNDEFINED.

• VUID-VkGraphicsPipelineCreateInfo-None-08893
  The pipeline must be created with pre-rasterization shader state.

• VUID-VkGraphicsPipelineCreateInfo-pStages-08894
  If pStages includes a vertex shader stage, the pipeline must be created with vertex input state.

• VUID-VkGraphicsPipelineCreateInfo-pDynamicState-08896
  If pDynamicState->pDynamicStates includes VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE, or if it does not and pRasterizationState->rasterizerDiscardEnable is VK_FALSE, the pipeline must be created with fragment shader state and fragment output interface state.

• VUID-VkGraphicsPipelineCreateInfo-None-09043
  If pDynamicState->pDynamicStates does not include VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the
colorWriteMask member of the corresponding element of pColorBlendState->pAttachments must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09531
  If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfoKHR is included, VkRenderingInputAttachmentIndexInfoKHR::colorAttachmentCount must be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09652
  If the pipeline is being created with fragment shader state and fragment output state, the value of renderPass is VK_NULL_HANDLE, and VkRenderingInputAttachmentIndexInfoKHR is not included, the fragment shader must not contain any input attachments with a InputAttachmentIndex greater than or equal to VkPipelineRenderingCreateInfo::colorAttachmentCount.

- VUID-VkGraphicsPipelineCreateInfo-renderPass-09532
  If the pipeline is being created with fragment output state, and the value of renderPass is VK_NULL_HANDLE, VkRenderingAttachmentLocationInfoKHR::colorAttachmentCount must be equal to VkPipelineRenderingCreateInfo::colorAttachmentCount.

Valid Usage (Implicit)

- VUID-VkGraphicsPipelineCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_GRAPHICS_PIPELINE_CREATE_INFO.

- VUID-VkGraphicsPipelineCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkAttachmentSampleCountInfoAMD, VkMultiviewPerViewAttributesInfoNVX, VkPipelineCreateFlags2CreateInfoKHR, VkPipelineCreationFeedbackCreateInfo, VkPipelineDiscardRectangleStateCreateInfoEXT, VkPipelineFragmentShadingRateStateCreateInfoKHR, VkPipelineLibraryCreateInfoKHR, VkPipelineRenderingCreateInfo, VkRenderingAttachmentLocationInfoKHR, or VkRenderingInputAttachmentIndexInfoKHR.

- VUID-VkGraphicsPipelineCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkGraphicsPipelineCreateInfo-pDynamicState-parameter
  If pDynamicState is not NULL, pDynamicState must be a valid pointer to a valid VkPipelineDynamicStateCreateInfo structure.

- VUID-VkGraphicsPipelineCreateInfo-commonparent
  Each of basePipelineHandle, layout, and renderPass that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

The VkPipelineRenderingCreateInfo structure is defined as:
typedef struct VkPipelineRenderingCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewMask;
    uint32_t colorAttachmentCount;
    const VkFormat* pColorAttachmentFormats;
    VkFormat depthAttachmentFormat;
    VkFormat stencilAttachmentFormat;
} VkPipelineRenderingCreateInfo;

or the equivalent

typedef VkPipelineRenderingCreateInfo VkPipelineRenderingCreateInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **viewMask** is the viewMask used for rendering.
- **colorAttachmentCount** is the number of entries in pColorAttachmentFormats
- **pColorAttachmentFormats** is a pointer to an array of VkFormat values defining the format of color attachments used in this pipeline.
- **depthAttachmentFormat** is a VkFormat value defining the format of the depth attachment used in this pipeline.
- **stencilAttachmentFormat** is a VkFormat value defining the format of the stencil attachment used in this pipeline.

When a pipeline is created without a VkRenderPass, if the pNext chain of VkGraphicsPipelineCreateInfo includes this structure, it specifies the view mask and format of attachments used for rendering. If this structure is not specified, and the pipeline does not include a VkRenderPass, viewMask and colorAttachmentCount are 0, and depthAttachmentFormat and stencilAttachmentFormat are VK_FORMAT_UNDEFINED. If a graphics pipeline is created with a valid VkRenderPass, parameters of this structure are ignored.

If depthAttachmentFormat, stencilAttachmentFormat, or any element of pColorAttachmentFormats is VK_FORMAT_UNDEFINED, it indicates that the corresponding attachment is unused within the render pass. Valid formats indicate that an attachment can be used - but it is still valid to set the attachment to NULL when beginning rendering.

**Valid Usage**

- VUID-VkPipelineRenderingCreateInfo-colorAttachmentCount-09533
  colorAttachmentCount must be less than or equal to maxColorAttachments
The `VkPipelineCreateFlags2CreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkPipelineCreateFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags2KHR flags;
} VkPipelineCreateFlags2CreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineCreateFlagBits2KHR` specifying how a pipeline will be generated.

If this structure is included in the `pNext` chain of a pipeline creation structure, `flags` is used instead of the corresponding `flags` value passed in that creation structure, allowing additional creation flags to be specified.

Bits which **can** be set in `VkPipelineCreateFlags2CreateInfoKHR::flags`, specifying how a pipeline is created, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkPipelineCreateFlagBits2KHR
typedef VkFlags64 VkPipelineCreateFlagBits2KHR;
static const VkPipelineCreateFlagBits2KHR VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR = 0x00000001ULL;

// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_executable_properties
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_PENCIL_BIT_KHR = 0x80000000ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_executable_properties
static const VkPipelineCreateFlagBits2KHR
VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_PENCIL_BIT_KHR = 0x00000001ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_pipeline_executable_properties
• **VK_PIPELINE_CREATE_2_DISABLE_OPTIMIZATION_BIT_KHR** specifies that the created pipeline will not be optimized. Using this flag may reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• **VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• **VK_PIPELINE_CREATE_2_VIEW_INDEX_FROM_DEVICE_INDEX_BIT_KHR** specifies that any shader input variables decorated as ViewIndex will be assigned values as if they were decorated as DeviceIndex.
• VK_PIPELINE_CREATE_2_DISPATCH_BASE_BIT_KHR specifies that a compute pipeline can be used with vkCmdDispatchBase with a non-zero base workgroup.

• VK_PIPELINE_CREATE_2_CAPTURE_STATISTICS_BIT_KHR specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableStatisticsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time.

• VK_PIPELINE_CREATE_2_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which can later be retrieved by calling vkGetPipelineExecutableInternalRepresentationsKHR. Enabling this flag must not affect the final compiled pipeline but may disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries can be retrieved from the linked pipeline. Applications should retrieve IR from each library, and any linked pipelines, separately.

• VK_PIPELINE_CREATE_2_LIBRARY_BIT_KHR specifies that the pipeline cannot be used directly, and instead defines a pipeline library that can be combined with other pipelines using the VkPipelineLibraryCreateInfoKHR structure. This is available in ray tracing pipelines.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively VK_SHADER_UNUSED_KHR, such as from a shader group consisting entirely of zeros.

• VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR specifies that triangle primitives will be skipped during traversal using pipeline trace ray instructions.

• VK_PIPELINE_CREATE_2_RAY_TRACING_SKIP_AABBs_BIT_KHR specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.

• VK_PIPELINE_CREATE_2_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

• VK_PIPELINE_CREATE_2_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT_KHR specifies that pipeline creation will fail if a compile is required for creation of a valid VkPipeline object;
VK_PIPELINE_COMPILE_REQUIRED will be returned by pipeline creation, and the VkPipeline will be set to VK_NULL_HANDLE.

- When creating multiple pipelines, VK_PIPELINE_CREATE_2_EARLY_RETURN_ON_FAILURE_BIT_KHR specifies that control will be returned to the application if any individual pipeline returns a result which is not VK_SUCCESS rather than continuing to create additional pipelines.
- VK_PIPELINE_CREATE_2_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that the pipeline will be used with a fragment shading rate attachment.
- VK_PIPELINE_CREATE_2_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline may be used with an attachment feedback loop including color attachments.
- VK_PIPELINE_CREATE_2_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments.
- VK_PIPELINE_CREATE_2_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.

It is valid to set both VK_PIPELINE_CREATE_2_ALLOW_DERIVATIVES_BIT_KHR and VK_PIPELINE_CREATE_2_DERIVATIVE_BIT_KHR. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_KHR_maintenance5
typedef VkFlags64 VkPipelineCreateFlags2KHR;
```

VkPipelineCreateFlags2KHR is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits2KHR.

Bits which can be set in

- VkGraphicsPipelineCreateInfo::flags
- VkComputePipelineCreateInfo::flags
- VkRayTracingPipelineCreateInfoKHR::flags

specify how a pipeline is created, and are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCreateFlagBits {VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT = 0x00000001,
VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT = 0x00000002,

// Provided by VK_KHR_device_group
VK_PIPELINE_CREATE_DISPATCH_BASE_KHR = VK_PIPELINE_CREATE_DISPATCH_BASE
} VkPipelineCreateFlagBits;
• **VK_PIPELINE_CREATE_DISABLE_OPTIMIZATION_BIT** specifies that the created pipeline will not be optimized. Using this flag **may** reduce the time taken to create the pipeline.

• **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** specifies that the pipeline to be created is allowed to be the parent of a pipeline that will be created in a subsequent pipeline creation call.

• **VK_PIPELINE_CREATE_DERIVATIVE_BIT** specifies that the pipeline to be created will be a child of a previously created parent pipeline.

• **VK_PIPELINE_CREATE_VIEW_INDEX_FROM_DEVICE_INDEX_BIT** specifies that any shader input variables decorated as `ViewIndex` will be assigned values as if they were decorated as `DeviceIndex`.

• **VK_PIPELINE_CREATE_DISPATCH_BASE** specifies that a compute pipeline **can** be used with `vkCmdDispatchBase` with a non-zero base workgroup.

• **VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR** specifies that the shader compiler should capture statistics for the pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableStatisticsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time.

• **VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR** specifies that the shader compiler should capture the internal representations of pipeline executables produced by the compile process which **can** later be retrieved by calling `vkGetPipelineExecutableInternalRepresentationsKHR`. Enabling this flag **must** not affect the final compiled pipeline but **may** disable pipeline caching or otherwise affect pipeline creation time. When capturing IR from pipelines created with pipeline libraries, there is no guarantee that IR from libraries **can** be retrieved from the linked pipeline. Applications **should** retrieve IR from each library, and any linked pipelines, separately.

• **VK_PIPELINE_CREATE_LIBRARY_BIT_KHR** specifies that the pipeline **cannot** be used directly, and instead defines a pipeline library that **can** be combined with other pipelines using the `VkPipelineLibraryCreateInfoKHR` structure. This is available in ray tracing pipelines.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR** specifies that an any-hit shader will always be present when an any-hit shader would be executed. A NULL any-hit shader is an any-hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR** specifies that a closest hit shader will always be present when a closest hit shader would be executed. A NULL closest hit shader is a closest hit shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR** specifies that a miss shader will always be present when a miss shader would be executed. A NULL miss shader is a miss shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR** specifies that an intersection shader will always be present when an intersection shader would be executed. A NULL intersection shader is an intersection shader which is effectively `VK_SHADER_UNUSED_KHR`, such as from a shader group consisting entirely of zeros.

• **VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR** specifies that triangle primitives will be
skipped during traversal using pipeline trace ray instructions.

- **VK_PIPELINE_CREATERAY_TRACING_SKIP_AABB_BIT_KHR** specifies that AABB primitives will be skipped during traversal using pipeline trace ray instructions.

- **VK_PIPELINE_CREATERAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR** specifies that the shader group handles can be saved and reused on a subsequent run (e.g. for trace capture and replay).

- **VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILENREQUIRDBIT_KHR** specifies that pipeline creation will fail if a compile is required for creation of a valid VkPipeline object; **VK_PIPELINE_COMPILENREQUIRED** will be returned by pipeline creation, and the VkPipeline will be set to **VK_NULL_HANDLE**.

- When creating multiple pipelines, **VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT** specifies that control will be returned to the application if any individual pipeline returns a result which is not **VK_SUCCESS** rather than continuing to create additional pipelines.

- **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the pipeline will be used with a fragment shading rate attachment and dynamic rendering.

- **VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including color attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in pDynamicStates.

- **VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the pipeline may be used with an attachment feedback loop including depth-stencil attachments. It is ignored if **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** is set in pDynamicStates.

- **VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT** specifies that the ray tracing pipeline can be used with acceleration structures which reference an opacity micromap array.

It is valid to set both **VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT** and **VK_PIPELINE_CREATE_DERIVATIVE_BIT**. This allows a pipeline to be both a parent and possibly a child in a pipeline hierarchy. See Pipeline Derivatives for more information.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCreateFlags;
```

**VkPipelineCreateFlags** is a bitmask type for setting a mask of zero or more VkPipelineCreateFlagBits.

The **VkPipelineDynamicStateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDynamicStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDynamicStateCreateFlags flags;
    uint32_t dynamicStateCount;
    const VkDynamicState* pDynamicStates;
} VkPipelineDynamicStateCreateInfo;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **dynamicStateCount** is the number of elements in the **pDynamicStates** array.
• **pDynamicStates** is a pointer to an array of `VkDynamicState` values specifying which pieces of pipeline state will use the values from dynamic state commands rather than from pipeline state creation information.

### Valid Usage

- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-01442
  Each element of **pDynamicStates** must be unique

### Valid Usage (Implicit)

- VUID-VkPipelineDynamicStateCreateInfo-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_DYNAMIC_STATE_CREATE_INFO`
- VUID-VkPipelineDynamicStateCreateInfo-pNext-pNext
  **pNext** must be **NULL**
- VUID-VkPipelineDynamicStateCreateInfo-flags-zerobitmask
  **flags** must be **0**
- VUID-VkPipelineDynamicStateCreateInfo-pDynamicStates-parameter
  If **dynamicStateCount** is not **0**, **pDynamicStates** must be a valid pointer to an array of **dynamicStateCount** valid `VkDynamicState` values

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDynamicStateCreateFlags;
```

`VkPipelineDynamicStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The source of different pieces of dynamic state is specified by the `VkPipelineDynamicStateCreateInfo::pDynamicStates` property of the currently active pipeline, each of whose elements must be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDynamicState {
    VK_DYNAMIC_STATE_VIEWPORT = 0,
    VK_DYNAMIC_STATE_SCISSOR = 1,
    VK_DYNAMIC_STATE_LINE_WIDTH = 2,
    VK_DYNAMIC_STATE_DEPTH_BIAS = 3,
    VK_DYNAMIC_STATE_BLEND_CONSTANTS = 4,
};
```
VK_DYNAMIC_STATE_DEPTH_BOUNDS = 5,
VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK = 6,
VK_DYNAMIC_STATE_STENCIL_WRITE_MASK = 7,
VK_DYNAMIC_STATE_STENCIL_REFERENCE = 8,
// Provided by VK_VERSION_1_3

}

VkDynamicState
• VK_DYNAMIC_STATE_VIEWPORT specifies that the pViewports state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetViewport before any drawing commands. The number of viewports used by a pipeline is still specified by the viewportCount member of VkPipelineViewportStateCreateInfo.

• VK_DYNAMIC_STATE_SCISSOR specifies that the pScissors state in VkPipelineViewportStateCreateInfo will be ignored and must be set dynamically with vkCmdSetScissor before any drawing commands. The number of scissor rectangles used by a pipeline is still specified by the scissorCount member of VkPipelineViewportStateCreateInfo.

• VK_DYNAMIC_STATE_LINE_WIDTH specifies that the lineWidth state in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetLineWidth before any drawing commands that generate line primitives for the rasterizer.

• VK_DYNAMIC_STATE_DEPTH_BIAS specifies that any instance of VkDepthBiasRepresentationInfoEXT included in the pNext chain of VkPipelineRasterizationStateCreateInfo as well as the depthBiasConstantFactor, depthBiasClamp and depthBiasSlopeFactor states in VkPipelineRasterizationStateCreateInfo will be ignored and must be set dynamically with vkCmdSetDepthBias or vkCmdSetDepthBias2EXT before any draws are performed with depth bias enabled.

• VK_DYNAMIC_STATE_BLEND_CONSTANTS specifies that the blendConstants state in VkPipelineColorBlendStateCreateInfo will be ignored and must be set dynamically with vkCmdSetBlendConstants before any draws are performed with a pipeline state with VkPipelineColorBlendAttachmentState member blendEnable set to VK_TRUE and any of the blend functions using a constant blend color.

• VK_DYNAMIC_STATE_DEPTH_BOUNDS specifies that the minDepthBounds and maxDepthBounds states of VkPipelineDepthStencilStateCreateInfo will be ignored and must be set dynamically with vkCmdSetDepthBounds before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member depthBoundsTestEnable set to VK_TRUE.

• VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK specifies that the compareMask state in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and must be set dynamically with vkCmdSetStencilCompareMask before any draws are performed with a
pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to VK_TRUE

- **VK_DYNAMIC_STATE_STENCIL_WRITE_MASK** specifies that the `writeMask` state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and must be set dynamically with `vkCmdSetStencilWriteMask` for any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to VK_TRUE.

- **VK_DYNAMIC_STATE_STENCIL_REFERENCE** specifies that the `reference` state in `VkPipelineDepthStencilStateCreateInfo` for both front and back will be ignored and must be set dynamically with `vkCmdSetStencilReference` for any draws are performed with a pipeline state with `VkPipelineDepthStencilStateCreateInfo` member `stencilTestEnable` set to VK_TRUE.

- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** specifies that the `pDiscardRectangles` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and must be set dynamically with `vkCmdSetDiscardRectangleEXT` before any draw or clear commands.

- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT** specifies that the presence of the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure in the `VkGraphicsPipelineCreateInfo` chain with a `discardRectangleCount` greater than zero does not implicitly enable discard rectangles and they must be enabled dynamically with `vkCmdSetDiscardRectangleEnableEXT` before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

- **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT** specifies that the `discardRectangleMode` state in `VkPipelineDiscardRectangleStateCreateInfoEXT` will be ignored and must be set dynamically with `vkCmdSetDiscardRectangleModeEXT` before any draw commands. This is available on implementations that support at least specVersion 2 of the VK_EXT_discard_rectangles extension.

- **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** specifies that the `sampleLocationsInfo` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and must be set dynamically with `vkCmdSetSampleLocationsEXT` before any draw or clear commands. Enabling custom sample locations is still indicated by the `sampleLocationsEnable` member of `VkPipelineSampleLocationsStateCreateInfoEXT`.

- **VK_DYNAMIC_STATE_LINE_STIPPLE_EXT** specifies that the `lineStippleFactor` and `lineStipplePattern` state in `VkPipelineRasterizationLineStateCreateInfoKHR` will be ignored and must be set dynamically with `vkCmdSetLineStippleKHR` before any draws are performed with a pipeline state with `VkPipelineRasterizationLineStateCreateInfoKHR` member `stippledLineEnable` set to VK_TRUE.

- **VK_DYNAMIC_STATE_CULL_MODE** specifies that the `cullMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetCullMode` before any drawing commands.

- **VK_DYNAMIC_STATE_FRONT_FACE** specifies that the `frontFace` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and must be set dynamically with `vkCmdSetFrontFace` before any drawing commands.

- **VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY** specifies that the `topology` state in `VkPipelineInputAssemblyStateCreateInfo` only specifies the `topology class`, and the specific topology order and adjacency must be set dynamically with `vkCmdSetPrimitiveTopology` before any drawing commands.
• **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** specifies that the viewportCount and pViewports state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetViewportWithCount before any draw call.

• **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** specifies that the scissorCount and pScissors state in VkPipelineViewportStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetScissorWithCount before any draw call.

• **VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE** specifies that the stride state in VkVertexInputBindingDescription will be ignored and **must** be set dynamically with vkCmdBindVertexBuffers2 before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** specifies that the depthTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthTestEnable before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE** specifies that the depthWriteEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthWriteEnable before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_COMPARE_OP** specifies that the depthCompareOp state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthCompareOp before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE** specifies that the depthBoundsTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBoundsTestEnable before any draw call.

• **VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE** specifies that the stencilTestEnable state in VkPipelineDepthStencilStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetStencilTestEnable before any draw call.

• **VK_DYNAMIC_STATE_STENCIL_OP** specifies that the failOp, passOp, depthFailOp, and compareOp states in VkPipelineDepthStencilStateCreateInfo for both front and back will be ignored and **must** be set dynamically with vkCmdSetStencilOp before any draws are performed with a pipeline state with VkPipelineDepthStencilStateCreateInfo member stencilTestEnable set to VK_TRUE

• **VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE** specifies that the rasterizerDiscardEnable state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetRasterizerDiscardEnable before any drawing commands.

• **VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE** specifies that the depthBiasEnable state in VkPipelineRasterizationStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetDepthBiasEnable before any drawing commands.

• **VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** specifies that the primitiveRestartEnable state in VkPipelineInputAssemblyStateCreateInfo will be ignored and **must** be set dynamically with vkCmdSetPrimitiveRestartEnable before any drawing commands.

• **VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR** specifies that state in VkPipelineFragmentShadingRateStateCreateInfoKHR will be ignored and **must** be set dynamically with vkCmdSetFragmentShadingRateKHR before any drawing commands.

• **VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR** specifies that the default stack size computation for the pipeline will be ignored and **must** be set dynamically with vkCmdSetRayTracingPipelineStackSizeKHR before any ray tracing calls are performed.
• **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** specifies that the `pColorWriteEnables` state in `VkPipelineWriteCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT** specifies that the `domainOrigin` state in `VkPipelineTessellationDomainOriginStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetTessellationDomainOriginStateCreateInfo` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT** specifies that the `depthClampEnable` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetDepthClampEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_POLYGON_MODE_EXT** specifies that the `polygonMode` state in `VkPipelineRasterizationStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetPolygonModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** specifies that the `rasterizationSamples` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationSamplesEXT` before any draw call.

• **VK_DYNAMIC_STATE_SAMPLE_MASK_EXT** specifies that the `pSampleMask` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetSampleMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** specifies that the `alphaToCoverageEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToCoverageEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT** specifies that the `alphaToOneEnable` state in `VkPipelineMultisampleStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetAlphaToOneEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT** specifies that the `logicOpEnable` state in `VkPipelineColorBlendStateCreateInfo` will be ignored and **must** be set dynamically with `vkCmdSetLogicOpEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** specifies that the `blendEnable` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT** specifies that the `srcColorBlendFactor`, `dstColorBlendFactor`, `colorBlendOp`, `srcAlphaBlendFactor`, `dstAlphaBlendFactor`, and `alphaBlendOp` states in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendEquationEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** specifies that the `colorWriteMask` state in `VkPipelineColorBlendAttachmentState` will be ignored and **must** be set dynamically with `vkCmdSetColorWriteMaskEXT` before any draw call.

• **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** specifies that the `rasterizationStream` state in `VkPipelineRasterizationStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetRasterizationStreamEXT` before any draw call.

• **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT** specifies that the `depthClipEnable` state in `VkPipelineRasterizationStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetDepthClipEnableEXT` before any draw call.
• **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT** specifies that the `sampleLocationsEnable` state in `VkPipelineSampleLocationsStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetSampleLocationsEnableEXT` before any draw call.

• **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** specifies that the `colorBlendOp` state in `VkPipelineColorBlendAttachmentState` and `srcPremultiplied`, `dstPremultiplied`, and `blendOverlap` states in `VkPipelineColorBlendAdvancedStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetColorBlendAdvancedEXT` before any draw call.

• **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT** specifies that the `providingVertexMode` state in `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` will be ignored and **must** be set dynamically with `vkCmdSetProvokingVertexModeEXT` before any draw call.

• **VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT** specifies that the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` and `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` flags will be ignored and **must** be set dynamically with `vkCmdSetAttachmentFeedbackLoopEnableEXT` before any draw call.

### 10.3.1. Valid Combinations of Stages for Graphics Pipelines

If tessellation shader stages are omitted, the tessellation shading and fixed-function stages of the pipeline are skipped.

If a geometry shader is omitted, the geometry shading stage is skipped.

If a fragment shader is omitted, fragment color outputs have undefined values, and the fragment depth value is determined by Fragment Operations state. This can be useful for depth-only rendering.

Presence of a shader stage in a pipeline is indicated by including a valid `VkPipelineShaderStageCreateInfo` with `module` and `pName` selecting an entry point from a shader module, where that entry point is valid for the stage specified by `stage`.

Presence of some of the fixed-function stages in the pipeline is implicitly derived from enabled shaders and provided state. For example, the fixed-function tessellator is always present when the pipeline has valid Tessellation Control and Tessellation Evaluation shaders.

**For example:**

- Depth/stencil-only rendering in a subpass with no color attachments
  - Active Pipeline Shader Stages
    - Vertex Shader
  - Required: Fixed-Function Pipeline Stages
- VkPipelineVertexInputStateCreateInfo
- VkPipelineInputAssemblyStateCreateInfo
- VkPipelineViewportStateCreateInfo
- VkPipelineRasterizationStateCreateInfo
- VkPipelineMultisampleStateCreateInfo
- VkPipelineDepthStencilStateCreateInfo

- Color-only rendering in a subpass with no depth/stencil attachment
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo

- Rendering pipeline with tessellation and geometry shaders
  - Active Pipeline Shader Stages
    - Vertex Shader
    - Tessellation Control Shader
    - Tessellation Evaluation Shader
    - Geometry Shader
    - Fragment Shader
  - Required: Fixed-Function Pipeline Stages
    - VkPipelineVertexInputStateCreateInfo
    - VkPipelineInputAssemblyStateCreateInfo
    - VkPipelineTessellationStateCreateInfo
    - VkPipelineViewportStateCreateInfo
    - VkPipelineRasterizationStateCreateInfo
    - VkPipelineMultisampleStateCreateInfo
    - VkPipelineColorBlendStateCreateInfo
10.4. Ray Tracing Pipelines

Ray tracing pipelines consist of multiple shader stages, fixed-function traversal stages, and a pipeline layout.

**VK_SHADER_UNUSED_KHR** is a special shader index used to indicate that a ray generation, miss, or callable shader member is not used.

```c
#define VK_SHADER_UNUSED_KHR (~0U)
```

To create ray tracing pipelines, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkCreateRayTracingPipelinesKHR(    
    VkDevice device,                                
    VkDeferredOperationKHR deferredOperation,     
    VkPipelineCache pipelineCache,                
    uint32_t createInfoCount,                     
    const VkRayTracingPipelineCreateInfoKHR* pCreateInfos, 
    const VkAllocationCallbacks* pAllocator,     
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the ray tracing pipelines.
- **deferredOperation** is **VK_NULL_HANDLE** or the handle of a valid **VkDeferredOperationKHR** request deferral object for this command.
- **pipelineCache** is either **VK_NULL_HANDLE**, indicating that pipeline caching is disabled, or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of **VkRayTracingPipelineCreateInfoKHR** structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array in which the resulting ray tracing pipeline objects are returned.

The **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** error is returned if the implementation is unable to reuse the shader group handles provided in **VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle** when **VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay** is enabled.

Pipelines are created and returned as described for Multiple Pipeline Creation.

## Valid Usage

- VUID-vkCreateRayTracingPipelinesKHR-device-09677
device must support at least one queue family with the VK_QUEUE_COMPUTE_BIT capability

- VUID-vkCreateRayTracingPipelinesKHR-flags-03415
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, basePipelineIndex must be less than the index into pCreateInfos that corresponds to that element.

- VUID-vkCreateRayTracingPipelinesKHR-flags-03416
  If the flags member of any element of pCreateInfos contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, the base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.

- VUID-vkCreateRayTracingPipelinesKHR-flags-03816
  flags must not contain the VK_PIPELINE_CREATE_DISPATCH_BASE flag.

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-02903
  If pipelineCache was created with VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, host access to pipelineCache must be externally synchronized.

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete.

- VUID-vkCreateRayTracingPipelinesKHR-rayTracingPipeline-03586
  The rayTracingPipeline feature must be enabled.

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-03587
  If deferredOperation is not VK_NULL_HANDLE, the flags member of elements of pCreateInfos must not include VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT.

Valid Usage (Implicit)

- VUID-vkCreateRayTracingPipelinesKHR-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle.

- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle.

- VUID-vkCreateRayTracingPipelinesKHR-pCreateInfos-parameter
  pCreateInfos must be a valid pointer to an array of createInfoCount valid VkRayTracingPipelineCreateInfoKHR structures.

- VUID-vkCreateRayTracingPipelinesKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.

- VUID-vkCreateRayTracingPipelinesKHR-pPipelines-parameter
  pPipelines must be a valid pointer to an array of createInfoCount VkPipeline handles.
- VUID-vkCreateRayTracingPipelinesKHR-createInfoCount-arraylength
  `createInfoCount` must be greater than 0
- VUID-vkCreateRayTracingPipelinesKHR-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`
- VUID-vkCreateRayTracingPipelinesKHR-pipelineCache-parent
  If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`

## Return Codes

**Success**
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS`

The `VkRayTracingPipelineCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineCreateInfoKHR {
    VkStructureType     sType;                      // `sType` is a `VkStructureType` value identifying this structure.
    const void*         pNext;                     // `pNext` is NULL or a pointer to a structure extending this structure.
    VkPipelineCreateFlags flags;                  // `flags`
    uint32_t            stageCount;              // `stageCount`
    const VkPipelineShaderStageCreateInfo* pStages;  // `pStages`
    uint32_t            groupCount;              // `groupCount`
    const VkRayTracingShaderGroupCreateInfoKHR* pGroups; // `pGroups`
    uint32_t            maxPipelineRayRecursionDepth; // `maxPipelineRayRecursionDepth`
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo; // `pLibraryInfo`
    const VkRayTracingPipelineInterfaceCreateInfoKHR* pLibraryInterface; // `pLibraryInterface`
    const VkPipelineDynamicStateCreateInfo* pDynamicState; // `pDynamicState`
    VkPipelineLayout     layout;                  // `layout`
    VkPipeline           basePipelineHandle;     // `basePipelineHandle`
    int32_t              basePipelineIndex;      // `basePipelineIndex`
} VkRayTracingPipelineCreateInfoKHR;
```
• **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.

• **stageCount** is the number of entries in the **pStages** array.

• **pStages** is a pointer to an array of **stageCount** `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the ray tracing pipeline.

• **groupCount** is the number of entries in the **pGroups** array.

• **pGroups** is a pointer to an array of **groupCount** `VkRayTracingShaderGroupCreateInfoKHR` structures describing the set of the shader stages to be included in each shader group in the ray tracing pipeline.

• **maxPipelineRayRecursionDepth** is the maximum recursion depth of shaders executed by this pipeline.

• **pLibraryInfo** is a pointer to a `VkPipelineLibraryCreateInfoKHR` structure defining pipeline libraries to include.

• **pLibraryInterface** is a pointer to a `VkRayTracingPipelineInterfaceCreateInfoKHR` structure defining additional information when using pipeline libraries.

• **pDynamicState** is a pointer to a `VkPipelineDynamicStateCreateInfo` structure, and is used to indicate which properties of the pipeline state object are dynamic and can be changed independently of the pipeline state. This can be NULL, which means no state in the pipeline is considered dynamic.

• **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.

• **basePipelineHandle** is a pipeline to derive from.

• **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from.

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in Pipeline Derivatives.

When `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` is specified, this pipeline defines a pipeline library which cannot be bound as a ray tracing pipeline directly. Instead, pipeline libraries define common shaders and shader groups which can be included in future pipeline creation.

If pipeline libraries are included in **pLibraryInfo**, shaders defined in those libraries are treated as if they were defined as additional entries in **pStages**, appended in the order they appear in the **pLibraries** array and in the **pStages** array when those libraries were defined.

When referencing shader groups in order to obtain a shader group handle, groups defined in those libraries are treated as if they were defined as additional entries in **pGroups**, appended in the order they appear in the **pLibraries** array and in the **pGroups** array when those libraries were defined. The shaders these groups reference are set when the pipeline library is created, referencing those specified in the pipeline library, not in the pipeline that includes it.

The default stack size for a pipeline if `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` is not provided is computed as described in Ray Tracing Pipeline Stack.

If the **pNext** chain includes a `VkPipelineCreateFlags2CreateInfoKHR` structure,
VkPipelineCreateFlags2CreateInfoKHR::flags from that structure is used instead of flags from this structure.

Valid Usage

- **VUID-VkRayTracingPipelineCreateInfoKHR-None-09497**
  If the pNext chain does not include a VkPipelineCreateFlags2CreateInfoKHR structure, flags must be a valid combination of VkPipelineCreateFlagBits values.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07984**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineIndex is -1, basePipelineHandle must be a valid ray tracing VkPipeline handle.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07985**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and basePipelineHandle is VK_NULL_HANDLE, basePipelineIndex must be a valid index into the calling command's pCreateInfos parameter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-flags-07986**
  If flags contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, basePipelineIndex must be -1 or basePipelineHandle must be VK_NULL_HANDLE.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07987**
  If a push constant block is declared in a shader, a push constant range in layout must match the shader stage.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-10069**
  If a push constant block is declared in a shader, the block must be contained inside the push constant range in layout that matches the stage.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07988**
  If a resource variables is declared in a shader, a descriptor slot in layout must match the shader stage.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07990**
  If a resource variables is declared in a shader, a descriptor slot in layout must match the descriptor type.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-07991**
  If a resource variables is declared in a shader as an array, a descriptor slot in layout must match the descriptor count.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pStages-03426**
  The shader code for the entry points identified by pStages, and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

- **VUID-VkRayTracingPipelineCreateInfoKHR-layout-03428**
  The number of resources in layout accessible to each shader stage that is used by the pipeline must be less than or equal to VkPhysicalDeviceLimits::maxPerStageResources.

- **VUID-VkRayTracingPipelineCreateInfoKHR-pipelineCreationCacheControl-02905**
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT.
VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT

- VUID-VkRayTracingPipelineCreateInfoKHR-stage-03425
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, the stage member of at least one element of pStages, including those implicitly added by pLibraryInfo, must be VK_SHADER_STAGE_RAYGEN_BIT_KHR

- VUID-VkRayTracingPipelineCreateInfoKHR-maxPipelineRayRecursionDepth-03589
  maxPipelineRayRecursionDepth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayRecursionDepth

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03465
  If flags includes VK_PIPELINE_CREATE_LIBRARY_BIT_KHR, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03590
  If pLibraryInfo is not NULL and its libraryCount member is greater than 0, pLibraryInterface must not be NULL

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03591
  Each element of pLibraryInfo->pLibraries must have been created with the value of maxPipelineRayRecursionDepth equal to that in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03592
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with a layout that is compatible with the layout in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03593
  If pLibraryInfo is not NULL, each element of its pLibraries member must have been created with values of the maxPipelineRayPayloadSize and maxPipelineRayHitAttributeSize members of pLibraryInterface equal to those in this pipeline

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03594
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04718
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04719
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04720
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04721
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL.Closest_HIT_SHADERS_BIT_KHR, each element of pLibraryInfo->pLibraries must have been created with the
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR bit set

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04722
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR` bit set.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-04723
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, each element of `pLibraryInfo->pLibraries` must have been created with the `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR` bit set.

- VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-03595
  If the `VK_KHR_pipeline_library` extension is not enabled, `pLibraryInfo` and `pLibraryInterface` must be NULL.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03470
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the `anyHitShader` of that element must not be `VK_SHADER_UNUSED_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03471
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, for any element of `pGroups` with a type of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, the `closestHitShader` of that element must not be `VK_SHADER_UNUSED_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03596
  If the `rayTraversalPrimitiveCulling` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTraversalPrimitiveCulling-03597
  If the `rayTraversalPrimitiveCulling` feature is not enabled, `flags` must not include `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-06546
  `flags` must not include both `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` and `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR`.

- VUID-VkRayTracingPipelineCreateInfoKHR-flags-03598
  If `flags` includes `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`, `rayTracingPipelineShaderGroupHandleCaptureReplay` must be enabled.

- VUID-VkRayTracingPipelineCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03599
  If `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` is `VK_TRUE` and the `pShaderGroupCaptureReplayHandle` member of any element of `pGroups` is not `NULL`, `flags` must include `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`.
• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-07999
  If pLibraryInfo is NULL or its libraryCount is 0, stageCount must not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-08700
  If flags does not include VK_PIPELINE_CREATE_LIBRARY_BIT_KHR and either pLibraryInfo is NULL or its libraryCount is 0, groupCount must not be 0

• VUID-VkRayTracingPipelineCreateInfoKHR-pDynamicStates-03602
  Any element of the pDynamicStates member of pDynamicState must be VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pipelineStageCreationFeedbackCount-06652
  If VkPipelineCreationFeedbackCreateInfo::pipelineStageCreationFeedbackCount is not 0, it must be equal to stageCount

• VUID-VkRayTracingPipelineCreateInfoKHR-stage-06899
  The stage value in all pStages elements must be one of VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_ANY_HIT_BIT_KHR, VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR, VK_SHADER_STAGE_INTERSECTION_BIT_KHR, or VK_SHADER_STAGE_CALLABLE_BIT_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-flags-07403
  If flags includes VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT, each element of pLibraryInfo->pLibraries must have been created with the VK_PIPELINE_CREATE_RAY_TRACING_OPACITY_MICROMAP_BIT_EXT bit set

---

Valid Usage (Implicit)

• VUID-VkRayTracingPipelineCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_CREATE_INFO_KHR

• VUID-VkRayTracingPipelineCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCreateFlags2CreateInfoKHR or VkPipelineCreationFeedbackCreateInfo

• VUID-VkRayTracingPipelineCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkRayTracingPipelineCreateInfoKHR-pStages-parameter
  If stageCount is not 0, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

• VUID-VkRayTracingPipelineCreateInfoKHR-pGroups-parameter
  If groupCount is not 0, pGroups must be a valid pointer to an array of groupCount valid VkRayTracingShaderGroupCreateInfoKHR structures

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInfo-parameter
  If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure

• VUID-VkRayTracingPipelineCreateInfoKHR-pLibraryInterface-parameter
  If pLibraryInterface is not NULL, pLibraryInterface must be a valid pointer to a valid
The `VkRayTracingShaderGroupCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingShaderGroupCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRayTracingShaderGroupTypeKHR type;
    uint32_t generalShader;
    uint32_t closestHitShader;
    uint32_t anyHitShader;
    uint32_t intersectionShader;
    const void* pShaderGroupCaptureReplayHandle;
} VkRayTracingShaderGroupCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is the type of hit group specified in this structure.
- `generalShader` is the index of the ray generation, miss, or callable shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `closestHitShader` is the optional index of the closest hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `anyHitShader` is the optional index of the any-hit shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` or `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
- `intersectionShader` is the index of the intersection shader from `VkRayTracingPipelineCreateInfoKHR::pStages` in the group if the shader group has `type` of `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`, and `VK_SHADER_UNUSED_KHR` otherwise.
otherwise.

- \( p_{\text{ShaderGroupCaptureReplayHandle}} \) is NULL or a pointer to replay information for this shader group queried from \( \text{vkGetRayTracingCaptureReplayShaderGroupHandlesKHR} \), as described in Ray Tracing Capture Replay. Ignored if \( \text{VkPhysicalDeviceRayTracingPipelineFeaturesKHR} :: p_{\text{rayTracingPipelineShaderGroupHandleCaptureReplay}} \) is VK_FALSE.

## Valid Usage

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03474**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `generalShader` must be a valid index into \( \text{VkRayTracingPipelineCreateInfoKHR} :: p_{\text{Stages}} \) referring to a shader of `VK_SHADER_STAGE_RAYGEN_BIT_KHR`, `VK_SHADER_STAGE_MISS_BIT_KHR`, or `VK_SHADER_STAGE_CALLABLE_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03475**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR` then `closestHitShader`, `anyHitShader`, and `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03476**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR` then `intersectionShader` must be a valid index into \( \text{VkRayTracingPipelineCreateInfoKHR} :: p_{\text{Stages}} \) referring to a shader of `VK_SHADER_STAGE_INTERSECTION_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-type-03477**
  If `type` is `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR` then `intersectionShader` must be `VK_SHADER_UNUSED_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-closestHitShader-03478**
  `closestHitShader` must be either `VK_SHADER_UNUSED_KHR` or a valid index into \( \text{VkRayTracingPipelineCreateInfoKHR} :: p_{\text{Stages}} \) referring to a shader of `VK_SHADER_STAGE_CLOSEST_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-anyHitShader-03479**
  `anyHitShader` must be either `VK_SHADERUNUSED_KHR` or a valid index into \( \text{VkRayTracingPipelineCreateInfoKHR} :: p_{\text{Stages}} \) referring to a shader of `VK_SHADER_STAGE_ANY_HIT_BIT_KHR`.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03603**
  If \( \text{VkPhysicalDeviceRayTracingPipelineFeaturesKHR} :: p_{\text{rayTracingPipelineShaderGroupHandleCaptureReplayMixed}} \) is VK_FALSE then \( p_{\text{ShaderGroupCaptureReplayHandle}} \) must not be provided if it has not been provided on a previous call to ray tracing pipeline creation.

- **VUID-VkRayTracingShaderGroupCreateInfoKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03604**
  If \( \text{VkPhysicalDeviceRayTracingPipelineFeaturesKHR} :: p_{\text{rayTracingPipelineShaderGroupHandleCaptureReplayMixed}} \) is VK_FALSE then the caller must guarantee that no ray tracing pipeline creation commands with \( p_{\text{ShaderGroupCaptureReplayHandle}} \) provided execute simultaneously with ray tracing pipeline creation commands without \( p_{\text{ShaderGroupCaptureReplayHandle}} \) provided.
Valid Usage (Implicit)

• VUID-VkRayTracingShaderGroupCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_RAY_TRACING_SHADER_GROUP_CREATE_INFO_KHR

• VUID-VkRayTracingShaderGroupCreateInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkRayTracingShaderGroupCreateInfoKHR-type-parameter
  type must be a valid VkRayTracingShaderGroupTypeKHR value

Possible values of type in VkRayTracingShaderGroupCreateInfoKHR are:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkRayTracingShaderGroupTypeKHR {
    VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR = 0,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR = 1,
    VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR = 2,
} VkRayTracingShaderGroupTypeKHR;
```

• VK_RAY_TRACING_SHADER_GROUP_TYPE_GENERAL_KHR indicates a shader group with a single
  VK_SHADER_STAGE_RAYGEN_BIT_KHR, VK_SHADER_STAGE_MISS_BIT_KHR,
  or VK_SHADER_STAGE_CALLABLE_BIT_KHR shader in it.

• VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR specifies a shader group that only
  hits triangles and must not contain an intersection shader, only closest hit and any-hit shaders.

• VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR specifies a shader group that only
  intersects with custom geometry and must contain an intersection shader and may contain
  closest hit and any-hit shaders.

**NOTE**
For current group types, the hit group type could be inferred from the presence or
absence of the intersection shader, but we provide the type explicitly for future hit
groups that do not have that property.

The VkRayTracingPipelineInterfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkRayTracingPipelineInterfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxPipelineRayPayloadSize;
    uint32_t maxPipelineRayHitAttributeSize;
} VkRayTracingPipelineInterfaceCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.
• `maxPipelineRayPayloadSize` is the maximum payload size in bytes used by any shader in the pipeline.

• `maxPipelineRayHitAttributeSize` is the maximum attribute structure size in bytes used by any shader in the pipeline.

`maxPipelineRayPayloadSize` is calculated as the maximum number of bytes used by any block declared in the `RayPayloadKHR` or `IncomingRayPayloadKHR` storage classes. `maxPipelineRayHitAttributeSize` is calculated as the maximum number of bytes used by any block declared in the `HitAttributeKHR` storage class. As variables in these storage classes do not have explicit offsets, the size should be calculated as if each variable has a scalar alignment equal to the largest scalar alignment of any of the block’s members.

**NOTE**

There is no explicit upper limit for `maxPipelineRayPayloadSize`, but in practice it should be kept as small as possible. Similar to invocation local memory, it must be allocated for each shader invocation and for devices which support many simultaneous invocations, this storage can rapidly be exhausted, resulting in failure.

### Valid Usage

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-maxPipelineRayHitAttributeSize-03605

  `maxPipelineRayHitAttributeSize` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayHitAttributeSize`

### Valid Usage (Implicit)

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_RAY_TRACING_PIPELINE_INTERFACE_CREATE_INFO_KHR`

- VUID-VkRayTracingPipelineInterfaceCreateInfoKHR-pNext-pNext

  `pNext` must be `NULL`

To query the opaque handles of shaders in the ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingShaderGroupHandlesKHR(
    VkDevice device,   // Logical device
    VkPipeline pipeline,      // Ray tracing pipeline
    uint32_t firstGroup,     // First shader group index
    uint32_t groupCount,     // Number of shader groups
    size_t dataSize,         // Size of the returned handles buffer
    void* pData);            // Pointer to the returned handles buffer
```

- `device` is the logical device containing the ray tracing pipeline.
• **pipeline** is the ray tracing pipeline object containing the shaders.
• **firstGroup** is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.
• **groupCount** is the number of shader handles to retrieve.
• **dataSize** is the size in bytes of the buffer pointed to by `pData`.
• **pData** is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize`.

### Valid Usage

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-04619  
  `pipeline` must be a ray tracing pipeline

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-04050  
  `firstGroup` must be less than the number of shader groups in `pipeline`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-firstGroup-02419  
  The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader groups in `pipeline`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-02420  
  `dataSize` must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleSize × groupCount`

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-07828  
  `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupHandlesKHR-device-parameter  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parameter  
  `pipeline` must be a valid `VkPipeline` handle

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pData-parameter  
  `pData` must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetRayTracingShaderGroupHandlesKHR-dataSize-arraylength  
  `dataSize` must be greater than 0

- VUID-vkGetRayTracingShaderGroupHandlesKHR-pipeline-parent  
  `pipeline` must have been created, allocated, or retrieved from `device`
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the opaque capture data of shader groups in a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
VkResult vkGetRayTracingCaptureReplayShaderGroupHandlesKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t firstGroup,
    uint32_t groupCount,
    size_t dataSize,
    void* pData);
```

- `device` is the logical device containing the ray tracing pipeline.
- `pipeline` is the ray tracing pipeline object containing the shaders.
- `firstGroup` is the index of the first group to retrieve a handle for from the `VkRayTracingPipelineCreateInfoKHR::pGroups` array.
- `groupCount` is the number of shader handles to retrieve.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to an application-allocated buffer where the results will be written.

On success, an array of `groupCount` shader handles will be written to `pData`, with each element being of size `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize`.

Once queried, this opaque data can be provided at pipeline creation time (in a subsequent execution), using `VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle`, as described in Ray Tracing Capture Replay.

**Valid Usage**

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-04620
  pipeline must be a ray tracing pipeline

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-04051
  `firstGroup` must be less than the number of shader groups in `pipeline`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-firstGroup-03483
  The sum of `firstGroup` and `groupCount` must be less than or equal to the number of shader
groups in `pipeline`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-03484
  `dataSize` must be at least `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleCaptureReplaySize × groupCount`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-rayTracingPipelineShaderGroupHandleCaptureReplay-03606
  `VkPhysicalDeviceRayTracingPipelineFeaturesKHR::rayTracingPipelineShaderGroupHandleCaptureReplay` must be enabled to call this function

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-03607
  `pipeline` must have been created with a `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_SHADER_GROUP_HANDLE_CAPTURE_REPLAY_BIT_KHR`

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-07829
  `pipeline` must not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`

### Valid Usage (Implicit)

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parameter
  `pipeline` must be a valid `VkPipeline` handle

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pData-parameter
  `pData` must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-dataSize-arraylength
  `dataSize` must be greater than 0

- VUID-vkGetRayTracingCaptureReplayShaderGroupHandlesKHR-pipeline-parent
  `pipeline` must have been created, allocated, or retrieved from `device`

### Return Codes

#### Success
- `VK_SUCCESS`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query the pipeline stack size of shaders in a shader group in the ray tracing pipeline, call:
// Provided by VK_KHR_ray_tracing_pipeline
VkDeviceSize vkGetRayTracingShaderGroupStackSizeKHR(
    VkDevice device,
    VkPipeline pipeline,
    uint32_t group,
    VkShaderGroupShaderKHR groupShader);

• **device** is the logical device containing the ray tracing pipeline.
• **pipeline** is the ray tracing pipeline object containing the shaders groups.
• **group** is the index of the shader group to query.
• **groupShader** is the type of shader from the group to query.

The return value is the ray tracing pipeline stack size in bytes for the specified shader as called from the specified shader group.

### Valid Usage

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-04622
  * **pipeline must** be a ray tracing pipeline
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-group-03608
  * The value of **group must** be less than the number of shader groups in **pipeline**
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-03609
  * The shader identified by **groupShader** in **group must** not be **VK_SHADER_UNUSED_KHR**

### Valid Usage (Implicit)

- VUID-vkGetRayTracingShaderGroupStackSizeKHR-device-parameter
  * **device must** be a valid **VkDevice** handle
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parameter
  * **pipeline must** be a valid **VkPipeline** handle
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-groupShader-parameter
  * **groupShader must** be a valid **VkShaderGroupShaderKHR** value
- VUID-vkGetRayTracingShaderGroupStackSizeKHR-pipeline-parent
  * **pipeline must** have been created, allocated, or retrieved from **device**

Possible values of **groupShader** in **vkGetRayTracingShaderGroupStackSizeKHR** are:
```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef enum VkShaderGroupShaderKHR {
    VK_SHADER_GROUP_SHADER_GENERAL_KHR = 0,
    VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR = 1,
    VK_SHADER_GROUP_SHADER_ANY_HIT_KHR = 2,
    VK_SHADER_GROUP_SHADER_INTERSECTION_KHR = 3,
} VkShaderGroupShaderKHR;
```

- **VK_SHADER_GROUP_SHADER_GENERAL_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::generalShader`
- **VK_SHADER_GROUP_SHADER_CLOSEST_HIT_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::closestHitShader`
- **VK_SHADER_GROUP_SHADER_ANY_HIT_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::anyHitShader`
- **VK_SHADER_GROUP_SHADER_INTERSECTION_KHR** uses the shader specified in the group with `VkRayTracingShaderGroupCreateInfoKHR::intersectionShader`

To **dynamically set** the stack size for a ray tracing pipeline, call:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdSetRayTracingPipelineStackSizeKHR(
    VkCommandBuffer commandBuffer,    // Provided by VK_KHR_ray_tracing_pipeline
    uint32_t pipelineStackSize);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pipelineStackSize** is the stack size to use for subsequent ray tracing trace commands.

This command sets the stack size for subsequent ray tracing commands when the ray tracing pipeline is created with `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, the stack size is computed as described in *Ray Tracing Pipeline Stack*.

### Valid Usage

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-pipelineStackSize-03610
  
  **pipelineStackSize** must be large enough for any dynamic execution through the shaders in the ray tracing pipeline used by a subsequent trace call

### Valid Usage (Implicit)

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-parameter
  
  **commandBuffer** must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-recording

650
**commandBuffer** must be in the recording state

- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from must support compute operations
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdSetRayTracingPipelineStackSizeKHR-videocoding
  This command must only be called outside of a video coding scope

## Host Synchronization

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

## Command Properties

## 10.5. Pipeline Destruction

To destroy a pipeline, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipeline(
    VkDevice device,
    VkPipeline pipeline,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline.
- **pipeline** is the handle of the pipeline to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyPipeline-pipeline-00765
  All submitted commands that refer to **pipeline** must have completed execution
If VkAllocationCallbacks were provided when pipeline was created, a compatible set of callbacks must be provided here.

If no VkAllocationCallbacks were provided when pipeline was created, pAllocator must be NULL.

Valid Usage (Implicit)

device must be a valid VkDevice handle

If pipeline is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

If pipeline is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

Host access to pipeline must be externally synchronized.

10.6. Pipeline Derivatives

A pipeline derivative is a child pipeline created from a parent pipeline, where the child and parent are expected to have much commonality.

The goal of derivative pipelines is that they be cheaper to create using the parent as a starting point, and that it be more efficient (on either host or device) to switch/bind between children of the same parent.

A derivative pipeline is created by setting the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag in the Vk*PipelineCreateInfo structure. If this is set, then exactly one of basePipelineHandle or basePipelineIndex members of the structure must have a valid handle/index, and specifies the parent pipeline. If basePipelineHandle is used, the parent pipeline must have already been created. If basePipelineIndex is used, then the parent is being created in the same command. VK_NULL_HANDLE acts as the invalid handle for basePipelineHandle, and -1 is the invalid index for basePipelineIndex. If basePipelineIndex is used, the base pipeline must appear earlier in the array. The base pipeline must have been created with the VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT flag set.
10.7. Pipeline Cache

Pipeline cache objects allow the result of pipeline construction to be reused between pipelines and between runs of an application. Reuse between pipelines is achieved by passing the same pipeline cache object when creating multiple related pipelines. Reuse across runs of an application is achieved by retrieving pipeline cache contents in one run of an application, saving the contents, and using them to preinitialize a pipeline cache on a subsequent run. The contents of the pipeline cache objects are managed by the implementation. Applications can manage the host memory consumed by a pipeline cache object and control the amount of data retrieved from a pipeline cache object.

Pipeline cache objects are represented by VkPipelineCache handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineCache)
```

10.7.1. Creating a Pipeline Cache

To create pipeline cache objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineCache(
    VkDevice device,
    const VkPipelineCacheCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineCache* pPipelineCache);
```

- **device** is the logical device that creates the pipeline cache object.
- **pCreateInfo** is a pointer to a VkPipelineCacheCreateInfo structure containing initial parameters for the pipeline cache object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelineCache** is a pointer to a VkPipelineCache handle in which the resulting pipeline cache object is returned.

**NOTE**

Applications can track and manage the total host memory size of a pipeline cache object using the pAllocator. Applications can limit the amount of data retrieved from a pipeline cache object in vkGetPipelineCacheData. Implementations should not internally limit the total number of entries added to a pipeline cache object or the total host memory consumed.

Once created, a pipeline cache can be passed to the vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, and vkCreateComputePipelines commands. If the pipeline cache passed into these commands is not VK_NULL_HANDLE, the implementation will query it for possible reuse opportunities and update it with new content. The use of the pipeline cache object in these commands is internally synchronized, and the same pipeline cache object can be used in
multiple threads simultaneously.

If flags of pCreateInfo includes VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT, all commands that modify the returned pipeline cache object must be externally synchronized.

NOTE Implementations should make every effort to limit any critical sections to the actual accesses to the cache, which is expected to be significantly shorter than the duration of the vkCreate*Pipelines commands.

Valid Usage (Implicit)

• VUID-vkCreatePipelineCache-device-parameter
device must be a valid VkDevice handle

• VUID-vkCreatePipelineCache-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkPipelineCacheCreateInfo structure

• VUID-vkCreatePipelineCache-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreatePipelineCache-pPipelineCache-parameter
pPipelineCache must be a valid pointer to a VkPipelineCache handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineCacheCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCacheCreateFlags flags;
    size_t initialDataSize;
    const void* pInitialData;
} VkPipelineCacheCreateInfo;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• **flags** is a bitmask of VkPipelineCacheCreateFlagBits specifying the behavior of the pipeline cache.

• **initialDataSize** is the number of bytes in pInitialData. If initialDataSize is zero, the pipeline cache will initially be empty.

• **pInitialData** is a pointer to previously retrieved pipeline cache data. If the pipeline cache data is incompatible (as defined below) with the device, the pipeline cache will be initially empty. If initialDataSize is zero, pInitialData is ignored.

## Valid Usage

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00768**
  If initialDataSize is not 0, it must be equal to the size of pInitialData, as returned by vkGetPipelineCacheData when pInitialData was originally retrieved

- **VUID-VkPipelineCacheCreateInfo-initialDataSize-00769**
  If initialDataSize is not 0, pInitialData must have been retrieved from a previous call to vkGetPipelineCacheData

- **VUID-VkPipelineCacheCreateInfo-pipelineCreationCacheControl-02892**
  If the pipelineCreationCacheControl feature is not enabled, flags must not include VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT

## Valid Usage (Implicit)

- **VUID-VkPipelineCacheCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_CACHE_CREATE_INFO

- **VUID-VkPipelineCacheCreateInfo-pNext-pNext**
  pNext must be NULL

- **VUID-VkPipelineCacheCreateInfo-flags-parameter**
  flags must be a valid combination of VkPipelineCacheCreateFlagBits values

- **VUID-VkPipelineCacheCreateInfo-pInitialData-parameter**
  If initialDataSize is not 0, pInitialData must be a valid pointer to an array of initialDataSize bytes

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineCacheCreateFlags;
```

**VkPipelineCacheCreateFlags** is a bitmask type for setting a mask of zero or more VkPipelineCacheCreateFlagBits.

Bits which can be set in VkPipelineCacheCreateInfo::flags, specifying behavior of the pipeline cache, are:
```c
typedef enum VkPipelineCacheCreateFlagBits {
    // Provided by VK_VERSION_1_3
    VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT = 0x00000001,
} VkPipelineCacheCreateFlagBits;
```

- **VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT** specifies that all commands that modify the created VkPipelineCache will be externally synchronized. When set, the implementation may skip any unnecessary processing needed to support simultaneous modification from multiple threads where allowed.

### 10.7.2. Merging Pipeline Caches

Pipeline cache objects can be merged using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkMergePipelineCaches(
    VkDevice device,
    VkPipelineCache dstCache,
    uint32_t srcCacheCount,
    const VkPipelineCache* pSrcCaches);
```

- **device** is the logical device that owns the pipeline cache objects.
- **dstCache** is the handle of the pipeline cache to merge results into.
- **srcCacheCount** is the length of the pSrcCaches array.
- **pSrcCaches** is a pointer to an array of pipeline cache handles, which will be merged into dstCache. The previous contents of dstCache are included after the merge.

**NOTE**
The details of the merge operation are implementation-dependent, but implementations should merge the contents of the specified pipelines and prune duplicate entries.

#### Valid Usage

- VUID-vkMergePipelineCaches-dstCache-00770
  dstCache must not appear in the list of source caches

#### Valid Usage (Implicit)

- VUID-vkMergePipelineCaches-device-parameter
  device must be a valid VkDevice handle
- VUID-vkMergePipelineCaches-dstCache-parameter
  dstCache must be a valid VkPipelineCache handle
- VUID-vkMergePipelineCaches-pSrcCaches-parameter
**Host Synchronization**

- Host access to \texttt{dstCache} \textit{must} be externally synchronized

**Return Codes**

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

### 10.7.3. Retrieving Pipeline Cache Data

Data \textit{can} be retrieved from a pipeline cache object using the command:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPipelineCacheData(
    VkDevice device,
    VkPipelineCache pipelineCache,
    size_t* pDataSize,
    void* pData);
```

- \texttt{device} is the logical device that owns the pipeline cache.
- \texttt{pipelineCache} is the pipeline cache to retrieve data from.
- \texttt{pDataSize} is a pointer to a \texttt{size_t} value related to the amount of data in the pipeline cache, as described below.
- \texttt{pData} is either \texttt{NULL} or a pointer to a buffer.

If \texttt{pData} is \texttt{NULL}, then the maximum size of the data that \textit{can} be retrieved from the pipeline cache, in bytes, is returned in \texttt{pDataSize}. Otherwise, \texttt{pDataSize} \textit{must} point to a variable set by the application to the size of the buffer, in bytes, pointed to by \texttt{pData}, and on return the variable is overwritten with
the amount of data actually written to \( \text{pData} \). If \( \text{pDataSize} \) is less than the maximum size that \textbf{can} be retrieved by the pipeline cache, at most \( \text{pDataSize} \) bytes will be written to \( \text{pData} \), and \textbf{VK_INCOMPLETE} will be returned instead of \textbf{VK_SUCCESS}, to indicate that not all of the pipeline cache was returned.

Any data written to \( \text{pData} \) is valid and \textbf{can} be provided as the \( \text{pInitialData} \) member of the \text{VkPipelineCacheCreateInfo} structure passed to \text{vkCreatePipelineCache}.

Two calls to \text{vkGetPipelineCacheData} with the same parameters \textbf{must} retrieve the same data unless a command that modifies the contents of the cache is called between them.

The initial bytes written to \( \text{pData} \) \textbf{must} be a header as described in the Pipeline Cache Header section.

If \( \text{pDataSize} \) is less than what is necessary to store this header, nothing will be written to \( \text{pData} \) and zero will be written to \( \text{pDataSize} \).

### Valid Usage (Implicit)

- \text{VUID-vkGetPipelineCacheData-device-parameter}  
  \textit{device} \textbf{must} be a valid \text{VkDevice} handle
- \text{VUID-vkGetPipelineCacheData-pipelineCache-parameter}  
  \textit{pipelineCache} \textbf{must} be a valid \text{VkPipelineCache} handle
- \text{VUID-vkGetPipelineCacheData-pDataSize-parameter}  
  \textit{pDataSize} \textbf{must} be a valid pointer to a \text{size_t} value
- \text{VUID-vkGetPipelineCacheData-pData-parameter}  
  If the value referenced by \( \text{pDataSize} \) is not \( 0 \), and \( \text{pData} \) is not \textbf{NULL}, \( \text{pData} \) \textbf{must} be a valid pointer to an array of \( \text{pDataSize} \) bytes
- \text{VUID-vkGetPipelineCacheData-pipelineCache-parent}  
  \textit{pipelineCache} \textbf{must} have been created, allocated, or retrieved from \text{device}

### Return Codes

**Success**

- \text{VK_SUCCESS}
- \text{VK_INCOMPLETE}

**Failure**

- \text{VK_ERROR_OUT_OF_HOST_MEMORY}
- \text{VK_ERROR_OUT_OF_DEVICE_MEMORY}

### 10.7.4. Pipeline Cache Header

Applications \textbf{can} store the data retrieved from the pipeline cache, and use these data, possibly in a future run of the application, to populate new pipeline cache objects. The results of pipeline
compiles, however, may depend on the vendor ID, device ID, driver version, and other details of the device. To enable applications to detect when previously retrieved data is incompatible with the device, the pipeline cache data must begin with a valid pipeline cache header.

NOTE

Structures described in this section are not part of the Vulkan API and are only used to describe the representation of data elements in pipeline cache data. Accordingly, the valid usage clauses defined for structures defined in this section do not define valid usage conditions for APIs accepting pipeline cache data as input, as providing invalid pipeline cache data as input to any Vulkan API commands will result in the provided pipeline cache data being ignored.

Version one of the pipeline cache header is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineCacheHeaderVersionOne {
    uint32_t headerSize;
    VkPipelineCacheHeaderVersion headerVersion;
    uint32_t vendorID;
    uint32_t deviceID;
    uint8_t pipelineCacheUUID[VK_UUID_SIZE];
} VkPipelineCacheHeaderVersionOne;
```

- **headerSize** is the length in bytes of the pipeline cache header.
- **headerVersion** is a VkPipelineCacheHeaderVersion value specifying the version of the header. A consumer of the pipeline cache should use the cache version to interpret the remainder of the cache header.
- **vendorID** is the VkPhysicalDeviceProperties::vendorID of the implementation.
- **deviceID** is the VkPhysicalDeviceProperties::deviceID of the implementation.
- **pipelineCacheUUID** is the VkPhysicalDeviceProperties::pipelineCacheUUID of the implementation.

Unlike most structures declared by the Vulkan API, all fields of this structure are written with the least significant byte first, regardless of host byte-order.

The C language specification does not define the packing of structure members. This layout assumes tight structure member packing, with members laid out in the order listed in the structure, and the intended size of the structure is 32 bytes. If a compiler produces code that diverges from that pattern, applications must employ another method to set values at the correct offsets.

Valid Usage

- VUID-VkPipelineCacheHeaderVersionOne-headerSize-04967
  headerSize must be 32
- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-04968
  headerVersion must be VK_PIPELINE_CACHE_HEADER_VERSION_ONE
- VUID-VkPipelineCacheHeaderVersionOne-headerSize-08990
**Valid Usage (Implicit)**

- VUID-VkPipelineCacheHeaderVersionOne-headerVersion-parameter
  - `headerVersion` must be a valid `VkPipelineCacheHeaderVersion` value

Possible values of the `headerVersion` value of the pipeline cache header are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPipelineCacheHeaderVersion {
    VK_PIPELINE_CACHE_HEADER_VERSION_ONE = 1,
} VkPipelineCacheHeaderVersion;
```

- `VK_PIPELINE_CACHE_HEADER_VERSION_ONE` specifies version one of the pipeline cache, described by `VkPipelineCacheHeaderVersionOne`.

### 10.7.5. Destroying a Pipeline Cache

To destroy a pipeline cache, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineCache(
    VkDevice device,            // device is the logical device that destroys the pipeline cache object.
    VkPipelineCache pipelineCache,  // pipelineCache is the handle of the pipeline cache to destroy.
    const VkAllocationCallbacks* pAllocator);  // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
```

**Valid Usage**

- VUID-vkDestroyPipelineCache-pipelineCache-00771
  - If `VkAllocationCallbacks` were provided when `pipelineCache` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyPipelineCache-pipelineCache-00772
  - If no `VkAllocationCallbacks` were provided when `pipelineCache` was created, `pAllocator` must be `NULL`
Valid Usage (Implicit)

- VUID-vkDestroyPipelineCache-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyPipelineCache-pipelineCache-parameter
  If pipelineCache is not VK_NULL_HANDLE, pipelineCache must be a valid VkPipelineCache handle

- VUID-vkDestroyPipelineCache-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyPipelineCache-pipelineCache-parent
  If pipelineCache is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to pipelineCache must be externally synchronized

10.8. Specialization Constants

Specialization constants are a mechanism whereby constants in a SPIR-V module can have their constant value specified at the time the VkPipeline is created. This allows a SPIR-V module to have constants that can be modified while executing an application that uses the Vulkan API.

NOTE | Specialization constants are useful to allow a compute shader to have its local workgroup size changed at runtime by the user, for example.

Each VkPipelineShaderStageCreateInfo structure contains a pSpecializationInfo member, which can be NULL to indicate no specialization constants, or point to a VkSpecializationInfo structure.

The VkSpecializationInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationInfo {
    uint32_t mapEntryCount;
    const VkSpecializationMapEntry* pMapEntries;
    size_t dataSize;
    const void* pData;
} VkSpecializationInfo;
```

- mapEntryCount is the number of entries in the pMapEntries array.
- pMapEntries is a pointer to an array of VkSpecializationMapEntry structures, which map constant IDs to offsets in pData.
• `dataSize` is the byte size of the `pData` buffer.
• `pData` contains the actual constant values to specialize with.

**Valid Usage**

- VUID-VkSpecializationInfo-offset-00773
  The `offset` member of each element of `pMapEntries` must be less than `dataSize`

- VUID-VkSpecializationInfo-pMapEntries-00774
  The `size` member of each element of `pMapEntries` must be less than or equal to `dataSize` minus `offset`

- VUID-VkSpecializationInfo-constantID-04911
  The `constantID` value of each element of `pMapEntries` must be unique within `pMapEntries`

**Valid Usage (Implicit)**

- VUID-VkSpecializationInfo-pMapEntries-parameter
  If `mapEntryCount` is not 0, `pMapEntries` must be a valid pointer to an array of `mapEntryCount` valid `VkSpecializationMapEntry` structures

- VUID-VkSpecializationInfo-pData-parameter
  If `dataSize` is not 0, `pData` must be a valid pointer to an array of `dataSize` bytes

The `VkSpecializationMapEntry` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSpecializationMapEntry {
    uint32_t constantID;
    uint32_t offset;
    size_t size;
} VkSpecializationMapEntry;
```

• `constantID` is the ID of the specialization constant in SPIR-V.
• `offset` is the byte offset of the specialization constant value within the supplied data buffer.
• `size` is the byte size of the specialization constant value within the supplied data buffer.

If a `constantID` value is not a specialization constant ID used in the shader, that map entry does not affect the behavior of the pipeline.

**Valid Usage**

- VUID-VkSpecializationMapEntry-constantID-00776
  For a `constantID` specialization constant declared in a shader, `size` must match the byte size of the `constantID`. If the specialization constant is of type `boolean`, `size` must be the byte size of `VkBool32`
In human readable SPIR-V:

OpDecorate %x SpecId 13; decorate .x component of WorkgroupSize with ID 13
OpDecorate %y SpecId 42; decorate .y component of WorkgroupSize with ID 42
OpDecorate %z SpecId 3; decorate .z component of WorkgroupSize with ID 3
OpDecorate %wgsize BuiltIn WorkgroupSize; decorate WorkgroupSize onto constant
%i32 = OpTypeInt 32 0; declare an unsigned 32-bit type
%uvec3 = OpTypeVector %i32 3; declare a 3 element vector type of unsigned 32-bit
%x = OpSpecConstant %i32 1; declare the .x component of WorkgroupSize
%y = OpSpecConstant %i32 1; declare the .y component of WorkgroupSize
%z = OpSpecConstant %i32 1; declare the .z component of WorkgroupSize
%wgsize = OpSpecConstantComposite %uvec3 %x %y %z; declare WorkgroupSize

From the above we have three specialization constants, one for each of the x, y & z elements of the WorkgroupSize vector.

Now to specialize the above via the specialization constants mechanism:

```cpp
class VkSpecializationMapEntry {
    constantID: uint32_t = 0;
    offset: uint32_t = 0;
    size: uint32_t = 0;
}
const VkSpecializationMapEntry entries[] = {
    {constantID: 13, offset: 0 * sizeof(uint32_t), size: sizeof(uint32_t)},
    {constantID: 42, offset: 1 * sizeof(uint32_t), size: sizeof(uint32_t)},
    {constantID: 3, offset: 2 * sizeof(uint32_t), size: sizeof(uint32_t)}
};
const uint32_t data[] = { 16, 8, 4 }; // our workgroup size is 16x8x4
const VkSpecializationInfo info = {
    .mapEntryCount = 3,
    .pMapEntries = entries,
    .dataSize = 3 * sizeof(uint32_t),
    .pData = data,
};
```

Then when calling `vkCreateComputePipelines`, and passing the `VkSpecializationInfo` we defined as
the `pSpecializationInfo` parameter of `VkPipelineShaderStageCreateInfo`, we will create a compute pipeline with the runtime specified local workgroup size.

Another example would be that an application has a SPIR-V module that has some platform-dependent constants they wish to use.

In human readable SPIR-V:

```
OpDecorate %1 SpecId 0 ; decorate our signed 32-bit integer constant
OpDecorate %2 SpecId 12 ; decorate our 32-bit floating-point constant
%i32 = OpTypeInt 32 1 ; declare a signed 32-bit type
%float = OpTypeFloat 32 ; declare a 32-bit floating-point type
%i1 = OpSpecConstant %i32 -1 ; some signed 32-bit integer constant
%2 = OpSpecConstant %float 0.5 ; some 32-bit floating-point constant
```

From the above we have two specialization constants, one is a signed 32-bit integer and the second is a 32-bit floating-point value.

Now to specialize the above via the specialization constants mechanism:

```
struct SpecializationData {
    int32_t data0;
    float data1;
};

const VkSpecializationMapEntry entries[] =
{
    {
        .constantID = 0,
        .offset = offsetof(SpecializationData, data0),
        .size = sizeof(SpecializationData::data0)
    },
    {
        .constantID = 12,
        .offset = offsetof(SpecializationData, data1),
        .size = sizeof(SpecializationData::data1)
    }
};

SpecializationData data;
data.data0 = -42; // set the data for the 32-bit integer
data.data1 = 42.0f; // set the data for the 32-bit floating-point

const VkSpecializationInfo info =
{
    .mapEntryCount = 2,
    .pMapEntries = entries,
    .dataSize = sizeof(data),
    .pdata = &data,
```
It is legal for a SPIR-V module with specializations to be compiled into a pipeline where no specialization information was provided. SPIR-V specialization constants contain default values such that if a specialization is not provided, the default value will be used. In the examples above, it would be valid for an application to only specialize some of the specialization constants within the SPIR-V module, and let the other constants use their default values encoded within the OpSpecConstant declarations.

10.9. Pipeline Libraries

A pipeline library is a special pipeline that was created using the `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` and cannot be bound, instead it defines a set of pipeline state which can be linked into other pipelines. For ray tracing pipelines this includes shaders and shader groups. The application must maintain the lifetime of a pipeline library based on the pipelines that link with it.

This linkage is achieved by using the following structure within the appropriate creation mechanisms:

The `VkPipelineLibraryCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_library
typedef struct VkPipelineLibraryCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t libraryCount;
    const VkPipeline* pLibraries;
} VkPipelineLibraryCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `libraryCount` is the number of pipeline libraries in `pLibraries`.
- `pLibraries` is a pointer to an array of `VkPipeline` structures specifying pipeline libraries to use when creating a pipeline.

**Valid Usage**

- VUID-VkPipelineLibraryCreateInfoKHR-pLibraries-03381
  Each element of `pLibraries` must have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR`
Pipelines created with VK_PIPELINE_CREATE_LIBRARY_BIT_KHR libraries can depend on other pipeline libraries in VkPipelineLibraryCreateInfoKHR.

A pipeline library is considered in-use, as long as one of the linking pipelines is in-use. This applies recursively if a pipeline library includes other pipeline libraries.

### 10.10. Pipeline Binding

Once a pipeline has been created, it can be bound to the command buffer using the command:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindPipeline(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipeline pipeline);
```

- `commandBuffer` is the command buffer that the pipeline will be bound to.
- `pipelineBindPoint` is a VkPipelineBindPoint value specifying to which bind point the pipeline is bound. Binding one does not disturb the others.
- `pipeline` is the pipeline to be bound.

Once bound, a pipeline binding affects subsequent commands that interact with the given pipeline type in the command buffer until a different pipeline of the same type is bound to the bind point, or until the pipeline bind point is disturbed by binding a shader object as described in Interaction with Pipelines. Commands that do not interact with the given pipeline type must not be affected by the pipeline state.

### Valid Usage

- VUID-vkCmdBindPipeline-pipelineBindPoint-00777
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_COMPUTE, the VkCommandPool that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00778
  If `pipelineBindPoint` is VK_PIPELINE_BIND_POINT_GRAPHICS, the VkCommandPool that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-00779
If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE`, `pipeline` **must** be a compute pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00780
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS`, `pipeline` **must** be a graphics pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-00781
  If the `variableMultisampleRate` feature is not supported, `pipeline` is a graphics pipeline, the current subpass uses no attachments, and this is not the first call to this function with a graphics pipeline after transitioning to the current subpass, then the sample count specified by this pipeline **must** match that set in the previous pipeline

- VUID-vkCmdBindPipeline-variableSampleLocations-01525
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE`, and `pipeline` is a graphics pipeline created with a `VkPipelineSampleLocationsStateCreateInfoEXT` structure having its `sampleLocationsEnable` member set to `VK_TRUE` but without `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` enabled then the current render pass instance **must** have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element **must** match the `sampleLocationsInfo` specified in `VkPipelineSampleLocationsStateCreateInfoEXT` when the pipeline was created

- VUID-vkCmdBindPipeline-None-02323
  This command **must** not be recorded when transform feedback is active

- VUID-vkCmdBindPipeline-pipelineBindPoint-02391
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdBindPipeline-pipelineBindPoint-02392
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `pipeline` **must** be a ray tracing pipeline

- VUID-vkCmdBindPipeline-pipelineBindPoint-06721
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR`, `commandBuffer` **must** not be a protected command buffer

- VUID-vkCmdBindPipeline-pipelineBindPoint-03382
  `pipeline` **must** not have been created with `VK_PIPELINE_CREATE_LIBRARY_BIT_KHR` set

- VUID-vkCmdBindPipeline-commandBuffer-04809
  If `commandBuffer` is a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled and `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and `pipeline` was created with `VkPipelineDiscardRectangleStateCreateInfoEXT` structure and its `discardRectangleCount` member is not `0`, or the pipeline was created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` enabled, then the pipeline **must** have been created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` enabled

- VUID-vkCmdBindPipeline-pipelineBindPoint-04881
  If `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_GRAPHICS` and the
provokingVertexModePerPipeline limit is VK_FALSE, then pipeline’s VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode must be the same as that of any other pipelines previously bound to this bind point within the current render pass instance, including any pipeline already bound when beginning the render pass instance

Valid Usage (Implicit)

- VUID-vkCmdBindPipeline-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdBindPipeline-pipelineBindPoint-parameter pipelineBindPoint must be a valid VkPipelineBindPoint value
- VUID-vkCmdBindPipeline-pipeline-parameter pipeline must be a valid VkPipeline handle
- VUID-vkCmdBindPipeline-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdBindPipeline-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
- VUID-vkCmdBindPipeline-videocoding This command must only be called outside of a video coding scope
- VUID-vkCmdBindPipeline-commonparent Both of commandBuffer, and pipeline must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Possible values of vkCmdBindPipeline::pipelineBindPoint, specifying the bind point of a pipeline object, are:
// Provided by VK_VERSION_1_0
typedef enum VkPipelineBindPoint {
    VK_PIPELINE_BIND_POINT_GRAPHICS = 0,
    VK_PIPELINE_BIND_POINT_COMPUTE = 1,
    // Provided by VK_KHR_ray_tracing_pipeline
    VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR = 1000165000,
} VkPipelineBindPoint;

- `VK_PIPELINE_BIND_POINT_COMPUTE` specifies binding as a compute pipeline.
- `VK_PIPELINE_BIND_POINT_GRAPHICS` specifies binding as a graphics pipeline.
- `VK_PIPELINE_BIND_POINT_RAY_TRACING_KHR` specifies binding as a ray tracing pipeline.

### 10.10.1. Interaction With Shader Objects

If the `shaderObject` feature is enabled, applications can use both pipelines and shader objects at the same time. The interaction between pipelines and shader objects is described in Interaction with Pipelines.

### 10.11. Dynamic State

When a pipeline object is bound, any pipeline object state that is not specified as dynamic is applied to the command buffer state. Pipeline object state that is specified as dynamic is not applied to the command buffer state at this time.

Instead, dynamic state can be modified at any time and persists for the lifetime of the command buffer, or until modified by another dynamic state setting command, or made invalid by binding a pipeline in which that state is statically specified.

When a pipeline object is bound, the following applies to each state parameter:

- If the state is not specified as dynamic in the new pipeline object, then that command buffer state is overwritten by the state in the new pipeline object. Before any draw or dispatch call with this pipeline there must not have been any calls to any of the corresponding dynamic state setting commands after this pipeline was bound.

- If the state is specified as dynamic in the new pipeline object, then that command buffer state is not disturbed. Before any draw or dispatch call with this pipeline there must have been at least one call to each of the corresponding dynamic state setting commands. The state-setting commands must be recorded after command buffer recording was begun, or after the last command binding a pipeline object with that state specified as static, whichever was the latter.

- If the state is not included (corresponding pointer in `VkGraphicsPipelineCreateInfo` was NULL or was ignored) in the new pipeline object, then that command buffer state is not disturbed.

Dynamic state that does not affect the result of operations can be left undefined.

**NOTE**

For example, if blending is disabled by the pipeline object state then the dynamic color blend constants do not need to be specified in the command buffer, even if
this state is specified as dynamic in the pipeline object.

Applications running on Vulkan implementations advertising an `VkPhysicalDeviceDriverProperties::conformanceVersion` less than 1.3.8.0 should be aware that rebinding the currently bound pipeline object may not reapply static state.

10.12. Pipeline Properties and Shader Information

When a pipeline is created, its state and shaders are compiled into zero or more device-specific executables, which are used when executing commands against that pipeline. To query the properties of these pipeline executables, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutablePropertiesKHR(
    VkDevice device,
    const VkPipelineInfoKHR* pPipelineInfo,
    uint32_t* pExecutableCount,
    VkPipelineExecutablePropertiesKHR* pProperties);
```

- `device` is the device that created the pipeline.
- `pPipelineInfo` describes the pipeline being queried.
- `pExecutableCount` is a pointer to an integer related to the number of pipeline executables available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkPipelineExecutablePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of pipeline executables associated with the pipeline is returned in `pExecutableCount`. Otherwise, `pExecutableCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pExecutableCount` is less than the number of pipeline executables associated with the pipeline, at most `pExecutableCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

**Valid Usage**

- VUID-vkGetPipelineExecutablePropertiesKHR-pipelineExecutableInfo-03270
  The `pipelineExecutableInfo` feature must be enabled
- VUID-vkGetPipelineExecutablePropertiesKHR-pipeline-03271
  The `pipeline` member of `pPipelineInfo` must have been created with `device`
Valid Usage (Implicit)

- VUID-vkGetPipelineExecutablePropertiesKHR-device-parameter
  *device* must be a valid `VkDevice` handle

- VUID-vkGetPipelineExecutablePropertiesKHR-pPipelineInfo-parameter
  *pPipelineInfo* must be a valid pointer to a valid `VkPipelineInfoKHR` structure

- VUID-vkGetPipelineExecutablePropertiesKHR-pExecutableCount-parameter
  *pExecutableCount* must be a valid pointer to a `uint32_t` value

- VUID-vkGetPipelineExecutablePropertiesKHR-pProperties-parameter
  If the value referenced by *pExecutableCount* is not 0, and *pProperties* is not NULL, *pProperties* must be a valid pointer to an array of *pExecutableCount* `VkPipelineExecutablePropertiesKHR` structures

Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutablePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutablePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags stages;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    uint32_t subgroupSize;
} VkPipelineExecutablePropertiesKHR;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *stages* is a bitmask of zero or more `VkShaderStageFlagBits` indicating which shader stages (if any) were principally used as inputs to compile this pipeline executable.
- *name* is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this pipeline executable.
- *description* is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable description of this pipeline executable.
string which is a human readable description for this pipeline executable.

- `subgroupSize` is the subgroup size with which this pipeline executable is dispatched.

Not all implementations have a 1:1 mapping between shader stages and pipeline executables and some implementations **may** reduce a given shader stage to fixed function hardware programming such that no pipeline executable is available. No guarantees are provided about the mapping between shader stages and pipeline executables and **stages should** be considered a best effort hint. Because the application **cannot** rely on the `stages` field to provide an exact description, `name` and `description` provide a human readable name and description which more accurately describes the given pipeline executable.

### Valid Usage (Implicit)

- VUID-VkPipelineExecutablePropertiesKHR-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_PROPERTIES_KHR`
- VUID-VkPipelineExecutablePropertiesKHR-pNext-pNext
  - `pNext` **must** be `NULL`

The `VkPipelineInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
} VkPipelineInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is a `VkPipeline` handle.

### Valid Usage (Implicit)

- VUID-VkPipelineInfoKHR-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_INFO_KHR`
- VUID-VkPipelineInfoKHR-pNext-pNext
  - `pNext` **must** be `NULL`
- VUID-VkPipelineInfoKHR-pipeline-parameter
  - `pipeline` **must** be a valid `VkPipeline` handle

Each pipeline executable **may** have a set of statistics associated with it that are generated by the pipeline compilation process. These statistics **may** include things such as instruction counts, amount of spilling (if any), maximum number of simultaneous threads, or anything else which **may**
aid developers in evaluating the expected performance of a shader. To query the compile time statistics associated with a pipeline executable, call:

```c
// Provided by VK_KHR_pipeline_executable_properties
VkResult vkGetPipelineExecutableStatisticsKHR(
    VkDevice device, 
    const VkPipelineExecutableInfoKHR* pExecutableInfo, 
    uint32_t* pStatisticCount, 
    VkPipelineExecutableStatisticKHR* pStatistics);
```

- `device` is the device that created the pipeline.
- `pExecutableInfo` describes the pipeline executable being queried.
- `pStatisticCount` is a pointer to an integer related to the number of statistics available or queried, as described below.
- `pStatistics` is either `NULL` or a pointer to an array of `VkPipelineExecutableStatisticKHR` structures.

If `pStatistics` is `NULL`, then the number of statistics associated with the pipeline executable is returned in `pStatisticCount`. Otherwise, `pStatisticCount` must point to a variable set by the application to the number of elements in the `pStatistics` array, and on return the variable is overwritten with the number of structures actually written to `pStatistics`. If `pStatisticCount` is less than the number of statistics associated with the pipeline executable, at most `pStatisticCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available statistics were returned.

### Valid Usage

- **VUID-vkGetPipelineExecutableStatisticsKHR-pipelineExecutableInfo-03272**
  The `pipelineExecutableInfo` feature must be enabled
- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03273**
  The pipeline member of `pExecutableInfo` must have been created with `device`
- **VUID-vkGetPipelineExecutableStatisticsKHR-pipeline-03274**
  The pipeline member of `pExecutableInfo` must have been created with `VK_PIPELINE_CREATE_CAPTURE_STATISTICS_BIT_KHR`

### Valid Usage (Implicit)

- **VUID-vkGetPipelineExecutableStatisticsKHR-device-parameter**
  `device` must be a valid `VkDevice` handle
- **VUID-vkGetPipelineExecutableStatisticsKHR-pExecutableInfo-parameter**
  `pExecutableInfo` must be a valid pointer to a valid `VkPipelineExecutableInfoKHR` structure
- **VUID-vkGetPipelineExecutableStatisticsKHR-pStatisticCount-parameter**
**pStatisticCount** must be a valid pointer to a `uint32_t` value

- VUID-vkGetPipelineExecutableStatisticsKHR-pStatistics-parameter

  If the value referenced by `pStatisticCount` is not 0, and `pStatistics` is not `NULL`, `pStatistics` must be a valid pointer to an array of `pStatisticCount` `VkPipelineExecutableStatisticKHR` structures

---

**Return Codes**

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineExecutableInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkPipeline pipeline;
    uint32_t executableIndex;
} VkPipelineExecutableInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipeline` is the pipeline to query.
- `executableIndex` is the index of the pipeline executable to query in the array of executable properties returned by `vkGetPipelineExecutablePropertiesKHR`.

---

**Valid Usage**

- VUID-VkPipelineExecutableInfoKHR-executableIndex-03275

  `executableIndex` must be less than the number of pipeline executables associated with `pipeline` as returned in the `pExecutableCount` parameter of `vkGetPipelineExecutablePropertiesKHR`

---

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutableInfoKHR-sType-sType
The `VkPipelineExecutableStatisticKHR` structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableStatisticKHR {
    VkStructureType sType;
    void* pNext;
    char name[VK_MAX_DESCRIPTION_SIZE];
    char description[VK_MAX_DESCRIPTION_SIZE];
    VkPipelineExecutableStatisticFormatKHR format;
    VkPipelineExecutableStatisticValueKHR value;
} VkPipelineExecutableStatisticKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **name** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a short human readable name for this statistic.
- **description** is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which is a human readable description for this statistic.
- **format** is a `VkPipelineExecutableStatisticFormatKHR` value specifying the format of the data found in **value**.
- **value** is the value of this statistic.

**Valid Usage (Implicit)**

- VUID-VkPipelineExecutableStatisticKHR-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_STATISTIC_KHR`
- VUID-VkPipelineExecutableStatisticKHR-pNext-pNext
  - **pNext** must be NULL

The `VkPipelineExecutableStatisticFormatKHR` enum is defined as:
typedef enum VkPipelineExecutableStatisticFormatKHR {
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR = 0,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR = 1,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR = 2,
    VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR = 3,
} VkPipelineExecutableStatisticFormatKHR;

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR specifies that the statistic is returned as a 32-bit boolean value which must be either VK_TRUE or VK_FALSE and should be read from the b32 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR specifies that the statistic is returned as a signed 64-bit integer and should be read from the i64 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR specifies that the statistic is returned as an unsigned 64-bit integer and should be read from the u64 field of VkPipelineExecutableStatisticValueKHR.

- VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR specifies that the statistic is returned as a 64-bit floating-point value and should be read from the f64 field of VkPipelineExecutableStatisticValueKHR.

The VkPipelineExecutableStatisticValueKHR union is defined as:

typedef union VkPipelineExecutableStatisticValueKHR {
    VkBool32 b32;
    int64_t i64;
    uint64_t u64;
    double f64;
} VkPipelineExecutableStatisticValueKHR;

- b32 is the 32-bit boolean value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_BOOL32_KHR.

- i64 is the signed 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_INT64_KHR.

- u64 is the unsigned 64-bit integer value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_UINT64_KHR.

- f64 is the 64-bit floating-point value if the VkPipelineExecutableStatisticFormatKHR is VK_PIPELINE_EXECUTABLE_STATISTIC_FORMAT_FLOAT64_KHR.

Each pipeline executable may have one or more text or binary internal representations associated with it which are generated as part of the compile process. These may include the final shader assembly, a binary form of the compiled shader, or the shader compiler's internal representation at any number of intermediate compile steps. To query the internal representations associated with a pipeline executable, call:
// Provided by VK_KHR_pipeline_executable_properties

VkResult vkGetPipelineExecutableInternalRepresentationsKHR(
    VkDevice device,
    const VkPipelineExecutableInfoKHR* pExecutableInfo,
    uint32_t* pInternalRepresentationCount,
    VkPipelineExecutableInternalRepresentationKHR* pInternalRepresentations);

- **device** is the device that created the pipeline.
- **pExecutableInfo** describes the pipeline executable being queried.
- **pInternalRepresentationCount** is a pointer to an integer related to the number of internal representations available or queried, as described below.
- **pInternalRepresentations** is either NULL or a pointer to an array of VkPipelineExecutableInternalRepresentationKHR structures.

If **pInternalRepresentations** is NULL, then the number of internal representations associated with the pipeline executable is returned in **pInternalRepresentationCount**. Otherwise, **pInternalRepresentationCount** must point to a variable set by the application to the number of elements in the **pInternalRepresentations** array, and on return the variable is overwritten with the number of structures actually written to **pInternalRepresentations**. If **pInternalRepresentationCount** is less than the number of internal representations associated with the pipeline executable, at most **pInternalRepresentationCount** structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representations were returned.

While the details of the internal representations remain implementation-dependent, the implementation should order the internal representations in the order in which they occur in the compiled pipeline with the final shader assembly (if any) last.

---

### Valid Usage

- [VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipelineExecutableInfo-03276](#) The **pipelineExecutableInfo** feature must be enabled

- [VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03277](#) The **pipeline** member of **pExecutableInfo** must have been created with **device**

- [VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pipeline-03278](#) The **pipeline** member of **pExecutableInfo** must have been created with VK_PIPELINE_CREATE_CAPTURE_INTERNAL_REPRESENTATIONS_BIT_KHR

### Valid Usage (Implicit)

- [VUID-vkGetPipelineExecutableInternalRepresentationsKHR-device-parameter](#) **device** must be a valid **VkDevice** handle

- [VUID-vkGetPipelineExecutableInternalRepresentationsKHR-pExecutableInfo-parameter](#) **pExecutableInfo** must be a valid pointer to a valid **VkPipelineExecutableInfoKHR** structure
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkPipelineExecutableInternalRepresentationKHR structure is defined as:

```c
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPipelineExecutableInternalRepresentationKHR {
    VkStructureType     sType;
    void*               pNext;
    char                 name[VK_MAX_DESCRIPTION_SIZE];
    char                 description[VK_MAX_DESCRIPTION_SIZE];
    VkBool32             isText;
    size_t               dataSize;
    void*                pData;
} VkPipelineExecutableInternalRepresentationKHR;
```

• `sType` is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `name` is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a short human readable name for this internal representation.
• `description` is an array of VK_MAX_DESCRIPTION_SIZE char containing a null-terminated UTF-8 string which is a human readable description for this internal representation.
• `isText` specifies whether the returned data is text or opaque data. If `isText` is VK_TRUE then the data returned in `pData` is text and is guaranteed to be a null-terminated UTF-8 string.
• `dataSize` is an integer related to the size, in bytes, of the internal representation’s data, as described below.
pData is either NULL or a pointer to a block of data into which the implementation will write the internal representation.

If pData is NULL, then the size, in bytes, of the internal representation data is returned in dataSize. Otherwise, dataSize must be the size of the buffer, in bytes, pointed to by pData and on return dataSize is overwritten with the number of bytes of data actually written to pData including any trailing null character. If dataSize is less than the size, in bytes, of the internal representation's data, at most dataSize bytes of data will be written to pData, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available representation was returned.

If isText is VK_TRUE and pData is not NULL and dataSize is not zero, the last byte written to pData will be a null character.

Valid Usage (Implicit)

- VUID-VkPipelineExecutableInternalRepresentationKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_EXECUTABLE_INTERNAL_REPRESENTATION_KHR
- VUID-VkPipelineExecutableInternalRepresentationKHR-pNext-pNext
  pNext must be NULL

10.13. Pipeline Creation Feedback

Feedback about the creation of a particular pipeline object can be obtained by adding a VkPipelineCreationFeedbackCreateInfo structure to the pNext chain of VkGraphicsPipelineCreateInfo, VkRayTracingPipelineCreateInfoKHR, or VkComputePipelineCreateInfo. The VkPipelineCreationFeedbackCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedbackCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreationFeedback* pPipelineCreationFeedback;
    uint32_t pipelineStageCreationFeedbackCount;
    VkPipelineCreationFeedback* pPipelineStageCreationFeedbacks;
} VkPipelineCreationFeedbackCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pPipelineCreationFeedback is a pointer to a VkPipelineCreationFeedback structure.
- pipelineStageCreationFeedbackCount is the number of elements in pPipelineStageCreationFeedbacks.
- pPipelineStageCreationFeedbacks is a pointer to an array of pipelineStageCreationFeedbackCount VkPipelineCreationFeedback structures.

An implementation should write pipeline creation feedback to pPipelineCreationFeedback and may
write pipeline stage creation feedback to \texttt{pPipelineStageCreationFeedbacks}. An implementation \textbf{must} set or clear the \texttt{VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT} in \texttt{VkPipelineCreationFeedback::flags} for \texttt{pPipelineCreationFeedback} and every element of \texttt{pPipelineStageCreationFeedbacks}.

\begin{footnotesize}
\begin{minipage}{\textwidth}
\textbf{NOTE} \quad One common scenario for an implementation to skip per-stage feedback is when \texttt{VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT} is set in \texttt{pPipelineCreationFeedback}.
\end{minipage}
\end{footnotesize}

When chained to \texttt{VkRayTracingPipelineCreateInfoKHR}, or \texttt{VkGraphicsPipelineCreateInfo}, the \texttt{i} element of \texttt{pPipelineStageCreationFeedbacks} corresponds to the \texttt{i} element of \texttt{VkRayTracingPipelineCreateInfoKHR::pStages}, or \texttt{VkGraphicsPipelineCreateInfo::pStages}. When chained to \texttt{VkComputePipelineCreateInfo}, the first element of \texttt{pPipelineStageCreationFeedbacks} corresponds to \texttt{VkComputePipelineCreateInfo::stage}.

\begin{footnotesize}
\begin{center}
\begin{tabular}{|l|}
\hline
\textbf{Valid Usage (Implicit)}
\hline
\begin{itemize}
\item VUID-VkPipelineCreationFeedbackCreateInfo-sType-sType \textit{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PIPELINE_CREATION_FEEDBACK_CREATE_INFO}
\item VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineCreationFeedback-parameter \textit{pPipelineCreationFeedback} \textbf{must} be a valid pointer to a \texttt{VkPipelineCreationFeedback} structure
\item VUID-VkPipelineCreationFeedbackCreateInfo-pPipelineStageCreationFeedbacks-parameter \textit{If pipelineStageCreationFeedbackCount} is not 0, \textit{pPipelineStageCreationFeedbacks} \textbf{must} be a valid pointer to an array of \texttt{pipelineStageCreationFeedbackCount} \texttt{VkPipelineCreationFeedback} structures
\end{itemize}
\hline
\end{tabular}
\end{center}
\end{footnotesize}

The \texttt{VkPipelineCreationFeedback} structure is defined as:

\begin{footnotesize}
\begin{verbatim}
// Provided by VK_VERSION_1_3
typedef struct VkPipelineCreationFeedback {
    VkPipelineCreationFeedbackFlags flags;
    uint64_t duration;
} VkPipelineCreationFeedback;
\end{verbatim}
\end{footnotesize}

\begin{itemize}
\item \textit{flags} is a bitmask of \texttt{VkPipelineCreationFeedbackFlagBits} providing feedback about the creation of a pipeline or of a pipeline stage.
\item \textit{duration} is the duration spent creating a pipeline or pipeline stage in nanoseconds.
\end{itemize}

If the \texttt{VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT} is not set in \textit{flags}, an implementation \textbf{must} not set any other bits in \textit{flags}, and the values of all other \texttt{VkPipelineCreationFeedback} data members are undefined.

Possible values of the \textit{flags} member of \texttt{VkPipelineCreationFeedback} are:
typedef enum VkPipelineCreationFeedbackFlagBits {
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT = 0x00000001,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT = 0x00000002,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT = 0x00000004,
    VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT,
    VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT_EXT = VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT,
} VkPipelineCreationFeedbackFlagBits;

• VK_PIPELINE_CREATION_FEEDBACK_VALID_BIT indicates that the feedback information is valid.

• VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT indicates that a readily usable pipeline or pipeline stage was found in the pipelineCache specified by the application in the pipeline creation command.

An implementation should set the VK_PIPELINE_CREATION_FEEDBACK_APPLICATION_PIPELINE_CACHE_HIT_BIT bit if it was able to avoid the large majority of pipeline or pipeline stage creation work by using the pipelineCache parameter of vkCreateGraphicsPipelines, vkCreateRayTracingPipelinesKHR, or vkCreateComputePipelines. When an implementation sets this bit for the entire pipeline, it may leave it unset for any stage.

NOTE
Implementations are encouraged to provide a meaningful signal to applications using this bit. The intention is to communicate to the application that the pipeline or pipeline stage was created “as fast as it gets” using the pipeline cache provided by the application. If an implementation uses an internal cache, it is discouraged from setting this bit as the feedback would be unactionable.

• VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT indicates that the base pipeline specified by the basePipelineHandle or basePipelineIndex member of the Vk*PipelineCreateInfo structure was used to accelerate the creation of the pipeline.

An implementation should set the VK_PIPELINE_CREATION_FEEDBACK_BASE_PIPELINE_ACCELERATION_BIT bit if it was able to avoid a significant amount of work by using the base pipeline.

NOTE
While “significant amount of work” is subjective, implementations are encouraged to provide a meaningful signal to applications using this bit. For example, a 1% reduction in duration may not warrant setting this bit, while a 50% reduction would.

typedef VkFlags VkPipelineCreationFeedbackFlags;
VkPipelineCreationFeedbackFlags is a bitmask type for providing zero or more VkPipelineCreationFeedbackFlagBits.
Chapter 11. Memory Allocation

Vulkan memory is broken up into two categories, *host memory* and *device memory*.

11.1. Host Memory

Host memory is memory needed by the Vulkan implementation for non-device-visible storage.

**NOTE**
This memory *may* be used to store the implementation’s representation and state of Vulkan objects.

Vulkan provides applications the opportunity to perform host memory allocations on behalf of the Vulkan implementation. If this feature is not used, the implementation will perform its own memory allocations. Since most memory allocations are off the critical path, this is not meant as a performance feature. Rather, this can be useful for certain embedded systems, for debugging purposes (e.g. putting a guard page after all host allocations), or for memory allocation logging.

Allocators are provided by the application as a pointer to a `VkAllocationCallbacks` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkAllocationCallbacks {
    void* pUserData;
   PFN_vkAllocationFunction pfnAllocation;
   PFN_vkReallocationFunction pfnReallocation;
   PFN_vkFreeFunction pfnFree;
   PFN_vkInternalAllocationNotification pfnInternalAllocation;
   PFN_vkInternalFreeNotification pfnInternalFree;
} VkAllocationCallbacks;
```

- `pUserData` is a value to be interpreted by the implementation of the callbacks. When any of the callbacks in `VkAllocationCallbacks` are called, the Vulkan implementation will pass this value as the first parameter to the callback. This value can vary each time an allocator is passed into a command, even when the same object takes an allocator in multiple commands.

- `pfnAllocation` is a `PFN_vkAllocationFunction` pointer to an application-defined memory allocation function.

- `pfnReallocation` is a `PFN_vkReallocationFunction` pointer to an application-defined memory reallocation function.

- `pfnFree` is a `PFN_vkFreeFunction` pointer to an application-defined memory free function.

- `pfnInternalAllocation` is a `PFN_vkInternalAllocationNotification` pointer to an application-defined function that is called by the implementation when the implementation makes internal allocations.

- `pfnInternalFree` is a `PFN_vkInternalFreeNotification` pointer to an application-defined function that is called by the implementation when the implementation frees internal allocations.
Valid Usage

- **VUID-VkAllocationCallbacks-pfnAllocation-00632**
  
  *pfnAllocation* must be a valid pointer to a valid application-defined `PFN_vkAllocationFunction`

- **VUID-VkAllocationCallbacks-pfnReallocation-00633**
  
  *pfnReallocation* must be a valid pointer to a valid application-defined `PFN_vkReallocationFunction`

- **VUID-VkAllocationCallbacks-pfnFree-00634**
  
  *pfnFree* must be a valid pointer to a valid application-defined `PFN_vkFreeFunction`

- **VUID-VkAllocationCallbacks-pfnInternalAllocation-00635**
  
  If either of *pfnInternalAllocation* or *pfnInternalFree* is not NULL, both must be valid callbacks

The type of *pfnAllocation* is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkAllocationFunction)(
    void* pUserData,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- *pUserData* is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- *size* is the size in bytes of the requested allocation.
- *alignment* is the requested alignment of the allocation in bytes and must be a power of two.
- *allocationScope* is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described [here](#).

If *pfnAllocation* is unable to allocate the requested memory, it must return NULL. If the allocation was successful, it must return a valid pointer to memory allocation containing at least *size* bytes, and with the pointer value being a multiple of *alignment*.

Correct Vulkan operation cannot be assumed if the application does not follow these rules.

For example, *pfnAllocation* (or *pfnReallocation*) could cause termination of running Vulkan instance(s) on a failed allocation for debugging purposes, either directly or indirectly. In these circumstances, it cannot be assumed that any part of any affected `VkInstance` objects are going to operate correctly (even `vkDestroyInstance`), and the application must ensure it cleans up properly via other means (e.g. process termination).

**NOTE**

Correct Vulkan operation cannot be assumed if the application does not follow these rules.
If `pfnAllocation` returns `NULL`, and if the implementation is unable to continue correct processing of the current command without the requested allocation, it must treat this as a runtime error, and generate `VK_ERROR_OUT_OF_HOST_MEMORY` at the appropriate time for the command in which the condition was detected, as described in Return Codes.

If the implementation is able to continue correct processing of the current command without the requested allocation, then it may do so, and must not generate `VK_ERROR_OUT_OF_HOST_MEMORY` as a result of this failed allocation.

The type of `pfnReallocation` is:

```c
// Provided by VK_VERSION_1_0
typedef void* (VKAPI_PTR *PFN_vkReallocationFunction)(
    void* pUserData,
    void* pOriginal,
    size_t size,
    size_t alignment,
    VkSystemAllocationScope allocationScope);
```

- `pUserData` is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- `pOriginal` must be either `NULL` or a pointer previously returned by `pfnReallocation` or `pfnAllocation` of a compatible allocator.
- `size` is the size in bytes of the requested allocation.
- `alignment` is the requested alignment of the allocation in bytes and must be a power of two.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

If the reallocation was successful, `pfnReallocation` must return an allocation with enough space for `size` bytes, and the contents of the original allocation from bytes zero to `min(original size, new size) - 1` must be preserved in the returned allocation. If `size` is larger than the old size, the contents of the additional space are undefined. If satisfying these requirements involves creating a new allocation, then the old allocation should be freed.

If `pOriginal` is `NULL`, then `pfnReallocation` must behave equivalently to a call to `PFN_vkAllocationFunction` with the same parameter values (without `pOriginal`).

If `size` is zero, then `pfnReallocation` must behave equivalently to a call to `PFN_vkFreeFunction` with the same `pUserData` parameter value, and `pMemory` equal to `pOriginal`.

If `pOriginal` is non-`NULL`, the implementation must ensure that `alignment` is equal to the `alignment` used to originally allocate `pOriginal`.

If this function fails and `pOriginal` is non-`NULL` the application must not free the old allocation.

`pfnReallocation` must follow the same rules for return values as `PFN_vkAllocationFunction`.

The type of `pfnFree` is:
typedef void (VKAPI_PTR *PFN_vkFreeFunction)(
    void* pUserData,
    void* pMemory);

- **pUserData** is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- **pMemory** is the allocation to be freed.

*pMemory* may be NULL, which the callback must handle safely. If *pMemory* is non-NULL, it must be a pointer previously allocated by `pfnAllocation` or `PFN_vkAllocation`. The application should free this memory.

The type of `PFN_vkInternalAllocationNotification` is:

typedef void (VKAPI_PTR *PFN_vkInternalAllocationNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- **pUserData** is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- **size** is the requested size of an allocation.
- **allocationType** is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- **allocationScope** is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

This is a purely informational callback.

The type of `PFN_vkInternalFreeNotification` is:

typedef void (VKAPI_PTR *PFN_vkInternalFreeNotification)(
    void* pUserData,
    size_t size,
    VkInternalAllocationType allocationType,
    VkSystemAllocationScope allocationScope);

- **pUserData** is the value specified for `VkAllocationCallbacks::pUserData` in the allocator specified by the application.
- **size** is the requested size of an allocation.
- `allocationType` is a `VkInternalAllocationType` value specifying the requested type of an allocation.
- `allocationScope` is a `VkSystemAllocationScope` value specifying the allocation scope of the lifetime of the allocation, as described here.

Each allocation has an *allocation scope* defining its lifetime and which object it is associated with. Possible values passed to the `allocationScope` parameter of the callback functions specified by `VkAllocationCallbacks`, indicating the allocation scope, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSystemAllocationScope {
    VK_SYSTEM_ALLOCATION_SCOPE_COMMAND = 0,
    VK_SYSTEM_ALLOCATION_SCOPE_OBJECT = 1,
    VK_SYSTEM_ALLOCATION_SCOPE_CACHE = 2,
    VK_SYSTEM_ALLOCATION_SCOPE_DEVICE = 3,
    VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE = 4,
} VkSystemAllocationScope;
```

- `VK_SYSTEM_ALLOCATION_SCOPE_COMMAND` specifies that the allocation is scoped to the duration of the Vulkan command.
- `VK_SYSTEM_ALLOCATION_SCOPE_OBJECT` specifies that the allocation is scoped to the lifetime of the Vulkan object that is being created or used.
- `VK_SYSTEM_ALLOCATION_SCOPE_CACHE` specifies that the allocation is scoped to the lifetime of a `VkPipelineCache` object.
- `VK_SYSTEM_ALLOCATION_SCOPE_DEVICE` specifies that the allocation is scoped to the lifetime of the Vulkan device.
- `VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE` specifies that the allocation is scoped to the lifetime of the Vulkan instance.

Most Vulkan commands operate on a single object, or there is a sole object that is being created or manipulated. When an allocation uses an allocation scope of `VK_SYSTEM_ALLOCATION_SCOPE_OBJECT` or `VK_SYSTEM_ALLOCATION_SCOPE_CACHE`, the allocation is scoped to the object being created or manipulated.

When an implementation requires host memory, it will make callbacks to the application using the most specific allocator and allocation scope available:

- If an allocation is scoped to the duration of a command, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_COMMAND` allocation scope. The most specific allocator available is used: if the object being created or manipulated has an allocator, that object's allocator will be used, else if the parent `VkDevice` has an allocator it will be used, else if the parent `VkInstance` has an allocator it will be used. Else,

- If an allocation is associated with a `VkPipelineCache` object, the allocator will use the `VK_SYSTEM_ALLOCATION_SCOPE_CACHE` allocation scope. The most specific allocator available is used (cache, else device, else instance). Else,
• If an allocation is scoped to the lifetime of an object, that object is being created or manipulated by the command, and that object’s type is not VkDevice or VkInstance, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_OBJECT. The most specific allocator available is used (object, else device, else instance). Else,

• If an allocation is scoped to the lifetime of a device, the allocator will use an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_DEVICE. The most specific allocator available is used (device, else instance). Else,

• If the allocation is scoped to the lifetime of an instance and the instance has an allocator, its allocator will be used with an allocation scope of VK_SYSTEM_ALLOCATION_SCOPE_INSTANCE.

• Otherwise an implementation will allocate memory through an alternative mechanism that is unspecified.

Objects that are allocated from pools do not specify their own allocator. When an implementation requires host memory for such an object, that memory is sourced from the object's parent pool’s allocator.

The application is not expected to handle allocating memory that is intended for execution by the host due to the complexities of differing security implementations across multiple platforms. The implementation will allocate such memory internally and invoke an application provided informational callback when these internal allocations are allocated and freed. Upon allocation of executable memory, pfnInternalAllocation will be called. Upon freeing executable memory, pfnInternalFree will be called. An implementation will only call an informational callback for executable memory allocations and frees.

The allocationType parameter to the pfnInternalAllocation and pfnInternalFree functions may be one of the following values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkInternalAllocationType {
    VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE = 0,
} VkInternalAllocationType;
```

• VK_INTERNAL_ALLOCATION_TYPE_EXECUTABLE specifies that the allocation is intended for execution by the host.

An implementation must only make calls into an application-provided allocator during the execution of an API command. An implementation must only make calls into an application-provided allocator from the same thread that called the provoking API command. The implementation should not synchronize calls to any of the callbacks. If synchronization is needed, the callbacks must provide it themselves. The informational callbacks are subject to the same restrictions as the allocation callbacks.

If an implementation intends to make calls through a VkAllocationCallbacks structure between the time a vkCreate* command returns and the time a corresponding vkDestroy* command begins, that implementation must save a copy of the allocator before the vkCreate* command returns. The callback functions and any data structures they rely upon must remain valid for the lifetime of the object they are associated with.
If an allocator is provided to a `vkCreate*` command, a compatible allocator **must** be provided to the corresponding `vkDestroy*` command. Two `VkAllocationCallbacks` structures are compatible if memory allocated with `pfnAllocation` or `pfnReallocation` in each can be freed with `pfnReallocation` or `pfnFree` in the other. An allocator **must** not be provided to a `vkDestroy*` command if an allocator was not provided to the corresponding `vkCreate*` command.

If a non-NULL allocator is used, the `pfnAllocation`, `pfnReallocation` and `pfnFree` members **must** be non-NULL and point to valid implementations of the callbacks. An application **can** choose to not provide informational callbacks by setting both `pfnInternalAllocation` and `pfnInternalFree` to NULL. `pfnInternalAllocation` and `pfnInternalFree` **must** either both be NULL or both be non-NULL.

If `pfnAllocation` or `pfnReallocation` fail, the implementation **may** fail object creation and/or generate a `VK_ERROR_OUT_OF_HOST_MEMORY` error, as appropriate.

Allocation callbacks **must** not call any Vulkan commands.

The following sets of rules define when an implementation is permitted to call the allocator callbacks.

`pfnAllocation` or `pfnReallocation` **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be allocated from any API command.
- Allocations scoped to a command **may** be allocated from any API command.
- Allocations scoped to a `VkPipelineCache` **may** only be allocated from:
  - `vkCreatePipelineCache`
  - `vkMergePipelineCaches` for `dstCache`
  - `vkCreateGraphicsPipelines` for `pipelineCache`
  - `vkCreateComputePipelines` for `pipelineCache`
- Allocations scoped to a `VkDescriptorPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkAllocateDescriptorSets` for the `descriptorPool` member of its `pAllocateInfo` parameter
  - `vkCreateDescriptorPool`
- Allocations scoped to a `VkCommandPool` **may** only be allocated from:
  - any command that takes the pool as a direct argument
  - `vkCreateCommandPool`
  - `vkAllocateCommandBuffers` for the `commandPool` member of its `pAllocateInfo` parameter
  - any `vkCmd*` command whose `commandBuffer` was allocated from that `VkCommandPool`
- Allocations scoped to any other object **may** only be allocated in that object's `vkCreate*` command.

`pfnFree`, or `pfnReallocation` with zero size, **may** be called in the following situations:

- Allocations scoped to a `VkDevice` or `VkInstance` **may** be freed from any API command.
• Allocations scoped to a command must be freed by any API command which allocates such memory.

• Allocations scoped to a VkPipelineCache may be freed from vkDestroyPipelineCache.

• Allocations scoped to a VkDescriptorPool may be freed from:
  ◦ any command that takes the pool as a direct argument

• Allocations scoped to a VkCommandPool may be freed from:
  ◦ any command that takes the pool as a direct argument
  ◦ vkResetCommandBuffer whose commandBuffer was allocated from that VkCommandPool

• Allocations scoped to any other object may be freed in that object’s vkDestroy* command.

• Any command that allocates host memory may also free host memory of the same scope.

11.2. Device Memory

Device memory is memory that is visible to the device — for example the contents of the image or buffer objects, which can be natively used by the device.

11.2.1. Device Memory Properties

Memory properties of a physical device describe the memory heaps and memory types available.

To query memory properties, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceMemoryProperties(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties* pMemoryProperties);
```

• `physicalDevice` is the handle to the device to query.

• `pMemoryProperties` is a pointer to a VkPhysicalDeviceMemoryProperties structure in which the properties are returned.

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceMemoryProperties-physicalDevice-parameter
  `physicalDevice` must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceMemoryProperties-pMemoryProperties-parameter
  `pMemoryProperties` must be a valid pointer to a VkPhysicalDeviceMemoryProperties structure

The VkPhysicalDeviceMemoryProperties structure is defined as:
typedef struct VkPhysicalDeviceMemoryProperties {
    uint32_t memoryTypeCount;
    VkMemoryType memoryTypes[VK_MAX_MEMORY_TYPES];
    uint32_t memoryHeapCount;
    VkMemoryHeap memoryHeaps[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryProperties;

- **memoryTypeCount** is the number of valid elements in the `memoryTypes` array.
- **memoryTypes** is an array of `VK_MAX_MEMORY_TYPES` `VkMemoryType` structures describing the memory types that can be used to access memory allocated from the heaps specified by `memoryHeaps`.
- **memoryHeapCount** is the number of valid elements in the `memoryHeaps` array.
- **memoryHeaps** is an array of `VK_MAX_MEMORY_HEAPS` `VkMemoryHeap` structures describing the memory heaps from which memory can be allocated.

The `VkPhysicalDeviceMemoryProperties` structure describes a number of memory heaps as well as a number of memory types that can be used to access memory allocated in those heaps. Each heap describes a memory resource of a particular size, and each memory type describes a set of memory properties (e.g. host cached vs. uncached) that can be used with a given memory heap. Allocations using a particular memory type will consume resources from the heap indicated by that memory type's heap index. More than one memory type may share each heap, and the heaps and memory types provide a mechanism to advertise an accurate size of the physical memory resources while allowing the memory to be used with a variety of different properties.

The number of memory heaps is given by `memoryHeapCount` and is less than or equal to `VK_MAX_MEMORY_HEAPS`. Each heap is described by an element of the `memoryHeaps` array as a `VkMemoryHeap` structure. The number of memory types available across all memory heaps is given by `memoryTypeCount` and is less than or equal to `VK_MAX_MEMORY_TYPES`. Each memory type is described by an element of the `memoryTypes` array as a `VkMemoryType` structure.

At least one heap must include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` in `VkMemoryHeap::flags`. If there are multiple heaps that all have similar performance characteristics, they may all include `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT`. In a unified memory architecture (UMA) system there is often only a single memory heap which is considered to be equally “local” to the host and to the device, and such an implementation must advertise the heap as device-local.

Each memory type returned by `vkGetPhysicalDeviceMemoryProperties` must have its `propertyFlags` set to one of the following values:

- 0
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` | `VK_MEMORY_PROPERTY_HOST_CACHED_BIT`
- `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` |
VK_MEMORY_PROPERTY_HOST_CACHED_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORYPROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_CACHED_BIT
• VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT | VK_MEMORY_PROPERTY_LAZY_ALLOCATED_BIT
• VK_MEMORY_PROPERTY_PROTECTED_BIT
• VK_MEMORY_PROPERTY_PROTECTED_BIT | VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT

There must be at least one memory type with both the VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT and VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bits set in its propertyFlags. There must be at least one memory type with the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set in its propertyFlags.

For each pair of elements X and Y returned in memoryTypes, X must be placed at a lower index position than Y if:

• the set of bit flags returned in the propertyFlags member of X is a strict subset of the set of bit flags returned in the propertyFlags member of Y; or

• the propertyFlags members of X and Y are equal, and X belongs to a memory heap with greater performance (as determined in an implementation-specific manner)

There is no ordering requirement between X and Y elements for the case their propertyFlags members are not in a subset relation. That potentially allows more than one possible way to order the same set of memory types. Notice that the list of all allowed memory property flag combinations is written in a valid order. But if instead VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT was before VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT | VK_MEMORY_PROPERTY_HOST_COHERENT_BIT, the list would still be in a valid order.

This ordering requirement enables applications to use a simple search loop to select the desired memory type along the lines of:

```c
// Find a memory in `memoryTypeBitsRequirement` that includes all of `requiredProperties`
int32_t findProperties(const VkPhysicalDeviceMemoryProperties* pMemoryProperties,
                        uint32_t memoryTypeBitsRequirement,
```
 VkMemoryPropertyFlags requiredProperties) {
    const uint32_t memoryCount = pMemoryProperties->memoryTypeCount;
    for (uint32_t memoryIndex = 0; memoryIndex < memoryCount; ++memoryIndex) {
        const uint32_t memoryTypeBits = (1 << memoryIndex);
        const bool isRequiredMemoryType = memoryTypeBitsRequirement & memoryTypeBits;

        const VkMemoryPropertyFlags properties = pMemoryProperties->memoryTypes[memoryIndex].propertyFlags;
        const bool hasRequiredProperties = (properties & requiredProperties) == requiredProperties;

        if (isRequiredMemoryType && hasRequiredProperties)
            return static_cast<int32_t>(memoryIndex);
    }

    // failed to find memory type
    return -1;
}

// Try to find an optimal memory type, or if it does not exist try fallback memory type
// 'device' is the VkDevice
// 'image' is the VkImage that requires memory to be bound
// 'memoryProperties' properties as returned by vkGetPhysicalDeviceMemoryProperties
// 'requiredProperties' are the property flags that must be present
// 'optimalProperties' are the property flags that are preferred by the application
VkMemoryRequirements memoryRequirements;
vkGetImageMemoryRequirements(device, image, &memoryRequirements);
int32_t memoryType;
    memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, optimalProperties);
    if (memoryType == -1) // not found; try fallback properties
        memoryType = findProperties(&memoryProperties, memoryRequirements.memoryTypeBits, requiredProperties);

VK_MAX_MEMORY_TYPES is the length of an array of VkMemoryType structures describing memory types, as returned in VkPhysicalDeviceMemoryProperties::memoryTypes.

#define VK_MAX_MEMORY_TYPES 32U

VK_MAX_MEMORY_HEAPS is the length of an array of VkMemoryHeap structures describing memory heaps, as returned in VkPhysicalDeviceMemoryProperties::memoryHeaps.

#define VK_MAX_MEMORY_HEAPS 16U

To query memory properties, call:
void vkGetPhysicalDeviceMemoryProperties2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

or the equivalent command

void vkGetPhysicalDeviceMemoryProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceMemoryProperties2* pMemoryProperties);

- `physicalDevice` is the handle to the device to query.
- `pMemoryProperties` is a pointer to a `VkPhysicalDeviceMemoryProperties2` structure in which the properties are returned.

`vkGetPhysicalDeviceMemoryProperties2` behaves similarly to `vkGetPhysicalDeviceMemoryProperties`, with the ability to return extended information in a `pNext` chain of output structures.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceMemoryProperties2-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMemoryProperties2-pMemoryProperties-parameter `pMemoryProperties` must be a valid pointer to a `VkPhysicalDeviceMemoryProperties2` structure

The `VkPhysicalDeviceMemoryProperties2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMemoryProperties2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceMemoryProperties memoryProperties;
} VkPhysicalDeviceMemoryProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceMemoryProperties2 VkPhysicalDeviceMemoryProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `memoryProperties` is a `VkPhysicalDeviceMemoryProperties` structure which is populated with the same values as in `vkGetPhysicalDeviceMemoryProperties`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryProperties2-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PROPERTIES_2`

- VUID-VkPhysicalDeviceMemoryProperties2-pNext-pNext
  
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkPhysicalDeviceMemoryBudgetPropertiesEXT`

- VUID-VkPhysicalDeviceMemoryProperties2-sType-unique
  
  The `sType` value of each struct in the `pNext` chain **must** be unique

The `VkMemoryHeap` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryHeap {
    VkDeviceSize size;
    VkMemoryHeapFlags flags;
} VkMemoryHeap;
```

- `size` is the total memory size in bytes in the heap.
- `flags` is a bitmask of `VkMemoryHeapFlagBits` specifying attribute flags for the heap.

Bits which **may** be set in `VkMemoryHeap::flags`, indicating attribute flags for the heap, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkMemoryHeapFlagBits {
    VK_MEMORY_HEAP_DEVICE_LOCAL_BIT = 0x00000001,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT = 0x00000002,
    // Provided by VK_KHR_device_group_creation
    VK_MEMORY_HEAP_MULTI_INSTANCE_BIT_KHR = VK_MEMORY_HEAP_MULTI_INSTANCE_BIT,
} VkMemoryHeapFlagBits;
```

- `VK_MEMORY_HEAP_DEVICE_LOCAL_BIT` specifies that the heap corresponds to device-local memory. Device-local memory **may** have different performance characteristics than host-local memory, and **may** support different memory property flags.

- `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` specifies that in a logical device representing more than one physical device, there is a per-physical device instance of the heap memory. By default, an allocation from such a heap will be replicated to each physical device's instance of the heap.
typedef VkFlags VkMemoryHeapFlags;

VkMemoryHeapFlags is a bitmask type for setting a mask of zero or more VkMemoryHeapFlagBits.

The VkMemoryType structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkMemoryType {
    VkMemoryPropertyFlags propertyFlags;
    uint32_t heapIndex;
} VkMemoryType;
```

- **heapIndex** describes which memory heap this memory type corresponds to, and **must** be less than `memoryHeapCount` from the VkPhysicalDeviceMemoryProperties structure.
- **propertyFlags** is a bitmask of VkMemoryPropertyFlagBits of properties for this memory type.

Bits which **may** be set in VkMemoryType::propertyFlags, indicating properties of a memory type, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkMemoryPropertyFlagBits {
    VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT = 0x00000001,
    VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT = 0x00000002,
    VK_MEMORY_PROPERTY_HOST_COHERENT_BIT = 0x00000004,
    VK_MEMORY_PROPERTY_HOST_CACHED_BIT = 0x00000008,
    VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_MEMORY_PROPERTY_PROTECTED_BIT = 0x00000020,
} VkMemoryPropertyFlagBits;
```

- **VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT** bit specifies that memory allocated with this type is the most efficient for device access. This property will be set if and only if the memory type belongs to a heap with the VK_MEMORY_HEAP_DEVICE_LOCAL_BIT set.
- **VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT** bit specifies that memory allocated with this type can be mapped for host access using vkMapMemory.
- **VK_MEMORY_PROPERTY_HOST_COHERENT_BIT** bit specifies that the host cache management commands vkFlushMappedMemoryRanges and vkInvalidateMappedMemoryRanges are not needed to flush host writes to the device or make device writes visible to the host, respectively.
- **VK_MEMORY_PROPERTY_HOST_CACHED_BIT** bit specifies that memory allocated with this type is cached on the host. Host memory accesses to uncached memory are slower than to cached memory, however uncached memory is always host coherent.
- **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit specifies that the memory type only allows device access to the memory. Memory types **must** not have both
VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT and VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set. Additionally, the object’s backing memory may be provided by the implementation lazily as specified in Lazily Allocated Memory.

- VK_MEMORY_PROPERTY_PROTECTED_BIT bit specifies that the memory type only allows device access to the memory, and allows protected queue operations to access the memory. Memory types must not have VK_MEMORY_PROPERTY_PROTECTED_BIT set and any of VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT set, or VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, or VK_MEMORY_PROPERTY_HOST_CACHED_BIT set.

// Provided by VK_VERSION_1_0
typedef VkFlags VkMemoryPropertyFlags;

VkMemoryPropertyFlags is a bitmask type for setting a mask of zero or more VkMemoryPropertyFlagBits.

If the VkPhysicalDeviceMemoryBudgetPropertiesEXT structure is included in the pNext chain of VkPhysicalDeviceMemoryProperties2, it is filled with the current memory budgets and usages.

The VkPhysicalDeviceMemoryBudgetPropertiesEXT structure is defined as:

// Provided by VK_EXT_memory_budget
typedef struct VkPhysicalDeviceMemoryBudgetPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize heapBudget[VK_MAX_MEMORY_HEAPS];
    VkDeviceSize heapUsage[VK_MAX_MEMORY_HEAPS];
} VkPhysicalDeviceMemoryBudgetPropertiesEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- heapBudget is an array of VK_MAX_MEMORY_HEAPS VkDeviceSize values in which memory budgets are returned, with one element for each memory heap. A heap’s budget is a rough estimate of how much memory the process can allocate from that heap before allocations may fail or cause performance degradation. The budget includes any currently allocated device memory.
- heapUsage is an array of VK_MAX_MEMORY_HEAPS VkDeviceSize values in which memory usages are returned, with one element for each memory heap. A heap’s usage is an estimate of how much memory the process is currently using in that heap.

The values returned in this structure are not invariant. The heapBudget and heapUsage values must be zero for array elements greater than or equal to VkPhysicalDeviceMemoryProperties::memoryHeapCount. The heapBudget value must be non-zero for array elements less than VkPhysicalDeviceMemoryProperties::memoryHeapCount. The heapBudget value must be less than or equal to VkMemoryHeap::size for each heap.
11.2.2. Device Memory Objects

A Vulkan device operates on data in device memory via memory objects that are represented in the API by a `VkDeviceMemory` handle:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeviceMemory)
```

11.2.3. Device Memory Allocation

To allocate memory objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateMemory(
    VkDevice device,
    const VkMemoryAllocateInfo* pAllocateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDeviceMemory* pMemory);
```

- `device` is the logical device that owns the memory.
- `pAllocateInfo` is a pointer to a `VkMemoryAllocateInfo` structure describing parameters of the allocation. A successfully returned allocation must use the requested parameters—no substitution is permitted by the implementation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMemory` is a pointer to a `VkDeviceMemory` handle in which information about the allocated memory is returned.

Allocations returned by `vkAllocateMemory` are guaranteed to meet any alignment requirement of the implementation. For example, if an implementation requires 128 byte alignment for images and 64 byte alignment for buffers, the device memory returned through this mechanism would be 128-byte aligned. This ensures that applications can correctly suballocate objects of different types (with potentially different alignment requirements) in the same memory object.

When memory is allocated, its contents are undefined with the following constraint:

- The contents of unprotected memory must not be a function of the contents of data protected memory objects, even if those memory objects were previously freed.

**NOTE** The contents of memory allocated by one application should not be a function of data from protected memory objects of another application, even if those memory
objects were previously freed.

The maximum number of valid memory allocations that can exist simultaneously within a VkDevice may be restricted by implementation- or platform-dependent limits. The maxMemoryAllocationCount feature describes the number of allocations that can exist simultaneously before encountering these internal limits.

For historical reasons, if maxMemoryAllocationCount is exceeded, some implementations may return VK_ERROR_TOO_MANY_OBJECTS. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Many protected memory implementations involve complex hardware and system software support, and often have additional and much lower limits on the number of simultaneous protected memory allocations (from memory types with the VK_MEMORY_PROPERTY_PROTECTED_BIT property) than for non-protected memory allocations. These limits can be system-wide, and depend on a variety of factors outside of the Vulkan implementation, so they cannot be queried in Vulkan. Applications should use as few allocations as possible from such memory types by suballocating aggressively, and be prepared for allocation failure even when there is apparently plenty of capacity remaining in the memory heap. As a guideline, the Vulkan conformance test suite requires that at least 80 minimum-size allocations can exist concurrently when no other uses of protected memory are active in the system.

Some platforms may have a limit on the maximum size of a single allocation. For example, certain systems may fail to create allocations with a size greater than or equal to 4GB. Such a limit is implementation-dependent, and if such a failure occurs then the error VK_ERROR_OUT_OF_DEVICE_MEMORY must be returned. This limit is advertised in VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationSize.

### Valid Usage

- **VUID-vkAllocateMemory-pAllocateInfo-01713**
  
pAllocateInfo->allocationSize must be less than or equal to VkPhysicalDeviceMemoryProperties::memoryHeaps[memindex].size where memindex = VkPhysicalDeviceMemoryProperties::memoryTypes[pAllocateInfo->memoryTypeIndex].heapIndex as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that device was created from

- **VUID-vkAllocateMemory-pAllocateInfo-01714**
  
pAllocateInfo->memoryTypeIndex must be less than VkPhysicalDeviceMemoryProperties::memoryTypeCount as returned by vkGetPhysicalDeviceMemoryProperties for the VkPhysicalDevice that device was created from

- **VUID-vkAllocateMemory-maxMemoryAllocationCount-04101**
  
There must be less than VkPhysicalDeviceLimits::maxMemoryAllocationCount device memory allocations currently allocated on the device
Valid Usage (Implicit)

- VUID-vkAllocateMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkAllocateMemory-pAllocateInfo-parameter
  pAllocateInfo must be a valid pointer to a valid VkMemoryAllocateInfo structure

- VUID-vkAllocateMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkAllocateMemory-pMemory-parameter
  pMemory must be a valid pointer to a VkDeviceMemory handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkMemoryAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize allocationSize;
    uint32_t memoryTypeIndex;
} VkMemoryAllocateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `allocationSize` is the size of the allocation in bytes.
- `memoryTypeIndex` is an index identifying a memory type from the memoryTypes array of the VkPhysicalDeviceMemoryProperties structure.

The internal data of an allocated device memory object must include a reference to implementation-specific resources, referred to as the memory object's payload. Applications can also import and export that internal data to and from device memory objects to share data between
Vulkan instances and other compatible APIs. A \texttt{VkMemoryAllocateInfo} structure defines a memory import operation if its \texttt{pNext} chain includes one of the following structures:

- \texttt{VkImportMemoryWin32HandleInfoKHR} with a non-zero \texttt{handleType} value
- \texttt{VkImportMemoryFdInfoKHR} with a non-zero \texttt{handleType} value
- \texttt{VkImportMemoryHostPointerInfoEXT} with a non-zero \texttt{handleType} value

If the parameters define an import operation and the external handle type is \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT}, \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT}, or \texttt{VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT}, \texttt{allocationSize} is ignored. The implementation must query the size of these allocations from the OS.

Whether device memory objects constructed via a memory import operation hold a reference to their payload depends on the properties of the handle type used to perform the import, as defined below for each valid handle type. Importing memory must not modify the content of the memory. Implementations must ensure that importing memory does not enable the importing Vulkan instance to access any memory or resources in other Vulkan instances other than that corresponding to the memory object imported. Implementations must also ensure accessing imported memory which has not been initialized does not allow the importing Vulkan instance to obtain data from the exporting Vulkan instance or vice-versa.

\begin{table}[h]
\centering
\begin{tabular}{|c|p{\textwidth}|}
\hline
\textbf{NOTE} & How exported and imported memory is isolated is left to the implementation, but applications should be aware that such isolation may prevent implementations from placing multiple exportable memory objects in the same physical or virtual page. Hence, applications should avoid creating many small external memory objects whenever possible. \\
\hline
\end{tabular}
\end{table}

Importing memory must not increase overall heap usage within a system. However, it must affect the following per-process values:

- \texttt{VkPhysicalDeviceMaintenance3Properties::maxMemoryAllocationCount}
- \texttt{VkPhysicalDeviceMemoryBudgetPropertiesEXT::heapUsage}

When performing a memory import operation, it is the responsibility of the application to ensure the external handles and their associated payloads meet all valid usage requirements. However, implementations must perform sufficient validation of external handles and payloads to ensure that the operation results in a valid memory object which will not cause program termination, device loss, queue stalls, or corruption of other resources when used as allowed according to its allocation parameters. If the external handle provided does not meet these requirements, the implementation must fail the memory import operation with the error code \texttt{VK_ERROR_INVALID_EXTERNAL_HANDLE}.

\begin{table}[h]
\centering
\begin{tabular}{|c|}
\hline
\textbf{Valid Usage} \\
\hline
- \texttt{VUID-VkMemoryAllocateInfo-allocationSize-07897} \\
  If the parameters do not define an import or export operation, \texttt{allocationSize} must be \\
\hline
\end{tabular}
\end{table}
greater than 0

- VUID-VkMemoryAllocateInfo-None-00657
  The parameters **must** not define more than one **import operation**

- VUID-VkMemoryAllocateInfo-allocationSize-07899
  If the parameters define an export operation, **allocationSize must** be greater than 0

- VUID-VkMemoryAllocateInfo-pNext-00639
  If the `pNext` chain includes a `VkExportMemoryAllocateInfo` structure, and any of the handle types specified in `VkExportMemoryAllocateInfo::handleTypes` require a dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures`, or by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`, the `pNext` chain **must** include a `VkMemoryDedicatedAllocateInfo` or `VkDedicatedAllocationMemoryAllocateInfoNV` structure with either its `image` or `buffer` member set to a value other than `VK_NULL_HANDLE`

- VUID-VkMemoryAllocateInfo-allocationSize-01742
  If the parameters define an import operation, the external handle specified was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the payload being imported was created

- VUID-VkMemoryAllocateInfo-None-00643
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the device mask specified by `VkMemoryAllocateFlagsInfo` must match the mask specified when the payload being imported was allocated

- VUID-VkMemoryAllocateInfo-None-00644
  If the parameters define an import operation and the external handle specified was created by the Vulkan API, the list of physical devices that comprise the logical device passed to `vkAllocateMemory must` match the list of physical devices that comprise the logical device on which the payload was originally allocated

- VUID-VkMemoryAllocateInfo-memoryTypeIndex-00645
  If the parameters define an import operation and the external handle is an NT handle or a global share handle created outside of the Vulkan API, the value of `memoryTypeIndex` **must** be one of those returned by `vkGetMemoryWin32HandlePropertiesKHR`

- VUID-VkMemoryAllocateInfo-allocationSize-01743
  If the parameters define an import operation, the external handle was created by the Vulkan API, and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT`, then the values of `allocationSize` and `memoryTypeIndex` **must** match those specified when the payload being imported was created

- VUID-VkMemoryAllocateInfo-allocationSize-00647
  If the parameters define an import operation and the external handle type is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT`, **allocationSize must** match the size specified when creating the Direct3D 12 heap from which the payload was extracted
• VUID-VkMemoryAllocateInfo-memoryTypeIndex-00648
  If the parameters define an import operation and the external handle is a POSIX file
descriptor created outside of the Vulkan API, the value of memoryTypeIndex must be one of
those returned by vkGetMemoryFdPropertiesKHR

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-01872
  If the protectedMemory feature is not enabled, the VkMemoryAllocateInfo::memoryTypeIndex
  must not indicate a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-VkMemoryAllocateInfo-memoryTypeIndex-01744
  If the parameters define an import operation and the external handle is a host pointer,
  the value of memoryTypeIndex must be one of those returned by
  vkGetMemoryHostPointerPropertiesEXT

• VUID-VkMemoryAllocateInfo-allocationSize-01745
  If the parameters define an import operation and the external handle is a host pointer,
allocationSize must be an integer multiple of
  VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment

• VUID-VkMemoryAllocateInfo-pNext-02806
  If the parameters define an import operation and the external handle is a host pointer,
  the pNext chain must not include a VkMemoryDedicatedAllocateInfo structure with either
  its image or buffer field set to a value other than VK_NULL_HANDLE

• VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03329
  If VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress is not zero,
  VkMemoryAllocateFlagsInfo::flags must include
  VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

• VUID-VkMemoryAllocateInfo-flags-03330
  If VkMemoryAllocateFlagsInfo::flags includes
  VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
  the bufferDeviceAddressCaptureReplay feature must be enabled

• VUID-VkMemoryAllocateInfo-flags-03331
  If VkMemoryAllocateFlagsInfo::flags includes VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
  the bufferDeviceAddress feature must be enabled

• VUID-VkMemoryAllocateInfo-pNext-03332
  If the pNext chain includes a VkImportMemoryHostPointerInfoEXT structure,
  VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

• VUID-VkMemoryAllocateInfo-opaqueCaptureAddress-03333
  If the parameters define an import operation,
  VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress must be zero

Valid Usage (Implicit)

• VUID-VkMemoryAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_INFO

• VUID-VkMemoryAllocateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either
If the `pNext` chain includes a `VkMemoryDedicatedAllocateInfo` structure, then that structure includes a handle of the sole buffer or image resource that the memory can be bound to.

The `VkMemoryDedicatedAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkBuffer buffer;
} VkMemoryDedicatedAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedAllocateInfo VkMemoryDedicatedAllocateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is `VK_NULL_HANDLE` or a handle of an image which this memory will be bound to.
- `buffer` is `VK_NULL_HANDLE` or a handle of a buffer which this memory will be bound to.

### Valid Usage

- VUID-VkMemoryDedicatedAllocateInfo-image-01432
  At least one of `image` and `buffer` must be `VK_NULL_HANDLE`

- VUID-VkMemoryDedicatedAllocateInfo-image-02964
  If `image` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the `VkMemoryRequirements::size` of the image

- VUID-VkMemoryDedicatedAllocateInfo-image-01434
  If `image` is not `VK_NULL_HANDLE`, `image` must have been created without `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in `VkImageCreateInfo::flags`

- VUID-VkMemoryDedicatedAllocateInfo-buffer-02965
  If `buffer` is not `VK_NULL_HANDLE`, `VkMemoryAllocateInfo::allocationSize` must equal the
VkMemoryRequirements::size of the buffer

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01436
  If buffer is not VK_NULL_HANDLE, buffer must have been created without VK_BUFFER_CREATE_SPARSE_BINDING_BIT set in VkBufferCreateInfo::flags

- VUID-VkMemoryDedicatedAllocateInfo-image-01876
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01877
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT, and the external handle was created by the Vulkan API, then the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-image-01878
  If image is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated image allocation and image must be identical to the image associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-buffer-01879
  If buffer is not VK_NULL_HANDLE and VkMemoryAllocateInfo defines a memory import operation with handle type VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT, the memory being imported must also be a dedicated buffer allocation and buffer must be identical to the buffer associated with the imported memory

- VUID-VkMemoryDedicatedAllocateInfo-image-01797
  If image is not VK_NULL_HANDLE, image must not have been created with VK_IMAGE_CREATE_DISJOINT_BIT set in VkImageCreateInfo::flags

### Valid Usage (Implicit)

- VUID-VkMemoryDedicatedAllocateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_DEDICATED_ALLOCATE_INFO

- VUID-VkMemoryDedicatedAllocateInfo-image-parameter
If the `pNext` chain includes a `VkMemoryPriorityAllocateInfoEXT` structure, then that structure includes a priority for the memory.

The `VkMemoryPriorityAllocateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_memory_priority
typedef struct VkMemoryPriorityAllocateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float priority;
} VkMemoryPriorityAllocateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `priority` is a floating-point value between 0 and 1, indicating the priority of the allocation relative to other memory allocations. Larger values are higher priority. The granularity of the priorities is implementation-dependent.

Memory allocations with higher priority may be more likely to stay in device-local memory when the system is under memory pressure.

If this structure is not included, it is as if the `priority` value were 0.5.

### Valid Usage

- **VUID-VkMemoryPriorityAllocateInfoEXT-priority-02602**

  `priority` must be between 0 and 1, inclusive

### Valid Usage (Implicit)

- **VUID-VkMemoryPriorityAllocateInfoEXT-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_PRIORITY_ALLOCATE_INFO_EXT`

When allocating memory whose payload may be exported to another process or Vulkan instance, add a `VkExportMemoryAllocateInfo` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure, specifying the handle types that may be exported.
The VkExportMemoryAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExportMemoryAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExportMemoryAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExportMemoryAllocateInfo VkExportMemoryAllocateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `handleTypes` is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more memory handle types the application can export from the resulting allocation. The application can request multiple handle types for the same allocation.

**Valid Usage**

- VUID-VkExportMemoryAllocateInfo-handleTypes-00656
  The bits in `handleTypes` must be supported and compatible, as reported by VkExternalImageFormatProperties or VkExternalBufferProperties

**Valid Usage (Implicit)**

- VUID-VkExportMemoryAllocateInfo-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_EXPORT_MEMORY_ALLOCATE_INFO

- VUID-VkExportMemoryAllocateInfo-handleTypes-parameter
  `handleTypes` must be a valid combination of VkExternalMemoryHandleTypeFlagBits values

### 11.2.4. Win32 External Memory

To specify additional attributes of NT handles exported from a memory object, add a VkExportMemoryWin32HandleInfoKHR structure to the `pNext` chain of the VkMemoryAllocateInfo structure. The VkExportMemoryWin32HandleInfoKHR structure is defined as:
typedef struct VkExportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const SECURITY_ATTRIBUTES* pAttributes;
    DWORD dwAccess;
    LPCWSTR name;
} VkExportMemoryWin32HandleInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pAttributes** is a pointer to a Windows `SECURITY_ATTRIBUTES` structure specifying security attributes of the handle.
- **dwAccess** is a `DWORD` specifying access rights of the handle.
- **name** is a null-terminated UTF-16 string to associate with the payload referenced by NT handles exported from the created memory.

If `VkExportMemoryAllocateInfo` is not included in the same `pNext` chain, this structure is ignored.

If `VkExportMemoryAllocateInfo` is included in the `pNext` chain of `VkMemoryAllocateInfo` with a Windows `handleType`, but either `VkExportMemoryWin32HandleInfoKHR` is not included in the `pNext` chain, or it is included but `pAttributes` is set to NULL, default security descriptor values will be used, and child processes created by the application will not inherit the handle, as described in the MSDN documentation for “Synchronization Object Security and Access Rights”.

For handles of the following types:

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT**

The implementation must ensure the access rights allow read and write access to the memory.

### Valid Usage

- **VUID-VkExportMemoryWin32HandleInfoKHR-handleTypes-00657**

If `VkExportMemoryAllocateInfo::handleTypes` does not include `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT`, a `VkExportMemoryWin32HandleInfoKHR` structure must not be included in the `pNext` chain of `VkMemoryAllocateInfo`. 

---

708
Valid Usage (Implicit)

- VUID-VkExportMemoryWin32HandleInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXPORT_MEMORY_WIN32_HANDLE_INFO_KHR

- VUID-VkExportMemoryWin32HandleInfoKHR-pAttributes-parameter
  If pAttributes is not NULL, pAttributes must be a valid pointer to a valid SECURITY_ATTRIBUTES value

To import memory from a Windows handle, add a VkImportMemoryWin32HandleInfoKHR structure to the pNext chain of the VkMemoryAllocateInfo structure.

The VkImportMemoryWin32HandleInfoKHR structure is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkImportMemoryWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    HANDLE handle;
    LPCWSTR name;
} VkImportMemoryWin32HandleInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the type of handle or name.
- handle is NULL or the external handle to import.
- name is NULL or a null-terminated UTF-16 string naming the payload to import.

Importing memory object payloads from Windows handles does not transfer ownership of the handle to the Vulkan implementation. For handle types defined as NT handles, the application must release handle ownership using the CloseHandle system call when the handle is no longer needed. For handle types defined as NT handles, the imported memory object holds a reference to its payload.

NOTE
Non-NT handle import operations do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct VkDeviceMemory object.
Valid Usage

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00658
  If `handleType` is not 0, it **must** be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`.

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-00659
  The memory from which `handle` was exported, or the memory named by `name` **must** have been created on the same underlying physical device as `device`.

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-00660
  If `handleType` is not 0, it **must** be defined as an NT handle or a global share handle.

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-01439
  If `handleType` is not 0, and `handle` is NULL, `name` **must** name a valid memory resource of the type specified by `handleType`.

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01441
  If `handle` is not NULL, `name` **must** be NULL.

- VUID-VkImportMemoryWin32HandleInfoKHR-handle-01518
  If `handle` is not NULL, it **must** obey any requirements listed for `handleType` in external memory handle types compatibility.

- VUID-VkImportMemoryWin32HandleInfoKHR-name-01519
  If `name` is not NULL, it **must** obey any requirements listed for `handleType` in external memory handle types compatibility.

Valid Usage (Implicit)

- VUID-VkImportMemoryWin32HandleInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_WIN32_HANDLE_INFO_KHR`.

- VUID-VkImportMemoryWin32HandleInfoKHR-handleType-parameter
  If `handleType` is not 0, `handleType` **must** be a valid `VkExternalMemoryHandleTypeFlagBits` value.

To export a Windows handle representing the payload of a Vulkan device memory object, call:
VkResult vkGetMemoryWin32HandleKHR(
    VkDevice device, const VkMemoryGetWin32HandleInfoKHR* pGetWin32HandleInfo, HANDLE* pHandle);

- `device` is the logical device that created the device memory being exported.
- `pGetWin32HandleInfo` is a pointer to a `VkMemoryGetWin32HandleInfoKHR` structure containing parameters of the export operation.
- `pHandle` will return the Windows handle representing the payload of the device memory object.

For handle types defined as NT handles, the handles returned by `vkGetMemoryWin32HandleKHR` are owned by the application and hold a reference to their payload. To avoid leaking resources, the application must release ownership of them using the `CloseHandle` system call when they are no longer needed.

**NOTE**

Non-NT handle types do not add a reference to their associated payload. If the original object owning the payload is destroyed, all resources and handles sharing that payload will become invalid.

**Valid Usage (Implicit)**

- VUID-vkGetMemoryWin32HandleKHR-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetMemoryWin32HandleKHR-pGetWin32HandleInfo-parameter `pGetWin32HandleInfo` must be a valid pointer to a valid `VkMemoryGetWin32HandleInfoKHR` structure
- VUID-vkGetMemoryWin32HandleKHR-pHandle-parameter `pHandle` must be a valid pointer to a `HANDLE` value

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkMemoryGetWin32HandleInfoKHR` structure is defined as:
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryGetWin32HandleInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetWin32HandleInfoKHR;

• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **memory** is the memory object from which the handle will be exported.
• **handleType** is a [VkExternalMemoryHandleTypeFlagBits](#) value specifying the type of handle requested.

The properties of the handle returned depend on the value of **handleType**. See [VkExternalMemoryHandleTypeFlagBits](#) for a description of the properties of the defined external memory handle types.

**Valid Usage**

• [VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00662](#) **handleType** must have been included in [VkExportMemoryAllocateInfo::handleTypes](#) when **memory** was created

• [VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00663](#) If **handleType** is defined as an NT handle, [vkGetMemoryWin32HandleKHR](#) must be called no more than once for each valid unique combination of **memory** and **handleType**

• [VUID-VkMemoryGetWin32HandleInfoKHR-handleType-00664](#) **handleType** must be defined as an NT handle or a global share handle

**Valid Usage (Implicit)**

• [VUID-VkMemoryGetWin32HandleInfoKHR-sType-sType](#) **sType** must be [VK_STRUCTURE_TYPE_MEMORY_GET_WIN32_HANDLE_INFO_KHR](#)

• [VUID-VkMemoryGetWin32HandleInfoKHR-pNext-pNext](#) **pNext** must be **NULL**

• [VUID-VkMemoryGetWin32HandleInfoKHR-memory-parameter](#) **memory** must be a valid [VkDeviceMemory](#) handle

• [VUID-VkMemoryGetWin32HandleInfoKHR-handleType-parameter](#) **handleType** must be a valid [VkExternalMemoryHandleTypeFlagBits](#) value

Windows memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when
importing such handles, call:

```c
// Provided by VK_KHR_external_memory_win32
VkResult vkGetMemoryWin32HandlePropertiesKHR(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    HANDLE handle,
    VkMemoryWin32HandlePropertiesKHR* pMemoryWin32HandleProperties);
```

- `device` is the logical device that will be importing `handle`.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `handle`.
- `handle` is the handle which will be imported.
- `pMemoryWin32HandleProperties` is a pointer to a `VkMemoryWin32HandlePropertiesKHR` structure in which properties of `handle` are returned.

**Valid Usage**

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handle-00665
  
  handle must point to a valid Windows memory handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-00666
  
  handleType must not be one of the handle types defined as opaque

**Valid Usage (Implicit)**

- VUID-vkGetMemoryWin32HandlePropertiesKHR-device-parameter
  
  device must be a valid `VkDevice` handle

- VUID-vkGetMemoryWin32HandlePropertiesKHR-handleType-parameter
  
  handleType must be a valid `VkExternalMemoryHandleTypeFlagBits` value

- VUID-vkGetMemoryWin32HandlePropertiesKHR-pMemoryWin32HandleProperties-parameter
  
  pMemoryWin32HandleProperties must be a valid pointer to a `VkMemoryWin32HandlePropertiesKHR` structure

**Return Codes**

- **Success**
  
  - `VK_SUCCESS`

- **Failure**
  
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_INVALID_EXTERNAL_HANDLE`
The `VkMemoryWin32HandlePropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_win32
typedef struct VkMemoryWin32HandlePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryWin32HandlePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the specified windows handle can be imported as.

**Valid Usage (Implicit)**

- VUID-VkMemoryWin32HandlePropertiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_WIN32_HANDLE_PROPERTIES_KHR`
- VUID-VkMemoryWin32HandlePropertiesKHR-pNext-pNext
  `pNext` must be `NULL`

### 11.2.5. File Descriptor External Memory

To import memory from a POSIX file descriptor handle, add a `VkImportMemoryFdInfoKHR` structure to the `pNext` chain of the `VkMemoryAllocateInfo` structure. The `VkImportMemoryFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkImportMemoryFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    int fd;
} VkImportMemoryFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the handle type of `fd`.
- `fd` is the external handle to import.

Importing memory from a file descriptor transfers ownership of the file descriptor from the application to the Vulkan implementation. The application must not perform any operations on the file descriptor after a successful import. The imported memory object holds a reference to its payload.
Applications can import the same payload into multiple instances of Vulkan, into the same instance from which it was exported, and multiple times into a given Vulkan instance. In all cases, each import operation must create a distinct 

**Valid Usage**

- VUID-VkImportMemoryFdInfoKHR-handleType-00667
  
  If `handleType` is not 0, it must be supported for import, as reported by `VkExternalImageFormatProperties` or `VkExternalBufferProperties`

- VUID-VkImportMemoryFdInfoKHR-fd-00668
  
  The memory from which `fd` was exported must have been created on the same underlying physical device as `device`

- VUID-VkImportMemoryFdInfoKHR-handleType-00669
  
  If `handleType` is not 0, it must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`

- VUID-VkImportMemoryFdInfoKHR-handleType-00670
  
  If `handleType` is not 0, `fd` must be a valid handle of the type specified by `handleType`

- VUID-VkImportMemoryFdInfoKHR-fd-01746
  
  The memory represented by `fd` must have been created from a physical device and driver that is compatible with `device` and `handleType`, as described in External memory handle types compatibility

- VUID-VkImportMemoryFdInfoKHR-fd-01520
  
  `fd` must obey any requirements listed for `handleType` in external memory handle types compatibility

**Valid Usage (Implicit)**

- VUID-VkImportMemoryFdInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_FD_INFO_KHR`

- VUID-VkImportMemoryFdInfoKHR-handleType-parameter
  
  If `handleType` is not 0, `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

To export a POSIX file descriptor referencing the payload of a Vulkan device memory object, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdKHR(
    VkDevice            device,
    const VkMemoryGetFdInfoKHR* pGetInfo,
    int*                 pfd);
```

- `device` is the logical device that created the device memory being exported.
• `pGetFdInfo` is a pointer to a `VkMemoryGetFdInfoKHR` structure containing parameters of the export operation.

• `pFd` will return a file descriptor referencing the payload of the device memory object.

Each call to `vkGetMemoryFdKHR` must create a new file descriptor holding a reference to the memory object’s payload and transfer ownership of the file descriptor to the application. To avoid leaking resources, the application must release ownership of the file descriptor using the `close` system call when it is no longer needed, or by importing a Vulkan memory object from it. Where supported by the operating system, the implementation must set the file descriptor to be closed automatically when an `execve` system call is made.

---

### Valid Usage (Implicit)

- VUID-vkGetMemoryFdKHR-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetMemoryFdKHR-pGetFdInfo-parameter
  - `pGetFdInfo` must be a valid pointer to a valid `VkMemoryGetFdInfoKHR` structure

- VUID-vkGetMemoryFdKHR-pFd-parameter
  - `pFd` must be a valid pointer to an `int` value

---

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

---

The `VkMemoryGetFdInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryGetFdInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkMemoryGetFdInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` is the memory object from which the handle will be exported.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of handle
The properties of the file descriptor exported depend on the value of `handleType`. See `VkExternalMemoryHandleTypeFlagBits` for a description of the properties of the defined external memory handle types.

**NOTE**

The size of the exported file may be larger than the size requested by `VkMemoryAllocateInfo::allocationSize`. If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`, then the application can query the file’s actual size with `lseek`.

## Valid Usage

- VUID-VkMemoryGetFdInfoKHR-handleType-00671
  - `handleType` must have been included in `VkExportMemoryAllocateInfo::handleTypes` when memory was created

- VUID-VkMemoryGetFdInfoKHR-handleType-00672
  - `handleType` must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT`

## Valid Usage (Implicit)

- VUID-VkMemoryGetFdInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_GET_FD_INFO_KHR`

- VUID-VkMemoryGetFdInfoKHR-pNext-pNext
  - `pNext` must be `NULL`

- VUID-VkMemoryGetFdInfoKHR-memory-parameter
  - `memory` must be a valid `VkDeviceMemory` handle

- VUID-VkMemoryGetFdInfoKHR-handleType-parameter
  - `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

POSIX file descriptor memory handles compatible with Vulkan may also be created by non-Vulkan APIs using methods beyond the scope of this specification. To determine the correct parameters to use when importing such handles, call:

```c
// Provided by VK_KHR_external_memory_fd
VkResult vkGetMemoryFdPropertiesKHR(
    VkDevice device,                     /* device, */
    VkExternalMemoryHandleTypeFlagBits  /* handleType, */
    int                                 /* fd, */
    VkMemoryFdPropertiesKHR*            /* pMemoryFdProperties */);
```

- `device` is the logical device that will be importing `fd`. 
• **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `fd`.

• `fd` is the handle which will be imported.

• **pMemoryFdProperties** is a pointer to a `VkMemoryFdPropertiesKHR` structure in which the properties of the handle `fd` are returned.

---

**Valid Usage**

• VUID-vkGetMemoryFdPropertiesKHR-fd-00673
  
  `fd` must point to a valid POSIX file descriptor memory handle

• VUID-vkGetMemoryFdPropertiesKHR-handleType-00674
  
  `handleType` must not be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT`

---

**Valid Usage (Implicit)**

• VUID-vkGetMemoryFdPropertiesKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

• VUID-vkGetMemoryFdPropertiesKHR-handleType-parameter
  
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

• VUID-vkGetMemoryFdPropertiesKHR-pMemoryFdProperties-parameter
  
  `pMemoryFdProperties` must be a valid pointer to a `VkMemoryFdPropertiesKHR` structure

---

**Return Codes**

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_INVALID_EXTERNAL_HANDLE`

---

The `VkMemoryFdPropertiesKHR` structure returned is defined as:

```c
// Provided by VK_KHR_external_memory_fd
typedef struct VkMemoryFdPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryFdPropertiesKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.
memoryTypeBits is a bitmask containing one bit set for every memory type which the specified file descriptor can be imported as.

Valid Usage (Implicit)

- VUID-VkMemoryFdPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_FD_PROPERTIES_KHR
- VUID-VkMemoryFdPropertiesKHR-pNext-pNext
  pNext must be NULL

11.2.6. Host External Memory

To import memory from a host pointer, add a VkImportMemoryHostPointerInfoEXT structure to the pNext chain of the VkMemoryAllocateInfo structure. The VkImportMemoryHostPointerInfoEXT structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
typedef struct VkImportMemoryHostPointerInfoEXT {
    VkStructureType    sType;
    const void*        pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
    void*              pHostPointer;
} VkImportMemoryHostPointerInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalMemoryHandleTypeFlagBits value specifying the handle type.
- pHostPointer is the host pointer to import from.

Importing memory from a host pointer shares ownership of the memory between the host and the Vulkan implementation. The application can continue to access the memory through the host pointer but it is the application’s responsibility to synchronize device and non-device access to the payload as defined in Host Access to Device Memory Objects.

Applications can import the same payload into multiple instances of Vulkan and multiple times into a given Vulkan instance. However, implementations may fail to import the same payload multiple times into a given physical device due to platform constraints.

Importing memory from a particular host pointer may not be possible due to additional platform-specific restrictions beyond the scope of this specification in which case the implementation must fail the memory import operation with the error code VK_ERROR_INVALID_EXTERNAL_HANDLE_KHR.

Whether device memory objects imported from a host pointer hold a reference to their payload is undefined. As such, the application must ensure that the imported memory range remains valid and accessible for the lifetime of the imported memory object.
Implementations may support importing host pointers for memory types which are not host-visible. In this case, after a successful call to `vkAllocateMemory`, the memory range imported from `pHostPointer` must not be accessed by the application until the `VkDeviceMemory` has been destroyed. Memory contents for the host memory becomes undefined on import, and is left undefined after the `VkDeviceMemory` has been destroyed. Applications must also not access host memory which is mapped to the same physical memory as `pHostPointer`, but mapped to a different host pointer while the `VkDeviceMemory` handle is valid. Implementations running on general-purpose operating systems should not support importing host pointers for memory types which are not host-visible.

**NOTE** Using host pointers to back non-host visible allocations is a platform-specific use case, and applications should not attempt to do this unless instructed by the platform.

### Valid Usage

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01747**
  If `handleType` is not 0, it must be supported for import, as reported in `VkExternalMemoryProperties`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01748**
  If `handleType` is not 0, it must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- **VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-01749**
  `pHostPointer` must be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01750**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, `pHostPointer` must be a pointer to `allocationSize` number of bytes of host memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-01751**
  If `handleType` is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, `pHostPointer` must be a pointer to `allocationSize` number of bytes of host mapped foreign memory, where `allocationSize` is the member of the `VkMemoryAllocateInfo` structure this structure is chained to

### Valid Usage (Implicit)

- **VUID-VkImportMemoryHostPointerInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_HOST_POINTER_INFO_EXT`

- **VUID-VkImportMemoryHostPointerInfoEXT-handleType-parameter**
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value

- **VUID-VkImportMemoryHostPointerInfoEXT-pHostPointer-parameter**
  `pHostPointer` must be a pointer value
To determine the correct parameters to use when importing host pointers, call:

```c
// Provided by VK_EXT_external_memory_host
VkResult vkGetMemoryHostPointerPropertiesEXT(
    VkDevice device,
    VkExternalMemoryHandleTypeFlagBits handleType,
    const void* pHostPointer,
    VkMemoryHostPointerPropertiesEXT* pMemoryHostPointerProperties);
```

- `device` is the logical device that will be importing `pHostPointer`.
- `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the type of the handle `pHostPointer`.
- `pHostPointer` is the host pointer to import from.
- `pMemoryHostPointerProperties` is a pointer to a `VkMemoryHostPointerPropertiesEXT` structure in which the host pointer properties are returned.

**Valid Usage**

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01752
  handleType must be `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-01753
  pHostPointer must be a pointer aligned to an integer multiple of `VkPhysicalDeviceExternalMemoryHostPropertiesEXT::minImportedHostPointerAlignment`

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01754
  If handleType is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT`, pHostPointer must be a pointer to host memory

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-01755
  If handleType is `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`, pHostPointer must be a pointer to host mapped foreign memory

**Valid Usage (Implicit)**

- VUID-vkGetMemoryHostPointerPropertiesEXT-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetMemoryHostPointerPropertiesEXT-handleType-parameter
  handleType must be a valid `VkExternalMemoryHandleTypeFlagBits` value

- VUID-vkGetMemoryHostPointerPropertiesEXT-pHostPointer-parameter
  pHostPointer must be a pointer value

- VUID-vkGetMemoryHostPointerPropertiesEXT-pMemoryHostPointerProperties-parameter
  pMemoryHostPointerProperties must be a valid pointer to a
The VkMemoryHostPointerPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_external_memory_host
typedef struct VkMemoryHostPointerPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
} VkMemoryHostPointerPropertiesEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryTypeBits** is a bitmask containing one bit set for every memory type which the specified host pointer can be imported as.

The value returned by memoryTypeBits should only include bits that identify memory types which are host visible. Implementations may include bits that identify memory types which are not host visible. Behavior for imported pointers of such types is defined by VkImportMemoryHostPointerInfoEXT.

### Valid Usage (Implicit)

- VUID-VkMemoryHostPointerPropertiesEXT-sType-sType
  - sType must be VK_STRUCTURE_TYPE_MEMORY_HOST_POINTER_PROPERTIES_EXT
- VUID-VkMemoryHostPointerPropertiesEXT-pNext-pNext
  - pNext must be NULL

### 11.2.7. Device Group Memory Allocations

If the pNext chain of VkMemoryAllocateInfo includes a VkMemoryAllocateFlagsInfo structure, then that structure includes flags and a device mask controlling how many instances of the memory will be allocated.

The VkMemoryAllocateFlagsInfo structure is defined as:
or the equivalent

// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagsInfo VkMemoryAllocateFlagsInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkMemoryAllocateFlagBits` controlling the allocation.
- **deviceMask** is a mask of physical devices in the logical device, indicating that memory **must** be allocated on each device in the mask, if `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set in `flags`.

If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is not set, the number of instances allocated depends on whether `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set in the memory heap. If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is set, then memory is allocated for every physical device in the logical device (as if `deviceMask` has bits set for all device indices). If `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` is not set, then a single instance of memory is allocated (as if `deviceMask` is set to one).

On some implementations, allocations from a multi-instance heap **may** consume memory on all physical devices even if the `deviceMask` excludes some devices. If `VkPhysicalDeviceGroupProperties::subsetAllocation` is `VK_TRUE`, then memory is only consumed for the devices in the device mask.

**NOTE**
In practice, most allocations on a multi-instance heap will be allocated across all physical devices. Unicast allocation support is an optional optimization for a minority of allocations.

**Valid Usage**

- **VUID-VkMemoryAllocateFlagsInfo-deviceMask-00675**
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** be a valid device mask
- **VUID-VkMemoryAllocateFlagsInfo-deviceMask-00676**
  If `VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT` is set, `deviceMask` **must** not be zero
Valid Usage (Implicit)

- VUID-VkMemoryAllocateFlagsInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_ALLOCATE_FLAGS_INFO

- VUID-VkMemoryAllocateFlagsInfo-flags-parameter
  flags must be a valid combination of VkMemoryAllocateFlagBits values

Bits which can be set in VkMemoryAllocateFlagsInfo::flags, controlling device memory allocation, are:

```cpp
// Provided by VK_VERSION_1_1
typedef enum VkMemoryAllocateFlagBits {
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT = 0x00000001,

    // Provided by VK_VERSION_1_2
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT = 0x00000002,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000004,

    // Provided by VK_KHR_device_group
    VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT,

    // Provided by VK_KHR_buffer_device_address
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT_KHR = VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT,
    VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = VK_MEMORY_ALLOCATEDEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkMemoryAllocateFlagBits;
```

or the equivalent

```cpp
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlagBits VkMemoryAllocateFlagBitsKHR;
```

- VK_MEMORY_ALLOCATE_DEVICE_MASK_BIT specifies that memory will be allocated for the devices in VkMemoryAllocateFlagsInfo::deviceMask.

- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT specifies that the memory can be attached to a buffer object created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set in usage, and that the memory handle can be used to retrieve an opaque address via vkGetDeviceMemoryOpaqueCaptureAddress.

- VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT specifies that the memory’s address can be saved and reused on a subsequent run (e.g. for trace capture and replay), see VkBufferOpaqueCaptureAddressCreateInfo for more detail.
or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkMemoryAllocateFlags VkMemoryAllocateFlagsKHR;
```

**VkMemoryAllocateFlags** is a bitmask type for setting a mask of zero or more **VkMemoryAllocateFlagBits**.

### 11.2.8. Opaque Capture Address Allocation

To request a specific device address for a memory allocation, add a **VkMemoryOpaqueCaptureAddressAllocateInfo** structure to the **pNext** chain of the **VkMemoryAllocateInfo** structure. The **VkMemoryOpaqueCaptureAddressAllocateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkMemoryOpaqueCaptureAddressAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkMemoryOpaqueCaptureAddressAllocateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkMemoryOpaqueCaptureAddressAllocateInfo
    VkMemoryOpaqueCaptureAddressAllocateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **opaqueCaptureAddress** is the opaque capture address requested for the memory allocation.

If **opaqueCaptureAddress** is zero, no specific address is requested.

If **opaqueCaptureAddress** is not zero, it **should** be an address retrieved from **vkGetDeviceMemoryOpaqueCaptureAddress** on an identically created memory allocation on the same implementation.

**NOTE**

In most cases, it is expected that a non-zero **opaqueAddress** is an address retrieved from **vkGetDeviceMemoryOpaqueCaptureAddress** on an identically created memory allocation. If this is not the case, it is likely that **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS** errors will occur.

This is, however, not a strict requirement because trace capture/replay tools may need to adjust memory allocation parameters for imported memory.
If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

### Valid Usage (Implicit)

- `VUID-VkMemoryOpaqueCaptureAddressAllocateInfo-sType-sType`
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_OPAQUE_CAPTURE_ADDRESS_ALLOCATE_INFO`

#### 11.2.9. Freeing Device Memory

To free a memory object, call:

```c
// Provided by VK_VERSION_1_0
void vkFreeMemory(
    VkDevice device,
    VkDeviceMemory memory,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that owns the memory.
- `memory` is the `VkDeviceMemory` object to be freed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

Before freeing a memory object, an application must ensure the memory object is no longer in use by the device — for example by command buffers in the pending state. Memory can be freed whilst still bound to resources, but those resources must not be used afterwards. Freeing a memory object releases the reference it held, if any, to its payload. If there are still any bound images or buffers, the memory object's payload may not be immediately released by the implementation, but must be released by the time all bound images and buffers have been destroyed. Once all references to a payload are released, it is returned to the heap from which it was allocated.

How memory objects are bound to Images and Buffers is described in detail in the Resource Memory Association section.

If a memory object is mapped at the time it is freed, it is implicitly unmapped.

**NOTE**

As described below, host writes are not implicitly flushed when the memory object is unmapped, but the implementation must guarantee that writes that have not been flushed do not affect any other memory.

### Valid Usage

- `VUID-vkFreeMemory-memory-00677`
  - All submitted commands that refer to `memory` (via images or buffers) must have completed execution
Valid Usage (Implicit)

- VUID-vkFreeMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkFreeMemory-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-vkFreeMemory-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
  VkAllocationCallbacks structure

- VUID-vkFreeMemory-memory-parent
  If memory is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to memory must be externally synchronized

11.2.10. Host Access to Device Memory Objects

Memory objects created with vkAllocateMemory are not directly host accessible.

Memory objects created with the memory property VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT are considered mappable. Memory objects must be mappable in order to be successfully mapped on the host.

To retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkMapMemory(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize offset,
    VkDeviceSize size,
    VkMemoryMapFlags flags,
    void** ppData);
```

- device is the logical device that owns the memory.
- memory is the VkDeviceMemory object to be mapped.
- offset is a zero-based byte offset from the beginning of the memory object.
- size is the size of the memory range to map, or VK_WHOLE_SIZE to map from offset to the end of the allocation.
- flags is a bitmask of VkMemoryMapFlagBits specifying additional parameters of the memory map operation.
• ppData is a pointer to a void* variable in which a host-accessible pointer to the beginning of the mapped range is returned. This pointer minus offset must be aligned to at least VkPhysicalDeviceLimits::minMemoryMapAlignment.

After a successful call to vkMapMemory the memory object memory is considered to be currently host mapped.

**NOTE**

It is an application error to call vkMapMemory on a memory object that is already host mapped.

**NOTE**

vkMapMemory will fail if the implementation is unable to allocate an appropriately sized contiguous virtual address range, e.g. due to virtual address space fragmentation or platform limits. In such cases, vkMapMemory must return VK_ERROR_MEMORY_MAP_FAILED. The application can improve the likelihood of success by reducing the size of the mapped range and/or removing unneeded mappings using vkUnmapMemory.

vkMapMemory does not check whether the device memory is currently in use before returning the host-accessible pointer. The application must guarantee that any previously submitted command that writes to this range has completed before the host reads from or writes to that range, and that any previously submitted command that reads from that range has completed before the host writes to that region (see here for details on fulfilling such a guarantee). If the device memory was allocated without the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT set, these guarantees must be made for an extended range: the application must round down the start of the range to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, and round the end of the range up to the nearest multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize.

While a range of device memory is host mapped, the application is responsible for synchronizing both device and host access to that memory range.

**NOTE**

It is important for the application developer to become meticulously familiar with all of the mechanisms described in the chapter on Synchronization and Cache Control as they are crucial to maintaining memory access ordering.

Calling vkMapMemory is equivalent to calling vkMapMemory2KHR with an empty pNext chain.

### Valid Usage

- VUID-vkMapMemory-memory-00678
  memory must not be currently host mapped
- VUID-vkMapMemory-offset-00679
  offset must be less than the size of memory
- VUID-vkMapMemory-size-00680
  If size is not equal to VK_WHOLE_SIZE, size must be greater than 0
- VUID-vkMapMemory-size-00681
  If size is not equal to VK_WHOLE_SIZE, size must be less than or equal to the size of the
memory minus offset

• VUID-vkMapMemory-memory-00682
memory must have been created with a memory type that reports
VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

• VUID-vkMapMemory-memory-00683
memory must not have been allocated with multiple instances

• VUID-vkMapMemory-flags-09568
VK_MEMORY_MAP_PLACED_BIT_EXT must not be set in flags

Valid Usage (Implicit)

• VUID-vkMapMemory-device-parameter
device must be a valid VkDevice handle

• VUID-vkMapMemory-memory-parameter
memory must be a valid VkDeviceMemory handle

• VUID-vkMapMemory-flags-parameter
flags must be a valid combination of VkMemoryMapFlagBits values

• VUID-vkMapMemory-ppData-parameter
ppData must be a valid pointer to a pointer value

• VUID-vkMapMemory-memory-parent
memory must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to memory must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_MEMORY_MAP_FAILED

Bits which can be set in vkMapMemory::flags and VkMemoryMapInfoKHR::flags, specifying additional properties of a memory map, are:
typedef enum VkMemoryMapFlagBits {
    // Provided by VK_EXT_map_memory_placed
    VK_MEMORY_MAP_PLACED_BIT_EXT = 0x00000001,
} VkMemoryMapFlagBits;

• **VK_MEMORY_MAP_PLACED_BIT_EXT** requests that the implementation place the memory map at the virtual address specified by the application via `VkMemoryMapPlacedInfoEXT::pPlacedAddress`, replacing any existing mapping at that address. This flag **must** not be used with `vkMapMemory` as there is no way to specify the placement address.

typedef VkFlags VkMemoryMapFlags;

**VkMemoryMapFlags** is a bitmask type for setting a mask of zero or more `VkMemoryMapFlagBits`.

Alternatively, to retrieve a host virtual address pointer to a region of a mappable memory object, call:

```c
// Provided by VK_KHR_map_memory2
VkResult vkMapMemory2KHR(
    VkDevice device,               // Provided by VK_KHR_map_memory2
    const VkMemoryMapInfoKHR* pMemoryMapInfo,          // provided by VK_KHR_map_memory2
    void** ppData);
```

• **device** is the logical device that owns the memory.

• **pMemoryMapInfo** is a pointer to a `VkMemoryMapInfoKHR` structure describing parameters of the map.

• **pData** is a pointer to a `void *` variable in which is returned a host-accessible pointer to the beginning of the mapped range. This pointer minus `VkMemoryMapInfoKHR::offset` **must** be aligned to at least `VkPhysicalDeviceLimits::minMemoryMapAlignment`.

This function behaves identically to `vkMapMemory` except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

**Valid Usage (Implicit)**

• VUID-vkMapMemory2KHR-device-parameter
  **device** must be a valid `VkDevice` handle

• VUID-vkMapMemory2KHR-pMemoryMapInfo-parameter
  `pMemoryMapInfo` must be a valid pointer to a valid `VkMemoryMapInfoKHR` structure

• VUID-vkMapMemory2KHR-ppData-parameter
  **pData** must be a valid pointer to a pointer value
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_MEMORY_MAP_FAILED

The `VkMemoryMapInfoKHR` structure is defined as:

```
// Provided by VK_KHR_map_memory2
typedef struct VkMemoryMapInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkMemoryMapFlags flags;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMemoryMapInfoKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkMemoryMapFlagBits` specifying additional parameters of the memory map operation.
• `memory` is the `VkDeviceMemory` object to be mapped.
• `offset` is a zero-based byte offset from the beginning of the memory object.
• `size` is the size of the memory range to map, or `VK_WHOLE_SIZE` to map from `offset` to the end of the allocation.

Valid Usage

• VUID-VkMemoryMapInfoKHR-memory-07958
  memory must not be currently host mapped

• VUID-VkMemoryMapInfoKHR-offset-07959
  offset must be less than the size of `memory`

• VUID-VkMemoryMapInfoKHR-size-07960
  If `size` is not equal to `VK_WHOLE_SIZE`, size must be greater than 0

• VUID-VkMemoryMapInfoKHR-size-07961
  If `size` is not equal to `VK_WHOLE_SIZE`, size must be less than or equal to the size of the memory minus offset
• VUID-VkMemoryMapInfoKHR-memory-07962
  memory must have been created with a memory type that reports
  VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT

• VUID-VkMemoryMapInfoKHR-memory-07963
  memory must not have been allocated with multiple instances

• VUID-VkMemoryMapInfoKHR-flags-09569
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the memoryMapPlaced feature must be enabled

• VUID-VkMemoryMapInfoKHR-flags-09570
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the pNext chain must include a VkMemoryMapPlacedInfoEXT structure and VkMemoryMapPlacedInfoEXT::pPlacedAddress must not be NULL

• VUID-VkMemoryMapInfoKHR-flags-09571
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is not enabled, offset must be zero

• VUID-VkMemoryMapInfoKHR-flags-09572
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is not enabled, size must be VK_WHOLE_SIZE or VkMemoryAllocateInfo::allocationSize

• VUID-VkMemoryMapInfoKHR-flags-09573
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and the memoryMapRangePlaced feature is enabled, offset must be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment

• VUID-VkMemoryMapInfoKHR-flags-09574
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and size is not VK_WHOLE_SIZE, size must be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment

• VUID-VkMemoryMapInfoKHR-flags-09651
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags and size is VK_WHOLE_SIZE, VkMemoryAllocateInfo::allocationSize must be aligned to an integer multiple of VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment

• VUID-VkMemoryMapInfoKHR-flags-09575
  If VK_MEMORY_MAP_PLACED_BIT_EXT is set in flags, the memory object must not have been imported from a handle type of VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT or VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT

Valid Usage (Implicit)

• VUID-VkMemoryMapInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_MAP_INFO_KHR

• VUID-VkMemoryMapInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkMemoryMapPlacedInfoEXT

• VUID-VkMemoryMapInfoKHR-sType-unique
The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkMemoryMapInfoKHR-flags-parameter
  flags must be a valid combination of `VkMemoryMapFlagBits` values
- VUID-VkMemoryMapInfoKHR-memory-parameter
  memory must be a valid `VkDeviceMemory` handle

### Host Synchronization

- Host access to memory must be externally synchronized

If `VK_MEMORY_MAP_PLACED_BIT_EXT` is set in `VkMemoryMapInfoKHR::flags` and the `pNext` chain of `VkMemoryMapInfoKHR` includes a `VkMemoryMapPlacedInfoEXT` structure, then that structure specifies the placement address of the memory map. The implementation will place the memory map at the specified address, replacing any existing maps in the specified memory range. Replacing memory maps in this way does not implicitly unmap Vulkan memory objects. Instead, the application must ensure no other Vulkan memory objects are mapped anywhere in the specified virtual address range. If successful, `pData` will be set to the same value as `VkMemoryMapPlacedInfoEXT::pPlacedAddress` and `vkMapMemory2KHR` will return `VK_SUCCESS`. If it cannot place the map at the requested address for any reason, the memory object is left unmapped and `vkMapMemory2KHR` will return `VK_ERROR_MEMORY_MAP_FAILED`.

The `VkMemoryMapPlacedInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_map_memory_placed
typedef struct VkMemoryMapPlacedInfoEXT {
    VkStructureType sType;
    const void* pNext;
    void* pPlacedAddress;
} VkMemoryMapPlacedInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pPlacedAddress` is the virtual address at which to place the address. If `VkMemoryMapInfoKHR::flags` does not contain `VK_MEMORY_MAP_PLACED_BIT_EXT`, this value is ignored.

### Valid Usage

- VUID-VkMemoryMapPlacedInfoEXT-flags-09576
  If `VkMemoryMapInfoKHR::flags` contains `VK_MEMORY_MAP_PLACED_BIT_EXT`, `pPlacedAddress` must not be NULL
- VUID-VkMemoryMapPlacedInfoEXT-pPlacedAddress-09577
  `pPlacedAddress` must be aligned to an integer multiple of `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT::minPlacedMemoryMapAlignment`
The address range specified by `pPlacedAddress` and `VkMemoryMapInfoKHR::size` must not overlap any existing Vulkan memory object mapping.

**Valid Usage (Implicit)**

- **VUID-VkMemoryMapPlacedInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_MEMORY_MAP_PLACED_INFO_EXT`

Two commands are provided to enable applications to work with non-coherent memory allocations: `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`.

**NOTE**

If the memory object was created with the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` set, `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges` are unnecessary and may have a performance cost. However, availability and visibility operations still need to be managed on the device. See the description of host access types for more information.

**NOTE**

While memory objects imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT` are inherently mapped to host address space, they are not considered to be host mapped device memory unless they are explicitly host mapped using `vkMapMemory`. That means flushing or invalidating host caches with respect to host accesses performed on such memory through the original host pointer specified at import time is the responsibility of the application and must be performed with appropriate synchronization primitives provided by the platform which are outside the scope of Vulkan. `vkFlushMappedMemoryRanges` and `vkInvalidateMappedMemoryRanges`, however, can still be used on such memory objects to synchronize host accesses performed through the host pointer of the host mapped device memory range returned by `vkMapMemory`.

After a successful call to `vkMapMemory` or `vkMapMemory2KHR` the memory object memory is considered to be currently *host mapped*.

To flush ranges of non-coherent memory from the host caches, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFlushMappedMemoryRanges(
    VkDevice device,
    uint32_t memoryRangeCount,
    const VkMappedMemoryRange* pMemoryRanges);
```

- `device` is the logical device that owns the memory ranges.
- `memoryRangeCount` is the length of the `pMemoryRanges` array.
• `pMemoryRanges` is a pointer to an array of `VkMappedMemoryRange` structures describing the memory ranges to flush.

`vkFlushMappedMemoryRanges` guarantees that host writes to the memory ranges described by `pMemoryRanges` are made available to the host memory domain, such that they can be made available to the device memory domain via memory domain operations using the `VK_ACCESS_HOST_WRITE_BIT` access type.

Within each range described by `pMemoryRanges`, each set of `nonCoherentAtomSize` bytes in that range is flushed if any byte in that set has been written by the host since it was first host mapped, or the last time it was flushed. If `pMemoryRanges` includes sets of `nonCoherentAtomSize` bytes where no bytes have been written by the host, those bytes must not be flushed.

Unmapping non-coherent memory does not implicitly flush the host mapped memory, and host writes that have not been flushed may not ever be visible to the device. However, implementations must ensure that writes that have not been flushed do not become visible to any other memory.

**NOTE**
The above guarantee avoids a potential memory corruption in scenarios where host writes to a mapped memory object have not been flushed before the memory is unmapped (or freed), and the virtual address range is subsequently reused for a different mapping (or memory allocation).

### Valid Usage (Implicit)

• VUID-vkFlushMappedMemoryRanges-device-parameter
  
  `device` must be a valid `VkDevice` handle

• VUID-vkFlushMappedMemoryRanges-pMemoryRanges-parameter
  
  `pMemoryRanges` must be a valid pointer to an array of `memoryRangeCount` valid `VkMappedMemoryRange` structures

• VUID-vkFlushMappedMemoryRanges-memoryRangeCount-arraylength
  
  `memoryRangeCount` must be greater than 0

### Return Codes

**Success**

• `VK_SUCCESS`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`

• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To invalidate ranges of non-coherent memory from the host caches, call:
// Provided by VK_VERSION_1_0
VkResult vkInvalidateMappedMemoryRanges(
    VkDevice device,  
    uint32_t memoryRangeCount,  
    const VkMappedMemoryRange* pMemoryRanges);

• device is the logical device that owns the memory ranges.
• memoryRangeCount is the length of the pMemoryRanges array.
• pMemoryRanges is a pointer to an array of VkMappedMemoryRange structures describing the memory ranges to invalidate.

vkInvalidateMappedMemoryRanges guarantees that device writes to the memory ranges described by pMemoryRanges, which have been made available to the host memory domain using the VK_ACCESS_HOST_WRITE_BIT and VK_ACCESS_HOST_READ_BIT access types, are made visible to the host. If a range of non-coherent memory is written by the host and then invalidated without first being flushed, its contents are undefined.

Within each range described by pMemoryRanges, each set of nonCoherentAtomSize bytes in that range is invalidated if any byte in that set has been written by the device since it was first host mapped, or the last time it was invalidated.

NOTE Mapping non-coherent memory does not implicitly invalidate that memory.

Valid Usage (Implicit)

• VUID-vkInvalidateMappedMemoryRanges-device-parameter device must be a valid VkDevice handle
• VUID-vkInvalidateMappedMemoryRanges-pMemoryRanges-parameter pMemoryRanges must be a valid pointer to an array of memoryRangeCount valid VkMappedMemoryRange structures
• VUID-vkInvalidateMappedMemoryRanges-memoryRangeCount-arraylength memoryRangeCount must be greater than 0

Return Codes

Success
• VK_SUCCESS
Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkMappedMemoryRange structure is defined as:
typedef struct VkMappedMemoryRange {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
    VkDeviceSize offset;
    VkDeviceSize size;
} VkMappedMemoryRange;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memory** is the memory object to which this range belongs.
- **offset** is the zero-based byte offset from the beginning of the memory object.
- **size** is either the size of range, or VK_WHOLE_SIZE to affect the range from offset to the end of the current mapping of the allocation.

### Valid Usage

- **VUID-VkMappedMemoryRange-memory-00684**
  
  memory must be currently host mapped

- **VUID-VkMappedMemoryRange-size-00685**
  
  If size is not equal to VK_WHOLE_SIZE, offset and size must specify a range contained within the currently mapped range of memory

- **VUID-VkMappedMemoryRange-size-00686**
  
  If size is equal to VK_WHOLE_SIZE, offset must be within the currently mapped range of memory

- **VUID-VkMappedMemoryRange-size-00687**
  
  offset must be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize

- **VUID-VkMappedMemoryRange-size-01389**
  
  If size is equal to VK_WHOLE_SIZE, the end of the current mapping of memory must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize bytes from the beginning of the memory object, or be equal to the end of the memory object

- **VUID-VkMappedMemoryRange-size-01390**
  
  If size is not equal to VK_WHOLE_SIZE, size must either be a multiple of VkPhysicalDeviceLimits::nonCoherentAtomSize, or offset plus size must equal the size of memory

### Valid Usage (Implicit)

- **VUID-VkMappedMemoryRange-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_MAPPED_MEMORY_RANGE

- **VUID-VkMappedMemoryRange-pNext-pNext**
pNext must be NULL

- VUID-VkMappedMemoryRange-memory-parameter
  memory must be a valid VkDeviceMemory handle

To unmap a memory object once host access to it is no longer needed by the application, call:

```c
// Provided by VK_VERSION_1_0
void vkUnmapMemory(
    VkDevice device,
    VkDeviceMemory memory);
```

- device is the logical device that owns the memory.
- memory is the memory object to be unmapped.

Calling `vkUnmapMemory` is equivalent to calling `vkUnmapMemory2KHR` with an empty pNext chain and the flags parameter set to zero.

### Valid Usage

- VUID-vkUnmapMemory-memory-00689
  memory must be currently host mapped

### Valid Usage (Implicit)

- VUID-vkUnmapMemory-device-parameter
  device must be a valid VkDevice handle
- VUID-vkUnmapMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-vkUnmapMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to memory must be externally synchronized

Alternatively, to unmap a memory object once host access to it is no longer needed by the application, call:
// Provided by VK_KHR_map_memory2
VkResult vkUnmapMemory2KHR(
    VkDevice device,                  
    const VkMemoryUnmapInfoKHR*      
    pMemoryUnmapInfo);                

• device is the logical device that owns the memory.

• pMemoryUnmapInfo is a pointer to a VkMemoryUnmapInfoKHR structure describing parameters of the unmap.

This function behaves identically to vkUnmapMemory except that it gets its parameters via an extensible structure pointer rather than directly as function arguments.

Valid Usage (Implicit)

• VUID-vkUnmapMemory2KHR-device-parameter  
  device must be a valid VkDevice handle

• VUID-vkUnmapMemory2KHR-pMemoryUnmapInfo-parameter  
  pMemoryUnmapInfo must be a valid pointer to a valid VkMemoryUnmapInfoKHR structure

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_MEMORY_MAP_FAILED

The VkMemoryUnmapInfoKHR structure is defined as:

// Provided by VK_KHR_map_memory2
typedef struct VkMemoryUnmapInfoKHR {
    Vk StructureType            sType;
    const void*                 pNext;
    VkMemoryUnmapFlagsKHR       flags;
    VkDeviceMemory              memory;
} VkMemoryUnmapInfoKHR;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is a bitmask of VkMemoryUnmapFlagBitsKHR specifying additional parameters of the memory map operation.

• memory is the VkDeviceMemory object to be unmapped.
Valid Usage

- **VUID-VkMemoryUnmapInfoKHR-memory-07964**
  memory must be currently host mapped

- **VUID-VkMemoryUnmapInfoKHR-flags-09579**
  If `VK_MEMORY_UNMAP_RESERVE_BIT_EXT` is set in `flags`, the `memoryUnmapReserve` must be enabled

- **VUID-VkMemoryUnmapInfoKHR-flags-09580**
  If `VK_MEMORY_UNMAP_RESERVE_BIT_EXT` is set in `flags`, the memory object must not have been imported from a handle type of `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT` or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT`

Valid Usage (Implicit)

- **VUID-VkMemoryUnmapInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_UNMAP_INFO_KHR`

- **VUID-VkMemoryUnmapInfoKHR-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkMemoryUnmapInfoKHR-flags-parameter**
  `flags` must be a valid combination of `VkMemoryUnmapFlagBitsKHR` values

- **VUID-VkMemoryUnmapInfoKHR-memory-parameter**
  `memory` must be a valid `VkDeviceMemory` handle

Host Synchronization

- Host access to `memory` must be externally synchronized

Bits which can be set in `VkMemoryUnmapInfoKHR::flags`, specifying additional properties of a memory unmap, are:

```c
// Provided by VK_KHR_map_memory2
typedef enum VkMemoryUnmapFlagBitsKHR {
    // Provided by VK_EXT_map_memory_placed
    VK_MEMORY_UNMAP_RESERVE_BIT_EXT = 0x00000001,
} VkMemoryUnmapFlagBitsKHR;
```

- `VK_MEMORY_UNMAP_RESERVE_BIT_EXT` requests that virtual address range currently occupied by the memory map remain reserved after the `vkUnmapMemory2KHR` call completes. Future system memory map operations or calls to `vkMapMemory` or `vkMapMemory2KHR` will not return addresses in that range unless the range has since been unreserved by the application or the mapping is explicitly placed in that range by calling `vkMapMemory2KHR` with `VK_MEMORY_MAP_PLACED_BIT_EXT`, or doing the system memory map equivalent. When `VK_MEMORY_UNMAP_RESERVE_BIT_EXT` is set, the memory unmap operation may fail, in which case...
the memory object will remain host mapped and \texttt{vkUnmapMemory2KHR} will return \texttt{VK_ERROR_MEMORY_MAP_FAILED}.

\begin{verbatim}
// Provided by VK_KHR_map_memory2
typedef VkFlags VkMemoryUnmapFlagsKHR;
\end{verbatim}

\texttt{VkMemoryUnmapFlagsKHR} is a bitmask type for setting a mask of zero or more \texttt{VkMemoryUnmapFlagBitsKHR}.

### 11.2.11. Lazily Allocated Memory

If the memory object is allocated from a heap with the \texttt{VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT} bit set, that object's backing memory \textit{may} be provided by the implementation lazily. The actual committed size of the memory \textit{may} initially be as small as zero (or as large as the requested size), and monotonically increases as additional memory is needed.

A memory type with this flag set is only allowed to be bound to a \texttt{VkImage} whose usage flags include \texttt{VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT}.

\begin{note}

Using lazily allocated memory objects for framebuffer attachments that are not needed once a render pass instance has completed \textit{may} allow some implementations to never allocate memory for such attachments.

\end{note}

To determine the amount of lazily-allocated memory that is currently committed for a memory object, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
void vkGetDeviceMemoryCommitment(
    VkDevice device,
    VkDeviceMemory memory,
    VkDeviceSize* pCommittedMemoryInBytes);
\end{verbatim}

- \texttt{device} is the logical device that owns the memory.
- \texttt{memory} is the memory object being queried.
- \texttt{pCommittedMemoryInBytes} is a pointer to a \texttt{VkDeviceSize} value in which the number of bytes currently committed is returned, on success.

The implementation \textit{may} update the commitment at any time, and the value returned by this query \textit{may} be out of date.

The implementation guarantees to allocate any committed memory from the \texttt{heapIndex} indicated by the memory type that the memory object was created with.

\begin{validusage}

- \texttt{VUID-vkGetDeviceMemoryCommitment-memory-00690}

\end{validusage}
memory must have been created with a memory type that reports VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT

Valid Usage (Implicit)

- VUID-vkGetDeviceMemoryCommitment-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeviceMemoryCommitment-memory-parameter
memory must be a valid VkDeviceMemory handle
- VUID-vkGetDeviceMemoryCommitment-pCommittedMemoryInBytes-parameter
pCommittedMemoryInBytes must be a valid pointer to a VkDeviceSize value
- VUID-vkGetDeviceMemoryCommitment-memory-parent
memory must have been created, allocated, or retrieved from device

11.2.12. Protected Memory

Protected memory divides device memory into protected device memory and unprotected device memory.

Protected memory adds the following concepts:

- Memory:
  - Unprotected device memory, which can be visible to the device and can be visible to the host
  - Protected device memory, which can be visible to the device but must not be visible to the host
- Resources:
  - Unprotected images and unprotected buffers, to which unprotected memory can be bound
  - Protected images and protected buffers, to which protected memory can be bound
- Command buffers:
  - Unprotected command buffers, which can be submitted to a device queue to execute unprotected queue operations
  - Protected command buffers, which can be submitted to a protected-capable device queue to execute protected queue operations
- Device queues:
  - Unprotected device queues, to which unprotected command buffers can be submitted
  - Protected-capable device queues, to which unprotected command buffers or protected command buffers can be submitted
- Queue submissions:
  - Unprotected queue submissions, through which unprotected command buffers can be
Protected queue submissions, through which protected command buffers can be submitted

- Queue operations
  - Unprotected queue operations
  - Protected queue operations

**Protected Memory Access Rules**

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_FALSE`, applications must not perform any of the following operations:

- Write to unprotected memory within protected queue operations.
- Access protected memory within protected queue operations other than in framebuffer-space pipeline stages, the compute shader stage, or the transfer stage.
- Perform a query within protected queue operations.

If `VkPhysicalDeviceProtectedMemoryProperties::protectedNoFault` is `VK_TRUE`, these operations are valid, but reads will return undefined values, and writes will either be dropped or store undefined values.

Additionally, indirect operations must not be performed within protected queue operations.

Whether these operations are valid or not, or if any other invalid usage is performed, the implementation must guarantee that:

- Protected device memory must never be visible to the host.
- Values written to unprotected device memory must not be a function of values from protected memory.

### 11.2.13. Peer Memory Features

*Peer memory* is memory that is allocated for a given physical device and then bound to a resource and accessed by a different physical device, in a logical device that represents multiple physical devices. Some ways of reading and writing peer memory may not be supported by a device.

To determine how peer memory can be accessed, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDeviceGroupPeerMemoryFeatures(
    VkDevice device, 
    uint32_t heapIndex, 
    uint32_t localDeviceIndex, 
    uint32_t remoteDeviceIndex, 
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);
```

or the equivalent command
// Provided by VK_KHR_device_group
void vkGetDeviceGroupPeerMemoryFeaturesKHR(
    VkDevice device,
    uint32_t heapIndex,
    uint32_t localDeviceIndex,
    uint32_t remoteDeviceIndex,
    VkPeerMemoryFeatureFlags* pPeerMemoryFeatures);

• device is the logical device that owns the memory.
• heapIndex is the index of the memory heap from which the memory is allocated.
• localDeviceIndex is the device index of the physical device that performs the memory access.
• remoteDeviceIndex is the device index of the physical device that the memory is allocated for.
• pPeerMemoryFeatures is a pointer to a VkPeerMemoryFeatureFlags bitmask indicating which types of memory accesses are supported for the combination of heap, local, and remote devices.

Valid Usage

• VUID-vkGetDeviceGroupPeerMemoryFeatures-heapIndex-00691 heapIndex must be less than memoryHeapCount
• VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00692 localDeviceIndex must be a valid device index
• VUID-vkGetDeviceGroupPeerMemoryFeatures-remoteDeviceIndex-00693 remoteDeviceIndex must be a valid device index
• VUID-vkGetDeviceGroupPeerMemoryFeatures-localDeviceIndex-00694 localDeviceIndex must not equal remoteDeviceIndex

Valid Usage (Implicit)

• VUID-vkGetDeviceGroupPeerMemoryFeatures-device-parameter device must be a valid VkDevice handle
• VUID-vkGetDeviceGroupPeerMemoryFeatures-pPeerMemoryFeatures-parameter pPeerMemoryFeatures must be a valid pointer to a VkPeerMemoryFeatureFlags value

Bits which may be set in vkGetDeviceGroupPeerMemoryFeatures::pPeerMemoryFeatures, indicating supported peer memory features, are:
typedef enum VkPeerMemoryFeatureFlagBits {
    VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT = 0x00000001,
    VK_PEER_MEMORY_FEATURE_COPY_DST_BIT = 0x00000002,
    VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT = 0x00000004,
    VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT = 0x00000008,
} VkPeerMemoryFeatureFlagBits;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlagBits VkPeerMemoryFeatureFlagBitsKHR;

• **VK_PEER_MEMORY_FEATURE_COPY_SRC_BIT** specifies that the memory can be accessed as the source of any vkCmdCopy* command.

• **VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** specifies that the memory can be accessed as the destination of any vkCmdCopy* command.

• **VK_PEER_MEMORY_FEATURE_GENERIC_SRC_BIT** specifies that the memory can be read as any memory access type.

• **VK_PEER_MEMORY_FEATURE_GENERIC_DST_BIT** specifies that the memory can be written as any memory access type. Shader atomics are considered to be writes.

**NOTE** The peer memory features of a memory heap also apply to any accesses that may be performed during image layout transitions.

**VK_PEER_MEMORY_FEATURE_COPY_DST_BIT** must be supported for all host local heaps and for at least one device-local memory heap.

If a device does not support a peer memory feature, it is still valid to use a resource that includes both local and peer memory bindings with the corresponding access type as long as only the local bindings are actually accessed. For example, an application doing split-frame rendering would use framebuffer attachments that include both local and peer memory bindings, but would scissor the rendering to only update local memory.
or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkPeerMemoryFeatureFlags VkPeerMemoryFeatureFlagsKHR;
```

`VkPeerMemoryFeatureFlags` is a bitmask type for setting a mask of zero or more `VkPeerMemoryFeatureFlagBits`.

### 11.2.14. Opaque Capture Address Query

To query a 64-bit opaque capture address value from a memory object, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetDeviceMemoryOpaqueCaptureAddress(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetDeviceMemoryOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkDeviceMemoryOpaqueCaptureAddressInfo* pInfo);
```

- `device` is the logical device that the memory object was allocated on.
- `pInfo` is a pointer to a `VkDeviceMemoryOpaqueCaptureAddressInfo` structure specifying the memory object to retrieve an address for.

The 64-bit return value is an opaque address representing the start of `pInfo->memory`.

If the memory object was allocated with a non-zero value of `VkMemoryOpaqueCaptureAddressAllocateInfo::opaqueCaptureAddress`, the return value must be the same address.

**NOTE** The expected usage for these opaque addresses is only for trace capture/replay tools to store these addresses in a trace and subsequently specify them during replay.

### Valid Usage

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-None-03334
  The `bufferDeviceAddress` feature must be enabled
If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled.

**Valid Usage (Implicit)**

- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceMemoryOpaqueCaptureAddress-pInfo-parameter `pInfo` must be a valid pointer to a valid `VkDeviceMemoryOpaqueCaptureAddressInfo` structure

The `VkDeviceMemoryOpaqueCaptureAddressInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDeviceMemoryOpaqueCaptureAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkDeviceMemory memory;
} VkDeviceMemoryOpaqueCaptureAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkDeviceMemoryOpaqueCaptureAddressInfo
VkDeviceMemoryOpaqueCaptureAddressInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memory` specifies the memory whose address is being queried.

**Valid Usage**

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-03336 `memory` must have been allocated with `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT`

**Valid Usage (Implicit)**

- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_DEVICE_MEMORY_OPAQUE_CAPTURE_ADDRESS_INFO`
- VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-pNext-pNext `pNext` must be `NULL`
• VUID-VkDeviceMemoryOpaqueCaptureAddressInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle
Chapter 12. Resource Creation

Vulkan supports two primary resource types: buffers and images. Resources are views of memory with associated formatting and dimensionality. Buffers provide access to raw arrays of bytes, whereas images can be multidimensional and may have associated metadata.

Other resource types, such as acceleration structures and micromaps use buffers as the backing store for opaque data structures.

12.1. Buffers

Buffers represent linear arrays of data which are used for various purposes by binding them to a graphics or compute pipeline via descriptor sets or certain commands, or by directly specifying them as parameters to certain commands.

Buffers are represented by VkBuffer handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBuffer)
```

To create buffers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateBuffer(
    VkDevice device, 
    const VkBufferCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkBuffer* pBuffer);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a VkBufferCreateInfo structure containing parameters affecting creation of the buffer.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pBuffer` is a pointer to a VkBuffer handle in which the resulting buffer object is returned.

Valid Usage

- VUID-vkCreateBuffer-device-09664
  
  device must support at least one queue family with one of the
  VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, 
  VK_QUEUE_SPIRE_BINDING_BIT, VK_QUEUE_TRANSFER_BIT, VK_QUEUE_COMPUTE_BIT, or 
  VK_QUEUE_GRAPHICS_BIT capabilities

- VUID-vkCreateBuffer-flags-00911

  If the flags member of pCreateInfo includes VK_BUFFER_CREATE_SPARSE_BINDING_BIT,
creating this **VkBuffer** must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed **VkPhysicalDeviceLimits::sparseAddressSpaceSize**

### Valid Usage (Implicit)

- **VUID-vkCreateBuffer-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateBuffer-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure
- **VUID-vkCreateBuffer-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreateBuffer-pBuffer-parameter**
  - `pBuffer` must be a valid pointer to a `VkBuffer` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR**

The `VkBufferCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkDeviceSize size;
    VkBufferUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkBufferCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• flags is a bitmask of VkBufferCreateFlagBits specifying additional parameters of the buffer.
• size is the size in bytes of the buffer to be created.
• usage is a bitmask of VkBufferUsageFlagBits specifying allowed usages of the buffer.
• sharingMode is a VkSharingMode value specifying the sharing mode of the buffer when it will be accessed by multiple queue families.
• queueFamilyIndexCount is the number of entries in the pQueueFamilyIndices array.
• pQueueFamilyIndices is a pointer to an array of queue families that will access this buffer. It is ignored if sharingMode is not VK_SHARING_MODE_CONCURRENT.

If the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR structure, VkBufferUsageFlags2CreateInfoKHR::usage from that structure is used instead of usage from this structure.

Valid Usage

• VUID-VkBufferCreateInfo-None-09499
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfoKHR structure, usage must be a valid combination of VkBufferUsageFlagBits values

• VUID-VkBufferCreateInfo-None-09500
  If the pNext chain does not include a VkBufferUsageFlags2CreateInfoKHR structure, usage must not be 0

• VUID-VkBufferCreateInfo-size-00912
  size must be greater than 0

• VUID-VkBufferCreateInfo-sharingMode-00913
  If sharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid pointer to an array of queueFamilyIndexCount uint32_t values

• VUID-VkBufferCreateInfo-sharingMode-00914
  If sharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater than 1

• VUID-VkBufferCreateInfo-sharingMode-01419
  If sharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices must be unique and must be less than pQueueFamilyPropertyCount returned by either vkGetPhysicalDeviceQueueFamilyProperties2 or vkGetPhysicalDeviceQueueFamilyProperties for the physicalDevice that was used to create device

• VUID-VkBufferCreateInfo-flags-00915
  If the sparseBinding feature is not enabled, flags must not contain VK_BUFFER_CREATE_SPARSE_BINDING_BIT

• VUID-VkBufferCreateInfo-flags-00916
  If the sparseResidencyBuffer feature is not enabled, flags must not contain VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT

• VUID-VkBufferCreateInfo-flags-00917
  If the sparseResidencyAliased feature is not enabled, flags must not contain
• VUID-VkBufferCreateInfo-flags-00918
  If flags contains VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or
  VK_BUFFER_CREATE_SPARSE_ALIASED_BIT, it must also contain
  VK_BUFFER_CREATE_SPARSE_BINDING_BIT

• VUID-VkBufferCreateInfo-pNext-00920
  If the pNext chain includes a VkExternalMemoryBufferCreateInfo structure, its
  handleTypes member must only contain bits that are also in VkExternalBufferProperties
  ::externalMemoryProperties.compatibleHandleTypes, as returned by
  vkGetPhysicalDeviceExternalBufferProperties with pExternalBufferInfo->handleType
  equal to any one of the handle types specified in VkExternalMemoryBufferCreateInfo
  ::handleTypes

• VUID-VkBufferCreateInfo-flags-01887
  If the protectedMemory feature is not enabled, flags must not contain
  VK_BUFFER_CREATE_PROTECTED_BIT

• VUID-VkBufferCreateInfo-None-01888
  If any of the bits VK_BUFFER_CREATE_SPARSE_BINDING_BIT,
  VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT, or VK_BUFFER_CREATE_SPARSE_ALIASED_BIT are set,
  VK_BUFFER_CREATE_PROTECTED_BIT must not also be set

• VUID-VkBufferCreateInfo-opaqueCaptureAddress-03337
  If VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress is not zero, flags
  must include VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT

• VUID-VkBufferCreateInfo-flags-03338
  If flags includes VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, the
  bufferDeviceAddressCaptureReplay feature must be enabled

• VUID-VkBufferCreateInfo-usage-04813
  If usage includes VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR or
  VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR, and flags does not include
  VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain must include a
  VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles
  including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation
  member specifying a decode operation

• VUID-VkBufferCreateInfo-usage-04814
  If usage includes VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR or
  VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR, and flags does not include
  VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain must include a
  VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles
  including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation
  member specifying an encode operation

• VUID-VkBufferCreateInfo-flags-08325
  If flags includes VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then
  videoMaintenance1 must be enabled

• VUID-VkBufferCreateInfo-size-06409
  size must be less than or equal to VkPhysicalDeviceMaintenance4Properties

752
If `flags` includes `VK_BUFFER_CREATE_PROTECTED_BIT`, then `usage` must not contain any of the following bits:

- `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT`
- `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`
- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR`
- `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`
- `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR`
- `VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT`
- `VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT`

**Valid Usage (Implicit)**

- VUID-VkBufferCreateInfo-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_BUFFER_CREATE_INFO`

- VUID-VkBufferCreateInfo-pNext-pNext
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBufferOpaqueCaptureAddressCreateInfo`, `VkBufferUsageFlags2CreateInfoKHR`, `VkExternalMemoryBufferCreateInfo`, or `VkVideoProfileListInfoKHR`

- VUID-VkBufferCreateInfo-sType-unique
  - The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkBufferCreateInfo-flags-parameter
  - `flags` must be a valid combination of `VkBufferCreateFlagBits` values

- VUID-VkBufferCreateInfo-sharingMode-parameter
  - `sharingMode` must be a valid `VkSharingMode` value

The `VkBufferUsageFlags2CreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkBufferUsageFlags2CreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBufferUsageFlags2KHR usage;
} VkBufferUsageFlags2CreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkBufferUsageFlagBits2KHR` specifying allowed usages of the buffer.
If this structure is included in the `pNext` chain of a buffer creation structure, `usage` is used instead of the corresponding `usage` value passed in that creation structure, allowing additional usage flags to be specified. If this structure is included in the `pNext` chain of a buffer query structure, the usage flags of the buffer are returned in `usage` of this structure, and the usage flags representable in `usage` of the buffer query structure are also returned in that field.

**Valid Usage (Implicit)**

- VUID-VkBufferUsageFlags2CreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_USAGE_FLAGS_2_CREATE_INFO_KHR`
- VUID-VkBufferUsageFlags2CreateInfoKHR-usage-parameter
  `usage` must be a valid combination of `VkBufferUsageFlagBits2KHR` values
- VUID-VkBufferUsageFlags2CreateInfoKHR-usage-requiredbitmask
  `usage` must not be `0`

Bits which **can** be set in `VkBufferUsageFlags2CreateInfoKHR::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_KHR_maintenance5
// Flag bits for VkBufferUsageFlagBits2KHR
typedef VkFlags64 VkBufferUsageFlagBits2KHR;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR = 0x00000001ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR = 0x00000002ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR = 0x00000004ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR = 0x00000008ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR = 0x00000010ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR = 0x00000020ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR = 0x00000040ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR = 0x00000080ULL;
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR = 0x00000100ULL;
// Provided by VK_KHR_maintenance5 with VK_EXT_conditional_rendering
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_CONDITIONAL_RENDERING_BIT_EXT = 0x00000200ULL;
// Provided by VK_KHR_maintenance5 with VK_KHR_ray_tracing_pipeline
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR = 0x00000400ULL;
// Provided by VK_KHR_maintenance5 with VK_NV_ray_tracing
static const VkBufferUsageFlagBits2KHR VK_BUFFER_USAGE_2_RAY_TRACING_BIT_NV = 0x00000400ULL;
```
• `VK_BUFFER_USAGE_2_TRANSFER_SRC_BIT_KHR` specifies that the buffer can be used as the source of a transfer command (see the definition of `VK_PIPELINE_STAGE_TRANSFER_BIT`).

• `VK_BUFFER_USAGE_2_TRANSFER_DST_BIT_KHR` specifies that the buffer can be used as the destination of a transfer command.
- **VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

- **VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR** specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

- **VK_BUFFER_USAGE_2_UNIFORM_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.

- **VK_BUFFER_USAGE_2_STORAGE_BUFFER_BIT_KHR** specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

- **VK_BUFFER_USAGE_2_INDEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2KHR and vkCmdBindIndexBuffer.

- **VK_BUFFER_USAGE_2_VERTEX_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as an element of the pBuffer array to vkCmdBindVertexBuffers.

- **VK_BUFFER_USAGE_2_INDIRECT_BUFFER_BIT_KHR** specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, or vkCmdDispatchIndirect.

- **VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT** specifies that the buffer is suitable for using for binding as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

- **VK_BUFFER_USAGE_2_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT** specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

- **VK_BUFFER_USAGE_2_SHADER_BINDING_TABLE_BIT_KHR** specifies that the buffer is suitable for use as a Shader Binding Table.

- **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR** specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

- **VK_BUFFER_USAGE_2_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR** specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.

- **VK_BUFFER_USAGE_2_SHADER_DEVICE_ADDRESS_BIT_KHR** specifies that the buffer can be used to retrieve a buffer device address via vkGetBufferDeviceAddress and use that address to access the buffer’s memory from a shader.

- **VK_BUFFER_USAGE_2_VIDEO_DECODE_SRC_BIT_KHR** specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.

- **VK_BUFFER_USAGE_2_VIDEO_DECODE_DST_BIT_KHR** is reserved for future use.

- **VK_BUFFER_USAGE_2_VIDEO_ENCODE_DST_BIT_KHR** specifies that the buffer can be used as the destination video bitstream buffer in a video encode operation.

- **VK_BUFFER_USAGE_2_VIDEO_ENCODE_SRC_BIT_KHR** is reserved for future use.
## VkBufferUsageFlags2KHR

`VkBufferUsageFlags2KHR` is a bitmask type for setting a mask of zero or more `VkBufferUsageFlagBits2KHR`.

Bits which can be set in `VkBufferCreateInfo::usage`, specifying usage behavior of a buffer, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBufferUsageFlagBits {
    VK_BUFFER_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_BUFFER_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT = 0x00000004,
    VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT = 0x00000008,
    VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT = 0x00000010,
    VK_BUFFER_USAGE_STORAGE_BUFFER_BIT = 0x00000020,
    VK_BUFFER_USAGE_INDEX_BUFFER_BIT = 0x00000040,
    VK_BUFFER_USAGE_VERTEX_BUFFER_BIT = 0x00000080,
    VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT = 0x00000100,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT = 0x00020000,
    // Provided by VK_KHR_video_decode_queue
    VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00002000,
    VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00004000,
    // Provided by VK_KHR_transform_feedback
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT = 0x00000800,
    VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT = 0x00001000,
    // Provided by VK_KHR_acceleration_structure
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR = 0x00080000,
    VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR = 0x00100000,
    // Provided by VK_KHR_explicit_queue
    VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_video_encode_queue
    VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00008000,
    VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00010000,
    // Provided by VK_KHR_opacity_micromap
    VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT = 0x00800000,
    VK_BUFFER_USAGE_MICROMAP_STORAGE_BIT_EXT = 0x01000000,
    // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT_KHR = VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT,
} VkBufferUsageFlagBits;
```
VK_BUFFER_USAGE_TRANSFER_SRC_BIT specifies that the buffer can be used as the source of a transfer command (see the definition of VK_PIPELINE_STAGE_TRANSFER_BIT).

VK_BUFFER_USAGE_TRANSFER_DST_BIT specifies that the buffer can be used as the destination of a transfer command.

VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT specifies that the buffer can be used to create a VkBufferView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC.

VK_BUFFER_USAGE_STORAGE_BUFFER_BIT specifies that the buffer can be used in a VkDescriptorBufferInfo suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC.

VK_BUFFER_USAGE_INDEX_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdBindIndexBuffer2KHR and vkCmdBindIndexBuffer.

VK_BUFFER_USAGE_VERTEX_BUFFER_BIT specifies that the buffer is suitable for passing as an element of the pBuffers array to vkCmdBindVertexBuffers.

VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT specifies that the buffer is suitable for passing as the buffer parameter to vkCmdDrawIndirect, vkCmdDrawIndexedIndirect, or vkCmdDispatchIndirect.

VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a transform feedback buffer with vkCmdBindTransformFeedbackBuffersEXT.

VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT specifies that the buffer is suitable for using as a counter buffer with vkCmdBeginTransformFeedbackEXT and vkCmdEndTransformFeedbackEXT.

VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR specifies that the buffer is suitable for use as a Shader Binding Table.

VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR specifies that the buffer is suitable for use as a read-only input to an acceleration structure build.

VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR specifies that the buffer is suitable for storage space for a VkAccelerationStructureKHR.

VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT specifies that the buffer can be used to retrieve a buffer device address via vkGetBufferDeviceAddress and use that address to access the buffer’s memory from a shader.

VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR specifies that the buffer can be used as the source video bitstream buffer in a video decode operation.

VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR is reserved for future use.

VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR specifies that the buffer can be used as the
destination video bitstream buffer in a **video encode operation**.

- **VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** is reserved for future use.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferUsageFlags;
```

**VkBufferUsageFlags** is a bitmask type for setting a mask of zero or more **VkBufferUsageFlagBits**.

Bits which **can** be set in **VkBufferCreateInfo::flags**, specifying additional parameters of a buffer, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkBufferCreateFlagBits {
    VK_BUFFER_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_BUFFER_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    // Provided by VK_VERSION_1_1
    VK_BUFFER_CREATE_PROTECTED_BIT = 0x00000008,
    // Provided by VK_VERSION_1_2
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT = 0x00000010,
    // Provided by VK_KHR_video_maintenance1
    VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00000040,
    // Provided by VK_KHR_buffer_device_address
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR =
    VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT,
} VkBufferCreateFlagBits;
```

- **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** specifies that the buffer will be backed using sparse memory binding.
- **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** specifies that the buffer **can** be partially backed using sparse memory binding. Buffers created with this flag **must** also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.
- **VK_BUFFER_CREATE_SPARSE_ALIASED_BIT** specifies that the buffer will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another buffer (or another portion of the same buffer). Buffers created with this flag **must** also be created with the **VK_BUFFER_CREATE_SPARSE_BINDING_BIT** flag.
- **VK_BUFFER_CREATE_PROTECTED_BIT** specifies that the buffer is a protected buffer.
- **VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT** specifies that the buffer’s address **can** be saved and reused on a subsequent run (e.g. for trace capture and replay), see **VkBufferOpaqueCaptureAddressCreateInfo** for more detail.
- **VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR** specifies that the buffer **can** be used in **video coding operations** without having to specify at buffer creation time the set of video profiles the buffer will be used with.

See **Sparse Resource Features** and **Physical Device Features** for details of the sparse memory
features supported on a device.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferCreateFlags;
```

**VkBufferCreateFlags** is a bitmask type for setting a mask of zero or more **VkBufferCreateFlagBits**.

To define a set of external memory handle types that may be used as backing store for a buffer, add a **VkExternalMemoryBufferCreateInfo** structure to the **pNext** chain of the **VkBufferCreateInfo** structure. The **VkExternalMemoryBufferCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryBufferCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryBufferCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryBufferCreateInfo VkExternalMemoryBufferCreateInfoKHR;
```

**NOTE**
A **VkExternalMemoryBufferCreateInfo** structure with a non-zero **handleTypes** field must be included in the creation parameters for a buffer that will be bound to memory that is either exported or imported.

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **handleTypes** is zero or a bitmask of **VkExternalMemoryHandleTypeFlagBits** specifying one or more external memory handle types.

### Valid Usage (Implicit)

- **VUID-VkExternalMemoryBufferCreateInfo-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_BUFFER_CREATE_INFO**

- **VUID-VkExternalMemoryBufferCreateInfo-handleTypes-parameter**
  - **handleTypes** must be a valid combination of **VkExternalMemoryHandleTypeFlagBits** values

To request a specific device address for a buffer, add a **VkBufferOpaqueCaptureAddressCreateInfo** structure to the **pNext** chain of the **VkBufferCreateInfo** structure. The **VkBufferOpaqueCaptureAddressCreateInfo** structure is defined as:
```c
typedef struct VkBufferOpaqueCaptureAddressCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint64_t opaqueCaptureAddress;
} VkBufferOpaqueCaptureAddressCreateInfo;
```
or the equivalent
```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferOpaqueCaptureAddressCreateInfo VkBufferOpaqueCaptureAddressCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **opaqueCaptureAddress** is the opaque capture address requested for the buffer.

If `opaqueCaptureAddress` is zero, no specific address is requested.

If `opaqueCaptureAddress` is not zero, then it **should** be an address retrieved from `vkGetBufferOpaqueCaptureAddress` for an identically created buffer on the same implementation.

If this structure is not present, it is as if `opaqueCaptureAddress` is zero.

Apps **should** avoid creating buffers with app-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS` errors.

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and during capture will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.

### Valid Usage (Implicit)

- **VUID-VkBufferOpaqueCaptureAddressCreateInfo-sType-sType**  
  sType **must** be `VK_STRUCTURE_TYPE_BUFFER_OPAQUE_CAPTURE_ADDRESS_CREATE_INFO`
To destroy a buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyBuffer(
    VkDevice device,
    VkBuffer buffer,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `buffer` is the buffer to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyBuffer-buffer-00922**
  All submitted commands that refer to `buffer`, either directly or via a `VkBufferView`, **must** have completed execution.

- **VUID-vkDestroyBuffer-buffer-00923**
  If `VkAllocationCallbacks` were provided when `buffer` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyBuffer-buffer-00924**
  If no `VkAllocationCallbacks` were provided when `buffer` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyBuffer-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyBuffer-buffer-parameter**
  If `buffer` is not `VK_NULL_HANDLE`, `buffer` **must** be a valid `VkBuffer` handle.

- **VUID-vkDestroyBuffer-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyBuffer-buffer-parent**
  If `buffer` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `buffer` **must** be externally synchronized.
12.2. Buffer Views

A buffer view represents a contiguous range of a buffer and a specific format to be used to interpret the data. Buffer views are used to enable shaders to access buffer contents using image operations. In order to create a valid buffer view, the buffer must have been created with at least one of the following usage flags:

- VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT
- VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT

Buffer views are represented by VkBufferView handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferView)
```

To create a buffer view, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateBufferView(
    VkDevice device,           // device is the logical device that creates the buffer view.
    const VkBufferViewCreateInfo* pCreateInfo, // pCreateInfo is a pointer to a VkBufferViewCreateInfo structure containing parameters to be used to create the buffer view.
    const VkAllocationCallbacks* pAllocator,   // pAllocator controls host memory allocation as described in the Memory Allocation chapter.
    VkBufferView* pView);  // pView is a pointer to a VkBufferView handle in which the resulting buffer view object is returned.
```

Valid Usage

- VUID-vkCreateBufferView-device-09665
  device must support at least one queue family with one of the VK_QUEUE_COMPUTE_BIT or VK_QUEUE_GRAPHICS_BIT capabilities

Valid Usage (Implicit)

- VUID-vkCreateBufferView-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateBufferView-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkBufferViewCreateInfo structure

763
• VUID-vkCreateBufferView-pAllocator-parameter
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

• VUID-vkCreateBufferView-pView-parameter
  
  `pView` must be a valid pointer to a `VkBufferView` handle.

---

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBufferViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferViewCreateFlags flags;
    VkBuffer buffer;
    VkFormat format;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkBufferViewCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `buffer` is a `VkBuffer` on which the view will be created.
- `format` is a `VkFormat` describing the format of the data elements in the buffer.
- `offset` is an offset in bytes from the base address of the buffer. Accesses to the buffer view from shaders use addressing that is relative to this starting offset.
- `range` is a size in bytes of the buffer view. If `range` is equal to `VK_WHOLE_SIZE`, the range from `offset` to the end of the buffer is used. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of the `texel block size` of `format`, the nearest smaller multiple is used.

The buffer view has a `buffer view usage` identifying which descriptor types can be created from it. This usage can be defined by including the `VkBufferUsageFlags2CreateInfoKHR` structure in the `pNext` chain, and specifying the `usage` value there. If this structure is not included, it is equal to the `VkBufferCreateInfo::usage` value used to create `buffer`. 
Valid Usage

- **VUID-VkBufferViewCreateInfo-offset-00925**
  
  `offset` **must** be less than the size of `buffer`

- **VUID-VkBufferViewCreateInfo-range-00928**
  
  If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be greater than 0

- **VUID-VkBufferViewCreateInfo-range-00929**
  
  If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be an integer multiple of the texel block size of `format`

- **VUID-VkBufferViewCreateInfo-range-00930**
  
  If `range` is not equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by 
  \[
  \left\lfloor \frac{\text{range}}{\text{texel block size}} \right\rfloor \times \text{texels per block}
  \] 
  where texel block size and texels per block are as defined in the **Compatible Formats** table for `format`, **must** be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`

- **VUID-VkBufferViewCreateInfo-offset-00931**
  
  If `range` is not equal to `VK_WHOLE_SIZE`, the sum of `offset` and `range` **must** be less than or equal to the size of `buffer`

- **VUID-VkBufferViewCreateInfo-range-04059**
  
  If `range` is equal to `VK_WHOLE_SIZE`, the number of texel buffer elements given by 
  \[
  \left\lfloor \frac{(\text{size} - \text{offset})}{\text{texel block size}} \right\rfloor \times \text{texels per block}
  \] 
  where `size` is the size of `buffer`, and texel block size and texels per block are as defined in the **Compatible Formats** table for `format`, **must** be less than or equal to `VkPhysicalDeviceLimits::maxTexelBufferElements`

- **VUID-VkBufferViewCreateInfo-buffer-00932**
  
  `buffer` **must** have been created with a `usage` value containing at least one of `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`

- **VUID-VkBufferViewCreateInfo-format-08778**
  
  If the `buffer view usage` contains `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT`, then `format` features of `format` **must** contain `VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT`

- **VUID-VkBufferViewCreateInfo-format-08779**
  
  If the `buffer view usage` contains `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, then `format` features of `format` **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT`

- **VUID-VkBufferViewCreateInfo-buffer-09093**
  
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkBufferViewCreateInfo-offset-02749**
  
  If the `texelBufferAlignment` feature is not enabled, `offset` **must** be a multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`

- **VUID-VkBufferViewCreateInfo-buffer-02750**
  
  If the `texelBufferAlignment` feature is enabled and if `buffer` was created with `usage` containing `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, `offset` **must** be a multiple of the lesser of `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetAlignmentBytes` or, if `VkPhysicalDeviceTexelBufferAlignmentProperties::storageTexelBufferOffsetSingleTexelAlignment`
ignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead.

- VUID-VkBufferViewCreateInfo-buffer-02751
  If the texelBufferAlignment feature is enabled and if buffer was created with usage containing VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT, offset must be a multiple of the lesser of VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetAlignmentBytes or, if VkPhysicalDeviceTexelBufferAlignmentProperties::uniformTexelBufferOffsetSingleTexelAlignment is VK_TRUE, the size of a texel of the requested format. If the size of a texel is a multiple of three bytes, then the size of a single component of format is used instead.

- VUID-VkBufferViewCreateInfo-pNext-08780
  If the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR, its usage must not contain any other bit than VK_BUFFER_USAGE_2_UNIFORM_TEXEL_BUFFER_BIT_KHR or VK_BUFFER_USAGE_2_STORAGE_TEXEL_BUFFER_BIT_KHR.

- VUID-VkBufferViewCreateInfo-pNext-08781
  If the pNext chain includes a VkBufferUsageFlags2CreateInfoKHR, its usage must be a subset of the VkBufferCreateInfo::usage specified or VkBufferUsageFlags2CreateInfoKHR::usage from VkBufferCreateInfo::pNext when creating buffer.

### Valid Usage (Implicit)

- VUID-VkBufferViewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_VIEW_CREATE_INFO.

- VUID-VkBufferViewCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkBufferUsageFlags2CreateInfoKHR.

- VUID-VkBufferViewCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkBufferViewCreateInfo-flags-zerobitmask
  flags must be 0.

- VUID-VkBufferViewCreateInfo-buffer-parameter
  buffer must be a valid VkBuffer handle.

- VUID-VkBufferViewCreateInfo-format-parameter
  format must be a valid VkFormat value.

// Provided by VK_VERSION_1_0
typedef VkFlags VkBufferViewCreateFlags;

VkBufferViewCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a buffer view, call:
void vkDestroyBufferView(
    VkDevice device,
    VkBufferView bufferView,
    const VkAllocationCallbacks* pAllocator);

• **device** is the logical device that destroys the buffer view.
• **bufferView** is the buffer view to destroy.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

## Valid Usage

- VUID-vkDestroyBufferView-bufferView-00936
  All submitted commands that refer to **bufferView** must have completed execution

- VUID-vkDestroyBufferView-bufferView-00937
  If **VkAllocationCallbacks** were provided when **bufferView** was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyBufferView-bufferView-00938
  If no **VkAllocationCallbacks** were provided when **bufferView** was created, **pAllocator** must be NULL

## Valid Usage (Implicit)

- VUID-vkDestroyBufferView-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkDestroyBufferView-bufferView-parameter
  If **bufferView** is not **VK_NULL_HANDLE**, **bufferView** must be a valid **VkBufferView** handle

- VUID-vkDestroyBufferView-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- VUID-vkDestroyBufferView-bufferView-parent
  If **bufferView** is a valid handle, it must have been created, allocated, or retrieved from **device**

## Host Synchronization

- Host access to **bufferView** must be externally synchronized

### 12.2.1. Buffer View Format Features

Valid uses of a **VkBufferView** may depend on the buffer view’s **format features**, defined below. Such
constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, then the buffer view’s set of format features is the value of VkFormatProperties3::bufferFeatures found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkBufferViewCreateInfo::format.

### 12.3. Images

Images represent multidimensional - up to 3 - arrays of data which can be used for various purposes (e.g. attachments, textures), by binding them to a graphics or compute pipeline via descriptor sets, or by directly specifying them as parameters to certain commands.

Images are represented by VkImage handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImage)
```

To create images, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImage(
    VkDevice device,
    const VkImageCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImage* pImage);
```

- `device` is the logical device that creates the image.
- `pCreateInfo` is a pointer to a VkImageCreateInfo structure containing parameters to be used to create the image.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pImage` is a pointer to a VkImage handle in which the resulting image object is returned.

#### Valid Usage

- **VUID-vkCreateImage-device-09666**
  - `device` must support at least one queue family with one of the VK_QUEUE_VIDEO_ENCODE_BIT_KHR, VK_QUEUE_VIDEO_DECODE_BIT_KHR, VK_QUEUE_SPARSE_BINDING_BIT, VK_QUEUE_TRANSFER_BIT, VK_QUEUE_COMPUTE_BIT, or VK_QUEUE_GRAPHICS_BIT capabilities

- **VUID-vkCreateImage-flags-00939**
  - If the `flags` member of `pCreateInfo` includes VK_IMAGE_CREATE_SPARSE_BINDING_BIT, creating this `VkImage` must not cause the total required sparse memory for all currently valid sparse resources on the device to exceed `VkPhysicalDeviceLimits::sparseAddressSpaceSize`
Valid Usage (Implicit)

- VUID-vkCreateImage-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateImage-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

- VUID-vkCreateImage-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateImage-pImage-parameter
  pImage must be a valid pointer to a VkImage handle

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateFlags flags;
    VkImageType imageType;
    VkFormat format;
    VkExtent3D extent;
    uint32_t mipLevels;
    uint32_t arrayLayers;
    VkSampleCountFlagBits samples;
    VkImageTiling tiling;
    VkImageUsageFlags usage;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkImageLayout initialLayout;
} VkImageCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **flags** is a bitmask of `VkImageCreateFlagBits` describing additional parameters of the image.

• **imageType** is a `VkImageType` value specifying the basic dimensionality of the image. Layers in array textures do not count as a dimension for the purposes of the image type.

• **format** is a `VkFormat` describing the format and type of the texel blocks that will be contained in the image.

• **extent** is a `VkExtent3D` describing the number of data elements in each dimension of the base level.

• **mipLevels** describes the number of levels of detail available for minified sampling of the image.

• **arrayLayers** is the number of layers in the image.

• **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.

• **tiling** is a `VkImageTiling` value specifying the tiling arrangement of the texel blocks in memory.

• **usage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the image.

• **sharingMode** is a `VkSharingMode` value specifying the sharing mode of the image when it will be accessed by multiple queue families.

• **queueFamilyIndexCount** is the number of entries in the `pQueueFamilyIndices` array.

• **pQueueFamilyIndices** is a pointer to an array of queue families that will access this image. It is ignored if `sharingMode` is not `VK_SHARING_MODE_CONCURRENT`.

• **initialLayout** is a `VkImageLayout` value specifying the initial `VkImageLayout` of all image subresources of the image. See Image Layouts.

Images created with **tiling** equal to `VK_IMAGE_TILING_LINEAR` have further restrictions on their limits and capabilities compared to images created with **tiling** equal to `VK_IMAGE_TILING_OPTIMAL`. Creation of images with **tiling** `VK_IMAGE_TILING_LINEAR` may not be supported unless other parameters meet all of the constraints:

• **imageType** is `VK_IMAGE_TYPE_2D`

• **format** is not a depth/stencil format

• **mipLevels** is 1

• **arrayLayers** is 1

• **samples** is `VK_SAMPLE_COUNT_1_BIT`

• **usage** only includes `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and/or `VK_IMAGE_USAGE_TRANSFER_DST_BIT`

Images created with one of the **formats that require a sampler Y’C_bC_r conversion**, have further restrictions on their limits and capabilities compared to images created with other formats. Creation of images with a format requiring **Y’C_bC_r conversion** may not be supported unless other parameters meet all of the constraints:

• **imageType** is `VK_IMAGE_TYPE_2D`

• **mipLevels** is 1

• **arrayLayers** is 1, unless the `ycbcrImageArrays` feature is enabled, or otherwise indicated by

VkImageFormatProperties::maxArrayLayers, as returned by vkGetPhysicalDeviceImageFormatProperties

- samples is VK_SAMPLE_COUNT_1_BIT

Implementations may support additional limits and capabilities beyond those listed above.

To determine the set of valid usage bits for a given format, call vkGetPhysicalDeviceFormatProperties.

If the size of the resultant image would exceed maxResourceSize, then vkCreateImage must fail and return VK_ERROR_OUT_OF_DEVICE_MEMORY. This failure may occur even when all image creation parameters satisfy their valid usage requirements.

If the implementation reports VK_TRUE in VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements, usage of VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT must not affect the memory type requirements of the image as described in Sparse Resource Memory Requirements and Resource Memory Association.

NOTE

For images created without VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for the format the image is created with.

For images created with VK_IMAGE_CREATE_EXTENDED_USAGE_BIT a usage bit is valid if it is supported for at least one of the formats a VkImageView created from the image can have (see Image Views for more detail).

### Image Creation Limits

Valid values for some image creation parameters are limited by a numerical upper bound or by inclusion in a bitset. For example, VkImageCreateInfo::arrayLayers is limited by imageCreateMaxArrayLayers, defined below; and VkImageCreateInfo::samples is limited by imageCreateSampleCounts, also defined below.

Several limiting values are defined below, as well as assisting values from which the limiting values are derived. The limiting values are referenced by the relevant valid usage statements of VkImageCreateInfo.

- Let uint64_t imageCreateDrmFormatModifiers[] be the set of Linux DRM format modifiers that the resultant image may have.
  - If tiling is not VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then imageCreateDrmFormatModifiers is empty.
  - If VkImageCreateInfo::pNext contains VkImageDrmFormatModifierExplicitCreateInfoEXT, then imageCreateDrmFormatModifiers contains exactly one modifier, VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.
  - If VkImageCreateInfo::pNext contains VkImageDrmFormatModifierListCreateInfoEXT, then imageCreateDrmFormatModifiers contains the entire array VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers.
Let `VkBool32 imageCreateMaybeLinear` indicate if the resultant image may be linear.

- If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateMaybeLinear` is `VK_TRUE`.
- If tiling is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateMaybeLinear` is `VK_FALSE`.
- If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `imageCreateMaybeLinear` is `VK_TRUE` if and only if `imageCreateDrmFormatModifiers` contains `DRM_FORMAT_MOD_LINEAR`.

Let `VkFormatFeatureFlags imageCreateFormatFeatures` be the set of valid format features available during image creation.

- If tiling is `VK_IMAGE_TILING_LINEAR`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
- If tiling is `VK_IMAGE_TILING_OPTIMAL`, then `imageCreateFormatFeatures` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` with parameter `format` equal to `VkImageCreateInfo::format`.
- If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the value of `imageCreateFormatFeatures` is found by calling `vkGetPhysicalDeviceFormatProperties2` with `VkImageFormatProperties::format` equal to `VkImageCreateInfo::format` and with `VkDrmFormatModifierPropertiesListEXT` chained into `VkFormatProperties2`; by collecting all members of the returned array `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` whose `drmFormatModifier` belongs to `imageCreateDrmFormatModifiers`; and by taking the bitwise intersection, over the collected array members, of `drmFormatModifierTilingFeatures`. (The resultant `imageCreateFormatFeatures` may be empty).

Let `VkImageFormatProperties2 imageCreateImageFormatPropertiesList[]` be the list of structures obtained by calling `vkGetPhysicalDeviceImageFormatProperties2`, possibly multiple times, as follows:

- The parameters `VkPhysicalDeviceImageFormatInfo2::format`, `imageType`, `tiling`, `usage`, and `flags must` be equal to those in `VkImageCreateInfo`.
- If `VkImageCreateInfo::pNext` contains a `VkExternalMemoryImageCreateInfo` structure whose `handleTypes` is not `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext must` contain a `VkPhysicalDeviceExternalImageFormatInfo` structure whose `handleType` is not `0`; and `vkGetPhysicalDeviceImageFormatProperties2` must be called for each handle type in `VkExternalMemoryImageCreateInfo::handleTypes`, successively setting `VkPhysicalDeviceExternalImageFormatInfo::handleType` on each call.
- If `VkImageCreateInfo::pNext` contains no `VkExternalMemoryImageCreateInfo` structure, or contains a structure whose `handleTypes` is `0`, then `VkPhysicalDeviceImageFormatInfo2::pNext must` either contain no `VkPhysicalDeviceExternalImageFormatInfo` structure, or contain a structure whose `handleType` is `0`.
- If `VkImageCreateInfo::pNext` contains a `VkVideoProfileListInfoKHR` structure then `VkPhysicalDeviceImageFormatInfo2::pNext must` also contain the same `VkVideoProfileListInfoKHR` structure on each call.
If \texttt{tiling} is \texttt{VK\_IMAGE\_TILING\_DRM\_FORMAT\_MODIFIER\_EXT}, then:

- \texttt{VkPhysicalDeviceImageFormatInfo2::<pNext} must contain a \texttt{VkPhysicalDeviceImageDrmFormatModifierInfoEXT} structure where \texttt{sharingMode} is equal to \texttt{VkImageCreateInfo::<sharingMode};

- if \texttt{sharingMode} is \texttt{VK\_SHARING\_MODE\_CONCURRENT}, then \texttt{queueFamilyIndexCount} and \texttt{pQueueFamilyIndices} must be equal to those in \texttt{VkImageCreateInfo};

- if \texttt{flags} contains \texttt{VK\_IMAGE\_CREATE\_MODIFIABLE\_FORMAT\_BIT}, then the \texttt{VkImageFormatListCreateInfo} structure included in the \texttt{pNext} chain of \texttt{VkPhysicalDeviceImageFormatInfo2} must be equivalent to the one included in the \texttt{pNext} chain of \texttt{VkImageCreateInfo};

- \texttt{vkGetPhysicalDeviceImageFormatProperties2} must be called for each modifier in \texttt{imageCreateDrmFormatModifiers}, successively setting \texttt{VkPhysicalDeviceImageDrmFormatModifierInfoEXT::<drmFormatModifier} on each call.

If \texttt{tiling} is not \texttt{VK\_IMAGE\_TILING\_DRM\_FORMAT\_MODIFIER\_EXT}, then \texttt{VkPhysicalDeviceImageFormatInfo2::<pNext} must contain no \texttt{VkPhysicalDeviceImageDrmFormatModifierInfoEXT} structure.

If any call to \texttt{vkGetPhysicalDeviceImageFormatProperties2} returns an error, then \texttt{imageCreateImageFormatPropertiesList} is defined to be the empty list.

- Let \texttt{uint32\_t imageCreateMaxMipLevels} be the minimum value of \texttt{VkImageFormatProperties::<maxMipLevels} in \texttt{imageCreateImageFormatPropertiesList}. The value is undefined if \texttt{imageCreateImageFormatPropertiesList} is empty.

- Let \texttt{uint32\_t imageCreateMaxArrayLayers} be the minimum value of \texttt{VkImageFormatProperties::<maxArrayLayers} in \texttt{imageCreateImageFormatPropertiesList}. The value is undefined if \texttt{imageCreateImageFormatPropertiesList} is empty.

- Let \texttt{VkExtent3D imageCreateMaxExtent} be the component-wise minimum over all \texttt{VkImageFormatProperties::<maxExtent} values in \texttt{imageCreateImageFormatPropertiesList}. The value is undefined if \texttt{imageCreateImageFormatPropertiesList} is empty.

- Let \texttt{VkSampleCountFlags imageCreateSampleCounts} be the intersection of each \texttt{VkImageFormatProperties::<sampleCounts} in \texttt{imageCreateImageFormatPropertiesList}. The value is undefined if \texttt{imageCreateImageFormatPropertiesList} is empty.

- Let \texttt{VkVideoFormatPropertiesKHR videoFormatProperties[]} be defined as follows.
  - If \texttt{VkImageCreateInfo::<pNext} contains a \texttt{VkVideoProfileListInfoKHR} structure, then \texttt{videoFormatProperties} is the list of structures obtained by calling \texttt{vkGetPhysicalDeviceVideoFormatPropertiesKHR} with \texttt{VkPhysicalDeviceVideoFormatInfoKHR::<imageUsage} equal to the \texttt{usage} member of \texttt{VkImageCreateInfo} and \texttt{VkPhysicalDeviceVideoFormatInfoKHR::<pNext} containing the same \texttt{VkVideoProfileListInfoKHR} structure chained to \texttt{VkImageCreateInfo}.
  - If \texttt{VkImageCreateInfo::<pNext} contains no \texttt{VkVideoProfileListInfoKHR} structure, then \texttt{videoFormatProperties} is an empty list.

- Let \texttt{VkBool32 supportedVideoFormat} indicate if the image parameters are supported by the specified video profiles.
supportedVideoFormat is VK_TRUE if there exists an element in the videoFormatProperties list for which all of the following conditions are true:

- `VkImageCreateInfo::format` equals `VkVideoFormatPropertiesKHR::format`.
- `VkImageCreateInfo::flags` only contains bits also set in `VkVideoFormatPropertiesKHR::imageCreateFlags`.
- `VkImageCreateInfo::imageType` equals `VkVideoFormatPropertiesKHR::imageType`.
- `VkImageCreateInfo::tiling` equals `VkVideoFormatPropertiesKHR::imageTiling`.
- `VkImageCreateInfo::usage` only contains bits also set in `VkVideoFormatPropertiesKHR::imageUsageFlags`, or `VkImageCreateInfo::flags` includes `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT`.

Otherwise supportedVideoFormat is VK_FALSE.

Valid Usage

- VUID-VkImageCreateInfo-imageCreateMaxMipLevels-02251
  Each of the following values (as described in Image Creation Limits) must not be undefined: `imageCreateMaxMipLevels`, `imageCreateMaxArrayLayers`, `imageCreateMaxExtent`, and `imageCreateSampleCounts`.

- VUID-VkImageCreateInfo-sharingMode-00941
  If `sharingMode` is VK_SHARING_MODE_CONCURRENT, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values.

- VUID-VkImageCreateInfo-sharingMode-00942
  If `sharingMode` is VK_SHARING_MODE_CONCURRENT, `queueFamilyIndexCount` must be greater than 1.

- VUID-VkImageCreateInfo-sharingMode-01420
  If `sharingMode` is VK_SHARING_MODE_CONCURRENT, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either `vkGetPhysicalDeviceQueueFamilyProperties` or `vkGetPhysicalDeviceQueueFamilyProperties2` for the physicalDevice that was used to create device.

- VUID-VkImageCreateInfo-format-00943
  `format` must not be VK_FORMAT_UNDEFINED.

- VUID-VkImageCreateInfo-extent-00944
  `extent.width` must be greater than 0.

- VUID-VkImageCreateInfo-extent-00945
  `extent.height` must be greater than 0.

- VUID-VkImageCreateInfo-extent-00946
  `extent.depth` must be greater than 0.

- VUID-VkImageCreateInfo-mipLevels-00947
  `mipLevels` must be greater than 0.

- VUID-VkImageCreateInfo-arrayLayers-00948
  `arrayLayers` must be greater than 0.
arrayLayers must be greater than 0

- VUID-VkImageCreateInfo-flags-00949
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-flags-08865
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, extent.width and extent.height must be equal

- VUID-VkImageCreateInfo-flags-08866
  If flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT, arrayLayers must be greater than or equal to 6

- VUID-VkImageCreateInfo-flags-00950
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, imageType must be VK_IMAGE_TYPE_3D

- VUID-VkImageCreateInfo-flags-09403
  If flags contains VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, flags must not include VK_IMAGE_CREATE_SPARSE_ALIASED_BIT, VK_IMAGE_CREATE_SPARSE_BINDING_BIT, or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT

- VUID-VkImageCreateInfo-extent-02252
  extent.width must be less than or equal to imageCreateMaxExtent.width (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-extent-02253
  extent.height must be less than or equal to imageCreateMaxExtent.height (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-extent-02254
  extent.depth must be less than or equal to imageCreateMaxExtent.depth (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-imageType-00956
  If imageType is VK_IMAGE_TYPE_1D, both extent.height and extent.depth must be 1

- VUID-VkImageCreateInfo-imageType-00957
  If imageType is VK_IMAGE_TYPE_2D, extent.depth must be 1

- VUID-VkImageCreateInfo-mipLevels-00958
  mipLevels must be less than or equal to the number of levels in the complete mipmap chain based on extent.width, extent.height, and extent.depth

- VUID-VkImageCreateInfo-mipLevels-02255
  mipLevels must be less than or equal to imageCreateMaxMipLevels (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-arrayLayers-02256
  arrayLayers must be less than or equal to imageCreateMaxArrayLayers (as defined in Image Creation Limits)

- VUID-VkImageCreateInfo-imageType-00961
  If imageType is VK_IMAGE_TYPE_3D, arrayLayers must be 1

- VUID-VkImageCreateInfo-samples-02257
If $\text{samples}$ is not $\text{VK\_SAMPLE\_COUNT\_1\_BIT}$, then $\text{imageType}$ must be $\text{VK\_IMAGE\_TYPE\_2D}$, flags must not contain $\text{VK\_IMAGE\_CREATE\_CUBE\_COMPATIBLE\_BIT}$, mipLevels must be equal to 1, and $\text{imageCreateMaybeLinear}$ (as defined in Image Creation Limits) must be $\text{VK\_FALSE}$.

- **VUID-VkImageCreateInfo-usage-00963**
  If usage includes $\text{VK\_IMAGE\_USAGE\_TRANSIENT\_ATTACHMENT\_BIT}$, then bits other than $\text{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}$, and $\text{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}$ must not be set.

- **VUID-VkImageCreateInfo-usage-00964**
  If usage includes $\text{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_TRANSIENT\_ATTACHMENT\_BIT}$, or $\text{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}$, extent.width must be less than or equal to $\text{VkPhysicalDeviceLimits::maxFramebufferWidth}$.

- **VUID-VkImageCreateInfo-usage-00965**
  If usage includes $\text{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_TRANSIENT\_ATTACHMENT\_BIT}$, or $\text{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}$, extent.height must be less than or equal to $\text{VkPhysicalDeviceLimits::maxFramebufferHeight}$.

- **VUID-VkImageCreateInfo-usage-00966**
  If usage includes $\text{VK\_IMAGE\_USAGE\_TRANSIENT\_ATTACHMENT\_BIT}$, usage must also contain at least one of $\text{VK\_IMAGE\_USAGE\_COLOR\_ATTACHMENT\_BIT}$, $\text{VK\_IMAGE\_USAGE\_DEPTH\_STENCIL\_ATTACHMENT\_BIT}$, or $\text{VK\_IMAGE\_USAGE\_INPUT\_ATTACHMENT\_BIT}$.

- **VUID-VkImageCreateInfo-samples-02258**
  $\text{samples}$ must be a valid $\text{VkSampleCountFlagBits}$ value that is set in $\text{imageCreateSampleCounts}$ (as defined in Image Creation Limits).

- **VUID-VkImageCreateInfo-usage-00968**
  If the shaderStorageImageMultisample feature is not enabled, and usage contains $\text{VK\_IMAGE\_USAGE\_STORAGE\_BIT}$, $\text{samples}$ must be $\text{VK\_SAMPLE\_COUNT\_1\_BIT}$.

- **VUID-VkImageCreateInfo-flags-00969**
  If the sparseBinding feature is not enabled, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_BINDING\_BIT}$.

- **VUID-VkImageCreateInfo-flags-01924**
  If the sparseResidencyAliased feature is not enabled, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_ALIASED\_BIT}$.

- **VUID-VkImageCreateInfo-tiling-04121**
  If tiling is $\text{VK\_IMAGE\_TILING\_LINEAR}$, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT}$.

- **VUID-VkImageCreateInfo-imageType-00970**
  If $\text{imageType}$ is $\text{VK\_IMAGE\_TYPE\_1D}$, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT}$.

- **VUID-VkImageCreateInfo-imageType-00971**
  If the sparseResidencyImage2D feature is not enabled, and $\text{imageType}$ is $\text{VK\_IMAGE\_TYPE\_2D}$, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT}$.

- **VUID-VkImageCreateInfo-imageType-00972**
  If the sparseResidencyImage2D feature is not enabled, and $\text{imageType}$ is $\text{VK\_IMAGE\_TYPE\_2D}$, flags must not contain $\text{VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT}$.
If the `sparseResidencyImage3D` feature is not enabled, and `imageType` is `VK_IMAGE_TYPE_3D`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkImageCreateInfo-imageType-00973**
  If the `sparseResidency2Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_2_BIT`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkImageCreateInfo-imageType-00974**
  If the `sparseResidency4Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_4_BIT`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkImageCreateInfo-imageType-00975**
  If the `sparseResidency8Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_8_BIT`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkImageCreateInfo-imageType-00976**
  If the `sparseResidency16Samples` feature is not enabled, `imageType` is `VK_IMAGE_TYPE_2D`, and `samples` is `VK_SAMPLE_COUNT_16_BIT`, `flags` must not contain `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

- **VUID-VkImageCreateInfo-flags-00987**
  If `flags` contains `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`, it must also contain `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`.

- **VUID-VkImageCreateInfo-None-01925**
  If any of the bits `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` are set, `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` must not also be set.

- **VUID-VkImageCreateInfo-pNext-00990**
  If the `pNext` chain includes a `VkExternalMemoryImageCreateInfo` structure, its `handleTypes` member must only contain bits that are also in `VkExternalImageFormatProperties`::`externalMemoryProperties.compatibleHandleTypes`, as returned by `vkGetPhysicalDeviceImageFormatProperties2` with `format`, `imageType`, `tiling`, `usage`, and `flags` equal to those in this structure, and with a `VkPhysicalDeviceExternalImageFormatInfo` structure included in the `pNext` chain, with a `handleType` equal to any one of the handle types specified in `VkExternalMemoryImageCreateInfo`::`handleTypes`.

- **VUID-VkImageCreateInfo-physicalDeviceCount-01421**
  If the logical device was created with `VkDeviceGroupDeviceCreateInfo`. 

---

777
physicalDeviceCount equal to 1, flags must not contain
VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT

- VUID-VkImageCreateInfo-flags-02259
  If flags contains VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT, then mipLevels must be one, arrayLayers must be one, imageType must be VK_IMAGE_TYPE_2D, and imageCreateMaybeLinear (as defined in Image Creation Limits) must be VK_FALSE

- VUID-VkImageCreateInfo-flags-01572
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then format must be a compressed image format

- VUID-VkImageCreateInfo-flags-01573
  If flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, then flags must also contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT

- VUID-VkImageCreateInfo-initialLayout-00993
  initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED

- VUID-VkImageCreateInfo-pNext-01443
  If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, initialLayout must be VK_IMAGE_LAYOUT_UNDEFINED

- VUID-VkImageCreateInfo-format-06410
  If the image format is one of the formats that require a sampler Y′C_B_C_R conversion, mipLevels must be 1

- VUID-VkImageCreateInfo-format-06411
  If the image format is one of the formats that require a sampler Y′C_B_C_R conversion, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-format-06412
  If the image format is one of the formats that require a sampler Y′C_B_C_R conversion, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-imageCreateFormatFeatures-02260
  If format is a multi-planar format, and if imageCreateFormatFeatures (as defined in Image Creation Limits) does not contain VK_FORMAT_FEATURE_DISJOINT_BIT, then flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-01577
  If format is not a multi-planar format, and flags does not include VK_IMAGE_CREATE_ALIAS_BIT, flags must not contain VK_IMAGE_CREATE_DISJOINT_BIT

- VUID-VkImageCreateInfo-format-04712
  If format has a _422 or _420 suffix, extent.width must be a multiple of 2

- VUID-VkImageCreateInfo-format-04713
  If format has a _420 suffix, extent.height must be a multiple of 2

- VUID-VkImageCreateInfo-tiling-02261
  If tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the pNext chain must include exactly one of VkImageDrmFormatModifierListCreateInfoEXT or VkImageDrmFormatModifierExplicitCreateInfoEXT structures
If the `pNext` chain includes a `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then tiling must be `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.

If tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and `flags` contains `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with non-zero `viewFormatCount`.

If `flags` contains `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`, then the `format` must be a depth or depth/stencil format.

If `format` is a depth-stencil format, `usage` includes `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencelUsageCreateInfo` structure, then its `stencilUsage` member must also include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If `format` is a depth-stencil format, `usage` does not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, and the `pNext` chain includes a `VkImageStencelUsageCreateInfo` structure, then its `stencilUsage` member must also not include `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`.

If the `shaderStorageImageMultisample` feature is not enabled, `format` is a depth-stencil format.
format and the pNext chain includes a VkImageStencilUsageCreateInfo structure with its stencilUsage including VK_IMAGE_USAGE_STORAGE_BIT, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-imageType-02082
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, imageType must be VK_IMAGE_TYPE_2D

- VUID-VkImageCreateInfo-samples-02083
  If usage includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, samples must be VK_SAMPLE_COUNT_1_BIT

- VUID-VkImageCreateInfo-imageView2DOn3DImage-04459
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageView2DOn3DImage is VK_FALSE, flags must not contain VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT

- VUID-VkImageCreateInfo-multisampleArrayImage-04460
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::multisampleArrayImage is VK_FALSE, and samples is not VK_SAMPLE_COUNT_1_BIT, then arrayLayers must be 1

- VUID-VkImageCreateInfo-pNext-06722
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is not a multi-planar format and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats must either be compatible with the format as described in the compatibility table or, if flags contains VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT, be an uncompressed format that is size-compatible with format

- VUID-VkImageCreateInfo-pNext-10062
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and format is a multi-planar format and flags contains VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VkImageFormatListCreateInfo::viewFormatCount is not zero, then each format in VkImageFormatListCreateInfo::pViewFormats must be compatible with the VkFormat for the plane of the image format

- VUID-VkImageCreateInfo-flags-04738
  If flags does not contain VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the pNext chain includes a VkImageFormatListCreateInfo structure, then VkImageFormatListCreateInfo::viewFormatCount must be 0 or 1

- VUID-VkImageCreateInfo-usage-04815
  If usage includes VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, and flags does not include VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying a decode operation

- VUID-VkImageCreateInfo-usage-04816
  If usage includes VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR,
and flags does not include VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then the pNext chain must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0 and pProfiles including at least one VkVideoProfileInfoKHR structure with a videoCodecOperation member specifying an encode operation.

- VUID-VkImageCreateInfo-flags-08328
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then videoMaintenance1 must be enabled.

- VUID-VkImageCreateInfo-flags-08329
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage does not include VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_ENCODE_PBP_BIT_KHR.

- VUID-VkImageCreateInfo-flags-08331
  If flags includes VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_ENCODE_PBP_BIT_KHR.

- VUID-VkImageCreateInfo-pNext-06811
  If the pNext chain includes a VkVideoProfileListInfoKHR structure with profileCount greater than 0, then supportedVideoFormat must be VK_TRUE.

- VUID-VkImageCreateInfo-imageCreateFormatFeatures-09048
  If imageCreateFormatFeatures (as defined in Image Creation Limits) does not contain VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT, then usage must not contain VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT.

**Valid Usage (Implicit)**

- VUID-VkImageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_CREATE_INFO

- VUID-VkImageCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkExternalMemoryImageCreateInfo, VkImageDrmFormatModifierExplicitCreateInfoEXT, VkImageDrmFormatModifierListCreateInfoEXT, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkImageSwapchainCreateInfoKHR, or VkVideoProfileListInfoKHR.

- VUID-VkImageCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkImageCreateInfo-flags-parameter
  flags must be a valid combination of VkImageCreateFlagBits values.

- VUID-VkImageCreateInfo-imageType-parameter
  imageType must be a valid VkImageType value.

- VUID-VkImageCreateInfo-format-parameter
  format must be a valid VkFormat value.

- VUID-VkImageCreateInfo-samples-parameter
samples must be a valid VkSampleCountFlagBits value

- VUID-VkImageCreateInfo-tiling-parameter
  tiling must be a valid VkImageTiling value

- VUID-VkImageCreateInfo-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkImageCreateInfo-usage-requiredbitmask
  usage must not be 0

- VUID-VkImageCreateInfo-sharingMode-parameter
  sharingMode must be a valid VkSharingMode value

- VUID-VkImageCreateInfo-initialLayout-parameter
  initialLayout must be a valid VkImageLayout value

The VkImageStencilUsageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageStencilUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags stencilUsage;
} VkImageStencilUsageCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stencilUsage** is a bitmask of VkImageUsageFlagBits describing the intended usage of the stencil aspect of the image.

If the **pNext** chain of VkImageCreateInfo includes a VkImageStencilUsageCreateInfo structure, then that structure includes the usage flags specific to the stencil aspect of the image for an image with a depth-stencil format.

This structure specifies image usages which only apply to the stencil aspect of a depth/stencil format image. When this structure is included in the **pNext** chain of VkImageCreateInfo, the stencil aspect of the image must only be used as specified by stencilUsage. When this structure is not included in the **pNext** chain of VkImageCreateInfo, the stencil aspect of an image must only be used as specified by VkImageCreateInfo::usage. Use of other aspects of an image are unaffected by this structure.

This structure can also be included in the **pNext** chain of VkPhysicalDeviceImageFormatInfo2 to query additional capabilities specific to image creation parameter combinations including a separate set of usage flags for the stencil aspect of the image using vkGetPhysicalDeviceImageFormatProperties2. When this structure is not included in the **pNext** chain of VkPhysicalDeviceImageFormatInfo2 then the implicit value of stencilUsage matches that of VkPhysicalDeviceImageFormatInfo2::usage.
Valid Usage

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-02539
  If stencilUsage includes VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT, it must not include bits other than VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT or VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT

Valid Usage (Implicit)

- VUID-VkImageStencilUsageCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_STENCIL_USAGE_CREATE_INFO

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-parameter
  stencilUsage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkImageStencilUsageCreateInfo-stencilUsage-requiredbitmask
  stencilUsage must not be 0

To define a set of external memory handle types that may be used as backing store for an image, add a VkExternalMemoryImageCreateInfo structure to the pNext chain of the VkImageCreateInfo structure. The VkExternalMemoryImageCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalMemoryImageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlags handleTypes;
} VkExternalMemoryImageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory
typedef VkExternalMemoryImageCreateInfo VkExternalMemoryImageCreateInfoKHR;
```

**NOTE**
A VkExternalMemoryImageCreateInfo structure with a non-zero handleTypes field must be included in the creation parameters for an image that will be bound to memory that is either exported or imported.

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleTypes is zero or a bitmask of VkExternalMemoryHandleTypeFlagBits specifying one or more external memory handle types.
Valid Usage (Implicit)

- VUID-VkExternalMemoryImageCreateInfo-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_EXTERNAL_MEMORY_IMAGE_CREATE_INFO**

- VUID-VkExternalMemoryImageCreateInfo-handleTypes-parameter
  
  **handleTypes** must be a valid combination of **VkExternalMemoryHandleTypeFlagBits** values

If the **pNext** chain of **VkImageCreateInfo** includes a **VkImageSwapchainCreateInfoKHR** structure, then that structure includes a swapchain handle indicating that the image will be bound to memory from that swapchain.

The **VkImageSwapchainCreateInfoKHR** structure is defined as:

```c
typedef struct VkImageSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
} VkImageSwapchainCreateInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **swapchain** is **VK_NULL_HANDLE** or a handle of a swapchain that the image will be bound to.

Valid Usage

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-00995
  
  If **swapchain** is not **VK_NULL_HANDLE**, the fields of **VkImageCreateInfo** must match the implied image creation parameters of the swapchain

Valid Usage (Implicit)

- VUID-VkImageSwapchainCreateInfoKHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_SWAPCHAIN_CREATE_INFO_KHR**

- VUID-VkImageSwapchainCreateInfoKHR-swapchain-parameter
  
  If **swapchain** is not **VK_NULL_HANDLE**, **swapchain** must be a valid **VkSwapchainKHR** handle

If the **pNext** chain of **VkImageCreateInfo** includes a **VkImageFormatListCreateInfo** structure, then that structure contains a list of all formats that can be used when creating views of this image.
The VkImageFormatListCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkImageFormatListCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t viewFormatCount;
    const VkFormat* pViewFormats;
} VkImageFormatListCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_image_format_list
typedef VkImageFormatListCreateInfo VkImageFormatListCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `viewFormatCount` is the number of entries in the `pViewFormats` array.
- `pViewFormats` is a pointer to an array of VkFormat values specifying all formats which can be used when creating views of this image.

If `viewFormatCount` is zero, `pViewFormats` is ignored and the image is created as if the VkImageFormatListCreateInfo structure were not included in the `pNext` chain of VkImageCreateInfo.

**Valid Usage**

- VUID-VkImageFormatListCreateInfo-viewFormatCount-09540
  If `viewFormatCount` is not 0, each element of `pViewFormats` must not be VK_FORMAT_UNDEFINED

**Valid Usage (Implicit)**

- VUID-VkImageFormatListCreateInfo-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_IMAGE_FORMAT_LIST_CREATE_INFO
- VUID-VkImageFormatListCreateInfo-pViewFormats-parameter
  If `viewFormatCount` is not 0, `pViewFormats` must be a valid pointer to an array of `viewFormatCount` valid VkFormat values

If the `pNext` chain of VkImageCreateInfo includes a VkImageDrmFormatModifierListCreateInfoEXT structure, then the image will be created with one of the Linux DRM format modifiers listed in the structure. The choice of modifier is implementation-dependent.

The VkImageDrmFormatModifierListCreateInfoEXT structure is defined as:
typedef struct VkImageDrmFormatModifierListCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t drmFormatModifierCount;
    const uint64_t* pDrmFormatModifiers;
} VkImageDrmFormatModifierListCreateInfoEXT;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `drmFormatModifierCount` is the length of the `pDrmFormatModifiers` array.
- `pDrmFormatModifiers` is a pointer to an array of Linux DRM format modifiers.

**Valid Usage**

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-02263 Each modifier in `pDrmFormatModifiers` must be compatible with the parameters in `VkImageCreateInfo` and its `pNext` chain, as determined by querying `VkPhysicalDeviceImageFormatInfo2` extended with `VkPhysicalDeviceImageDrmFormatModifierInfoEXT`.

**Valid Usage (Implicit)**

- VUID-VkImageDrmFormatModifierListCreateInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_LIST_CREATE_INFO_EXT`.
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-pDrmFormatModifiers-parameter `pDrmFormatModifiers` must be a valid pointer to an array of `drmFormatModifierCount` `uint64_t` values.
- VUID-VkImageDrmFormatModifierListCreateInfoEXT-drmFormatModifierCount-arraylength `drmFormatModifierCount` must be greater than 0.

If the `pNext` chain of `VkImageCreateInfo` includes a `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure, then the image will be created with the Linux DRM format modifier and memory layout defined by the structure.

The `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure is defined as:
typedef struct VkImageDrmFormatModifierExplicitCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint64_t drmFormatModifier;
    uint32_t drmFormatModifierPlaneCount;
    const VkSubresourceLayout* pPlaneLayouts;
} VkImageDrmFormatModifierExplicitCreateInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- drmFormatModifier is the Linux DRM format modifier with which the image will be created.
- drmFormatModifierPlaneCount is the number of memory planes in the image (as reported by VkDrmFormatModifierPropertiesEXT) as well as the length of the pPlaneLayouts array.
- pPlaneLayouts is a pointer to an array of VkSubresourceLayout structures describing the image’s memory planes.

The i\textsuperscript{th} member of pPlaneLayouts describes the layout of the image’s i\textsuperscript{th} memory plane (that is, VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT). In each element of pPlaneLayouts, the implementation must ignore size. The implementation calculates the size of each plane, which the application can query with vkGetImageSubresourceLayout.

When creating an image with VkImageDrmFormatModifierExplicitCreateInfoEXT, it is the application’s responsibility to satisfy all valid usage requirements. However, the implementation must validate that the provided pPlaneLayouts, when combined with the provided drmFormatModifier and other creation parameters in VkImageCreateInfo and its pNext chain, produce a valid image. (This validation is necessarily implementation-dependent and outside the scope of Vulkan, and therefore not described by valid usage requirements). If this validation fails, then vkCreateImage returns VK_ERROR_INVALID_DRM_FORMAT_MODIFIER_PLANE_LAYOUT_EXT.

**Valid Usage**

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifier-02264
  drmFormatModifier must be compatible with the parameters in VkImageCreateInfo and its pNext chain, as determined by querying VkPhysicalDeviceImageFormatInfo2 extended with VkPhysicalDeviceImageDrmFormatModifierInfoEXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-02265
  drmFormatModifierPlaneCount must be equal to the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with VkImageCreateInfo::format and drmFormatModifier, as found by querying VkDrmFormatModifierPropertiesListEXT

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-size-02267
  For each element of pPlaneLayouts, size must be 0

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-arrayPitch-02268
For each element of `pPlaneLayouts`, `arrayPitch` must be 0 if `VkImageCreateInfo::arrayLayers` is 1

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-depthPitch-02269
  For each element of `pPlaneLayouts`, `depthPitch` must be 0 if `VkImageCreateInfo::extent.depth` is 1

---

**Valid Usage (Implicit)**

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_EXPLICIT_CREATE_INFO_EXT`

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-pPlaneLayouts-parameter
  `pPlaneLayouts` must be a valid pointer to an array of `drmFormatModifierPlaneCount VkSubresourceLayout` structures

- VUID-VkImageDrmFormatModifierExplicitCreateInfoEXT-drmFormatModifierPlaneCount-arraylength
  `drmFormatModifierPlaneCount` must be greater than 0

---

Bits which can be set in

- `VkImageViewUsageCreateInfo::usage`
- `VkImageStencilUsageCreateInfo::stencilUsage`
- `VkImageCreateInfo::usage`

specify intended usage of an image, and are:
// Provided by VK_VERSION_1_0
typedef enum VkImageUsageFlagBits {
    VK_IMAGE_USAGE_TRANSFER_SRC_BIT = 0x00000001,
    VK_IMAGE_USAGE_TRANSFER_DST_BIT = 0x00000002,
    VK_IMAGE_USAGE_SAMPLED_BIT = 0x00000004,
    VK_IMAGE_USAGE_STORAGE_BIT = 0x00000008,
    VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT = 0x00000010,
    VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT = 0x00000020,
    VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT = 0x00000040,
    VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT = 0x00000080,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR = 0x00000400,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR = 0x00000800,
    // Provided by VK_KHR_video_decode_queue
    VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR = 0x00001000,
    // Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR = 0x00000100,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR = 0x00002000,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR = 0x00004000,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR = 0x00008000,
    // Provided by VK_EXT_host_image_copy
    VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT = 0x00400000,
    // Provided by VK_KHR_video_encode_queue
    VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT = 0x00080000
} VkImageUsageFlagBits;

• **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** specifies that the image can be used as the source of a transfer command.

• **VK_IMAGE_USAGE_TRANSFER_DST_BIT** specifies that the image can be used as the destination of a transfer command.

• **VK_IMAGE_USAGE_SAMPLED_BIT** specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot either of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and be sampled by a shader.

• **VK_IMAGE_USAGE_STORAGE_BIT** specifies that the image can be used to create a VkImageView suitable for occupying a VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.

• **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for use as a color or resolve attachment in a VkFramebuffer.

• **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for use as a depth/stencil or depth/stencil resolve attachment in a VkFramebuffer.

• **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT** specifies that implementations may support using memory allocations with the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT to back an image with
this usage. This bit can be set for any image that can be used to create a VkImageView suitable for use as a color, resolve, depth/stencil, or input attachment.

- **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** specifies that the image can be used to create a VkImageView suitable for occupying VkDescriptorSet slot of type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT; be read from a shader as an input attachment; and be used as an input attachment in a framebuffer.

- **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** specifies that the image can be used to create a VkImageView suitable for use as a fragment shading rate attachment

- **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** specifies that the image can be used as a decode output picture in a video decode operation.

- **VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR** is reserved for future use.

- **VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR** specifies that the image can be used as an output reconstructed picture or an input reference picture in a video encode operation.

- **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** is reserved for future use.

- **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR** specifies that the image can be used as an output reconstructed picture or an input reference picture in a video encode operation.

- **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the image can be transitioned to the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT layout to be used as a color or depth/stencil attachment in a VkFramebuffer and/or as a read-only input resource in a shader (sampled image, combined image sampler or input attachment) in the same render pass.

- **VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT** specifies that the image can be used with host copy commands and host layout transitions.

    // Provided by VK_VERSION_1_0  
    typedef VkFlags VkImageUsageFlags;

**VkImageUsageFlags** is a bitmask type for setting a mask of zero or more **VkImageUsageFlagBits**.

When creating a VkImageView one of the following **VkImageUsageFlagBits** must be set:

- **VK_IMAGE_USAGE_SAMPLED_BIT**
- **VK_IMAGE_USAGE_STORAGE_BIT**
- **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR**
Bits which can be set in `VkImageCreateInfo::flags`, specifying additional parameters of an image, are:

```cpp
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
    // Provided by VK_KHR_video_maintenance1
    VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR = 0x00100000,
    // Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
    // Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR = 
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR = 
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
    // Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_CREATE_DISJOINT_BIT_KHR = VK_IMAGE_CREATE_DISJOINT_BIT,
    // Provided by VK_KHR_bind_memory2
    VK_IMAGE_CREATE_ALIAS_BIT_KHR = VK_IMAGE_CREATE_ALIAS_BIT,
} VkImageCreateFlagBits;
```
• **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding.

• **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag **must** also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag **must** also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a *VkImageView* with a different format from the image. For **multi-planar formats**, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a *VkImageView* can be created of a **plane** of the image.

• **VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT** specifies that the image can be used to create a *VkImageView* of type **VK_IMAGE_VIEW_TYPE_CUBE** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**.

• **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image can be used to create a *VkImageView* of type **VK_IMAGE_VIEW_TYPE_2D** or **VK_IMAGE_VIEW_TYPE_2D_ARRAY**.

• **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.

• **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image can be used with a non-zero value of the `splitInstanceBindRegionCount` member of a *VkBindImageMemoryDeviceGroupInfo* structure passed into `vkBindImageMemory2`. This flag also has the effect of making the image use the standard sparse image block dimensions.

• **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** specifies that the image having a compressed format can be used to create a *VkImageView* with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

• **VK_IMAGE_CREATE_EXTENDED_USAGE_BIT** specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a *VkImageView* created from the image can have.

• **VK_IMAGE_CREATE_DISJOINT_BIT** specifies that an image with a **multi-planar format** must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a **disjoint image** from an image without this bit set.

• **VK_IMAGE_CREATE_ALIAS_BIT** specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the **Memory Aliasing** section. This flag further specifies that each plane of a **disjoint image** can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear representation with a plane of a multi-planar disjoint image, according to the rules in **Compatible Formats of Planes of Multi-Planar Formats**. If the **pNext** chain includes a *VkExternalMemoryImageCreateInfo* structure whose `handleTypes` member is not **0**, it is as if **VK_IMAGE_CREATE_ALIAS_BIT** is set.

• **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** specifies that an image with a depth or depth/stencil format can be used with custom sample locations when used as a
depth/stencil attachment.

- **VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR** specifies that the image can be used in video coding operations without having to specify at image creation time the set of video profiles the image will be used with, except for images used only as DPB pictures, as long as the image is otherwise compatible with the video profile in question.

  This enables exchanging video picture data without additional copies or conversions when used as:

  - **Decode output pictures**, indifferent of the video profile used to produce them.
  - **Encode input pictures**, indifferent of the video profile used to consume them.

  This includes images created with both **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** and **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR**, which is necessary to use the same video picture as the reconstructed picture and decode output picture in a video decode operation on implementations supporting **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR**.

  However, images with only DPB usage remain tied to the video profiles the image was created with, as the data layout of such DPB-only images may be implementation- and codec-dependent.

  If an application would like to share or reuse the device memory backing such images (e.g. for the purposes of temporal aliasing), then it should create separate image objects for each video profile and bind them to the same underlying device memory range, similar to how memory resources can be shared across separate video sessions or any other memory-backed resource.

  See **Sparse Resource Features** and **Sparse Physical Device Features** for more details.

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;

VkImageCreateFlags is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits.

Possible values of VkImageCreateInfo::imageType, specifying the basic dimensionality of an image, are:
```
```c
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```
• **VK_IMAGE_TYPE_2D** specifies a two-dimensional image.
• **VK_IMAGE_TYPE_3D** specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
} VkImageTiling;
```

• **VK_IMAGE_TILING_OPTIMAL** specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).
• **VK_IMAGE_TILING_LINEAR** specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).
• **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT** indicates that the image's tiling is defined by a Linux DRM format modifier. The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and can be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice device,
    VkImage image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

• **device** is the logical device that owns the image.
• **image** is the image whose layout is being queried.
• **pSubresource** is a pointer to a `VkImageSubresource` structure selecting a specific image subresource from the image.
• **pLayout** is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is linear, then the returned layout is valid for host access.

If the image's tiling is **VK_IMAGE_TILING_LINEAR** and its format is a multi-planar format, then `vkGetImageSubresourceLayout` describes one **format plane** of the image. If the image's tiling is **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT**, then `vkGetImageSubresourceLayout` describes one **memory plane** of the image. If the image's tiling is **VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT** and the image is
then the returned layout has an implementation-dependent meaning; the vendor of the image's DRM format modifier may provide documentation that explains how to interpret the returned layout.

vkGetImageSubresourceLayout is invariant for the lifetime of a single image.

**Valid Usage**

- VUID-vkGetImageSubresourceLayout-image-07790
  
  image must have been created with tiling equal to VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

- VUID-vkGetImageSubresourceLayout-aspectMask-00997
  
  The aspectMask member of pSubresource must only have a single bit set

- VUID-vkGetImageSubresourceLayout-mipLevel-01716
  
  The mipLevel member of pSubresource must be less than the mipLevels specified in image

- VUID-vkGetImageSubresourceLayout-arrayLayer-01717
  
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in image

- VUID-vkGetImageSubresourceLayout-format-08886
  
  If format of the image is a color format that is not a multi-planar image format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkGetImageSubresourceLayout-format-04462
  
  If format of the image has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- VUID-vkGetImageSubresourceLayout-format-04463
  
  If format of the image has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout-format-04464
  
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout-tiling-08717
  
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

- VUID-vkGetImageSubresourceLayout-tiling-09433
  
  If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier
Valid Usage (Implicit)

- VUID-vkGetImageSubresourceLayout-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetImageSubresourceLayout-image-parameter
  
  `image` must be a valid `VkImage` handle

- VUID-vkGetImageSubresourceLayout-pSubresource-parameter
  
  `pSubresource` must be a valid pointer to a valid `VkImageSubresource` structure

- VUID-vkGetImageSubresourceLayout-pLayout-parameter
  
  `pLayout` must be a valid pointer to a `VkSubresourceLayout` structure

- VUID-vkGetImageSubresourceLayout-image-parent
  
  `image` must have been created, allocated, or retrieved from `device`

The `VkImageSubresource` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

- `aspectMask` is a `VkImageAspectFlags` value selecting the image `aspect`.
- `mipLevel` selects the mipmap level.
- `arrayLayer` selects the array layer.

Valid Usage (Implicit)

- VUID-VkImageSubresource-aspectMask-parameter
  
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

- VUID-VkImageSubresource-aspectMask-requiredbitmask
  
  `aspectMask` must not be 0

Information about the layout of the image subresource is returned in a `VkSubresourceLayout` structure:
typedef struct VkSubresourceLayout {
    VkDeviceSize offset;
    VkDeviceSize size;
    VkDeviceSize rowPitch;
    VkDeviceSize arrayPitch;
    VkDeviceSize depthPitch;
} VkSubresourceLayout;

- **offset** is the byte offset from the start of the image or the plane where the image subresource begins.
- **size** is the size in bytes of the image subresource. **size** includes any extra memory that is required based on **rowPitch**.
- **rowPitch** describes the number of bytes between each row of texels in an image.
- **arrayPitch** describes the number of bytes between each array layer of an image.
- **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is **linear**, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset
```

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent array layers. **depthPitch** is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
*compressedTexelBlockByteSize + offset;
```

The value of **arrayPitch** is undefined for images that were not created as arrays. **depthPitch** is defined only for 3D images.

If the image has a **single-plane** color format and its tiling is **VK_IMAGE_TILING_LINEAR**, then the **aspectMask** member of VkImageSubresource must be **VK_IMAGE_ASPECT_COLOR_BIT**.

If the image has a depth/stencil format and its tiling is **VK_IMAGE_TILING_LINEAR**, then **aspectMask**
must be either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same offset and size are returned and represent the interleaved memory allocation.

If the image has a multi-planar format and its tiling is VK_IMAGE_TILING_LINEAR, then the aspectMask member of VkImageSubresource must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or (for 3-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT. Querying each of these image subresource layouts will return a different offset and size representing the region of memory used for that plane. If the image is disjoint, then the offset is relative to the base address of the plane. If the image is non-disjoint, then the offset is relative to the base address of the image.

If the image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of VkImageSubresource must be one of VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT, where the maximum allowed plane index i is defined by the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image’s VkImageCreateInfo::format and modifier. The memory range used by the subresource is described by offset and size. If the image is disjoint, then the offset is relative to the base address of the memory plane. If the image is non-disjoint, then the offset is relative to the base address of the image. If the image is non-linear, then rowPitch, arrayPitch, and depthPitch have an implementation-dependent meaning.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetImageSubresourceLayout2KHR(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

or the equivalent command

```c
// Provided by VK_EXT_host_image_copy
void vkGetImageSubresourceLayout2EXT(
    VkDevice device,
    VkImage image,
    const VkImageSubresource2KHR* pSubresource,
    VkSubresourceLayout2KHR* pLayout);
```

- **device** is the logical device that owns the image.
- **image** is the image whose layout is being queried.
- **pSubresource** is a pointer to a VkImageSubresource2KHR structure selecting a specific image for the image subresource.
- **pLayout** is a pointer to a VkSubresourceLayout2KHR structure in which the layout is returned.
vkGetImageSubresourceLayout2KHR behaves similarly to vkGetImageSubresourceLayout, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

It is legal to call vkGetImageSubresourceLayout2KHR with an image created with tiling equal to VK_IMAGE_TILING_OPTIMAL, but the members of VkSubresourceLayout2KHR::subresourceLayout will have undefined values in this case.

NOTE Structures chained from VkImageSubresource2KHR::pNext will also be updated when tiling is equal to VK_IMAGE_TILING_OPTIMAL.

Valid Usage

- VUID-vkGetImageSubresourceLayout2KHR-aspectMask-00997
  The aspectMask member of pSubresource must only have a single bit set

- VUID-vkGetImageSubresourceLayout2KHR-mipLevel-01716
  The mipLevel member of pSubresource must be less than the mipLevels specified in image

- VUID-vkGetImageSubresourceLayout2KHR-arrayLayer-01717
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in image

- VUID-vkGetImageSubresourceLayout2KHR-format-08886
  If format of the image is a color format that is not a multi-planar image format, and tiling of the image is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-vkGetImageSubresourceLayout2KHR-format-04462
  If format of the image has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- VUID-vkGetImageSubresourceLayout2KHR-format-04463
  If format of the image has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout2KHR-format-04464
  If format of the image does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-vkGetImageSubresourceLayout2KHR-tiling-08717
  If the tiling of the image is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

- VUID-vkGetImageSubresourceLayout2KHR-tiling-09435
  If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier
**Valid Usage (Implicit)**

- VUID-vkGetImageSubresourceLayout2KHR-device-parameter
  
  **device** must be a valid **VkDevice** handle

- VUID-vkGetImageSubresourceLayout2KHR-image-parameter
  
  **image** must be a valid **VkImage** handle

- VUID-vkGetImageSubresourceLayout2KHR-pSubresource-parameter
  
  **pSubresource** must be a valid pointer to a valid **VkImageSubresource2KHR** structure

- VUID-vkGetImageSubresourceLayout2KHR-pLayout-parameter
  
  **pLayout** must be a valid pointer to a **VkSubresourceLayout2KHR** structure

- VUID-vkGetImageSubresourceLayout2KHR-image-parent
  
  **image** must have been created, allocated, or retrieved from **device**

The **VkImageSubresource2KHR** structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkImageSubresource2KHR {
    VkStructureType sType;
    void* pNext;
    VkImageSubresource imageSubresource;
} VkImageSubresource2KHR;
```

or the equivalent

```c
// Provided by VK_EXT_host_image_copy
typedef VkImageSubresource2KHR VkImageSubresource2EXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **imageSubresource** is a **VkImageSubresource** structure.

**Valid Usage (Implicit)**

- VUID-VkImageSubresource2KHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_KHR**

- VUID-VkImageSubresource2KHR-pNext-pNext
  
  **pNext** must be **NULL**

- VUID-VkImageSubresource2KHR-imageSubresource-parameter
  
  **imageSubresource** must be a valid **VkImageSubresource** structure

Information about the layout of the image subresource is returned in a **VkSubresourceLayout2KHR**
structure:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkSubresourceLayout2KHR {
    VkStructureType sType;
    void* pNext;
    VkSubresourceLayout subresourceLayout;
} VkSubresourceLayout2KHR;
```
or the equivalent

```c
// Provided by VK_EXT_host_image_copy
typedef VkSubresourceLayout2KHR VkSubresourceLayout2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subresourceLayout` is a `VkSubresourceLayout` structure.

**Valid Usage (Implicit)**

- VUID-VkSubresourceLayout2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_KHR`
- VUID-VkSubresourceLayout2KHR-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkSubresourceHostMemcpySizeEXT`
- VUID-VkSubresourceLayout2KHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

To query the memory size needed to copy to or from an image using `vkCopyMemoryToImageEXT` or `vkCopyImageToMemoryEXT` when the `VK_HOST_IMAGE_COPY_MEMCPY_EXT` flag is specified, add a `VkSubresourceHostMemcpySizeEXT` structure to the `pNext` chain of the `VkSubresourceLayout2EXT` structure in a call to `vkGetImageSubresourceLayout2EXT`.

The `VkSubresourceHostMemcpySizeEXT` structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkSubresourceHostMemcpySizeEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize size;
} VkSubresourceHostMemcpySizeEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
To query the memory layout of an image subresource, without an image object, call:

```c
// Provided by VK_KHR_maintenance5
void vkGetDeviceImageSubresourceLayoutKHR(
    VkDevice device,
    const VkDeviceImageSubresourceInfoKHR* pInfo,
    VkSubresourceLayout2KHR* pLayout);
```

- **device** is the logical device that owns the image.
- **pInfo** is a pointer to a `VkDeviceImageSubresourceInfoKHR` structure containing parameters required for the subresource layout query.
- **pLayout** is a pointer to a `VkSubresourceLayout2KHR` structure in which the layout is returned.

`vkGetDeviceImageSubresourceLayoutKHR` behaves similarly to `vkGetImageSubresourceLayout2KHR`, but uses a `VkImageCreateInfo` structure to specify the image rather than a `VkImage` object.

The `VkDeviceImageSubresourceInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance5
typedef struct VkDeviceImageSubresourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    const VkImageSubresource2KHR* pSubresource;
} VkDeviceImageSubresourceInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.

• pSubresource pSubresource is a pointer to a VkImageSubresource2KHR structure selecting a specific image subresource for the query.

**Valid Usage**

- VUID-VkDeviceImageSubresourceInfoKHR-aspectMask-00997
  The aspectMask member of pSubresource must only have a single bit set

- VUID-VkDeviceImageSubresourceInfoKHR-mipLevel-01716
  The mipLevel member of pSubresource must be less than the mipLevels specified in pCreateInfo

- VUID-VkDeviceImageSubresourceInfoKHR-arrayLayer-01717
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in pCreateInfo

- VUID-VkDeviceImageSubresourceInfoKHR-format-08886
  If format of the image is a color format that is not a multi-planar image format, and tiling of the pCreateInfo is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkDeviceImageSubresourceInfoKHR-format-04462
  If format of the pCreateInfo has a depth component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_DEPTH_BIT

- VUID-VkDeviceImageSubresourceInfoKHR-format-04463
  If format of the pCreateInfo has a stencil component, the aspectMask member of pSubresource must contain VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkDeviceImageSubresourceInfoKHR-format-04464
  If format of the pCreateInfo does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkDeviceImageSubresourceInfoKHR-tiling-08717
  If the tiling of the pCreateInfo is VK_IMAGE_TILING_LINEAR and has a multi-planar image format, then the aspectMask member of pSubresource must be a single valid multi-planar aspect mask bit

**Valid Usage (Implicit)**

- VUID-VkDeviceImageSubresourceInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPEDEVICE_IMAGE_SUBRESOURCE_INFO_KHR

- VUID-VkDeviceImageSubresourceInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDeviceImageSubresourceInfoKHR-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkImageCreateInfo structure

- VUID-VkDeviceImageSubresourceInfoKHR-pSubresource-parameter

pSubresource must be a valid pointer to a valid VkImageSubresource2KHR structure

If an image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the image has a Linux DRM format modifier. To query the modifier, call:

```c
// Provided by VK_EXT_image_drm_format_modifier
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice device,
    VkImage image,
    VkImageDrmFormatModifierPropertiesEXT* pProperties);
```

- `device` is the logical device that owns the image.
- `image` is the queried image.
- `pProperties` is a pointer to a VkImageDrmFormatModifierPropertiesEXT structure in which properties of the image’s DRM format modifier are returned.

**Valid Usage**

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272
  image must have been created with tiling equal to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

**Valid Usage (Implicit)**

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter
  image must be a valid VkImage handle

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter
  pProperties must be a valid pointer to a VkImageDrmFormatModifierPropertiesEXT structure

- VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent
  image must have been created, allocated, or retrieved from device

**Return Codes**

**Success**
- VK_SUCCESS
The `VkImageDrmFormatModifierPropertiesEXT` structure is defined as:

```c
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint64_t drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` returns the image's Linux DRM format modifier.

If the `image` was created with `VkImageDrmFormatModifierListCreateInfoEXT`, then the returned `drmFormatModifier` must belong to the list of modifiers provided at time of image creation in `VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers`. If the `image` was created with `VkImageDrmFormatModifierExplicitCreateInfoEXT`, then the returned `drmFormatModifier` must be the modifier provided at time of image creation in `VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier`.

### Valid Usage (Implicit)

- `VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT`  
- `VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext`  
  `pNext` must be `NULL`

To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,  
    VkImage image,  
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image.
- `image` is the image to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
### Valid Usage

- **VUID-vkDestroyImage-image-01000**
  All submitted commands that refer to `image`, either directly or via a `VkImageView`, must have completed execution.

- **VUID-vkDestroyImage-image-01001**
  If `VkAllocationCallbacks` were provided when `image` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyImage-image-01002**
  If no `VkAllocationCallbacks` were provided when `image` was created, `pAllocator` must be `NULL`.

- **VUID-vkDestroyImage-image-04882**
  `image` must not have been acquired from `vkGetSwapchainImagesKHR`.

### Valid Usage (Implicit)

- **VUID-vkDestroyImage-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyImage-image-parameter**
  If `image` is not `VK_NULL_HANDLE`, `image` must be a valid `VkImage` handle.

- **VUID-vkDestroyImage-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyImage-image-parent**
  If `image` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `image` must be externally synchronized.

### 12.3.1. Image Format Features

Valid uses of a `VkImage` may depend on the image’s `format features`, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with `VK_IMAGE_TILING_LINEAR`, then its set of `format features` is the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`.

- If the image was created with `VK_IMAGE_TILING_OPTIMAL`, then its set of `format features` is the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageCreateInfo::format`. 

---

806
If the image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:

- The image's DRM format modifier is the value of `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
- Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageCreateInfo::format`.
- Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
- Then the image's set of `format features` is the value of `prop::drmFormatModifierTilingFeatures`.

**12.3.2. Image Mip Level Sizing**

A complete mipmap chain is the full set of mip levels, from the largest mip level provided, down to the minimum mip level size.

**Conventional Images**

For conventional images, the dimensions of each successive mip level, n+1, are:

\[
\begin{align*}
width_{n+1} &= \max(\lceil width_n / 2 \rceil, 1) \\
height_{n+1} &= \max(\lceil height_n / 2 \rceil, 1) \\
depth_{n+1} &= \max(\lceil depth_n / 2 \rceil, 1)
\end{align*}
\]

where `width_n`, `height_n`, and `depth_n` are the dimensions of the next larger mip level, n.

The minimum mip level size is:

- 1 for one-dimensional images,
- 1x1 for two-dimensional images, and
- 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[
\lceil \log_2(\max(width_0, height_0, depth_0)) \rceil + 1
\]

where `width_0`, `height_0`, and `depth_0` are the dimensions of the largest (most detailed) mip level, 0.

**12.4. Image Layouts**

Images are stored in implementation-dependent opaque layouts in memory. Each layout has
limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a `vkCmdPipelineBarrier` or a `vkCmdWaitEvents` command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see VkSubpassDependency).

Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the separateDepthStencilLayouts feature is enabled.

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of `VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL` may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the `VkImageCreateInfo::initialLayout` member. The `initialLayout` must be either `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`. If it is `VK_IMAGE_LAYOUT_PREINITIALIZED`, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is `VK_IMAGE_LAYOUT_UNDEFINED`, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the `VK_IMAGE_LAYOUT_PREINITIALIZED` or `VK_IMAGE_LAYOUT_GENERAL` layout. Calling `vkGetImageSubresourceLayout` for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
};
```
VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
// Provided by VK_VERSION_1_1
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 100017000,
// Provided by VK_VERSION_1_1
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 100017001,
// Provided by VK_VERSION_1_2
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
// Provided by VK_VERSION_1_2
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
// Provided by VK_VERSION_1_2
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
// Provided by VK_VERSION_1_2
VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
// Provided by VK_VERSION_1_3
VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
// Provided by VK_VERSION_1_3
VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
// Provided by VK_KHR_swapchain
VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
// Provided by VK_KHR_video_decode_queue
VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
// Provided by VK_KHR_video_decode_queue
VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
// Provided by VK_KHR_video_decode_queue
VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR = 1000024002,
// Provided by VK_KHR_shared_presentable_image
VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
// Provided by VK_KHR_fragment_shading_rate
VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR = 1000164003,
// Provided by VK_KHR_dynamic_rendering_local_read

VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL_KHR =
  VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL,
  // Provided by VK_KHR_imagetyping

The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory cannot be transitioned into this layout. This layout can be used as the `initialLayout` member of `VkImageCreateInfo`. This layout can be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and can be populated by data, but that it has not yet been initialized by the driver. Image memory cannot be transitioned into this layout. This layout can be used as the `initialLayout` member of `VkImageCreateInfo`. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data can be written to memory immediately, without first executing a layout transition. Currently, `VK_IMAGE_LAYOUT_PREINITIALIZED` is only useful with linear images because there is not a standard layout defined for `VK_IMAGE_TILING_OPTIMAL` images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that must only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a `VkFramebuffer`. This layout is valid only for image subresources of images created with the `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` usage bit enabled.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL` and `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`.

• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.

• **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_SAMPLED_BIT** or **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** usage bits enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**). This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display.

• **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be used for any usage the image supports.

• **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** must only be used as a decode output picture in a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR** is reserved for future use.
• **VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR** is reserved for future use.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR** must only be used as an encode input picture in a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR** must only be used as an output reconstructed picture or an input reference picture in a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** must only be used as either a color attachment or depth/stencil attachment in a *VkFramebuffer* and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** usage bit enabled and either the **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** and either the **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_SAMPLED_BIT** usage bits enabled.

• **VK_IMAGE_LAYOUT_RENDERING_LOCAL_READ_KHR** must only be used as either a storage image, or a color or depth/stencil attachment and an input attachment. This layout is valid only for image subresources of images created with either **VK_IMAGE_USAGE_STORAGE_BIT**, or both **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** and either of **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see *Clear Commands* and *Copy Commands*). For use as a framebuffer attachment, this is a member in the substructures of the *VkRenderPassCreateInfo* (see *Render Pass*). For use in a descriptor set, this is a member in the *VkDescriptorImageInfo* structure (see *Descriptor Set Updates*).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

• Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.

• Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the
image layout of the stencil aspect, thus VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL are considered to match.

When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else be VK_IMAGE_LAYOUT_UNDEFINED (implying that the contents of the image subresource need not be preserved). The new layout used in a transition must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications must provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

### 12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, image views representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by VkImageView handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

VK_REMAINING_ARRAY_LAYERS is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS ~0U
```

VK_REMAINING_MIP_LEVELS is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS ~0U
```
The types of image views that can be created are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;
```

To create an image view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice device,
    const VkImageViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImageView* pView);
```

- **device** is the logical device that creates the image view.
- **pCreateInfo** is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pView** is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

### Valid Usage

- **VUID-vkCreateImageView-device-09667**
  device must support at least one queue family with one of the `VK_QUEUE_VIDEO_ENCODE_BIT_KHR`, `VK_QUEUE_VIDEO_DECODE_BIT_KHR`, `VK_QUEUE_COMPUTE_BIT`, or `VK_QUEUE_GRAPHICS_BIT` capabilities

- **VUID-vkCreateImageView-image-09179**
  `VkImageViewCreateInfo::image` must have been created from device

### Valid Usage (Implicit)

- **VUID-vkCreateImageView-device-parameter**
device must be a valid VkDevice handle

- VUID-vkCreateImageView-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkImageViewCreateInfo structure

- VUID-vkCreateImageView-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateImageView-pView-parameter
  pView must be a valid pointer to a VkImageView handle

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkImageViewCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkImageViewCreateFlagBits specifying additional parameters of the image view.
- image is a VkImage on which the view will be created.
- viewType is a VkImageViewType value specifying the type of the image view.
- format is a VkFormat specifying the format and type used to interpret texel blocks of the image.
- components is a VkComponentMapping structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
• **subresourceRange** is a **VkImageSubresourceRange** structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the **image** creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter **usage** specifying the allowed usages of the image view that, by default, takes the value of the corresponding **usage** parameter specified in **VkImageCreateInfo** at image creation time. The implicit **usage** can be overridden by adding a **VkImageViewUsageCreateInfo** structure to the **pNext** chain, but the view usage **must** be a subset of the image usage. If **image** has a depth-stencil format and was created with a **VkImageStencilUsageCreateInfo** structure included in the **pNext** chain of **VkImageCreateInfo**, the usage is calculated based on the **subresource.aspectMask** provided:

- If **aspectMask** includes only **VK_IMAGE_ASPECT_STENCIL_BIT**, the implicit **usage** is equal to **VkImageUsageCreateInfo::stencilUsage**.
- If **aspectMask** includes only **VK_IMAGE_ASPECT_DEPTH_BIT**, the implicit **usage** is equal to **VkImageCreateInfo::usage**.
- If both aspects are included in **aspectMask**, the implicit **usage** is equal to the intersection of **VkImageCreateInfo::usage** and **VkImageStencilUsageCreateInfo::stencilUsage**.

If **image** was created with the **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** flag, and if the **format** of the image is not **multi-planar**, **format** can be different from the image’s format, but if **image** was created without the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag and they are not equal they **must** be compatible. Image format compatibility is defined in the **Format Compatibility Classes** section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the **format**, with only the interpretation of the bit pattern changing.

If **image** was created with a **multi-planar** format, and the image view’s **aspectMask** is one of **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT** or **VK_IMAGE_ASPECT_PLANE_2_BIT**, the view’s aspect mask is considered to be equivalent to **VK_IMAGE_ASPECT_COLOR_BIT** when used as a framebuffer attachment.

*NOTE* Values intended to be used with one view format may not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating-point denorm or NaN may be flushed or canonicalized when written or read through a view with a floating-point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to \(-2^b\) may be changed to \(-2^b + 1\) as described in Conversion from Normalized Fixed-Point to Floating-Point.

If **image** was created with the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag, **format** must be compatible with the image’s format as described above; or **must be** an uncompressed format, in which case it must be size-compatible with the image’s format. In this case, the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The **VkComponentMapping** components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping must be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer
attachments, and any VkImageView used with a combined image sampler that enables sampler Y’C_aC_R conversion.

If the image view is to be used with a sampler which supports sampler Y’C_aC_R conversion, an identically defined object of type VkSamplerYcbcrConversion to that used to create the sampler must be passed to vkCreateImageView in a VkSamplerYcbcrConversionInfo included in the pNext chain of VkImageViewCreateInfo. Conversely, if a VkSamplerYcbcrConversion object is passed to vkCreateImageView, an identically defined VkSamplerYcbcrConversion object must be used when sampling the image.

If the image has a multi-planar format, subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, and usage includes VK_IMAGE_USAGE_SAMPLED_BIT, then the format must be identical to the image format and the sampler to be used with the image view must enable sampler Y’C_aC_R conversion.

When such an image is used in a video coding operation, the sampler Y’C_aC_R conversion has no effect.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the image has a multi-planar format, and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y’C_aC_R conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{plane}, v_{plane})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{color}, v_{color})\) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same \((u_{plane}, v_{plane})\) or \((i_{plane}, j_{plane})\) coordinates.

---

Valid Usage

• VUID-VkImageViewCreateInfo-image-01003
  If image was not created with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT then viewType must not be VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

• VUID-VkImageViewCreateInfo-viewType-01004
  If the imageCubeArray feature is not enabled, viewType must not be VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

• VUID-VkImageViewCreateInfo-image-06723
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D_ARRAY

• VUID-VkImageViewCreateInfo-image-06727
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D

• VUID-VkImageViewCreateInfo-image-04970
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1

• VUID-VkImageViewCreateInfo-image-04971
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then VkImageCreateInfo::flags must not contain any of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

• VUID-VkImageViewCreateInfo-image-04972
  If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then viewType must be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

• VUID-VkImageViewCreateInfo-usage-02273
  The format features of the resultant image view must contain at least one bit

• VUID-VkImageViewCreateInfo-usage-02274
  If usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT

• VUID-VkImageViewCreateInfo-usage-02275
  If usage contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT

• VUID-VkImageViewCreateInfo-usage-02276
  If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkImageViewCreateInfo-usage-02277
If usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view’s format features must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- VUID-VkImageViewCreateInfo-image-08333
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, then the image view’s format features must contain VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08334
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the image view’s format features must contain VK_FORMAT_FEATURE_VIDEO_DECODE_DPB_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08335
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08336
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, then the image view’s format features must contain VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08337
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR and usage contains VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the image view’s format features must contain VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR

- VUID-VkImageViewCreateInfo-image-08338
  If image was created with VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR, then usage must not include VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR

- VUID-VkImageViewCreateInfo-subresourceRange-01478
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-subresourceRange-01718
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-image-01482
  If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- VUID-VkImageViewCreateInfo-subresourceRange-01483
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image
created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, or `viewType` is not `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.layerCount` must be non-zero and `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

- **VUID-VkImageViewCreateInfo-image-02724**
  If `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.baseArrayLayer` must be less than the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in `Image Mip Level Sizing`.

- **VUID-VkImageViewCreateInfo-subresourceRange-02725**
  If `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `image` is a 3D image created with `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set, and `viewType` is `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, `subresourceRange.layerCount` must be non-zero and `subresourceRange.baseArrayLayer + subresourceRange.layerCount` must be less than or equal to the depth computed from `baseMipLevel` and `extent.depth` specified in `VkImageCreateInfo` when `image` was created, according to the formula defined in `Image Mip Level Sizing`.

- **VUID-VkImageViewCreateInfo-image-01761**
  If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, but without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, and if the `format` of the `image` is not a multi-planar format, `format` must be compatible with the `format` used to create `image`, as defined in `Format Compatibility Classes`.

- **VUID-VkImageViewCreateInfo-image-01583**
  If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` must be compatible with, or must be an uncompressed format that is size-compatible with, the `format` used to create `image`.

- **VUID-VkImageViewCreateInfo-image-07072**
  If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and `format` is a non-compressed format, the `levelCount` member of `subresourceRange` must be 1.

- **VUID-VkImageViewCreateInfo-image-09487**
  If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, the `VkPhysicalDeviceMaintenance6PropertiesKHR::blockTexelViewCompatibleMultipleLayers` property is not set to `VK_TRUE`, and `format` is a non-compressed format, then the `layerCount` member of `subresourceRange` must be 1.

- **VUID-VkImageViewCreateInfo-pNext-01585**
  If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain of the `VkImageCreateInfo` structure used when creating `image` and `VkImageFormatListCreateInfo::viewFormatCount` is not zero then `format` must be one of the formats in `VkImageFormatListCreateInfo::pViewFormats`.

- **VUID-VkImageViewCreateInfo-image-01586**
  If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, if the `format` of the `image` is a multi-planar format, and if `subresourceRange.aspectMask` is one of the multi-planar aspect mask bits, then `format` must be compatible with the `VkFormat` for the plane.
of the image format indicated by subresourceRange.aspectMask, as defined in Compatible Formats of Planes of Multi-Planar Formats

- VUID-VkImageViewCreateInfo-subresourceRange-07818
  subresourceRange.aspectMask must only have at most 1 valid multi-planar aspect mask bit

- VUID-VkImageViewCreateInfo-image-01762
  If image was not created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, or if the format of the image is a multi-planar format and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_COLOR_BIT, format must be identical to the format used to create image

- VUID-VkImageViewCreateInfo-format-06415
  If the image view requires a sampler Y′CbCr conversion and usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the pNext chain must include a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE

- VUID-VkImageViewCreateInfo-format-04714
  If format has a _422 or _420 suffix then image must have been created with a width that is a multiple of 2

- VUID-VkImageViewCreateInfo-format-04715
  If format has a _420 suffix then image must have been created with a height that is a multiple of 2

- VUID-VkImageViewCreateInfo-pNext-01970
  If the pNext chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-pNext-06658
  If the pNext chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, format must be the same used in VkSamplerYcbcrConversionCreateInfo::format

- VUID-VkImageViewCreateInfo-image-01020
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkImageViewCreateInfo-subResourceRange-01021
  viewType must be compatible with the type of image as shown in the view type compatibility table

- VUID-VkImageViewCreateInfo-image-02086
  If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-usage-04550
  If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-VkImageViewCreateInfo-usage-04551
If the `attachmentFragmentShadingRate` feature is enabled, the `usage` for the image view includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, and `layeredShadingRateAttachments` is `VK_FALSE`, `subresourceRange.layerCount` must be `1`.

- **VUID-VkImageViewCreateInfo-pNext-02662**
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

- **VUID-VkImageViewCreateInfo-pNext-02663**
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

- **VUID-VkImageViewCreateInfo-pNext-02664**
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

- **VUID-VkImageViewCreateInfo-imageViewType-04973**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then `subresourceRange.layerCount` must be `1`.

- **VUID-VkImageViewCreateInfo-imageViewType-04974**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, then the remaining number of layers must be `1`.

- **VUID-VkImageViewCreateInfo-viewType-02960**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be `6`.

- **VUID-VkImageViewCreateInfo-viewType-02961**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be a multiple of `6`.

- **VUID-VkImageViewCreateInfo-viewType-02962**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers must be `6`.

- **VUID-VkImageViewCreateInfo-viewType-02963**
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers must be a multiple of `6`.

- **VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465**
  If the `VK_KHR_portability_subset` extension is enabled, and
VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04817
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04818
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, or VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-09594
  subresourceRange.aspectMask must be valid for the format the image was created with

Valid Usage (Implicit)

- VUID-VkImageViewCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO

- VUID-VkImageViewCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkImageViewUsageCreateInfo or VkSamplerYcbcrConversionInfo

- VUID-VkImageViewCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageViewCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkImageViewCreateInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageViewCreateInfo-viewType-parameter
  viewType must be a valid VkImageViewType value

- VUID-VkImageViewCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkImageViewCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkImageViewCreateInfo-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure
Bits which *can* be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
} VkImageViewCreateFlagBits;
```

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view *can* be restricted compared to the parent image's `usage` flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags usage;
} VkImageViewUsageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

**Valid Usage (Implicit)**

- VUID-VkImageViewUsageCreateInfo-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`
- VUID-VkImageViewUsageCreateInfo-usage-parameter

824
usage must be a valid combination of VkImageUsageFlagBits values

• VUID-VkImageViewUsageCreateInfo-usage-requiredbitmask
usage must not be 0

The VkImageSubresourceRange structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceRange {
    VkImageAspectFlags aspectMask;
    uint32_t baseMipLevel;
    uint32_t levelCount;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceRange;
```

• aspectMask is a bitmask of VkImageAspectFlagBits specifying which aspect(s) of the image are included in the view.
• baseMipLevel is the first mipmap level accessible to the view.
• levelCount is the number of mipmap levels (starting from baseMipLevel) accessible to the view.
• baseArrayLayer is the first array layer accessible to the view.
• layerCount is the number of array layers (starting from baseArrayLayer) accessible to the view.

The number of mipmap levels and array layers must be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the baseMipLevel or baseArrayLayer, it can set levelCount and layerCount to the special values VK_REMAINING_MIP_LEVELS and VK_REMAINING_ARRAY_LAYERS without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at baseArrayLayer correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is layerCount / 6, and image array layer (baseArrayLayer + i) is face index (i mod 6) of cube i/6. If the number of layers in the view, whether set explicitly in layerCount or implied by VK_REMAINING_ARRAY_LAYERS, is not a multiple of 6, the last cube map in the array must not be accessed.

aspectMask must be only VK_IMAGE_ASPECT_COLOR_BIT, VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT if format is a color, depth-only or stencil-only format, respectively, except if format is a multi-planar format. If using a depth/stencil format with both depth and stencil components, aspectMask must include at least one of VK_IMAGE_ASPECT_DEPTH_BIT and VK_IMAGE_ASPECT_STENCIL_BIT, and can include both.

When the VkImageSubresourceRange structure is used to select a subset of the slices of a 3D image’s mip level in order to create a 2D or 2D array image view of a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT, baseArrayLayer and layerCount specify the first slice index and the number of slices to include in the created image view. Such an image view can be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass...
instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the aspectMask must only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the aspectMask is ignored and both depth and stencil image subresources are used.

When creating a VkImageView, if sampler Y’C_b conversion is enabled in the sampler, the aspectMask of a subresourceRange used by the VkImageView must be VK_IMAGE_ASPECT_COLOR_BIT.

When creating a VkImageView, if sampler Y’C_b conversion is not enabled in the sampler and the image format is multi-planar, the image must have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the aspectMask of the VkImageView's subresourceRange must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

- VUID-VkImageSubresourceRange-levelCount-01720
  If levelCount is not VK_REMAINING_MIP_LEVELS, it must be greater than 0
- VUID-VkImageSubresourceRange-layerCount-01721
  If layerCount is not VK_REMAINING_ARRAY_LAYERS, it must be greater than 0
- VUID-VkImageSubresourceRange-aspectMask-01670
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, then it must not include any of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT
- VUID-VkImageSubresourceRange-aspectMask-02278
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

- VUID-VkImageSubresourceRange-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values
- VUID-VkImageSubresourceRange-aspectMask-requiredbitmask
  aspectMask must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
    // Provided by VK_KHR_maintenance4
    VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;

- **VK_IMAGE_ASPECT_NONE** specifies no image aspect, or the image aspect is not applicable.
- **VK_IMAGE_ASPECT_COLOR_BIT** specifies the color aspect.
- **VK_IMAGE_ASPECT_DEPTH_BIT** specifies the depth aspect.
- **VK_IMAGE_ASPECT_STENCIL_BIT** specifies the stencil aspect.
- **VK_IMAGE_ASPECT_METADATA_BIT** specifies the metadata aspect used for sparse resource operations.
- **VK_IMAGE_ASPECT_PLANE_0_BIT** specifies plane 0 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_1_BIT** specifies plane 1 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_2_BIT** specifies plane 2 of a multi-planar image format.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT** specifies memory plane 0.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT** specifies memory plane 1.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT** specifies memory plane 2.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT** specifies memory plane 3.
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;

• r is a VkComponentSwizzle specifying the component value placed in the R component of the output vector.
• g is a VkComponentSwizzle specifying the component value placed in the G component of the output vector.
• b is a VkComponentSwizzle specifying the component value placed in the B component of the output vector.
• a is a VkComponentSwizzle specifying the component value placed in the A component of the output vector.

Valid Usage (Implicit)

• VUID-VkComponentMapping-r-parameter
  r must be a valid VkComponentSwizzle value
• VUID-VkComponentMapping-g-parameter
  g must be a valid VkComponentSwizzle value
• VUID-VkComponentMapping-b-parameter
  b must be a valid VkComponentSwizzle value
• VUID-VkComponentMapping-a-parameter
  a must be a valid VkComponentSwizzle value

Possible values of the members of VkComponentMapping, specifying the component values placed in each component of the output vector, are:

828
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;

- **VK_COMPONENT_SWIZZLE_IDENTITY** specifies that the component is set to the identity swizzle.
- **VK_COMPONENT_SWIZZLE_ZERO** specifies that the component is set to zero.
- **VK_COMPONENT_SWIZZLE_ONE** specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each VkFormat.
- **VK_COMPONENT_SWIZZLE_R** specifies that the component is set to the value of the R component of the image.
- **VK_COMPONENT_SWIZZLE_G** specifies that the component is set to the value of the G component of the image.
- **VK_COMPONENT_SWIZZLE_B** specifies that the component is set to the value of the B component of the image.
- **VK_COMPONENT_SWIZZLE_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

To destroy an image view, call:

```c
void vkDestroyImageView(
    VkDevice device,
    VkImageView imageView,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the image view.
• **imageView** is the image view to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyImageView-imageView-01026**
  All submitted commands that refer to **imageView** must have completed execution.

- **VUID-vkDestroyImageView-imageView-01027**
  If **VkAllocationCallbacks** were provided when **imageView** was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyImageView-imageView-01028**
  If no **VkAllocationCallbacks** were provided when **imageView** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- **VUID-vkDestroyImageView-device-parameter**
  **device** must be a valid **VkDevice** handle.

- **VUID-vkDestroyImageView-imageView-parameter**
  If **imageView** is not **VK_NULL_HANDLE**, **imageView** must be a valid **VkImageView** handle.

- **VUID-vkDestroyImageView-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- **VUID-vkDestroyImageView-imageView-parent**
  If **imageView** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **imageView** must be externally synchronized.

### 12.5.1. Image View Format Features

Valid uses of a **VkImageView** may depend on the image view's **format features**, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the **VK_KHR_format_feature_flags2** extension is supported, and **VkImageViewCreateInfo::image** was created with **VK_IMAGE_TILING_LINEAR**, then the image view's set of **format features** is the value of **VkFormatProperties3::linearTilingFeatures** found by calling **vkGetPhysicalDeviceFormatProperties2** on the same **format** as **VkImageViewCreateInfo::format**.

- If Vulkan 1.3 is not supported and the **VK_KHR_format_feature_flags2** extension is not supported,
and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view's set of format features is the union of the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:

- VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
- VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
- VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, then the image view's set of format features is the value of VkFormatProperties::optimalTilingFeatures or VkFormatProperties3::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties or vkGetPhysicalDeviceImageFormatProperties2 on the same format as VkImageViewCreateInfo::format.

- If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not supported, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, then the image view's set of format features is the union of the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties or VkDrmFormatModifierProperties on the same format as VkImageViewCreateInfo::format, with:

  - VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  - VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  - VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

- If VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:

  - The image's DRM format modifier is the value of VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  - Let VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties be the array found by calling VkGetPhysicalDeviceDrmFormatModifierPropertiesList on the same format as VkImageViewCreateInfo::format.
  - Let VkDrmFormatModifierPropertiesEXT prop be the array element whose drmFormatModifier member is the value of the image's DRM format modifier.
  - Then the image view's set of format features is prop::drmFormatModifierTilingFeatures.

## 12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more
efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by `VkAccelerationStructureKHR` handles:

```plaintext
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

To create an acceleration structure, call:

```plaintext
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(             
    VkDevice device,                                     
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator,          
    VkAccelerationStructureKHR* pAccelerationStructure);
```

- `device` is the logical device that creates the acceleration structure object.
- `pCreateInfo` is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

The acceleration structure data is stored in the object referred to by `VkAccelerationStructureCreateInfoKHR::buffer`. Once memory has been bound to that buffer, it **must** be populated by acceleration structure build or acceleration structure copy commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

**NOTE**
The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the acceleration structure data using acceleration structure copy commands. During capture the tool will use `vkCopyAccelerationStructureToMemoryKHR` or `vkCmdCopyAccelerationStructureToMemoryKHR` with a `mode` of
VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR, and
vkCopyMemoryToAccelerationStructureKHR or
vkCmdCopyMemoryToAccelerationStructureKHR with a mode of
VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR during replay.

NOTE Memory does not need to be bound to the underlying buffer when
vkCreateAccelerationStructureKHR is called.

The input buffers passed to acceleration structure build commands will be referenced by the
implementation for the duration of the command. After the command completes, the acceleration
structure may hold a reference to any acceleration structure specified by an active instance
contained therein. Apart from this referencing, acceleration structures must be fully self-contained.
The application can reuse or free any memory which was used by the command as an input or as
scratch without affecting the results of ray traversal.

Valid Usage

- VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature
  must be enabled
- VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If VkAccelerationStructureCreateInfoKHR::deviceAddress is not zero, the
  accelerationStructureCaptureReplay feature must be enabled
- VUID-vkCreateAccelerationStructureKHR-device-03489
  If device was created with multiple physical devices, then the
  bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAccelerationStructureCreateInfoKHR
  structure
- VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
  VkAllocationCallbacks structure
- VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  pAccelerationStructure must be a valid pointer to a VkAccelerationStructureKHR handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The `VkAccelerationStructureCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureCreateFlagsKHR createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkAccelerationStructureTypeKHR type;
    VkDeviceAddress deviceAddress;
} VkAccelerationStructureCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `createFlags` is a bitmask of `VkAccelerationStructureCreateFlagBitsKHR` specifying additional creation parameters of the acceleration structure.
- `buffer` is the buffer on which the acceleration structure will be stored.
- `offset` is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of 256.
- `size` is the size required for the acceleration structure.
- `type` is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure that will be created.
- `deviceAddress` is the device address requested for the acceleration structure if the `accelerationStructureCaptureReplay` feature is being used. If `deviceAddress` is zero, no specific address is requested.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

**NOTE** The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and will add
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for an acceleration structure where deviceAddress is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Applications should create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

NOTE
VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR when the build is performed.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with vkGetAccelerationStructureBuildSizesKHR. If the acceleration structure is going to be the target of a compacting copy, vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR can be used to obtain the compacted size required.

Valid Usage

• VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If deviceAddress is not zero, createFlags must include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR

• VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09488
  If deviceAddress is not zero, it must have been retrieved from an identically created acceleration structure, except for buffer and deviceAddress

• VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09489
  If deviceAddress is not zero, buffer must have been created identically to the buffer used to create the acceleration structure from which deviceAddress was retrieved, except for VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress

• VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-09490
  If deviceAddress is not zero, buffer must have been created with a VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress that was retrieved from vkGetBufferOpaqueCaptureAddress for the buffer that was used to create the acceleration
structure from which `deviceAddress` was retrieved

- **VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613**
  If `createFlags` includes `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay` must be `VK_TRUE`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614**
  `buffer` must have been created with a usage value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615**
  `buffer` must not have been created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03616**
  The sum of `offset` and `size` must be less than the size of `buffer`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03734**
  `offset` must be a multiple of 256 bytes

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureCreateInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter**
  `createFlags` must be a valid combination of `VkAccelerationStructureCreateFlagBitsKHR` values

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter**
  `buffer` must be a valid `VkBuffer` handle

- **VUID-VkAccelerationStructureCreateInfoKHR-type-parameter**
  `type` must be a valid `VkAccelerationStructureTypeKHR` value

To get the build sizes for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,                               // device,
    VkAccelerationStructureBuildTypeKHR buildType, // buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,           // pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
• **pBuildInfo** is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.

• **pMaxPrimitiveCounts** is a pointer to an array of `pBuildInfo->geometryCount` uint32_t values defining the number of primitives built into each geometry.

• **pSizeInfo** is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` or `VkDeviceOrHostAddressConstKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

• The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`

• The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`

• For `VkAccelerationStructureBuildGeometryInfoKHR`:
  • Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  • `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
  • For each element of either `pGeometries` or `ppGeometries` at a given index, its `geometryType` member is equal to `pBuildInfo->geometryType`.
  • For each element of either `pGeometries` or `ppGeometries` at a given index, its `flags` member is equal to the corresponding member of the same element in `pBuildInfo`.
  • For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `vertexFormat` and `indexType` members of `geometry.triangles` are equal to the corresponding members of the same element in `pBuildInfo`.
  • For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `maxVertex` member of `geometry.triangles` is less than or equal to the corresponding member of the same element in `pBuildInfo`.
  • For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the applicable address in the `transformData` member of `geometry.triangles` is not `NULL`, the corresponding `transformData.hostAddress` parameter in `pBuildInfo` is not `NULL`. 
• For each VkAccelerationStructureBuildRangeInfoKHR corresponding to the VkAccelerationStructureBuildGeometryInfoKHR:
  ◦ Its primitiveCount member is less than or equal to the corresponding element of pMaxPrimitiveCounts.
  ◦ For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the pNext chain contains VkAccelerationStructureTrianglesOpacityMicromapEXT the corresponding member of pBuildInfo also contains VkAccelerationStructureTrianglesOpacityMicromapEXT and with an equivalent micromap.

Similarly, the updateScratchSize value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR mode under the above conditions, and the buildScratchSize value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR mode under the above conditions.

Valid Usage

• VUID-vkGetAccelerationStructureBuildSizesKHR-accelerationStructure-08933
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

• VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

• VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If pBuildInfo->geometryCount is not 0, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values

• VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If pBuildInfo->pGeometries or pBuildInfo->ppGeometries has a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each pMaxPrimitiveCounts[i] must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

Valid Usage (Implicit)

• VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
buildType must be a valid VkAccelerationStructureBuildTypeKHR value

• VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
pBuildInfo must be a valid pointer to a valid VkAccelerationStructureBuildGeometryInfoKHR structure

• VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
If pMaxPrimitiveCounts is not NULL, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values
The `VkAccelerationStructureBuildSizesInfoKHR` structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureSize` is the size in bytes required in a `VkAccelerationStructureKHR` for a build or update operation.
- `updateScratchSize` is the size in bytes required in a scratch buffer for an update operation.
- `buildScratchSize` is the size in bytes required in a scratch buffer for a build operation.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR`
- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext `pNext` must be `NULL`

Values which can be set in `VkAccelerationStructureCreateInfoKHR::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
} VkAccelerationStructureTypeKHR;
```

- `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` is a bottom-level acceleration structure

---

839
containing the AABBs or geometry to be intersected.

- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but **must** be specified at build time as either top or bottom.

Bits which **can** be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- **VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR** specifies that the acceleration structure's address **can** be saved and reused on a subsequent run.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

`VkAccelerationStructureCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkAccelerationStructureCreateFlagBitsKHR`.

Bits which **can** be set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` specifying additional parameters for acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT = 0x00000040,
    // Provided by VK_KHR_ray_tracing_position_fetch
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR = 0x00000800,
} VkBuildAccelerationStructureFlagBitsKHR;
```

- **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration
structure can be updated with a mode of `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` in `VkAccelerationStructureBuildGeometryInfoKHR`.

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` to produce a compacted acceleration structure.

- `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR` indicates that the given acceleration structure build should prioritize trace performance over build time.

- `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR` indicates that the given acceleration structure build should prioritize build time over trace performance.

- `VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR` indicates that this acceleration structure should minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` indicates that the opacity micromaps associated with the specified acceleration structure may change with an acceleration structure update.

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT` indicates that the data of the opacity micromaps associated with the specified acceleration structure may change with an acceleration structure update.

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISABLE_OPACITY_MICROMAPS_EXT` indicates that the specified acceleration structure may be referenced in an instance with `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` set.

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DATA_ACCESS_KHR` indicates that the specified acceleration structure can be used when fetching the vertex positions of a hit triangle.

**NOTE**

- `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` may take more time and memory than a normal build, and so should only be used when those features are needed.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;
```

`VkBuildAccelerationStructureFlagsKHR` is a bitmask type for setting a mask of zero or more `VkBuildAccelerationStructureFlagBitsKHR`.

Geometry types are specified by `VkGeometryTypeKHR`, which takes values:
• **VK_GEOMETRY_TYPE_TRIANGLES_KHR** specifies a geometry type consisting of triangles.
• **VK_GEOMETRY_TYPE_AABBS_KHR** specifies a geometry type consisting of axis-aligned bounding boxes.
• **VK_GEOMETRY_TYPE_INSTANCES_KHR** specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

• **VK_GEOMETRY_OPAQUE_BIT_KHR** indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.
• **VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR** indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation may invoke the any-hit shader more than once for this geometry.

**VkGeometryFlagsKHR** is a bitmask type for setting a mask of zero or more **VkGeometryFlagBitsKHR**.

To destroy an acceleration structure, call:

• **device** is the logical device that destroys the acceleration structure.
• **accelerationStructure** is the acceleration structure to destroy.
• **pAllocator** controls host memory allocation as described in the **Memory Allocation** chapter.
Valid Usage

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-08934**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442**
  All submitted commands that refer to `accelerationStructure` must have completed execution

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443**
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444**
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

- **VUID-vkDestroyAccelerationStructureKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter**
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle

- **VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent**
  If `accelerationStructure` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `accelerationStructure` must be externally synchronized

Possible values of `buildType` in `vkGetAccelerationStructureBuildSizesKHR` are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```
• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR requests the memory requirement for operations performed by the host.

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR requests the memory requirement for operations performed by the device.

• VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR requests the memory requirement for operations performed by either the host, or the device.

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
    VkDevice device,
    const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

• `device` is the logical device that the acceleration structure was created on.

• `pInfo` is a pointer to a `VkAccelerationStructureDeviceAddressInfoKHR` structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of `VkAccelerationStructureCreateInfoKHR::deviceAddress`, the return value will be the same address.

If the acceleration structure was created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`, the returned address must be consistent with the relative offset to other acceleration structures with type `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` allocated with the same `VkBuffer`. That is, the difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

The returned address must be aligned to 256 bytes.

**NOTE**
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure's start offset in its storage buffer for acceleration structure types other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

**Valid Usage**

• VUID-vkGetAccelerationStructureDeviceAddressKHR-accelerationStructure-08935
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

• VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled
If the buffer on which `pInfo->accelerationStructure` was placed is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

The buffer on which `pInfo->accelerationStructure` was placed must have been created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` usage flag.

### Valid Usage (Implicit)

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle.

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter**
  - `pInfo` must be a valid pointer to a valid `VkAccelerationStructureDeviceAddressInfoKHR` structure.

The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructure` specifies the acceleration structure whose address is being queried.

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR`.

- **VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext**
  - `pNext` must be `NULL`.

- **VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter**
  - `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle.

### 12.7. Micromaps

Micromaps are opaque data structures that are built by the implementation to encode sub-triangle data to be included in an acceleration structure.
Micromaps are represented by VkMicromapEXT handles:

```cpp
// Provided by VK_EXT_opacity_micromap
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkMicromapEXT)
```

To create a micromap, call:

```cpp
// Provided by VK_EXT_opacity_micromap
VkResult vkCreateMicromapEXT(
    VkDevice device,
    const VkMicromapCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkMicromapEXT* pMicromap);
```

- `device` is the logical device that creates the acceleration structure object.
- `pCreateInfo` is a pointer to a VkMicromapCreateInfoEXT structure containing parameters affecting creation of the micromap.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pMicromap` is a pointer to a VkMicromapEXT handle in which the resulting micromap object is returned.

Similar to other objects in Vulkan, the micromap creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into a micromap is determined by the parameters of VkMicromapCreateInfoEXT.

The micromap data is stored in the object referred to by VkMicromapCreateInfoEXT::buffer. Once memory has been bound to that buffer, it must be populated by micromap build or micromap copy commands such as vkCmdBuildMicromapsEXT, vkBuildMicromapsEXT, vkCmdCopyMicromapEXT, and vkCopyMicromapEXT.

**NOTE**  
The expected usage for a trace capture/replay tool is that it will serialize and later deserialize the micromap data using micromap copy commands. During capture the tool will use vkCopyMicromapToMemoryEXT or vkCmdCopyMicromapToMemoryEXT with a mode of VK_COPY_MICROMAP_MODE_SERIALIZE_EXT, and vkCopyMemoryToMicromapEXT or vkCmdCopyMemoryToMicromapEXT with a mode of VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT during replay.

The input buffers passed to micromap build commands will be referenced by the implementation for the duration of the command. Micromaps must be fully self-contained. The application can reuse or free any memory which was used by the command as an input or as scratch without affecting the results of a subsequent acceleration structure build using the micromap or traversal of that acceleration structure.
Valid Usage

- VUID-vkCreateMicromapEXT-micromap-07430
  The micromap feature **must** be enabled

- VUID-vkCreateMicromapEXT-deviceAddress-07431
  If VkMicromapCreateInfoEXT::deviceAddress is not zero, the micromapCaptureReplay feature **must** be enabled

- VUID-vkCreateMicromapEXT-device-07432
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature **must** be enabled

Valid Usage (Implicit)

- VUID-vkCreateMicromapEXT-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkCreateMicromapEXT-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkMicromapCreateInfoEXT structure

- VUID-vkCreateMicromapEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateMicromapEXT-pMicromap-parameter
  pMicromap **must** be a valid pointer to a VkMicromapEXT handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkMicromapCreateInfoEXT structure is defined as:
typedef struct VkMicromapCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapCreateFlagsEXT createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkMicromapTypeEXT type;
    VkDeviceAddress deviceAddress;
} VkMicromapCreateInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **createFlags** is a bitmask of `VkMicromapCreateFlagBitsEXT` specifying additional creation parameters of the micromap.
- **buffer** is the buffer on which the micromap will be stored.
- **offset** is an offset in bytes from the base address of the buffer at which the micromap will be stored, and **must** be a multiple of 256.
- **size** is the size required for the micromap.
- **type** is a `VkMicromapTypeEXT` value specifying the type of micromap that will be created.
- **deviceAddress** is the device address requested for the micromap if the `micromapCaptureReplay` feature is being used.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, `deviceAddress` **must** be an address retrieved from an identically created micromap on the same implementation. The micromap **must** also be placed on an identically created buffer and at the same offset.

Applications **should** avoid creating micromaps with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

**NOTE**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and will add `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` to all buffers used as storage for a micromap where `deviceAddress` is not zero. This also means that the tool will need to add `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.
Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATEDEVICE_ADDRESS_CAPTURE REPLAY_BIT`, to avoid address space allocation conflicts.

If the micromap will be the target of a build operation, the required size for a micromap can be queried with `vkGetMicromapBuildSizesEXT`.

### Valid Usage

- **VUID-VkMicromapCreateInfoEXT-deviceAddress-07433**
  - If `deviceAddress` is not zero, `createFlags` must include `VK_MICROMAP_CREATEDEVICEADDRESS_CAPTUREREPLAY_BIT_EXT`.

- **VUID-VkMicromapCreateInfoEXT-createFlags-07434**
  - If `createFlags` includes `VK_MICROMAP_CREATEDEVICEADDRESS_CAPTUREREPLAY_BIT_EXT`, `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapCaptureReplay` must be `VK_TRUE`.

- **VUID-VkMicromapCreateInfoEXT-buffer-07435**
  - `buffer` must have been created with a usage value containing `VK_BUFFERUSAGE_MICROMAP_STORAGE_BIT_EXT`.

- **VUID-VkMicromapCreateInfoEXT-offset-07436**
  - `buffer` must not have been created with `VK_BUFFERCREATE_SPARSERESIDENCY_BIT`.

- **VUID-VkMicromapCreateInfoEXT-offset-07437**
  - The sum of `offset` and `size` must be less than the size of `buffer`.

- **VUID-VkMicromapCreateInfoEXT-offset-07438**
  - `offset` must be a multiple of 256 bytes.

### Valid Usage (Implicit)

- **VUID-VkMicromapCreateInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURETYPE_MICROMAP_CREATEINFO_EXT`.

- **VUID-VkMicromapCreateInfoEXT-pNext-pNext**
  - `pNext` must be `NULL`.

- **VUID-VkMicromapCreateInfoEXT-createFlags-parameter**
  - `createFlags` must be a valid combination of `VkMicromapCreateFlagBitsEXT` values.

- **VUID-VkMicromapCreateInfoEXT-buffer-parameter**
  - `buffer` must be a valid `VkBuffer` handle.

- **VUID-VkMicromapCreateInfoEXT-type-parameter**
  - `type` must be a valid `VkMicromapTypeEXT` value.

To get the build sizes for a micromap, call:
// Provided by VK_EXT_opacity_micromap

void vkGetMicromapBuildSizesEXT(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkMicromapBuildInfoEXT* pBuildInfo,
    VkMicromapBuildSizesInfoEXT* pSizeInfo);

- **device** is the logical device that will be used for creating the micromap.
- **buildType** defines whether host or device operations (or both) are being queried for.
- **pBuildInfo** is a pointer to a `VkMicromapBuildInfoEXT` structure describing parameters of a build operation.
- **pSizeInfo** is a pointer to a `VkMicromapBuildSizesInfoEXT` structure which returns the size required for a micromap and the sizes required for the scratch buffers, given the build parameters.

The `dstMicromap` and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` members of `pBuildInfo` are ignored by this command.

A micromap created with the `micromapSize` returned by this command supports any build with a `VkMicromapBuildInfoEXT` structure subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`
- For `VkMicromapBuildInfoEXT`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - The sum of usage information in either `pUsageCounts` or `ppUsageCounts` is equal to the sum of usage information in either `pBuildInfo->pUsageCounts` or `pBuildInfo->ppUsageCounts`.

Similarly, the `buildScratchSize` value will support any build command specifying the `VK_BUILD_MICROMAP_MODE_BUILD_EXT` mode under the above conditions.

### Valid Usage

- **VUID-vkGetMicromapBuildSizesEXT-dstMicromap-09180**
  - `VkMicromapBuildInfoEXT::dstMicromap must have been created from device`
- **VUID-vkGetMicromapBuildSizesEXT-micromap-07439**
  - The micromap feature **must** be enabled
- **VUID-vkGetMicromapBuildSizesEXT-device-07440**
  - If **device** was created with multiple physical devices, then the
bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetMicromapBuildSizesEXT-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetMicromapBuildSizesEXT-buildType-parameter
  buildType must be a valid VkAccelerationStructureBuildTypeKHR value
- VUID-vkGetMicromapBuildSizesEXT-pBuildInfo-parameter
  pBuildInfo must be a valid pointer to a valid VkMicromapBuildInfoEXT structure
- VUID-vkGetMicromapBuildSizesEXT-pSizeInfo-parameter
  pSizeInfo must be a valid pointer to a VkMicromapBuildSizesInfoEXT structure

The VkMicromapBuildSizesInfoEXT structure describes the required build sizes for a micromap and scratch buffers and is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildSizesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize micromapSize;
    VkDeviceSize buildScratchSize;
    VkBool32 discardable;
} VkMicromapBuildSizesInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- micromapSize is the size in bytes required in a VkMicromapEXT for a build or update operation.
- buildScratchSize is the size in bytes required in a scratch buffer for a build operation.
- discardable indicates whether or not the micromap object may be destroyed after an acceleration structure build or update. A false value means that acceleration structures built with this micromap may contain references to the data contained therein, and the application must not destroy the micromap until ray traversal has concluded. A true value means that the information in the micromap will be copied by value into the acceleration structure, and the micromap may be destroyed after the acceleration structure build concludes.

Valid Usage (Implicit)

- VUID-VkMicromapBuildSizesInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_BUILD_SIZES_INFO_EXT
- VUID-VkMicromapBuildSizesInfoEXT-pNext-pNext
  pNext must be NULL
Values which **can** be set in `VkMicromapCreateInfoEXT::type` specifying the type of micromap, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapTypeEXT {
    VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT = 0,
} VkMicromapTypeEXT;
```

- `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` is a micromap containing data to control the opacity of a triangle.

Bits which **can** be set in `VkMicromapCreateInfoEXT::createFlags`, specifying additional creation parameters for micromaps, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkMicromapCreateFlagBitsEXT {
    VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT = 0x00000001,
} VkMicromapCreateFlagBitsEXT;
```

- `VK_MICROMAP_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_EXT` specifies that the micromap's address **can** be saved and reused on a subsequent run.

```c
// Provided by VK_EXT_opacity_micromap
typedef VkFlags VkMicromapCreateFlagsEXT;
```

`VkMicromapCreateFlagsEXT` is a bitmask type for setting a mask of zero or more `VkMicromapCreateFlagBitsEXT`.

Bits which **can** be set in `VkMicromapBuildInfoEXT::flags` specifying additional parameters for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapFlagBitsEXT {
    VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT = 0x00000001,
    VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT = 0x00000002,
    VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT = 0x00000004,
} VkBuildMicromapFlagBitsEXT;
```

- `VK_BUILD_MICROMAP_PREFER_FAST_TRACE_BIT_EXT` indicates that the given micromap build **should** prioritize trace performance over build time.

- `VK_BUILD_MICROMAP_PREFER_FAST_BUILD_BIT_EXT` indicates that the given micromap build **should** prioritize build time over trace performance.
VkBuildMicromapFlagsEXT is a bitmask type for setting a mask of zero or more VkBuildMicromapFlagBitsEXT.

To destroy a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
void vkDestroyMicromapEXT(
    VkDevice device,
    VkMicromapEXT micromap,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the micromap.
- **micromap** is the micromap to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyMicromapEXT-micromap-07441
  All submitted commands that refer to **micromap** must have completed execution.

- VUID-vkDestroyMicromapEXT-micromap-07442
  If **VkAllocationCallbacks** were provided when **micromap** was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyMicromapEXT-micromap-07443
  If no **VkAllocationCallbacks** were provided when **micromap** was created, **pAllocator** must be **NULL**.

### Valid Usage (Implicit)

- VUID-vkDestroyMicromapEXT-device-parameter
  **device** must be a valid ** VkDevice** handle.

- VUID-vkDestroyMicromapEXT-micromap-parameter
  If **micromap** is not **VK_NULL_HANDLE**, **micromap** must be a valid ** VkMicromapEXT** handle.

- VUID-vkDestroyMicromapEXT-pAllocator-parameter
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure.

- VUID-vkDestroyMicromapEXT-micromap-parent
  If **micromap** is a valid handle, it must have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **micromap** must be externally synchronized.
12.8. Resource Memory Association

Resources are initially created as virtual allocations with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources must be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but can be bound to memory differently on each. Each such replicated resource is an instance of the resource. For sparse resources, each instance can be bound to memory arbitrarily differently. For non-sparse resources, each instance can either be bound to the local or a peer instance of the memory, or for images can be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance's binding to memory.

NOTE | There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements structure in which the memory requirements of the buffer object are returned.
Valid Usage (Implicit)

- **VUID-vkGetBufferMemoryRequirements-device-parameter**
  - device must be a valid `VkDevice` handle
- **VUID-vkGetBufferMemoryRequirements-buffer-parameter**
  - buffer must be a valid `VkBuffer` handle
- **VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter**
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- **VUID-vkGetBufferMemoryRequirements-buffer-parent**
  - buffer must have been created, allocated, or retrieved from device

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
    VkMemoryRequirements* pMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **image** is the image to query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the image object are returned.

Valid Usage

- **VUID-vkGetImageMemoryRequirements-image-01588**
  - image must not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set

Valid Usage (Implicit)

- **VUID-vkGetImageMemoryRequirements-device-parameter**
  - device must be a valid `VkDevice` handle
- **VUID-vkGetImageMemoryRequirements-image-parameter**
  - image must be a valid `VkImage` handle
- **VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter**
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- **VUID-vkGetImageMemoryRequirements-image-parent**
  - image must have been created, allocated, or retrieved from device
The `VkMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;
```

- `size` is the size, in bytes, of the memory allocation **required** for the resource.
- `alignment` is the alignment, in bytes, of the offset within the allocation **required** for the resource.
- `memoryTypeBits` is a bitmask and contains one bit set for every supported memory type for the resource. Bit `i` is set if and only if the memory type `i` in the `VkPhysicalDeviceMemoryProperties` structure for the physical device is supported for the resource.

If the resource being queried was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` external memory handle type, the value of `size` has no meaning and should be ignored.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements2`, `vkGetImageMemoryRequirements2`, `vkGetDeviceBufferMemoryRequirements`, `vkGetDeviceImageMemoryRequirements`, `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

- The `memoryTypeBits` member always contains at least one bit set.
- If `buffer` is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_PROTECTED_BIT` bits set, or if `image` is a linear image that was not created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, then the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory can always be attached to these objects.
- If `buffer` was created with `VkExternalMemoryBufferCreateInfo::handleTypes` set to 0 or `image` was created with `VkExternalMemoryImageCreateInfo::handleTypes` set to 0, the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.
- The `memoryTypeBits` member is identical for all `VkBuffer` objects created with the same value for the `flags` and `usage` members in the `VkBufferCreateInfo` structure and the `handleTypes` member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if `usage1` and `usage2` of type `VkBufferUsageFlags` are such that the bits set in `usage2` are a subset of the bits set in `usage1`, and they have the same `flags` and `VkExternalMemoryBufferCreateInfo::handleTypes`, then the bits set in `memoryTypeBits` returned for `usage1` must be a subset of the bits set in `memoryTypeBits` returned for `usage2`, for all values of `flags`. 
The alignment member is a power of two.

The alignment member is identical for all VkBuffer objects created with the same combination of values for the usage and flags members in the VkBufferCreateInfo structure passed to vkCreateBuffer.

If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage objects created with the same combination of values for the flags, imageType, format, extent, mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure passed to vkCreateImage.

The alignment member satisfies the buffer descriptor offset alignment requirements associated with the VkBuffer’s usage:

- If usage included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.
- If usage included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment.
- If usage included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment.

For images created with a color format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit and VK_IMAGE_CREATE_PROTECTED_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

For images created with a depth/stencil format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the format member, the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit and VK_IMAGE_CREATE_PROTECTED_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, the VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT bit of the usage member if the VkPhysicalDeviceHostImageCopyPropertiesEXT::identicalMemoryTypeRequirements property is VK_FALSE, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

If the memory requirements are for a VkImage, the memoryTypeBits member must not refer to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set if the image did not have VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT bit set in the usage member of the VkImageCreateInfo structure passed to vkCreateImage.

If the memory requirements are for a VkBuffer, the memoryTypeBits member must not refer to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT bit set.

**NOTE**
The implication of this requirement is that lazily allocated memory is disallowed.
for buffers in all cases.

- The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.

- The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.

**NOTE**
This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, can be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

- If the `maintenance4` feature is enabled, these additional guarantees apply:
  - For a `VkBuffer`, the `size` memory requirement is never greater than that of another `VkBuffer` created with a greater or equal `size` specified in `VkBufferCreateInfo`, all other creation parameters being identical.
  - For a `VkBuffer`, the `size` memory requirement is never greater than the result of aligning `VkBufferCreateInfo::size` with the `alignment` memory requirement.
  - For a `VkImage`, the `size` memory requirement is never greater than that of another `VkImage` created with a greater or equal value in each of `extent.width`, `extent.height`, and `extent.depth`; all other creation parameters being identical.
  - The memory requirements returned by `vkGetDeviceBufferMemoryRequirements` are identical to those that would be returned by `vkGetBufferMemoryRequirements2` if it were called with a `VkBuffer` created with the same `VkBufferCreateInfo` values.
  - The memory requirements returned by `vkGetDeviceImageMemoryRequirements` are identical to those that would be returned by `vkGetImageMemoryRequirements2` if it were called with a `VkImage` created with the same `VkImageCreateInfo` values.

To determine the memory requirements for a buffer resource, call:

```
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice               device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice               device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
• `pInfo` is a pointer to a `VkBufferMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  - `pInfo` must be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure

- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

To determine the memory requirements for a buffer resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,           // Provided by VK_VERSION_1_3
    const VkDeviceBufferMemoryRequirements* pInfo,  // Provided by VK_VERSION_1_3
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,  // Provided by VK_KHR_maintenance4
    const VkDeviceBufferMemoryRequirements* pInfo,  // Provided by VK_KHR_maintenance4
    VkMemoryRequirements2* pMemoryRequirements);
```

• `device` is the logical device intended to own the buffer.

• `pInfo` is a pointer to a `VkDeviceBufferMemoryRequirements` structure containing parameters required for the memory requirements query.

• `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter
  - `pInfo` must be a valid pointer to a valid `VkDeviceBufferMemoryRequirements` structure

- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter
**pMemoryRequirements** must be a valid pointer to a **VkMemoryRequirements2** structure

The **VkBufferMemoryRequirementsInfo2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **buffer** is the buffer to query.

**Valid Usage (Implicit)**

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2**

- VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  **pNext** must be **NULL**

- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  **buffer** must be a valid **VkBuffer** handle

The **VkDeviceBufferMemoryRequirements** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **pCreateInfo** is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer to query.

---

### Valid Usage (Implicit)

- **VUID-VkDeviceBufferMemoryRequirements-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS`

- **VUID-VkDeviceBufferMemoryRequirements-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkBufferCreateInfo` structure

---

To determine the memory requirements for an image resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

• **device** is the logical device that owns the image.

• **pInfo** is a pointer to a `VkImageMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.

• **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

---

### Valid Usage (Implicit)

- **VUID-vkGetImageMemoryRequirements2-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetImageMemoryRequirements2-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkImageMemoryRequirementsInfo2` structure
To determine the memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device intended to own the image.
- **pInfo** is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceImageMemoryRequirements-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter**
  - `pInfo` must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure
- **VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter**
  - `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkImageMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

## Valid Usage

- **VUID-VkImageMemoryRequirementsInfo2-image-01589**
  If `image` was created with a *multi-planar* format and the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-02279**
  If `image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` and with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there must be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-01590**
  If `image` was not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-02280**
  If `image` was created with a single-plane format and with any *tiling* other than `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

## Valid Usage (Implicit)

- **VUID-VkImageMemoryRequirementsInfo2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2`

- **VUID-VkImageMemoryRequirementsInfo2-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkImagePlaneMemoryRequirementsInfo`

- **VUID-VkImageMemoryRequirementsInfo2-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkImageMemoryRequirementsInfo2-image-parameter**
  `image` must be a valid `VkImage` handle
The `VkDeviceImageMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkImageCreateInfo* pCreateInfo;
    VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a `VkImageCreateInfo` structure containing parameters affecting creation of the image to query.
- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless `pCreateInfo->tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `pCreateInfo->flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set.

### Valid Usage

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06416**
  The `pCreateInfo->pNext` chain must not contain a `VkImageSwapchainCreateInfoKHR` structure.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06417**
  If `pCreateInfo->format` specifies a multi-planar format and `pCreateInfo->flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set then `planeAspect` must not be `VK_IMAGE_ASPECT_NONE_KHR`.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06419**
  If `pCreateInfo->flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set and if the `pCreateInfo->tiling` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid multi-planar aspect mask bit.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06420**
  If `pCreateInfo->tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT`...
::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier

Valid Usage (Implicit)

- **VUID-VkDeviceImageMemoryRequirements-sType-sType**
  - *sType must be* VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS
- **VUID-VkDeviceImageMemoryRequirements-pNext-pNext**
  - *pNext must be* NULL
- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter**
  - *pCreateInfo must be* a valid pointer to a valid VkImageCreateInfo structure
- **VUID-VkDeviceImageMemoryRequirements-planeAspect-parameter**
  - If planeAspect is not 0, planeAspect must be a valid VkImageAspectFlagBits value

To determine the memory requirements for a plane of a disjoint image, add a VkImagePlaneMemoryRequirementsInfo structure to the pNext chain of the VkImageMemoryRequirementsInfo2 structure.

The VkImagePlaneMemoryRequirementsInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- *sType* is a VkStructureType value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *planeAspect* is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query.

Valid Usage

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281**
  - If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid multi-planar aspect mask bit
If the image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image’s format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier).

Valid Usage (Implicit)

• VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO

• VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter
  planeAspect must be a valid VkImageAspectFlagBits value

The VkMemoryRequirements2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• memoryRequirements is a VkMemoryRequirements structure describing the memory requirements of the resource.

Valid Usage (Implicit)

• VUID-VkMemoryRequirements2-sType-sType
  sType must be VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2

• VUID-VkMemoryRequirements2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkMemoryDedicatedRequirements

• VUID-VkMemoryRequirements2-sType-unique
  The sType value of each struct in the pNext chain must be unique
The `VkMemoryDedicatedRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType    sType;
    void*               pNext;
    VkBool32            prefersDedicatedAllocation;
    VkBool32            requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`, respectively.

Constraints on the values returned for buffer resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried included a `VkExternalMemoryBufferCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`. Otherwise, `requiresDedicatedAllocation` will be `VK_FALSE`.

- When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it must also set `prefersDedicatedAllocation` to `VK_TRUE`.

- If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when buffer was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried included a `VkExternalMemoryImageCreateInfo` structure, and any of the handle types specified in
**VkExternalMemoryImageCreateInfo::handleTypes** requires dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures`.

- `requiresDedicatedAllocation` may be `VK_TRUE` if the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.
- `requiresDedicatedAllocation` will otherwise be `VK_FALSE`.
- If `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when the image was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

**Valid Usage (Implicit)**

- `VUID-VkMemoryDedicatedRequirements-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORYDEDICATED_REQUIREMENTS`

To attach memory to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(  
    VkDevice device,  
    VkBuffer buffer,  
    VkDeviceMemory memory,  
    VkDeviceSize memoryOffset);
```

- `device` is the logical device that owns the buffer and memory.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through `VkBindBufferMemoryInfo` to `vkBindBufferMemory2`.

**Valid Usage**

- `VUID-vkBindBufferMemory-buffer-07459`
  
  `buffer` must not have been bound to a memory object

- `VUID-vkBindBufferMemory-buffer-01030`
  
  `buffer` must not have been created with any sparse memory binding flags

- `VUID-vkBindBufferMemory-memoryOffset-01031`
  
  `memoryOffset` must be less than the size of `memory`

- `VUID-vkBindBufferMemory-memory-01035`
  
  `memory` must have been allocated using one of the memory types allowed in the
memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- VUID-vkBindBufferMemory-memoryOffset-01036
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- VUID-vkBindBufferMemory-size-01037
  The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset

- VUID-vkBindBufferMemory-buffer-01444
  If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer

- VUID-vkBindBufferMemory-memory-01508
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero

- VUID-vkBindBufferMemory-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindBufferMemory-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindBufferMemory-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

- VUID-vkBindBufferMemory-memory-02985
  If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

- VUID-vkBindBufferMemory-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-vkBindBufferMemory-bufferDeviceAddressCaptureReplay-09200
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay feature is enabled and buffer was created with the
VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set

Valid Usage (Implicit)

- VUID-vkBindBufferMemory-device-parameter
  device must be a valid VkDevice handle
- VUID-vkBindBufferMemory-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-vkBindBufferMemory-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-vkBindBufferMemory-buffer-parent
  buffer must have been created, allocated, or retrieved from device
- VUID-vkBindBufferMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to buffer must be externally synchronized

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

or the equivalent command
// Provided by VK_KHR_bind_memory2

VkResult vkBindBufferMemory2KHR(
    VkDevice device, device,
    uint32_t bindInfoCount, bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);

• device is the logical device that owns the buffers and memory.
• bindInfoCount is the number of elements in pBindInfos.
• pBindInfos is a pointer to an array of bindInfoCount VkBindBufferMemoryInfo structures describing buffers and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.

If the maintenance6 feature is enabled, this command must attempt to perform all of the memory binding operations described by pBindInfos, and must not early exit on the first failure.

If any of the memory binding operations described by pBindInfos fail, the VkResult returned by this command must be the return value of any one of the memory binding operations which did not return VK_SUCCESS.

NOTE
If the vkBindBufferMemory2 command failed, VkBindMemoryStatusKHR structures were not included in the pNext chains of each element of pBindInfos, and bindInfoCount was greater than one, then the buffers referenced by pBindInfos will be in an indeterminate state, and must not be used.

Applications should destroy these buffers.

Valid Usage (Implicit)

• VUID-vkBindBufferMemory2-device-parameter
  device must be a valid VkDevice handle

• VUID-vkBindBufferMemory2-pBindInfos-parameter
  pBindInfos must be a valid pointer to an array of bindInfoCount valid VkBindBufferMemoryInfo structures

• VUID-vkBindBufferMemory2-bindInfoCount-arraylength
  bindInfoCount must be greater than 0

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
VkBindBufferMemoryInfo contains members corresponding to the parameters of vkBindBufferMemory.

The VkBindBufferMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the buffer. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified buffer.

**Valid Usage**

- VUID-VkBindBufferMemoryInfo-buffer-07459
  `buffer` must not have been bound to a memory object
- VUID-VkBindBufferMemoryInfo-buffer-01030
  `buffer` must not have been created with any sparse memory binding flags
- VUID-VkBindBufferMemoryInfo-memoryOffset-01031
  `memoryOffset` must be less than the size of `memory`
- VUID-VkBindBufferMemoryInfo-memory-01035
  `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with `buffer`
• VUID-VkBindBufferMemoryInfo-memoryOffset-01036
memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

• VUID-VkBindBufferMemoryInfo-size-01037
The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset.

• VUID-VkBindBufferMemoryInfo-buffer-01444
If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer.

• VUID-VkBindBufferMemoryInfo-memory-01508
If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero.

• VUID-VkBindBufferMemoryInfo-None-01898
If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

• VUID-VkBindBufferMemoryInfo-None-01899
If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

• VUID-VkBindBufferMemoryInfo-memory-02726
If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

• VUID-VkBindBufferMemoryInfo-memory-02985
If memory was allocated by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

• VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

• VUID-VkBindBufferMemoryInfo-bufferDeviceAddressCaptureReplay-09200
If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddressCaptureReplay feature is enabled and buffer was created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT bit set.
If the `pNext` chain includes a `VkBindBufferMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated.

**Valid Usage (Implicit)**

- **VUID-VkBindBufferMemoryInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO`

- **VUID-VkBindBufferMemoryInfo-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindBufferMemoryDeviceGroupInfo` or `VkBindMemoryStatusKHR`

- **VUID-VkBindBufferMemoryInfo-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkBindBufferMemoryInfo-buffer-parameter**
  - `buffer` must be a valid `VkBuffer` handle

- **VUID-VkBindBufferMemoryInfo-memory-parameter**
  - `memory` must be a valid `VkDeviceMemory` handle

- **VUID-VkBindBufferMemoryInfo-commonparent**
  - Both of `buffer`, and `memory` must have been created, allocated, or retrieved from the same `VkDevice`

The `VkBindBufferMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfo VkBindBufferMemoryDeviceGroupInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
If the pNext chain of VkBindBufferMemoryInfo includes a VkBindBufferMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i the buffer is attached to the instance of memory on the physical device with device index pDeviceIndices[i].

If deviceIndexCount is zero and memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of memory.

If deviceIndexCount is zero and memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
deviceIndexCount must either be zero or equal to the number of physical devices in the logical device
- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
All elements of pDeviceIndices must be valid device indices

**Valid Usage (Implicit)**

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO
- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

The VkBindMemoryStatusKHR structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkBindMemoryStatusKHR {
    VkStructureType sType;
    const void* pNext;
    VkResult* pResult;
} VkBindMemoryStatusKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pResult** is a pointer to a VkResult value.
If the `pNext` chain of `VkBindBufferMemoryInfo` or `VkBindImageMemoryInfo` includes a `VkBindMemoryStatusKHR` structure, then the `VkBindMemoryStatusKHR::pResult` will be populated with a value describing the result of the corresponding memory binding operation.

### Valid Usage (Implicit)

- VUID-VkBindMemoryStatusKHR-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_BIND_MEMORY_STATUS_KHR`
- VUID-VkBindMemoryStatusKHR-pResult-parameter
  - `pResult` **must** be a valid pointer to a `VkResult`

To attach memory to a `VkImage` object created without the `VK_IMAGE_CREATE_DISJOINT_BIT` set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice device,                     // device is the logical device that owns the image and memory.
    VkImage image,                       // image is the image.
    VkDeviceMemory memory,               // memory is the `VkDeviceMemory` object describing the device memory to attach.
    VkDeviceSize memoryOffset            // memoryOffset is the start offset of the region of memory which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in memory, starting from memoryOffset bytes, will be bound to the specified image.
);
```

`vkBindImageMemory` is equivalent to passing the same parameters through `VkBindImageMemoryInfo` to `vkBindImageMemory2`.

### Valid Usage

- VUID-vkBindImageMemory-image-07460
  - `image` **must** not have been bound to a memory object
- VUID-vkBindImageMemory-image-01045
  - `image` **must** not have been created with any sparse memory binding flags
- VUID-vkBindImageMemory-memoryOffset-01046
  - `memoryOffset` **must** be less than the size of `memory`
- VUID-vkBindImageMemory-image-01445
  - If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` **must** have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`
If the `VkMemoryAllocateInfo` provided when memory was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` must be zero.

If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate memory is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created.

If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created.

image must not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set.

memory must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with image.

memoryOffset must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with image.

The difference of the size of memory and memoryOffset must be greater than or equal to the size member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the same image.

Valid Usage (Implicit)

device must be a valid `VkDevice` handle.

image must be a valid `VkImage` handle.

memory must be a valid `VkDevice` handle.
Memory must be a valid VkDeviceMemory handle

- VUID-vkBindImageMemory-image-parent
  image must have been created, allocated, or retrieved from device

- VUID-vkBindImageMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to image must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

- device is the logical device that owns the images and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of VkBindImageMemoryInfo structures, describing images and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.
If the `maintenance6` feature is enabled, this command **must** attempt to perform all of the memory binding operations described by `pBindInfos`, and **must** not early exit on the first failure.

If any of the memory binding operations described by `pBindInfos` fail, the `VkResult` returned by this command **must** be the return value of any one of the memory binding operations which did not return `VK_SUCCESS`.

NOTE

If the `vkBindImageMemory2` command failed, `VkBindMemoryStatusKHR` structures were not included in the `pNext` chains of each element of `pBindInfos`, and `bindInfoCount` was greater than one, then the images referenced by `pBindInfos` will be in an indeterminate state, and must not be used.

Applications should destroy these images.

### Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858
  - If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT`, then all planes of `VkBindImageMemoryInfo::image` **must** be bound individually in separate `pBindInfos`

- VUID-vkBindImageMemory2-pBindInfos-04006
  - `pBindInfos` **must** not refer to the same image subresource more than once

### Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
  - `device` **must** be a valid `VkDevice` handle

- VUID-vkBindImageMemory2-pBindInfos-parameter
  - `pBindInfos` **must** be a valid pointer to an array of `bindInfoCount` valid `VkBindImageMemoryInfo` structures

- VUID-vkBindImageMemory2-bindInfoCount-arraylength
  - `bindInfoCount` **must** be greater than 0

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

`VkBindImageMemoryInfo` contains members corresponding to the parameters of
vkBindImageMemory.

The `VkBindImageMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

### Valid Usage

- **VUID-VkBindImageMemoryInfo-image-07460**
  `image` must not have been bound to a memory object

- **VUID-VkBindImageMemoryInfo-image-01045**
  `image` must not have been created with any sparse memory binding flags

- **VUID-VkBindImageMemoryInfo-memoryOffset-01046**
  `memoryOffset` must be less than the size of `memory`

- **VUID-VkBindImageMemoryInfo-image-01445**
  If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` must have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`

- **VUID-VkBindImageMemoryInfo-memory-02628**
  If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must
equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

- VUID-VkBindImageMemoryInfo-None-01901
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit set, the image must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindImageMemoryInfo-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-VkBindImageMemoryInfo-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-VkBindImageMemoryInfo-memory-02989
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

- VUID-VkBindImageMemoryInfo-pNext-01615
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

- VUID-VkBindImageMemoryInfo-pNext-01616
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

- VUID-VkBindImageMemoryInfo-pNext-01617
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image

- VUID-VkBindImageMemoryInfo-pNext-01618
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, image must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set

- VUID-VkBindImageMemoryInfo-image-07736
  If image was created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set, then the pNext chain must include a VkBindImagePlaneMemoryInfo structure

- VUID-VkBindImageMemoryInfo-pNext-01619
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the
 VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01620
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01621
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure's pNext chain

- VUID-VkBindImageMemoryInfo-pNext-01626
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindImageMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

- VUID-VkBindImageMemoryInfo-pNext-01627
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, and VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount is not zero, then image must have been created with the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit set

- VUID-VkBindImageMemoryInfo-pNext-01628
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions must be valid rectangles contained within the dimensions of image

- VUID-VkBindImageMemoryInfo-pNext-01629
  If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, the union of the areas of all elements of VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions that correspond to the same instance of image must cover the entire image

- VUID-VkBindImageMemoryInfo-image-01630
  If image was created with a valid swapchain handle in VkImageSwapchainCreateInfoKHR::swapchain, then the pNext chain must include a VkBindImageMemorySwapchainInfoKHR structure containing the same swapchain handle

- VUID-VkBindImageMemoryInfo-pNext-01631
  If the pNext chain includes a VkBindImageMemorySwapchainInfoKHR structure, memory must be VK_NULL_HANDLE

- VUID-VkBindImageMemoryInfo-pNext-01632
If the `pNext` chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, *memory must be a valid `VkDeviceMemory` handle*

---

**Valid Usage (Implicit)**

- **VUID-VkBindImageMemoryInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, `VkBindImagePlaneMemoryInfo`, or `VkBindMemoryStatusKHR`

- **VUID-VkBindImageMemoryInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkBindImageMemoryInfo-image-parameter**
  
  `image` must be a valid `VkImage` handle

- **VUID-VkBindImageMemoryInfo-commonparent**
  
  Both of `image`, and `memory` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

---

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
    uint32_t splitInstanceBindRegionCount;
    const VkRect2D* pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.  

---

883
• **pSplitInstanceBindRegions** is a pointer to an array of **VkRect2D** structures describing which regions of the image are attached to each instance of memory.

If the **pNext** chain of **VkBindImageMemoryInfo** includes a **VkBindImageMemoryDeviceGroupInfo** structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If **deviceIndexCount** is greater than zero, then on device index **i** **image** is attached to the instance of the memory on the physical device with device index **pDeviceIndices[i]**.

Let **N** be the number of physical devices in the logical device. If **splitInstanceBindRegionCount** is greater than zero, then **pSplitInstanceBindRegions** is a pointer to an array of **N**² rectangles, where the image region specified by the rectangle at element **i*N+j** in resource instance **i** is bound to the memory instance **j**. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to **memoryOffset**, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of **image**, and the block at (0,0) corresponds to memory starting at **memoryOffset**.

If **splitInstanceBindRegionCount** and **deviceIndexCount** are zero and the memory comes from a memory heap with the **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** bit set, then it is as if **pDeviceIndices** contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If **splitInstanceBindRegionCount** and **deviceIndexCount** are zero and the memory comes from a memory heap without the **VK_MEMORY_HEAP_MULTI_INSTANCE_BIT** bit set, then it is as if **pDeviceIndices** contains an array of zeros. In other words, by default each physical device attaches to instance zero.

---

**Valid Usage**

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633**
  At least one of **deviceIndexCount** and **splitInstanceBindRegionCount** must be zero

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634**
  **deviceIndexCount** must either be zero or equal to the number of physical devices in the logical device

- **VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635**
  All elements of **pDeviceIndices** must be valid device indices

- **VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636**
  **splitInstanceBindRegionCount** must either be zero or equal to the number of physical devices in the logical device squared

- **VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637**
  Elements of **pSplitInstanceBindRegions** that correspond to the same instance of an image must not overlap

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638**
  The **offset.x** member of any element of **pSplitInstanceBindRegions** must be a multiple of
the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of all non-metadata aspects of the image

• VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639
The offset.y member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of all non-metadata aspects of the image

• VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
The extent.width member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else extent.width + offset.x must equal the width of the image subresource

• VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
The extent.height member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else extent.height + offset.y must equal the height of the image subresource

Valid Usage (Implicit)

• VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO

• VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

• VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
If splitInstanceBindRegionCount is not 0, pSplitInstanceBindRegions must be a valid pointer to an array of splitInstanceBindRegionCount VkRect2D structures

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemorySwapchainInfoKHR structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The VkBindImageMemorySwapchainInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType   sType;
    const void*       pNext;
    VkSwapchainKHR    swapchain;
    uint32_t           imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• swapchain is VK_NULL_HANDLE or a swapchain handle.
• imageIndex is an image index within swapchain.

If swapchain is not NULL, the swapchain and imageIndex are used to determine the memory that the image is bound to, instead of memory and memoryOffset.

Memory can be bound to a swapchain and use the pDeviceIndices or pSplitInstanceBindRegions members of VkBindImageMemoryDeviceGroupInfo.

Valid Usage

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  imageIndex must be less than the number of images in swapchain

Valid Usage (Implicit)

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

Host Synchronization

- Host access to swapchain must be externally synchronized

In order to bind planes of a disjoint image, add a VkBindImagePlaneMemoryInfo structure to the pNext chain of VkBindImageMemoryInfo.

The VkBindImagePlaneMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.

Valid Usage

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283
  If the image’s tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid multi-planar aspect mask bit.

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284
  If the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image’s format and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`).

Valid Usage (Implicit)

• VUID-VkBindImagePlaneMemoryInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO`.

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
  `planeAspect` must be a valid `VkImageAspectFlagBits` value.

Buffer-Image Granularity

The implementation-dependent limit `bufferImageGranularity` specifies a page-like granularity at which linear and non-linear resources must be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. `bufferImageGranularity` is specified in bytes, and must be a power of two. Implementations which do not impose a granularity restriction may report a `bufferImageGranularity` value of one.

### NOTE

Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

```
resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)
```

The following property must hold:
That is, the end of the first resource (A) and the beginning of the second resource (B) must be on separate “pages” of size bufferImageGranularity. bufferImageGranularity may be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources can be closer than bufferImageGranularity, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments must all be multiples of the bufferImageGranularity. Therefore, memory bound to sparse resources naturally satisfies the bufferImageGranularity.

12.9. Resource Sharing Mode

Buffer and image objects are created with a sharing mode controlling how they can be accessed from queues. The supported sharing modes are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.

- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

**NOTE**

**VK_SHARING_MODE_CONCURRENT** may result in lower performance access to the buffer or image than **VK_SHARING_MODE_EXCLUSIVE**.

Ranges of buffers and image subresources of image objects created using **VK_SHARING_MODE_EXCLUSIVE** must only be accessed by queues in the queue family that has ownership of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using **VK_SHARING_MODE_EXCLUSIVE** is owned by some queue family, the application must perform a queue family ownership transfer to make the memory contents of a range or image subresource accessible to a different queue family.

**NOTE**

Images still require a layout transition from **VK_IMAGE_LAYOUT_UNDEFINED** or **VK_IMAGE_LAYOUT_PREINITIALIZED** before being used on the first queue.

A queue family can take ownership of an image subresource or buffer range of a resource created with **VK_SHARING_MODE_EXCLUSIVE**, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the
Ranges of buffers and image subresources of image objects created using 
`VK_SHARING_MODE_CONCURRENT` must only be accessed by queues from the queue families specified 
through the `queueFamilyIndexCount` and `pQueueFamilyIndices` members of the corresponding create 
info structures.

### 12.9.1. External Resource Sharing

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their 
underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying 
memory at a given time, regardless of whether the resource was created using 
`VK_SHARING_MODE_EXCLUSIVE` or `VK_SHARING_MODE_CONCURRENT`. Applications can transfer ownership of a 
resource's underlying memory only if the memory has been imported from or exported to another 
instance or external API using external memory handles. The semantics for transferring ownership 
between queues, and is also accomplished using 
`VkBufferMemoryBarrier` or `VkImageMemoryBarrier` operations. To make the contents of the 
underlying memory accessible in the destination instance or API, applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API.

Unlike queue family ownership transfers, the destination instance or API is not specified explicitly 
when releasing ownership, nor is the source instance or API specified when acquiring ownership. 
Instead, the image or memory barrier's `dstQueueFamilyIndex` or `srcQueueFamilyIndex` parameters are 
set to the reserved queue family index `VK_QUEUE_FAMILY_EXTERNAL` or `VK_QUEUE_FAMILY_FOREIGN_EXT` to 
represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs 
does not change the ownership of the underlying memory. The first entity to access the resource 
implicitly acquires ownership. An entity can also implicitly take ownership from another entity in 
the same way without an explicit ownership transfer. However, taking ownership in this way has 
the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same 
semantics as accessing a `VK_SHARING_MODE_EXCLUSIVE` resource, with one exception: Implementations 
**must** ensure layout transitions performed on one member of a set of identical subresources of 
identical images that alias the same range of an underlying memory object affect the layout of all 
the subresources in the set.

As a corollary, writes to any image subresources in such a set **must** not make the contents of 
memory used by other subresources in the set undefined. An application **can** define the content of 
a subresource of one image by performing device writes to an identical subresource of another 
image provided both images are bound to the same region of external memory. Applications **may** 
also add resources to such a set after the content of the existing set members has been defined 
without making the content undefined by creating a new image with the initial layout
VK_IMAGE_LAYOUT_UNDEFINED and binding it to the same region of external memory as the existing images.

Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

## 12.10. Memory Aliasing

A range of a VkDeviceMemory allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via `vkBindImageMemory`, `vkBindBufferMemory`, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource\(_A\) and resource\(_B\), bound respectively to memory range\(_A\) and range\(_B\). Let paddedRange\(_A\) and paddedRange\(_B\) be, respectively, range\(_A\) and range\(_B\) aligned to bufferImageGranularity. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources *alias* the memory in the intersection of range\(_A\) and range\(_B\). If one resource is linear and the other is non-linear, then the resources *alias* the memory in the intersection of paddedRange\(_A\) and paddedRange\(_B\).

Applications can alias memory, but use of multiple aliases is subject to several constraints.

Memory aliasing can be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image’s advertised layout) include bytes from the aliased range overlap the range. When a VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layouts, are *host-accessible subresources*. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory can be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were
created with the VK_IMAGE_CREATE_ALIAS_BIT flag set, and both are bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag.
- The single-plane image must have a VkFormat that is equivalent to that of the multi-planar image’s individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.
- The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then both images must be linear.
- All other creation parameters must be identical.

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from VK_IMAGE_LAYOUT_UNDEFINED to a valid layout before it is used, or from VK_IMAGE_LAYOUT_PREINITIALIZED if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass must declare
the attachments using the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, and follow the other rules listed in that section.

| NOTE | Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements. |

### 12.10.1. Resource Memory Overlap

Applications can safely access a resource concurrently as long as the memory locations do not overlap as defined in Memory Location. This includes aliased resources if such aliasing is well-defined. It also includes access from different queues and/or queue families if such concurrent access is supported by the resource. Transfer commands only access memory locations specified by the range of the transfer command.

| NOTE | The intent is that buffers (or linear images) can be accessed concurrently, even when they share cache lines, but otherwise do not access the same memory range. The concept of a device cache line size is not exposed in the memory model. |
Chapter 13. Samplers

VkSampler objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by VkSampler handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(  
    VkDevice device,  
    const VkSamplerCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSampler* pSampler);
```

- `device` is the logical device that creates the sampler.
- `pCreateInfo` is a pointer to a VkSamplerCreateInfo structure specifying the state of the sampler object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSampler` is a pointer to a VkSampler handle in which the resulting sampler object is returned.

**Valid Usage**

- VUID-vkCreateSampler-device-09668
  `device` must support at least one queue family with one of the VK_QUEUE_COMPUTE_BIT or VK_QUEUE_GRAPHICS_BIT capabilities

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There must be less than VkPhysicalDeviceLimits::maxSamplerAllocationCount VkSampler objects currently created on the device

**Valid Usage (Implicit)**

- VUID-vkCreateSampler-device-parameter
  `device` must be a valid VkDevice handle

- VUID-vkCreateSampler-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid VkSamplerCreateInfo structure

- VUID-vkCreateSampler-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid
**VkAllocationCallbacks** structure

- VUID-vkCreateSampler-pSampler-parameter
  
  `pSampler` must be a valid pointer to a **VkSampler** handle

---

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`

The **VkSamplerCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerCreateFlags flags;
    VkFilter magFilter;
    VkFilter minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float mipLodBias;
    VkBool32 anisotropyEnable;
    float maxAnisotropy;
    VkBool32 compareEnable;
    VkCompareOp compareOp;
    float minLod;
    float maxLod;
    VkBorderColor borderColor;
    VkBool32 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- `sType` is a **VkStructureType** value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of **VkSamplerCreateFlagBits** describing additional parameters of the sampler.
- `magFilter` is a **VkFilter** value specifying the magnification filter to apply to lookups.
- `minFilter` is a **VkFilter** value specifying the minification filter to apply to lookups.
- `mipmapMode` is a **VkSamplerMipmapMode** value specifying the mipmap filter to apply to lookups.
